B. Where portions of existing lawns, shrubs, paving, etc. are disturbed for installation of work of this Division, such items shall be repaired and/or replaced to the satisfaction of the Engineer.

C. Where the installation of conduit, ducts, piping, etc. requires the penetration of fire or smoke rated walls, ceilings or floors, the space around such conduit, duct, pipe, etc., shall be tightly filled with an approved non-combustible fire insulating material satisfactory to maintain the rating integrity of the wall, floor or ceilings affected.

D. Where ducts penetrate fire rated assemblies, fire dampers shall be provided with an appropriate access door.

E. Piping passing through floors, ceilings and walls in finished areas, unless otherwise specified, shall be fitted with chrome plated brass escutcheons of sufficient outside diameter to amply cover the sleeved openings and an inside diameter to closely fit the pipe around which it is installed.

F. Stainless steel collars shall be provided around all ducts, large pipes, etc., at all wall penetrations; both sides.

G. Where ducts, pipes, and conduits pass through interior or exterior walls, the wall openings shall be sealed air tight. This shall include sealing on both sides of the wall to ensure air does not enter or exit the wall cavity. This is especially critical on exterior walls where the wall cavity may be vented to the exterior.

H. When installing conduit, pipe, or any other work in insulated concrete form (ICF) walls, the responsible subcontractor for the work shall provide spray foam insulation to patch the rigid insulation to maintain full integrity of the insulating value of the wall after the mechanical and electrical work is complete. Furthermore, all new work shall NOT be installed in concrete center of wall. All mechanical and electrical installations shall be on the interior side of the concrete.

END OF SECTION 201100

SECTION 201200 - EXCAVATION, TRENCHING, BACKFILLING AND GRADING

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

   B. The Contractor shall include all excavating, filling, grading, and related items required to complete his work as shown on the drawings and specified herein or as required to complete, connect and place all mechanical systems in satisfactory operation.

   C. Unless otherwise shown or required, provide separate trenches for sewers, water lines and other underground raceways, with a minimum of 10 feet measured from outside diameter between pipes. In locations, such as close to buildings where separate trenches for sewers and water lines are impractical, lay the water pipe on a solid shelf at least 2'-0" above the top of the sewer and 2-0" to the side. Electric and fuel lines shall always be placed in a separate trench. All exterior lines shall have a minimum earth cover of thirty (30) inches to top of pipe, unless otherwise indicated.

   D. Water lines crossing under sewer lines, or crossing less than 2 feet above sewer lines, must be encased for a distance not less than 5 feet on either side of the point of crossover.

2. SUBSURFACE DATA

   A. Materials to be excavated shall be unclassified, and shall include earth, rock, or any other material encountered in the excavating to the depth and extent indicated on the drawings and specified herein. No adjustment in the Contract sum will be made on account of the presence or absence of rock, shale, or other materials encountered in the excavating. This paragraph is written to include the removal of all rock with no extras, whether rock is indicated or not.

3. BENCH MARKS AND MONUMENTS

   A. Maintain carefully all bench marks, monuments and other reference points. If disturbed or destroyed, replace as directed.

4. EXCAVATION

   A. Excavate trenches of sufficient width for proper installation of the work. When the depth of backfill over sewer pipe exceeds 10 feet, keep the trench at the level of the top of the pipe as narrow as practicable. Trench excavation for piping eight inches and smaller shall not exceed thirty-inch width for exterior lines and twenty-four-inch width for interior lines.

   B. Sheet and brace trenches as necessary to protect workmen and adjacent structures. Comply with local regulations or, in the absence thereof, with the "Manual of Accident Prevention in Construction" of the Associated General Contractors of America, Inc., and current OSHA Standards. Do not remove sheeting until trench is backfilled sufficiently to protect pipe and prevent injurious caving. Where removal of sheeting and/or bracing is hazardous, leave in place. Cut off such sheeting not to be removed at least 3 feet below finished grade.

C. Rules and regulations governing the respective utilities shall be observed in executing all work under this heading. Active utilities discovered in the course of excavation shall be protected or relocated in accordance with written instructions from the Engineer. Inactive and abandoned utilities encountered in trenching operations shall be removed and abandoned with ends plugged or capped in accord with current codes and safe practice. If in doubt, contact Engineers. Machine excavation shall not be allowed within ten (10) feet of existing electric lines or lines carrying combustible materials. Use only hand tools.

D. The removal of rock shall be accomplished by use of hand or power tools only. Blasting shall not be permitted unless authorized in writing by the Engineer. Any damage to existing structures, exterior services, or rock intended for bearing, shall be corrected at the Contractor's expense.

E. Perform final grading of trench bottoms by hand tools; carry machine excavation only to such depth that soil bearing for pipes and raceways will not be disturbed. Grade the bottom of trenches evenly to ensure uniform bearing for all piping and raceways. Cut bell holes as necessary for joints and jointmaking. Except as hereinafter specified, bottom of trenches for bell and spigot pipe, flanged pipe, etc. shall be shaped to the lower quadrant of pipe with additional excavation for bell or flange. Piping installed where it rests on bell, or flange and/or is supported with blocks or wedges will not be accepted.

F. Keep trenches free from water while construction therein is in progress. Under no circumstances lay pipe or appurtenances in water. Pump or bail water from bell holes to permit proper jointing of pipe. Any water pumping from this Contractor's trenches which is required during construction, shall be included in this Contract.

G. In no case shall excavation work be accomplished that will damage in any way the new structure, existing structures, equipment, utility lines, large trees to remain, etc. The Contractors shall take the necessary steps to prevent flow of eroded earth by water or landslide onto the property of others, or against the structures. The repair of all such damage or any other damage incurred in the course of excavation shall be borne by the responsible Contractor.

H. Use surveyor's level to establish elevations and grades.

I. The Contractor shall accept the site as he finds it and remove all trash, rubbish and material from the site prior to starting excavation of his work.

J. The Contractor shall provide and maintain barricades and temporary bridges around excavations as required for safety. Temporary bridges shall be provided where excavations cross paved areas and walks. The Contractor shall maintain these bridges in a safe and passable condition for all traffic until removal. Refer to OSHA Standards for such installations and comply with same in all details.

K. Pay particular attention to existing utilities and lines to avoid damage. The locations of existing lines which are indicated on the plans were taken unconfirmed from drawings prepared for previous construction and locations are approximate only. Also, certain water, gas, electric, storm and sanitary sewer lines and other underground appurtenances, active or abandoned, may not appear on the drawings. It shall be each Mechanical Contractor's responsibility to ascertain the location of all lines and excavate with caution in their area.

5. BACKFILL AND SURFACE REPAIR

A. Backfilling for mechanical work shall include all trenches, manhole pits, storage tank pits, and/or any other earth and/or rock openings which are excavated under this Contract. Backfilling shall be carefully performed and the surface restored to its original level to receive new finish. Wherever trenches and earth openings have not been properly filled and/or settlement occurs, they shall be re-excavated, re-filled and properly compacted, smoothed off and finally made to conform to the level of the original ground surface.

B. Unless otherwise indicated or specified, all piping shall be bedded on four (4) inches minimum of compacted naturally or artificially graded mixture of crushed gravel, crushed stone, or crushed sand with 100 percent passing a 1-inch sieve and not more than 8 percent passing a No. 200 sieve on undisturbed soil excavated as described hereinbefore. Install tracer wire above pipe. Cover the pipe with twelve (12) inches of compacted backfill to prevent settlement above and around the new pipe. The backfill shall be naturally or artificially graded mixture of crushed gravel, crushed stone, or crushed sand with 100 percent passing a 1-inch sieve and not more than 8 percent passing a No. 200 sieve. Prior to placing this second level of backfill, apply all required coatings and coverings to pipe, apply required tests and check the grading of the pipe to ensure that it is correct and that the pipe is free of swags, bows or bends. Also check lines for leaks at this point and repair as required. Once all of the preceding is accomplished, continue backfill with clean, debris and rock free earth tamped at six (6) inch intervals. Finish the backfill as specified following. Note: Water settling of backfill will be permitted only as an aid to mechanical compacting.

   (1) When installing any type of pipe below building footing, parallel or perpendicular to the footing, the area underneath the footing and in the zone of influence shall be backfilled with cementitious flowable fill. The zone of influence is the area within a 45-degree angle projecting down from the bottom edge of footers on all sides of the footing. Piping within flowable fill shall be isolated from the fill by a layer of heavy duty felt paper. Piping installed in trenches backfilled with flowable fill shall be anchored to the soil below prior to backfilling.

C. Backfill beneath areas to be seeded or sodded within six (6) inches of finished grade. The remaining six (6) inches shall be backfilled with clean top soil.

D. Backfill beneath paved areas, walks, etc. shall be brought to proper grade to receive the sub-base and paving. No paving shall be placed on uncompacted fill or unstable soil.

E. Backfill for natural gas lines shall be in strict accordance with the utility company or local municipalities requirements. If in doubt, contact the utility company or local municipality and/or the Engineer.

F. Backfill for lines carrying hazardous or combustible materials shall be in accordance with current codes, rules, regulations and safe practices. If in doubt, contact the Engineers.

G. Backfill for underground tanks shall be in accord with the tank manufacturer’s recommendations. If in doubt, contact the Engineers.

H. Wherever, in the opinion of the Engineer, the soil at or below the requisite pipe grade is unsuitable for supporting piping, special support shall be provided as directed by the Engineer.

I. Unsuitable material and surplus excavated material not required for backfill shall be removed from the site. The location of dump and length of haul shall be the affected Contractor's responsibility.

J. Provide and place any additional fill material from off the site as may be required for backfill. Fill obtained from off site shall be of kind and quality as specified for backfill and the source approved by the Engineer and shall be brought to the site by the Contractor requiring the fill.

K. In the absence (if not specified or indicated elsewhere in the drawings or specifications to be done by others) of such work by others, the Contractor shall lay new sod over his excavation work. Level, compress and water in accord with sound sodding practice.

L. When running any type of piping below a footer or in the zone of influence the piping shall be backfilled with cementitious flowable fill. The zone of influence is the area under the footer within a 45-degree angle projecting down from the bottom edge of the footer on all sides of the footer. Additionally, grease traps, manholes, vaults, and other underground structures shall be held away from building walls far enough to be outside of the zone of influence.

M. Warning Tape and Tracer Wire

Provide a yellow and black plastic tape in all trenches 6" above the buried utility that identifies the utility about to be encountered. For non-metallic pipe a #12 copper wire shall also be laid in the trench to aid in future location of the piping. A foil faced warning tape may be used in lieu of the plastic tape and wire.

N. All manholes, vaults, and similar underground structures shall have the top elevation set flush with finished grade unless specifically noted otherwise.

6. MINIMUM DEPTHS OF BURY (TO TOP OF PIPE)

In the absence of other indication, the following shall be the minimum depth of bury of exterior utility lines. (Check drawings for variations).

A. Domestic Water Lines .....36 inches.

B. Fire Protection Lines.....42 inches.

C. Storm Lines .....20 inches.

D. Sanitary Lines (Exterior).....36 inches.

E. Natural Gas Lines.....36 inches.

F. Fuel Oil Lines.....36 inches.

G. Other lines carrying combustible and/or hazardous materials.....36 inches.

END OF SECTION 201200

SECTION 201300 - PIPE, PIPE FITTINGS AND PIPE SUPPORT

1. GENERAL

A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. When a pipe size is not indicated, the Contractor shall request the pipe size from the Engineers. All piping shall be installed straight and true, parallel or perpendicular to the building construction. Piping shall be installed so as to allow for expansion without damage to the building finishes, structure, pipe, equipment, etc., use offsets, U-bends or expansion joints as required. Where a section of piping is not indicated but is obviously required for completion of the system, the Contractor shall provide same at no additional cost to the project. No mitered joints or field fabricated pipe bends shall be accepted. Pipe shall clear all windows, doors, louvers and other building openings.

C. All pipe shall be supported in a neat and workmanlike manner and wherever possible, parallel runs of horizontal piping shall be grouped together on trapeze type hangers. Vertical risers shall be supported at each floor line with approved steel pipe riser clamps. The use of wire or perforated metal to support pipes will not be permitted. Hanging pipes from other pipes shall not be permitted. Spacing of pipe supports shall not exceed eight feet for pipes up to 1-1/4 inches and ten feet on all other piping. Small vertical pipes (1 inch and less) shall be bracketed to walls, structural members, etc. at four (4) foot intervals so as to prevent vibration or damage by occupants. Insulated piping shall be supported on a rigid insulation block at each hanger so as to prevent crushing of insulation by hangers. Hangers shall pass completely around the insulation jacket and a steel protective saddle shall be applied to prevent compression of the insulation. (Refer to Specifications Section entitled INSULATION-MECHANICAL).

D. Where piping rests directly on a hanger, clip, bracket or other means of support, the support element shall be of the same material as the pipe, (e.g., copper to copper, ferrous to ferrous, etc.) or shall be electrically isolated one from the other so as to prevent pipe damage by electrolysis. Pay particular attention and do not allow copper pipe to rest on ferrous structural members, equipment, etc. without electrolytic isolation.

E. In general, piping shall be installed concealed except in Mechanical, Janitor Rooms, etc. unless otherwise indicated, and shall be installed underground or beneath concrete slabs only where indicated. All lines at ceilings shall be held as high as possible and shall run so as to avoid conflicts with other trades, and to facilitate the Owner's use and maintenance. Location of pipe in interior partitions shall be carefully coordinated with whoever will construct the partitions after the piping is in place. Where exposed risers occur, they shall be kept as close to walls as possible.

F. Installation of pipe shall be in such a manner as to provide complete drainage of the system toward the source. Drain valves shall be provided at all drainage points on pipes. Drain valves shall be 1/2" size gate type with 3/4" hose thread end and vacuum breaker. Label each drain valve.

G. All hot and cold-water piping shall be kept a sufficient distance apart so as to prevent heat transfer between them. Cold water piping shall also be kept apart from refrigerant hot gas lines.

H. Piping carrying water or other fluids subject to freezing shall not be installed in locations subject to freezing; if in doubt, consult Engineer.

I. Piping for all drainage systems shall be installed to permit flow, trapping, and venting in accord with current codes and sound practice.

J. All cast iron soil pipe and fittings shall be coated inside and out with coal tar varnish.

K. Non-metallic piping shall be installed in strict accordance with the manufacturer's instructions. If no such instructions are available, consult Engineers.

L. Nipples shall be of the same material, composition and weight classification as pipe with which installed.

M. Where piping is not indicated on the plans, but is obviously or apparently required, contact the Engineers prior to submission of a bid proposal.

N. Pay particular attention to conflict of piping with other work. Do not install until conflict is resolved. If necessary, contact Engineers.

O. Piping materials in each system shall, to the extent practicable, be of the same material. Frequent changes of material (for example, from copper to steel) shall be avoided and in no case, shall be accomplished without use of insulating unions and permission of the Engineers.

P. Apply approved pipe dope (for service intended) to all male threaded joints. Pay particular attention to dope for fuel gas lines. The dope shall be listed for such use.

Q. High points of closed loop hot water heating systems shall have manual or automatic air vents as indicated or required unless automatic air vents are specifically indicated. Pipe to suitable drainage point.

R. All piping shall be capped or plugged during erection as required to keep clean and debris and moisture free.

S. The entire domestic hot, cold and recirculating hot water piping system shall be sterilized in strict accord with requirements of the Department of Health Codes, Rules and Regulations for the State which the work is being accomplished in.

T. Provide expansion joints where shown on the plans and where required by good practice. Expansion joints shall be guided and anchored in accordance with the recommendations of the Expansion Joint Manufacturer's Association.

U. Where plastic pipe penetrates a fire rated assembly, it shall be replaced with a metal threaded adapter and a metal pipe per code.

V. Foam Core PVC is not permitted

W. Provide a fuel oil filter in front of the fuel oil pump as recommended by the pump and generator manufacturer.

X. Where piping penetrates interior or exterior walls, the wall shall be sealed airtight. Refer to the sleeving, cutting, patching and repairing section of the specifications for additional requirements.

Y. Provide thrust blocks on all storm, sanitary, water, steam, hot, chilled, condenser, etc., and any other piping subject to hammering. Thrust blocks shall be provided at all turns.

Z. All piping to hydronic coils shall be full size all the way to the coil connection on the unit. If control valve is smaller than pipe size indicated, transition immediately before and after control valve. Also, if coil connection at unit is a different size than the branch pipe size indicated, provide transition at coil connection to unit. On 3-way valve applications, the coil bypass pipe shall be full size.

AA. Provide check valves on individual hot and cold-water supplies to each mixing valve (including each sensor style faucet, safety shower, mop sink, etc.) and each showerhead with a diverter valve (including all ADA showers). This requirement shall not be satisfied by mixing valves or fixtures with internal check valves. Independent external check valves are required.

2. UNIONS AND FLANGES AND WELDED TEES

A. Screwed unions, soldered unions or bolted flanges shall be provided as required to permit removal of equipment, valves and piping accessories from the piping system. Keep adequate clearances for coil removal, rodding, tube replacement, motor lubrication, filter replacement, etc. Flanged joints shall be assembled with appropriate flanges, gaskets and bolting. Gaskets for steam piping systems shall be flexitalic spiral wound type. The clearance between flange faces shall be such that the connections can be gasketed and bolted tight without imposing undue strain on the piping system.

B. Dielectric insulating unions or couplings shall be used wherever the adjoining materials being connected are of dissimilar metals such as connections between copper and steel pipe.

C. Tee connections for welded pipe shall be made up with welding fittings. Where the size of the side outlet is such that a different connection technique than on the run is required, a weldolet, sockolet, or threadolet type fitting may be used for the branch in place of reducing tees only where the branch is 2/3 the run size or smaller.

D. All piping 2½" and larger shall use flanged joints in mechanical rooms.

3. SPECIFICATIONS STANDARDS

All piping and material shall be new, made in the United States and shall conform to the following minimum applicable standards:

A. Steel pipe; ASTM A-120, A-53 Grade A, A-53 Grade B.

B. Copper tube; Type K, L, M; ASTM B88-62; Type DWV ASTM B306-62.

C. Cast iron soil pipe; ASA A-40.l and CS 188-59.

D. Cast iron drainage fittings; ASA B16.12.

E. Cast iron screwed fittings; ASA B16.4.

F. Welding fittings; ASA B16.9.

G. Cast brass and wrought copper fittings; ASA B16.18.

H. Cast brass drainage fittings; ASA B16.23.

I. Reinforced concrete pipe; ASTM-C-76-64T.

J. Solder; Handy and Harmon, United Wire and Supply; Air Reduction Co. or equivalent.

K. CPVC Plastic pipe; ASTM D2846.

L. PVC plastic pipe; ASTM D1785.

M. ABS plastic pipe; ASTM D1788-73.

N. High Density Polyethylene Pipe (HDPE); ASTM D12484

4. PITCH OF PIPING

All piping systems shall be installed so as to drain to a low point. Certain minimum pitches shall be required for this drainage. For proper flow and/or for proper operation, the following pitches shall be required:

A. Interior Soil, Waste and Vent Piping:

1/4 inch per foot in direction of flow where possible but in no case less than 1/8" per foot.

B. Exterior Sanitary Lines:

Not less than one (1) percent fall in direction of flow and no greater than indicated.

C. Roof Leaders:

1/8 inch per foot where possible.

D. Condensate Drain Lines from Cooling Equipment:

Not less than 1/4 inch per foot in direction of flow.

E. High and Low-Pressure Steam Mains:

One inch in 20 feet in direction of flow.

F. Steam Condensate Return Lines:

One inch in 20 feet in direction of flow.

G. Exterior Storm Lines:

Not less than 1 percent grade in direction of flow.

H. All Other Lines:

Provide ample pitch to a low point to allow 100 percent drainage of the system.

5. APPLICATIONS

A. General Notes

(1) Where plastic piping penetrates a fire rated assembly, it shall be replaced with a threaded metal adapter and metal pipe or whatever means necessary to maintain the separation rating in accordance with local plumbing and fire codes.

(2) Plastic piping or any materials with a flame and smoke spread rating not approved for plenum use shall not be permitted in supply, return, relief or exhaust plenums.

(3) PVC, CPVC, or plastic piping shall not be used under paving, roads or areas where vehicular traffic is expected.

(4) PVC or plastic piping whether specifically listed or not may not be used in high rise buildings or anywhere else prohibited by code.

B. Sanitary Sewer – Exterior

(1) Service weight cast iron piping with bell and spigot fittings complying with ASTM A 74. All joints shall be compression gasket type.

C. Storm Sewer – Exterior

(1) Class II reinforced concrete pipe (RCP) with tongue and groove gasketed joints conforming to ASTM C-443.

(2) Service weight cast iron piping with bell and spigot fittings complying with ASTM A 74. All joints shall be compression gasket type.

D. Natural Gas Piping - Exterior

Exterior natural gas piping shall be thermoplastic gas pressure pipe with fittings complying with ASTM D 2513. All gas piping shall be installed per NFPA 54.

Columbia Gas requires, in compliance with Sections 192.283 and 192.285 of Title 49 of the Code of Federal Regulations, that Contractors installing plastic pipe be qualified in the procedures for joining plastic pipe. Contractors not previously qualified by Columbia should contact the local Columbia Gas office for information on the necessary procedures for qualifying under this requirement.

E. Domestic Water Piping - Exterior

(1) Type "K" hard copper with wrought copper fittings and brazed joints.

(2) Schedule 150 ductile iron piping with cement mortar lining and rubber gasketed joints.

F. Fire Protection - Exterior and Interior

Refer to the Fire Protection System section of these specifications.

G. Soil Waste and Vent Piping - General Requirements

(1) Water closet floor flanges and ells shall be cast iron regardless whether PVC piping is allowed or not.

H. Soil, Waste and Vent Piping (Below Slab)

(1) Schedule 40 PVC pipe with drainage pattern fittings and solvent cement joints made in accordance with the State Plumbing code.

(2) Waste piping serving Soda Machine drains, (floor sinks or floor drains) shall be: Service weight cast iron epoxy coated no-hub cast iron pipe and fittings, as manufactured by Newage Casting or approved equal. Certified to conform to ASTM A888 & CISPI 301. The two-part epoxy spray on coating shall have a 2.5 mil. Minimum exterior thickness and a 5 mil. Minimum interior thickness for adhesion and chemical resistance. Two-part epoxy is to be tested to be non- reactive from 2pH-12pH. Install piping in accordance to manufacturer's instructions. This branch piping shall run as this material until connected to the main.

(3) All sanitary piping below slab shall be service weight hubless cast iron with heavy duty bands. Bands shall be heavy duty with extra width for lateral support. Each coupling shall have a minimum of four bands. Cast iron will also be required at any other location where waste water temperature can exceed 120°F. Cast iron shall extend a minimum of 35' past last waste inlet..

I. Soil, Waste and Vent Piping (Above Slab)

(1) Service weight hubless cast iron pipe for all vertical sanitary waste and vent risers. Bands shall be heavy duty band with extra width for lateral support. Each coupling shall include a minimum of four bands. . Horizontal pipe and fittings 6” and larger, shall be suitably braced to prevent horizontal movement. Provide bracing in accordance to CIPI 301-00. Provide “Holdrite” bracing system or approved equal.

(2) All sanitary lateral and vent lateral piping shall be schedule 40 PVC pipe with drainage pattern fittings and solvent cement joints made in accordance with the State Plumbing code.

(3) All sanitary piping mains and branch piping above slab serving mechanical rooms drains, laundries and kitchens shall be service weight hubless cast iron with heavy duty bands. Bands shall be heavy duty with extra width for lateral support. Each coupling shall have a minimum of four bands. Cast iron will also be required at any other location where waste water temperature can exceed 120°F. Cast iron shall extend a minimum of 35' past last waste inlet..

J. Roof Leaders/Interior Storm Sewer Piping

(1) Service weight hubless cast iron pipe with manufacturers approved bands. Horizontal pipe and fittings 6” and larger, shall be suitably braced to prevent horizontal movement. Provide bracing in accordance to CIPI 301-00. Provide “Holdrite” bracing system or approved equal.

(2) Schedule 40 PVC pipe with drainage pattern fittings and solvent cement joints made in accordance with the State Plumbing code. All PVC piping installed above ceilings shall be provided with 1” insulation; refer to specification section 202200 for pipe insulation requirements.

K. Hydronic Piping (Heating Water, Baseboard Heating Water) - Underground

(1) General

a. Pre-insulated Piping
Furnish a complete system of factory pre-insulated steel piping for the specified service. All pre-insulated pipe, fittings, insulating materials, and technical support shall be provided by the pre-insulated piping system manufacturer. The system shall be Thermafab FERRO-THERM, Perma Pipe or Rovanco.

(2) Products

a. Carrier pipe shall be steel ASTM A-53, Grade B, ERW (Type E) or seamless (Type S), Standard weight for sizes 5" and larger, and shall be ASTM A-120/A-53, continuous weld (Type F), standard weight for sizes 4" and smaller. Seamless pipe smaller than 2" shall be ASTM A-106/A53, Grade B. All steel piping shall have ends cut square and beveled for butt-welding. Straight sections of factory insulated pipe shall have 6" of exposed pipe at each end for field joint fabrication.

b. Polyurethane foam insulation shall be injected with one shot into the annular space between carrier pipe and jacket with a minimum thickness of one inch. Insulation shall be rigid, 90-95% closed cell polyurethane with 2 to 3 pounds per cubic foot density and coefficient of thermal conductivity (K-factor) of 0.14 and shall conform to ASTM C-591. Maximum operating temperature shall not exceed 250 degrees F.

c. Jacketing material shall be extruded white polyvinyl chloride, consisting of clean, virgin NSF approved Class 12454-B PVC compound, conforming to ASTM D-1784, Type 1 Grade 1. PVC jacket shall have a wall thickness in mils equal to ten times the nominal jacket diameter and shall not be less than 60-mils. High density polyethylene (HDPE), conforming to ASTM D-1248, shall be used for jacketing larger than 20". Wall thickness for HDPE jacketing shall be 90-mils for sizes 8" and smaller, 100-mils for 10"-12", 150-mils for 14"-22", and 225-mils for 24" and larger. Jacketing for above ground, outdoors installations shall contain ultraviolet inhibitors for protection from sunlight. No FRP jacket allowed.

d. Straight run joints are insulated using urethane foam to the thickness specified, jacketed with PVC sleeves and sealed with polyethylene backed, pressure sensitive bituminous rubber tape, 30-mils thick. Above ground installations shall use white, pressure sensitive PVC tape.

e. Fittings are factory prefabricated and pre-insulated with urethane to the thickness specified, jacketed with a PVC fitting cover and then wrapped with polyethylene backed, pressure sensitive bituminous rubber tape, 30-mils thick. Carrier pipe fittings shall be butt-welded, except sizes smaller than 2" shall be socket-welded. Welds shall be radiographically inspected. At the Engineer's option, and for all above ground installations, fittings shall be jacketed using thermally butt-fused mitered sections of the same jacket material used on straight pipe sections. Fittings include expansion loops, elbows, tees, reducers and anchors. Fittings may be field insulated with liquid urethane foam insulation, jacketed with a PVC fitting cover and then wrapped with polyethylene backed, pressure sensitive bituminous rubber tape, 30-mils thick. Above ground installations shall use white, pressure sensitive PVC tape.

f. Expansion/contraction compensation will be accomplished utilizing factory prefabricated and pre-insulated expansion elbows, Z-bends, expansion loops and anchors specifically designed for the intended application. External expansion compensation will be provided utilizing flexible expansion bolsters, extending three feet on either side, both inside and outside the radius of the fittings.

(3) Execution

a. Pre-engineered systems shall be provided with all straight pipe and fittings factory pre-insulated and prefabricated to job dimensions. Field engineered systems shall be provided with factory insulated straight pipe sections and factory prefabricated fittings, or field fabricated fittings insulated with kits provided by the system manufacturer.

b. Underground systems shall be buried in a trench of not less than three (3) feet deeper than the top of the pipe and not less than eighteen inches wider than the combined O.D. of all piping systems.

c. Trench bottom shall have a minimum of 6” of sand, fill material as a cushion for the piping. All field cutting of the pipe shall be performed in accordance with the manufacturer’s installation instructions.

d. A hydrostatic pressure test shall be performed at one and one-half times the normal system operation pressure for not less than two hours. Care shall be taken to ensure all trapped air is removed from the system prior to the test. Appropriate safety precautions shall be taken to guard against possible injury to personnel in the even of a failure.

e. Field service shall be provided by a certified manufacturer’s representative or company field service technician. The technician will be available at the job a minimum of three times to check unloading, storing, and handling of pipe, joint installation, pressure testing and backfilling techniques.

L. Sump Pump Discharge

(1) Type “M” copper with solder joints.

M. Natural Gas Piping – Interior

(1) Schedule 40 black steel pipe with 150 psi malleable iron threaded fittings for pipe sizes 2" and smaller.

(2) Schedule 40 black steel pipe with 175 psi wrought steel buttwelded fittings for pipe sizes 2-1/2" and larger.

(3) Where gas pressure is 5 psi or greater, piping shall be schedule 40 black steel pipe with wrought steel buttwelded fittings.

NOTES:

(1) All gas piping shall be installed per NFPA 54.

(2) Unions or valves shall not be installed in an air plenum.

(3) Piping below slab must be sleeved and vented.

(4) Piping installed in concealed locations shall not have mechanical joints.

N. Domestic Cold, Hot and Recirculating Hot Water Piping (Above Slab)

(1) Type "L" hard copper tubing with wrought copper fittings with lead free solder equivalent in performance to 95/5. (Maximum lead content of solder and flux is 2%).

(2) Victaulic 607 or engineer approved equivalent mechanical grooved pipe couplings and fittings may be used in lieu of solder. For potable water, product shall utilize grade “P” EPDM gasket rated from +0ºF to +180ºF for improved resistance to chlorine, chloramine and other typical potable water disinfectants. Victaulic 608N may be utilized with copper groove system.

O. Trap Primer Piping

(1) Above slab: It shall match domestic water piping requirements.

(2) Underslab: It shall match domestic water piping requirements with a protective sleeve.

P. Domestic Cold, Hot and Recirculating Hot Water Piping (Below Slab)

Type "K" hard or soft copper tubing with wrought copper fittings and brazed joints. There shall be no joints beneath slabs.

Q. Hydronic Hot Water Piping (Heating Water, Baseboard Heating Water)

(1) Less than 2”: Type "L" hard copper tubing with wrought copper fittings and 95/5 solder. Press-fit fittings are allowed in mechanical rooms only.

(2) 2” to 4”: Type “L” hard copper tubing with brazed joints and fittings. Press-fit or Victaulic fittings shall be allowed in mechanical rooms only. Refer to item (4) below for Victaulic fitting requirements.

(3) 6" and Larger: Schedule 40 black steel pipe with 150# welded. Weldolets may be used for branch line connections to pipe mains. Victaulic fittings shall be allowed in mechanical rooms only. Refer to item (4) below for Victaulic fitting requirements.

(4) Schedule 40 Victaulic 107V/W07 or engineer approved equivalent mechanical grooved pipe couplings and fittings with 125# rating minimum may be used. Housings cast with torque-absorber and shift-limiting slant bold pad design. Install gaskets as recommended by the manufacturer. Piping system shall be rated for minimum of 250°F water temperature. Mechanical grooved piping may not be used if system water temperature exceeds 250°F.

a. Roll grooves in ends of pipe based on pipe and coupling manufacturer’s written instructions, which may or may not include torque settings, torque wrenches, extreme lubricant and specified gaps. Engineer reserves the right to inspect any and all installation of product. Factory trained representative must periodically visit the job site and provide on-site training. Grooved pipe shall be produced using approved

method by fitting manufacturer. Confirm all grooved pipe critical dimensions fall into the required tolerance range as listed by the tool manufacturer.

(5) Special Notes:

a. Dielectric unions shall be provided at all connections of dissimilar materials.

b. Victaulic and press-fit pipe fittings *for heating hot water* shall only be installed ~~*in accessible locations, i.e.*~~ in mechanical rooms~~*, above accessible lay-in ceilings, etc.*~~ These fittings shall not be installed above ~~*drywall*~~ ceilings, within walls, or within shafts.

c. Piping shall meet all State Boiler Code requirements. Pay particular attention to welded pipe requirements for hot water systems.

d. Takeoffs and branch piping to individual coils shall not be connected to the bottom of hydronic mains. Connection to mains shall be at the side of the main. Also refer to details on the drawings.

R. Hydronic Chilled Water/Process Chilled Water Piping

(1) Less than 1.5": Type "L" hard copper tubing with wrought copper fittings and 95/5 solder.

(2) 1.5" and Larger: Piping shall be high-density virgin polyethylene (HDPE) with a PE 4710 piping formulation and cell classification of 44576C for E per ASTM D 3350. All piping shall be SDR 9 with a minimum pressure rating of 250 psi.

(3) HDPE Piping shall be butt or socket fused in accordance with the manufacturer's instructions. The Contractor shall provide the Owner with one set of pipe fusing equipment, adequate to fuse all pipe sizes installed in the project. The Contractor shall provide the Owner with training on fusing techniques from the piping manufacturer.

(4) Victaulic HDPE piping system may be used in lieu of heat fusion joints for above ground HDPE applications. Contractor shall utilize Victaulic Style 905 HDPE Stab Couplings. Style 907 Transition Couplings may be used in conjunction with Vic-300/W761. Product shall be rated to pressures and temperatures exceeding the pipe. All grooved products must be of one manufacturer.

(5) Special Notes:

a. Dielectric unions shall be provided at all connections of dissimilar materials.

b. Where piping is within 10' of steam piping or steam condensate piping, piping 2-1/2" or larger shall be Schedule 40 black steel pipe with 250# welded or flanged joints. Weldolets may be used for branch line connections to pipe mains.

c. Piping shall meet all State Boiler Code requirements. Pay particular attention to welded pipe requirements for hot water systems.

d. Takeoffs and branch piping to individual coils shall not be connected to the bottom of hydronic mains. Connection to mains shall be at the side of the main. Also refer to details on the drawings.

S. Air Vent Discharge Lines

Type "L" soft copper; wrought copper fittings, 95/5 solder.

T. Steam and Condensate Return Piping

(1) 75 PSI - 150 PSI Steam Pressure: Steam and condensate return piping shall be Schedule 80 black steel pipe with 300 PSI fittings. All joints shall be welded or screw type. Screw fittings may be used for pipes 2" and smaller in size only. Welding neck flanges shall be used for connection to valves and flanged equipment. Weldolet and Threadolet fittings may be used for connecting branch pipe to mains where branch pipes are two pipe sizes smaller than the mains. Otherwise install welded tees.

(2) 1 PSI - 74 PSI Steam Pressure: Steam piping shall be Schedule 40 black steel with 150 PSI fittings. Condensate return piping shall be Schedule 80 black steel with 150 PSI fittings. All joints shall be welded or threaded screw type. Screw fittings may be used only for pipes 2" and smaller in size. Welding neck flanges shall be used for connection to valves and equipment. Threadolet or Weldolet fittings may be used for connecting branch pipes to mains where branch pipes are two pipe sizes smaller than the mains. Otherwise install welded tees.

(3) All gaskets for steam piping system flanged joints shall be flexitalic spiral wound type.

U. Low Pressure Steam Condensate

(1) 2” and smaller shall be Schedule 80 Black Steel with 300 lb. malleable iron, screwed fitting and 150 lb. screwed bronze gate valves. 2-1/2” and larger shall be Schedule 80 Black Steel with extra strong steel, welded with 150 lb. steel gate valves or 125 lb. flanged gate valves.

V. Condensate Drain Lines

(1) Type "DWV” copper, wrought copper, lead free solder.

W. Water Heater Relief Line

Type "M" copper tubing with sweat fittings and 95/5 solder.

X. LP Gas Piping

Same as specified for natural gas piping.

Y. Fuel Oil Suction, Return, Fill and Vent

(1) Interior – Standard weight black steel pipe with malleable iron screwed fitting.

(2) Exterior – Exterior fuel oil piping shall be Insul-tek Fiberclad Containment Piping. Approved equal manufacturers are Ric-Wil, Perma-Pipe and Thermacor. The Carrier pipe shall be dual pipe, standard weight steel pipe manufactured in accordance with ASTM A120A53, continuous weld. All pipe shall be cylindrical and straight, and ends shall be cut square, or beveled for welding.

(3) Carrier pipe fitting shall be steel socket weld fittings, in conformance with ANSI B31.1 and B16.11.

(4) Secondary containment pipe shall be steel, either electric resistance welded or spiral welded 10 gauge steel pipe, conforming to ASTM A211, A139, A135. All pipe shall be cylindrical and straight, and ends shall be cut square. Terminal sections shall be identical to straight sections except that they shall be fabricated with seals incorporating drain connections.

(5) Secondary containment pipe shall be protected by a totally corrosion-proof barrier of fiberglass reinforced plastic wound directly to the secondary containment pipe casing after it has been sand blasted to an SP-17 surface finish. The fiberglass reinforced plastic cladding shall be a minimum of 100 mils in thickness. Manufacturer's literature shall state that cathodic protection systems are not required due to the factory provided containment pipe coating, regardless of soil resistivity.

(6) Containment pipe fittings shall be factory fabricated from 10-gauge pipe with same fiberglass reinforced plastic coating as containment pipe and be fully compatible with the containment pipe material.

(7) Carrier pipe is to be centered and supported within containment pipe with centering devices. Centering devices are to be located not less than nine feet, or within twelve inches of the termination of the containment pipe on all fabricated pieces. Centering devices are to be so constructed as to allow free drainage of the system.

~~*Z. Engine Exhaust Piping*~~

~~*Schedule 40 black steel pipe with welded joints. Equipment connection shall be high temperature gasketed and flanged.*~~

AA. Acid Waste and Vent Piping - (Below Slab and Grade or Above Slab)

(1) Below slab: Schedule 40 non-flame retardant polypropylene pipe conforming to ASTM F1412 with joints made in accordance with the State Plumbing Code. Below grade piping shall be installed with fusion joint fittings.

(2) Above slab, pipe in non-plenum area: Schedule 40 flame retardant polypropylene pipe conforming to ASTM F1412 with joints made in accordance with the State Plumbing Code. Piping shall be installed with fusion joints within concealed spaces and with mechanical joints in accessible areas. All mechanical couplings below casework or exposed shall have the clamp edges smoothed or covered to keep sharp edges from cutting people.

(3) Piping shall be protected from sunlight in accordance with the manufacturer's recommendations.

(4) Acceptable manufacturers of acid waste and vent piping materials: Enfield (Ipex), Orion, or G.F. Sloane.

BB. Laboratory Deionized/RO Water Piping

Schedule 80 PVC pipe for pressure applications with solvent cement fittings. Pipe and fittings shall be manufactured from virgin rigid PVC vinyl compounds with a cell class of 12454 as identified in ASTM D-1748. Use caution to limit the amount of glue exposed to the interior of the piping. The system shall be flushed with a chlorine solution prior to activation of water purification system.

CC. Medical Gas Piping (Compressed Air Vacuum, Oxygen, Nitrogen and Nitrous Oxide)

Hard drawn, Type "L", pressure copper tubing conforming to ASTM B-88. Piping shall be factory washed and capped for medical gas service. Fittings shall be wrought copper, brazing type. Solder shall be brazing alloy with 1000°F melting point and suitable flux, Phoson Fifteen or Sil-Fos conforming to ASTM B-260.

END OF SECTION 201300

SECTION 201310 - WELDING

1. GENERAL

   A. All welding accomplished by the Contractor shall comply with provision of the latest revision of applicable codes, whether ASME Boiler and Pressure Vessel Code for pressure piping or such State and Local requirements as may supersede these codes.

   B. Welds shall be of sound metal thoroughly fused to the base metal at all points, free from cracks and reasonably free from oxidation blow holes and non-metallic inclusions. No fins or weld metal shall project within the pipe and should they occur they shall be removed. All pipe beveling shall be done by machine. The surface of all parts to be welded shall be thoroughly cleaned free from paints, oil, rust or scale at the time of welding, except that a light coat of oil may be used to preserve the beveled surfaces from rust.

   C. Pipe and fittings shall be carefully aligned with adjacent parts and this alignment must be preserved in a rigid manner during the process of welding.

   D. Each Contractor shall be responsible for quality of welding done by his organization and shall repair or replace any work not done in accordance with specifications. If required by the Architect/Engineer, the Contractor shall cut out at least three (3) welds during the job for X-raying and testing. These welds shall be selected at random by the Resident Inspector and shall be tested as a part of the Contractor's Contract. Certifications of these tests and X-rays shall be submitted, in triplicate to the Engineer. In case a faulty weld is discovered, the Contractor shall be required to furnish additional tests.

2. WELDING QUALIFICATIONS

   A. It is required that all welding of piping covered by this specification, regardless of conditions of service, be installed as follows:

      (1) Pipe welding shall comply with the provisions of the latest revision of the applicable codes, whether ASME Boiler and Pressure Vessel Code, ASA Code for Pressure Piping, or such state or local requirements as may supercede codes mentioned above.

      (2) Before any pipe welding is performed, submit to the Owner or his authorized representative, a copy of the welding procedure specifications, together with proof of its qualification as outlined and required by the most recent issue of the code having jurisdiction.

      (3) Before any welder shall perform any pipe welding, submit to the Owner or his authorized agent the operator's qualification record in conformance with the provisions of the code having jurisdiction, showing that the operator was tested under the proven procedure specifications submitted.

      (4) Standard Procedure Specifications and Welders qualified by the National Certified Pipe Welding Bureau shall be considered as conforming to the requirements of these specifications.

      (5) “R” Stamp: Any welder performing modifications, repairs, etc. to boilers, pressure vessels, or other pressure retaining items shall have a current R stamp issued by the National Board of Boiler and Pressure Vessel Inspectors.

(6) “PP” Stamp: Any welder working with steam systems exceeding 15 PSIG shall have a current PP stamp issued by ASME. This shall apply up to the first stop valve for single boiler installations and up to the second stop valve for multiple boiler installations.

B. MATERIALS

(1) Welding fittings shall conform to ASA B16.9; of the same materials, thickness, etc., as the pipe being jointed; see ASA B36.10.

END OF SECTION 201310

SECTION 202100 - VALVES AND COCKS

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

   B. The Contractor shall provide all valves required to control, maintain and direct flow of all fluid systems indicated or specified. This shall include, but may not be limited to all valves of all types including balancing cocks, air cocks, lubricated plug cocks, packed plug cocks, special valves for special systems, etc., for all Mechanical Systems.

   C. All valves shall be designed and rated for the service to which they are applied.

   D. The following type valves shall not be acceptable: Zinc, plastic, fiber or non-metallic.

   E. Ball valves with temperature and pressure ports are not an acceptable alternative to the balancing valves specified herein. Valves that do not comply with these specifications shall be removed and replaced by the Contractor with no increase in contract price.

   F. Each type of valve shall be of one manufacturer, i.e., gate valves, one manufacturer, globe valves, one manufacturer, silent check valves, one manufacturer, etc. The following valve manufacturers shall be acceptable: Lunkenheimer, Tour & Anderssen, Powell, Nibco, Crane, Jenkins, T & S Brass, Walworth, Milwaukee, DeZurik, Consolidated Valve Industries, Inc., Victaulic, Bell & Gossett, Flow Design, Watts, Victaulic.

   G. All valves shall comply with current Federal, State and Local Codes.

   H. All valves shall be new and of first quality.

   I. All valves shall be full line size. Valves and hydronic specialties shall not be reduced to coil or equipment connection size. Size reductions shall be made at the connection to the equipment.

   J. Angle stops for plumbing fixtures shall be quarter turn ball type.

   K. All valves for use in potable water systems shall comply with federal lead-free requirements that the lead content of wetted surfaces cannot exceed 0.25% by weight.

2. LOCATION OF MAINTENANCE VALVES

   Maintenance valves and unions, installed so as to isolate equipment from the system shall be installed at the following locations:

   A. At each plumbing fixture.

   B. At each air handling unit, and make–up air unit.

   C. At each unit heater.

   D. At each heating or cooling coil.

E. At all other locations indicated on the drawings.

3. WORKMANSHIP AND DESIGN

A. Handwheels for valves shall be of a suitable diameter to allow tight closure by hand with the application of reasonable force without additional leverage and without damage to stem, seat and disc. Seating surfaces shall be machined and finished to ensure tightness against leakage for service specified and shall seat freely. All screwed valves shall be so designed that when the screwed connection is properly made, no interference with, nor damage to the working parts of the valve shall occur. The same shall be true for sweat valves when solder or brazing is applied.

4. TYPES AND APPLICATION

A. GATE VALVES

Gate Valves shall be of the wedge disc type, permit straight line flow, complete shut-off and designed so that when the valve is wide open, it can be packed under pressure. Valves 1-1/2 inches and smaller shall be bronze, with ends to suit piping and non-rising stem. The valve shall have a deep stuffing box for long contact with the stem, packing gland and filled with high quality packing. Valves 2 inches thru 4 inches shall be iron body bronze mounted with flanged ends and non-rising stem. Boiler stop valves and valves larger than 4 inches shall be iron body bronze mounted flanged ends with outside screw and yoke with rising stem. Working pressure shall be 150 pounds when installed in piping with system pressures up to 150 pounds per square inch and 300 pounds for 250 pounds per square inch and over. 2" and under NIBCO T133, greater than 2" NIBCO F619. All gate valves 2” and smaller for use in potable water systems shall meet federal requirement to be lead free containing less than 0.25% lead by weight of wetted area. NIBCO F768B. Provide chain operator for all valves installed higher than 7’ above floor level.

B. GLOBE VALVES

Globe Valves shall permit control of flow rate from full flow to complete shut-off and designed that when the valve is wide open it can be repacked under pressure, and have a deep stuffing box with gland and filled with high quality packing. Valves 1-1/2 inches and smaller shall be bronze with ends to suit piping union bonnet, and with stainless steel plug type disc and seat of not less than 500 Brinnell hardness. Valves 2 inches and larger shall be iron body bronze mounted with flanged ends, yoke bonnet, and disc guide. Working pressure shall be 150 pounds when installed in piping with system pressures up to 150 pounds per square inch and 300 pounds for 250 pounds per square inch and over. 1-1/2" and under NIBCO T256AP, greater than 1-1/2" NIBCO F768B.

C. CHECK VALVES

Check Valves shall be horizontal swing type with two-piece hinges, disc construction seats to be bronze and bronze discs or with composition face depending on service and provide silent operation. Valves 1-1/2 inches and smaller shall be bronze with ends to suit piping, have full area "Y" pattern body and integral seats. Valves 2 inches and larger shall be iron body brass mounted and with flanged ends. Working pressure shall be 150 pounds when installed in piping with system pressures up to 150 pounds per square inch and 300 pounds for 250 pounds per square inch and over. 3" and under NIBCO T433Y, greater than 3" NIBCO F918B (for less than 100 psi systems) greater than 3” NIBCO F968B (for 100 psi or greater systems). Victaulic 716/779 check valves allowed with grooved piping system.

D. BALL VALVES (NON-POTABLE)

Ball Valves shall have removable lever handle with vinyl grip, adjustable stem gland screw, reinforced Teflon stuffing box ring, blow out proof stem, full port, bronze body, reinforced Teflon seats, chrome plated steel ball as manufactured by Consolidated Valve Industries, Inc., Lunkenheimer, Apollo, Jenkins, Nibco or equivalent. Provide a stem extension so that the base of the handle is 1/4" above the insulation similar to Nibseal. NIBCO T5800-70.

E. BALL VALVES (POTABLE WATER)

All valves for use in potable water systems 2-1/2" and smaller contain less than 0.25% lead by weight and comply with federal lead free potable water requirements. Ball valves shall have a removable lever handle with vinyl grip, adjustable stem gland screw, reinforced Teflon stuffing box ring, blowout proof stem, full port, stainless steel or bronze body, reinforced Teflon seats, stainless steel or chrome plate steel ball as manufactured by Apollo, Aslo, Nibco, Milwaukee, or equivalent. Provide a stem extension so that they bas of the handle is ¼" above the insulation similar to Nibseal. NIBCO S-585-66-LF.

F. BUTTERFLY VALVES

Butterfly valves shall be line sized cast iron body, lug style, 200 PSI rating (bubble tight) EPT or Viton seat, cartridge type; high strength stem. Disc to have ground and polished seating surface. Operator shall be locking lever style. Quality equivalent to Crane Monarch series. 3" and under NIBCO LD3222-3, greater than 3" NIBCO LD322-5. Valves 6" and over shall have gear driven operators. 3" and under Victaulic 608N, greater than 3" Vic-300 butterfly valves allowed with grooved piping system. Butterfly valves to be used in domestic water supply shall be provided with stainless steel disc.

G. BALANCING VALVES

Bell & Gossett, Model CB circuit setter balancing valve or approved equivalent. Calibrated balancing valve shall have flanged connections suitable for 125# working pressure at 250°F. 4" and up shall be rated at 175# at 250°F working pressure. Provide with brass readout valves fitted with an integral EPT insert and check valve. Each balance valve shall have a calibrated nameplate to assure specific valve settings and be constructed with internal seals to prevent leakage.

H. AIR COCKS

Straight nose; Lunkenheimer Fig. 476; bronze; tee handle; bent nose; Lunkenheimer Fig. 478, 125#; bronze; tee handle.

I. GAUGE COCKS

Straight, Lunkenheimer, Fig. 1178; 125#; bronze; tee handle. FIP.

J. LUBRICATED PLUG COCKS

2" and under; Homestead Fig. 601; 150#; semi-steel; screwed; 2-1/2" and over; Homestead Fig. 602; ±50#; semi-steel; flanged.

K. PACKED PLUG COCKS

2" and under; DeZurik Fig. 425-S; 175#; semi-steel; screwed. 2-1/2" and over; DeZurik Fig. 425-F; 175#; semi-steel; flanged.

END OF SECTION 202100

SECTION 202110 - ACCESS TO VALVES, EQUIPMENT, FILTERS, ETC.

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Requirements-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

   B. All mechanical equipment shall be installed in a manner which allows ready access to all components requiring service, adjustments, shutoff, etc.

   C. Filters shall be accessible, removable and replaceable without disconnecting mounting brackets, piping, wiring, etc.

   D. All oil cups, grease cups, grease fittings, etc. shall be accessible without disassembly of equipment, piping, ductwork, etc. (Extended oilers or grease fittings may be required).

   E. Provide access doors or panels for all equipment, valves, dampers, filters, fire dampers, etc. in concealed spaces not otherwise provided with suitable access. (Lay-in ceilings shall be considered acceptable access; splined or drywall ceilings shall not).

   F. All valves, unions, strainers, cleanouts, volume dampers, and test points shall be accessible.

   G. Access panels in lay-in ceilings shall be labeled with a lamacoid plate to indicate location of equipment, filters, valves, etc.

   H. Access panels in fire rated walls shall bear the same rating as the wall.

   I. Each fire damper shall be provided access through the duct to allow reset of the damper. This may be either a gasketed sheet metal panel over a suitable opening or a factory built access panel. The panel shall be at least one and one-half (12) inch larger than the opening all around and shall be held in place with sheet metal screws sufficiently to ensure that it is air tight. Manually check the size and location of each of these openings to ensure that the fire damper may be manually reset by use of hand only.

   J. Contractor shall coordinate the finish of all access doors and panels installed in finished areas with Architect.

2. ACCESS DOORS

   Refer to Sheet Metal and Flexible Duct section of the specifications.

END OF SECTION 202110

SECTION 202200 - INSULATION - MECHANICAL

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

   B. Work under this section shall include all labor, equipment, accessories, materials and services required to furnish and install all insulation, fittings and finishes for all mechanical systems specified herein and/or as indicated.

   C. Application of insulation materials shall be done in accordance with manufacturer's written recommendations. Where thickness of insulation is not specified, use applicable thickness recommended by manufacturer for specific use. Insulation shall be applied by a company regularly engaged in the application of insulation and any work deemed unacceptable by the Engineers shall be removed and properly installed at the expense of the Contractor.

2. MANUFACTURERS

   A. Insulation shall be as manufactured by Manville, Knauf, CertainTeed, Owens-Corning, Armacell or approved equivalent. Insulation sundries, adhesives, and jackets/covers shall be as made by Benjamin Foster, Zeston, Speedline, Proto, Childers, Vimasco or approved equivalent.

3. FIRE RATINGS AND STANDARDS

   A. Insulations, jackets and facings shall have composite fire and smoke hazard ratings as tested by ASTM E-84, NFPA 255 and UL 723 procedures not exceeding Flame Spread 25, Smoke Developed 50.

   B. Adhesives, mastics, tapes and fitting materials shall have component ratings as listed above.

   C. All products and their packaging shall bear a label indicating above requirements are not exceeded.

   D. Duct linings shall meet the Erosion Test Method in compliance with UL Publication No. 181.

4. GENERAL APPLICATION REQUIREMENTS

   A. Insulation shall be applied on clean, dry surfaces in a neat and workmanlike manner reflecting the best current practices in the trade. Insulation shall not be applied to piping, ductwork or equipment until tested, inspected and released for insulation.

   B. All insulation shall be continuous through walls, ceiling openings and sleeves. However, insulation shall be broken through fire walls. All covered pipe and ductwork is to be located a sufficient distance from walls, other pipe, ductwork and other obstacles to permit the application of the full thickness of insulation specified. If necessary, extra fittings and pipe are to be used. No noticeable deformation of insulation or discontinuity of vapor seal, where required, will be accepted.

   C. "Concealed", where used herein, shall mean hidden from sight as in trenches, chases, furred spaces, pipe shafts, or above hung finished ceilings. "Exposed" shall mean that piping or equipment is not "concealed" as defined above. Piping and equipment in service tunnels, mechanical equipment rooms, mechanical platform, mezzanine, penthouses, storage areas, unfinished rooms, etc. is to be considered as "exposed".

D. Existing and/or new insulation removed and/or damaged during course of construction shall be repaired or replaced as directed by the Engineer.

E. Vapor barrier jackets shall be applied with a continuous unbroken vapor seal. Do not use staples thru the jacket. NO EXCEPTIONS!

F. All insulation shall be installed with joints butted firmly together.

G. The Contractor shall ensure that all insulation (piping, ductwork, equipment, etc.) is completely continuous along all conduits, equipment, connection routes, etc. carrying cold fluids (air, water, other) and that condensation can, in no way, collect in or on the insulation, equipment, conduits, etc. Any such occurrence of condensation collection and/or damage therefrom shall be repaired solely at the expense of the Contractor.

5. PIPING SYSTEMS

A. GENERAL

(1) Bevel insulation and jacket at all points where insulation terminates at unions, flanges, valves and equipment. Note: Applies to hot water lines only; cold water lines require continuous insulation.

(2) Pipe insulation shall extend around valve bodies to above drain pans in hydronic equipment over pumps, etc. to ensure no condensation drip or collection.

(3) Factory molded fittings may be installed in lieu of built-up fittings. Jackets to be the same as adjoining insulation. Insulated fittings must have same or better K factors than adjoining straight run insulation.

(4) Valves, flanges and unions shall only be insulated when installed on piping whose surface temperature will be at or below the dew point temperature of the ambient air.

(5) Insulation shall not extend through fire and smoke walls. A UL-listed penetration system shall be used for each fire or smoke wall penetration in accordance with KBC. Materials used such as caulk, sleeves, etc. shall be manufactured by 3M, Hilti, or equal.

B. INSULATION SHIELDS

(1) Metal insulation shields are required at all pipe hangers where the piping is insulated. Metal shields shall be constructed of galvanized steel, formed to a 180-degree arc. Insulation shields shall be the following size:

PIPE SIZE	SHIELD GAUGE	SHIELD LENGTH
2" AND LESS	20	12"
2 1/2" TO 4"	18	12"
5" TO 10"	16	18"
12" AND GREATER	14	24"

C. INSULATION MATERIAL (FOR THE FOLLOWING SYSTEMS)

Insulation shall be Owens-Corning Model 25ASJ/SSL, or approved equivalent fiberglass pipe insulation with an all service jacket. The insulation shall be a heavy density, pipe insulation with a K factor .23 at 75°F mean temperature. The insulation shall be wrapped with a vapor barrier jacket. Approved manufacturers are listed in Section 2 – Manufacturers. The jacket shall have an inside foil surface with self sealing lap and a water vapor permeability of .02 perm/inch. All circumferential joints shall be vapor sealed with butt strips. All insulation shall be installed in strict accordance with the manufacturers' recommendations. The following pipes shall be insulated with the thickness of insulation as noted.

(1) Domestic Cold Water, including trap primer piping above slab, Lab High Purity Water, Lab Deionized Water (KDMC Projects – all 1")

a. 1" piping – use 1/2" thick insulation. Provide an additional ½" layer of insulation 3" above and 3" below vertical pipe supports.

b. Pipe sizes 1-1/4" and above – use 1'' thick insulation.

(2) Hydronic System Fill Lines from Domestic Cold Water – 1" thick.

(3) Domestic 110°F Hot Water and 110°F Recirculating Hot Water. (If heat traced, see below)

a. Piping 2'' or less – use 1'' thick insulation.

b. Piping 2-1/2" to 4" – use 1-1/2" thick insulation

c. Piping 5'' or greater – use 2'' thick insulation.

(4) Domestic 140°F Hot Water and 140°F Recirculating Hot Water. (If heat traced, see below)

a. Piping 2'' or less – use 1'' thick insulation.

b. Piping 2-1/2" to 4" – use 1-1/2" thick insulation

c. Piping 5'' or greater – use 2'' thick insulation.

(5) Hydronic Hot Water

a. Piping 2'' or less – use 1'' thick insulation.

b. Piping 2-1/2" to 4" – use 1-1/2" thick insulation

c. Piping 5'' or greater – use 2'' thick insulation.

(6) Hydronic Chilled Water

a. 1" Piping – use 1" thick insulation

b. Piping 1-1/4" to 4" – use 1 ½'' thick insulation.

c. Piping 5" and larger - use 2" thick insulation.

(7) Horizontal Roof Leaders.

a. Piping 3'' or less – use 1/2" thick insulation

b. Piping 4'' or greater – use 1'' thick insulation

(8) Sanitary Sewer and plumbing fixture P-traps to waste stack – see schedule below. Insulate horizontal runs which receive air conditioning condensate and which are not located below slab or grade.

a. Piping 3'' or less – use 1/2" thick insulation

b. Piping 4'' or greater – use 1'' thick insulation

(9) Condensate Drain Lines.

a. Piping 1 ½'' or less – use 1/2" thick insulation

b. Piping 2'' or greater – use 1'' thick insulation

(10) High Pressure Steam and/or High Temperature Hot Water (306°F-450°F)

a.	1" and less pipe size:	1 ½" thick
b.	1 ¼" thru 1 ½" pipe size:	2" thick
c.	2" thru 4" pipe size:	3" thick
d.	5" and larger pipes:	3 ½" thick

(11) Medium Pressure Steam and Medium Temperature Hot Water (251°F-305°F)

a.	1" and less pipe size:	1 ½" thick
b.	1-1/4" thru 1-1/2" pipe size:	2" thick
c.	2" thru 4" pipe size:	3" thick
d.	5" and larger pipes:	3 ½" thick

(12) Low Pressure Steam (201°F-250°F)

a.	1 ½" or less pipe size:	1 ½" thick
b.	1 ½" and larger pipe sizes:	3" thick

(13) Steam Condensate

a.	1 ½" and less pipe size:	1 ½" thick
b.	2" and larger pipe size:	3" thick

D. ENGINE EXHAUST AND MUFFLER (INTERIOR ONLY)

(1) Rigid hydrous calcium silicate; K factor; .40 at 200°F mean temperature; 2" thick. Provide with a 6-oz. canvas jacket with fire retardant lagging.

E. STEAM/STEAM CONDENSATE & HOT WATER PIPING REMOVABLE JACKETING INSULATION

(1) All steam pressure reducing stations shall be installed with removable jacketing insulation to allow service to the station. This includes all fittings, valves, etc. on the steam pressure reducing stations. All steam condensate pumps shall be installed with removable jacketing insulation over reservoir. All steam traps 2 1/2" and larger shall have removable jacket insulation. All steam control valves shall be installed with removable jackets for maintenance.

Designer shall coordinate with UK on removable jackets required for HVAC hot water components such as large control valves or strainers.

(2) Insulation shall meet at minimum the following specification:

a) Non-Asbestos Glass mat, type E needled fiber.
b) Temperature maximum of 450°F, Maximum water vapor transmission of 0.00 perm, and maximum moisture absorption of 0.2 percent by volume.
c) Jacket Material: Silicon/fiberglass compressed as required to give maximum 130F surface temperature depending on fluid medium in piping.
d) Construction: One piece jacket body with three-ply braided pure Teflon or Kevlar thread and insulation sewn as part of jacket.
e) Sewn lock stitch with a minimum 4 to 6 stitches per inch. The thread must be able to withstand the skin temperatures without degradation.
f) Hog rings, staples and wire are not are not acceptable methods of closure. Velcro straps alone are not acceptable unless written permission from UK (hook & loop method required).
g) No raw cut jacket edges shall be exposed.
h) Jackets shall be fastened using hook and loop (Velcro) straps
i) Provide a permanently attached Aluminum or stainless steel nameplate on each jacket to identify its location, size and tag number.
j) The insulation shall be designed to minimize the convection current in the space between the hot metal surface and the inner layer of insulation. To this end, during jacket fabrication, the layers of insulating mat shall be placed in an overlapping pattern.
k) Insulation must be sewn as integral part of the jacket to prevent shifting of the insulation.
l) Insulation thickness: As required for Touch Temperature Exterior of all jacket < 130F.

F. MECHANICAL ROOM INSULATION

(1) Provide Calcium Silicate insulation in mechanical room heating applications, where piping is more subject to abuse. Insulation in mechanical areas must be protected with an 8-oz. canvas jacket applied with lagging adhesive.

CALCIUM SILICATE INSULATION APPLICATION AND THICKNESS (INCHES)						
PIPE SYSTEM	TEMP		PIPE DIAMETER (inches)			
	RANGE DEG F	1	1.25-2	2.5 – 6	8	10+
HIGH PRESS STEAM (-76 PSIG)	320 - 500	3.0	3.5	4.0	4.0	4.0
MED PRESS STEAM (21-75 PSIG)	260-320	2.5	3.0	3.5	4.0	4.0

(1) Insulate all surfaces not requiring constant access.

(2) Provide removable insulation for surfaces requiring periodic access.

(3) Insulate all surfaces creating a burn hazard.

(4) Exposed piping in any room and all piping in boiler or mechanical rooms shall have an 8-oz. canvas jacket applied over the fiberglass factory ASU/SSL jacketing to further protect the insulation from abuse. This jacketing must be properly applied with lagging adhesive, such that the outer surface is smooth and free of wrinkles. The canvas jacketing in all mechanical areas is to be prepared by painting, and then painted according to the University of Kentucky standard piping color coding. All chilled water piping insulation shall be completely sealed so that a perfect vapor barrier is achieved

G. JACKETS

(1) Exposed (Mechanical Rooms, Interior Finished Rooms and Storage Rooms)

All insulated piping installed in the above areas shall have a canvas or PVC jacket:

a. Exposed piping in any room and all piping in boiler or mechanical rooms shall have an 8-oz. canvas jacket applied over the fiberglass factory ASJ/SSL jacketing to further protect the insulation from abuse. This jacketing must be properly applied with lagging adhesive, such that the outer surface is smooth and free of wrinkles. The canvas jacketing in all mechanical areas is to be prepared for painting, and then painted according to the University of Kentucky standard piping color coding. All chilled water piping insulation shall be completely sealed so that a perfect vapor barrier is achieved

b. For all systems except steam, plenum rated PVC jacket equal to LoSmoke PVC jacket with flame/smoke rating of 25/50, ASTM-E84 test method. Minimum thickness 0.04 inches. Steam systems shall utilize plenum rated CPVC jacket with minimum thickness of 0.04 inches. Jackets shall be applied over top of specified pipe insulation. Approved equal manufacturers are Zeston and Speedline. Approved equal manufacturers are Zeston and Speedline.

(2) Exposed (Exterior)

In addition to the insulation specified for the exterior pipe, provide .016" aluminum jacket or PVC jacket 0.05” thick. The jackets shall be installed as recommended by the manufacturer to maintain water tight seal. All longitudinal and transverse seams to be sealed water tight. PVC jacket shall be Ceel-Co, Proto, or Zeston.

6. DUCTWORK SYSTEMS

A. GENERAL

(1) Duct sizes indicated are the net free area inside clear dimensions; where ducts are internally lined, overall dimensions shall be increased accordingly.

(2) Duct insulation shall extend completely to all registers, grilles, diffusers, and louver outlets, etc., to ensure no condensation drip or collection. The backs of all supply diffusers, plenums, grilles, etc. shall be insulated only if indicated by details on the drawings.

(3) Insulate the ends of slot diffuser plenum boxes.

(4) All flexible duct connections on insulated ductwork shall be externally insulated.

(5) All duct outside of building envelope, including rooftop duct, duct in unconditioned attic spaces above the insulation, etc. shall have two layers of specified insulation. This shall apply to supply air, exhaust air where air is run through energy recovery unit, outside air, return air, and combustion air intake ducts.

B. EXTERNAL INSULATION

(1) Supply Air
(2) Outside Air
(3) Relief Air
(4) Ducts from the exterior of the building to the backdraft or motorized damper
(5) Boiler Combustion Air
(6) Flexible Duct Connections on Internally Lined Ducts

Owens/Corning “Faced Duct Wrap - Type 100", or approved equal, 2" thick fiberglass duct wrap, 1.0 pcf density factory laminated to a reinforced foil kraft vapor barrier facing (FRK) with a 2" stapling flange at one edge. Flame spread 24, smoke developed 50, vapor barrier performance 0.02 perms per inch. K factor shall not exceed .26 at 75°F. mean temperature. Minimum R-value of the 2” thick insulation shall be 7.4 out of package and 6.0 installed.

Special Notes:

a. Do not provide externally insulated duct per the above specification for any duct that is to be painted. Insulated duct that is to be painted shall be dual wall ductwork per specification Section 231200, Sheet Metal and Flexible Duct.
b. Where supply, return, and outside air ductwork is routed through an unconditioned attic or any other space outside of the building thermal envelope, the ductwork shall be provided with a minimum of 2 layers of duct wrap for a minimum R value of 11.0. Additionally, this shall apply to exhaust ductwork on entering side of energy recovery type air handling units.

C. EXTERNALLY INSULATED DUCT – OUTDOORS

(1) 2" semi-rigid fiberglass industrial board with foil scrim kraft vapor barrier facing or PSK Facing, 3.0 PCF density, K=.23 @ 75°F. Minimum R-value of 8.7. Owens/Corning, or approved equivalent industrial installation type 703. Weather proofing shall be ductmastic adhesive and sealer rated for outdoor use, Hardcast Flex-Grip 550, or approved equivalent.

(2) As an alternative to duct mastic adhesive and sealer, Contractor may provide a field applied aluminum jacket meeting the following specification:

Aluminum Jacket Material: Smooth finished sheets manufactured from 0.024-inch-thick aluminum alloy complying with ASTM B209 and having an integrally bonded 10mil thick, heat-bonded polyethylene and kraft paper moisture barrier over entire surface in contact with insulation.

Aluminum Jacket Applications: Apply aluminum jacketing to all external ductwork that is externally insulated. Cover all fittings and specialties with aluminum jacketing. Provide a 2-inch overlap at longitudinal seams and end joints. Secure jacket with stainless-steel sheet metal screws 6 inches o.c. and at end joints. Overlap longitudinal seams arranged to shed water and seal end joints with weatherproof mastic.

7. MECHANICAL EQUIPMENT

A. ROOF DRAIN SUMPS

(1) Owens-Corning Model 475-FR or approved equivalent rigid board insulation with exterior vapor barrier jacket formed to bottom of sump basin. Insulation shall have a K factor of .22 at 75°F. mean temperature. Insulation shall be 1" thick. Insulation shall be formed to roof drain sump. Vapor barrier shall remain continuous.

B. FLOOR DRAIN SUMPS (Applies to all Floor Drains which Receive Air Conditioning Condensate and which are Installed in Locations Other Than Slab on Grade)

(1) Owens-Corning Model 475-FR or approved equivalent rigid board insulation with exterior vapor barrier jacket formed to bottom of sump basin. Insulation shall have a K factor of .22 at 75°F. mean temperature. Insulation shall be 1" thick. Insulation shall be formed to roof drain sump. Vapor barrier shall remain continuous.

C. EXPANSION TANK, COMPRESSION TANK, AIR SEPARATOR, HEAT EXCHANGER, SIDESTREAM/LOOP FILTERS, AND HOT WATER STORAGE TANKS

(1) Owens-Corning "Tank Wrap I" or approved equivalent. Insulation shall be constructed of non-combustible, flexible wool. Insulation shall be 2" thick. K factor shall be .29 at 100°F. mean temperature. Insulation shall be attached in strict accordance with the manufacturer's recommendations. All insulation shall be jacketed with 6 oz. canvas with fire retardant lagging. Coordinate with mechanical contractor to extend all piping connections, blowdown ports, etc. outside of the insulation. Additionally, for loop filters and other equipment requiring periodic service, provide removable insulated covers.

END OF SECTION 202200

SECTION 202300 - THERMOMETERS AND OTHERS, MONITORING INSTRUMENTS

1. GENERAL

   A. The Contractor shall include all thermometers, pressure gauges and/or compound gauges at the locations indicated.

2. THERMOMETERS AND PRESSURE GAUGES

   A. All thermometers and gauges shall be readable from a standing position on the floor.

   B. Thermometers shall be linear, alcohol filled, graduated in 1°F. Or less and shall have adequate range for service intended.

   C. Pressure gauges shall be Bourdon Type, circular, 3" face, black letters on white face graduated in 2 PSI or less and shall have adequate range and shall be manufactured for service intended. Provide with pig tail connectors and gauge cocks.

   D. Pressure gauges and thermometers subject to vibration shall be mounted remotely away from vibrating pipe surface, etc., with flexible tubing.

   E. Mount thermometers in approved wells and install with thermal grease. Do not make direct contact of base with fluid in pipe.

   F. Gauges and thermometers shall be Marsh, Marshalltown, Weksler or equivalent.

3. Provide, when indicated on the plans, on the inlet and outlet of each terminal unit, a “Pete’s Plug” or equivalent pressure/temperature test station. Furnish two (2) matching thermometers and pressure gauges to the owner upon project completion.

END OF SECTION 202300

SECTION 202400 – IDENTIFICATIONS, TAGS, CHARTS, ETC.

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

2. VALVE TAGS AND CHARTS

   A. Provide and install on each valve in the Mechanical Systems a 1-1/2" diameter circular brass tag fitted to each valve so that it cannot be removed. Each tag shall be embossed consecutively with letter and number identifiers as to system and purpose respectively. Letter identifiers shall be as follows:

H	Heating
C	Cooling
HC	Combination Heating/Cooling
FP	Fire Protection
NG	Natural Gas

      Number identifiers shall be determined by the Contractor sequentially. For example, valve No. HC-1 may be maintenance stops for fan coil units. HC-2 maintenance stops for air heaters, etc.

   B. Provide three (3) copies of typewritten valve charts indicating each valve identifier, the valves purpose and its location. For example: "HC-1 Fan Coil Maintenance Stop-one valve at supply and return of each fan coil unit." One (1) copy of this chart shall be mounted in suitable wood frame(s) with clear plastic or glass covers in a conspicuous location in the Mechanical Room. Two other copies shall be turned over to the Engineers.

   C. Where more than one major Mechanical room is indicated for the project, install mounted valve schedule in each major Mechanical Room, and repeat only main valves which are to be operated in conjunction with operations of more than single Mechanical Room.

EQUIPMENT: COLOR:	ENGRAVES:
Valve Yellow	V.
Fire Damper Black	F.D.
Smoke Damper Black	SM.D.
Volume Damper Black	V.D.
Terminal Unit Red	T.

3. PIPING IDENTIFICATION

   A. GENERAL

      (1) Provide stenciled markers and arrows indicating direction of flow on all piping installed under this Contract. Markers and arrows shall be painted on the piping using machine cut stencils. All letters shall be sprayed using fast drying lacquer paint. All markers and arrows shall be properly oriented so that descriptive name may be easily read from the floor. At the Contractor's option, Setmark or equivalent manufactured marking system may be substituted for field marking. The

following table describes the size of the color field and size of the identification letter which shall be used for pipes of different outside pipe diameters.

OUTSIDE DIAMETER OF PIPE OR COVERING	LENGTH OF COLOR FIELD	SIZE OF LETTERS
INCHES	INCHES	INCHES
3/4 TO 1-1/4	8	1/2
1-1/2 TO 2	8	3/4
2-1/2 TO 6	12	1-1/4
8 TO 10	24	2-1/2
OVER 10	32	3-1/2

(2) “Concealed”, where used herein, shall mean hidden from sight as in trenches, chases, furred spaces, pipe shafts, or above hung finished ceilings. “Exposed” shall mean that piping or equipment is not “concealed” as defined above. Piping and equipment in service tunnels, mechanical equipment rooms, storage areas, or unfinished rooms is to be considered as “exposed”.

(3) All piping shall be marked not less than every 15 linear feet above a ceiling system, every 10 feet in a mechanical room, and at all points where lines pass through walls or floors.

(4) Provide pipe marker colors as indicated in the following table where manufactured marking systems are used:

University of Kentucky Standard Color Coding for Mechanical Piping Markers			
PIPE	ABBREVIATION	MARKER COLOR	NO.*
High Pressure steam and return (over 76 psig)	H.P.S. & H. P. R.	Safety Red	SW4081
Medium pressure steam and return (21 psig to 75 psig)	M.P.S. & M. P. R.	International Orange	SW4082
Low pressure steam and return (0 psig to 20 psig)	L.P.S. & L. P. R.	Safety Orange	SW4083
Domestic cold water	D.C.W.	Safety Green	SW4085
Domestic hot water	D.H.W.	Green Byte	SW4076

Freon – R502	FREON R-502	Recycled Red	SW4073

Notes: *Color and number are from the Sherwin Williams System 4000 color selection guide dated 1999.

A. Piping, whether exposed or concealed, shall be marked not less than every 15 linear feet and at the points where the piping passes through wall or floors.

B. In mechanical rooms, piping shall be labeled every 10 feet. (UK ONLY)

4. PIPE PAINTING (REFER ALSO TO ARCHITECTURAL SECTION ON PAINTING)

A. GENERAL

(1) Piping:
All plumbing and mechanical piping must be painted and labeled, including sprinkler lines, every 15 feet above a ceiling system and every 10 feet in an open mechanical room.

University of Kentucky Standard Color Coding for Mechanical Piping			
TYPE OF SERVICE	MARKINGS	COLOR	NO.*
High Pressure steam and return (over 76	H.P.S. & H. P. R.	Safety Red	SW4081

psig)

Freon – R500	FREON R-500	Junction Yellow	SW4033
Freon – R502	FREON R-502	Recycled Red	SW4073

Notes: *Color and number are from the Sherwin Williams System 4000 color selection guide dated 1999.

A. Water heaters, storage tanks, heat exchangers, etc., shall be painted light gray.

B. Piping, whether exposed or concealed, shall be marked not less than every 15 linear feet and at the points where the piping passes through wall or floors.

C. In mechanical rooms, piping shall be labeled every 10 feet. (UK ONLY)

5. EQUIPMENT IDENTIFICATION

A. All equipment, except in finished rooms, shall be identified by stenciling the title of the equipment as taken from the plans in a position that is clearly visible from the floor. The letters shall be made with black paint and shall be not less than two inches high. The titles shall be short and concise and abbreviations may be used as long as the meaning is clear. Lamacoid plates are also acceptable. In finished rooms or outdoors, equipment shall be identified by engraved nameplates.

6. DUCTWORK IDENTIFICATION

A. All ductwork shall be identified as to the service of the duct and direction of flow. The letters shall be at least two inches high and the flow arrow shall be at least six inches long. The letters and flow arrow shall be made by precut stencils and black oil base paint with aerosol can. Concealed ducts need not be identified.

7. ACCESS THROUGH LAY-IN CEILINGS

A. Mark the ceiling T-bar nearest the ceiling panel access to equipment, valves, damper, filter, duct heaters, etc., with a small red lamacoid plate with name of item above ceiling.

END OF SECTION 202400

SECTION 202500 - HANGERS, CLAMPS, ATTACHMENTS, ETC.

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Provisions - Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

   B. Each Contractor's attention is also directed to Section 201300, Pipe, Pipe Fittings and Pipe Support.

   C. This section includes, but is not limited to, furnishing and installing dampers, supports, anchors, and accessories for piping, ductwork, equipment, etc. Furnishing and installing shall be by each trade for the completion of their work.

   D. Power driven anchors and expansion anchors shall be permitted only when permission is granted in writing by the Architect and Engineer.

2. MATERIALS AND EQUIPMENT

   A. Hangers, Clamps, Attachments, Etc.:

	SIZE	SPECIFICATION
1. Pipe Rings	2" pipe and smaller	Adjustable swivel split ring or split pipe ring, Grinnell Figures 104 and 108, Elcen, Fee & Mason, or approved equivalent.
2. Pipe Clevis	2-1/2" pipe and larger	Adjustable wrought Clevis type, Grinnell Figure 260, Elcen, Fee & Mason, or approved equivalent.
3. Pipe Clevis	All	Steel Clevis for insulated pipe, Elcen Figure 12A, Grinnell, Fee & Mason or approved equivalent.
4. Rise Clamps	All	Extension pipe or riser clamp, Grinnell Figure 261, Elcen, Fee & Mason or approved equivalent.
5. Beam Clamps and Attachments	All	Grinnell Figure numbers listed or, Elcen, Fee & Mason, or approved equivalent. Malleable beam clamp with extension piece figure 229; I-beam clamp figure 131; C-clamp figures 83, 84, 85, 86, 87, and 88.
6. Brackets	All	Welded steel brackets medium weight, Grinnell Figure 195, Elcen, Fee & Mason or approved equivalent.
7. Concrete Inserts	All	Grinnell Figure numbers listed or, Elcen, Fee & Mason or approved equivalent. Wrought steel insert Figure 280 and wedge

		type insert Figure 281.
8. Concrete Fasteners	All	Self-drilling concrete inserts, Phillips, Grinnell, Elcen or approved equivalent.
9. Ceiling	All	Grinnell Figure numbers listed or Elcen, Fee & Mason, or approved equivalent. Pipe hanger flange Figure 153, adjustable swinging hanger flange Figure 155, ceiling flanges Figures 128 and 128R, and adjustable ceiling flange Figure 116.
10. Rod Attachments	All	Grinnell Figure numbers listed or Elcen, Fee & Mason, or approved equivalent. Extension piece Figure 157, rod coupling Figure 136, and forged steel turnbuckle Figure 230.
11. U-Bolts	All	Standard, U-bolt, Grinnell Figure 137, Elcen, Fee & Mason, or approved equivalent.
12. Welded Pipe Saddles	All	Pipe covering protection saddle sized for thickness of insulation, Grinnell Figure 186, Elcen, Fee & Mason or approved equivalent.
13. Pipe Roll	All	Adjustable swivel pipe roll, Grinnell Figure 174, Elcen, Fee & Mason, or approved equivalent.
14. Protection Saddle	All	18-gauge sheet metal pipe protection saddle, Elcen Figure 219, Fee & Mason, Power Strut, or approved equivalent.
15. Hanger Rods	All	Steel, diameter of the hanger threading, ASTM A-107.
16. Miscellaneous Steel	All	Steel angles, rods, bars, channels, etc., used in framing for supports and fabricated brackets, anchors, etc., shall conform to ASTM-A-7.
17. Concrete Channel Inserts	All	Continuous slot inserts, Unistrut, or approved equivalent. Heavy duty Series P-3200 or Light Duty Series P-3300 as required.
18. Adjustable Spot Insert	All	Adjustable spot insert Unistrut, or approved equivalent, P-3245. Design load 1000 lbs.

3. INSTALLATION

A. Unless otherwise specifically indicated or hereinafter specified in the specifications, all supporting, hanging and anchoring of piping, ductwork, equipment, etc., shall be done by each trade as is necessary for completion of the work and shall be as directed in the following paragraphs:

(1) Supporting and hanging shall be done so that excessive load will not be placed on any one hangers so as to allow for proper pitch and expansion of piping. Hangers and supports shall be placed as near as possible to joints, turns and branches.

(2) For concrete construction, utilize adjustable concrete inserts for fasteners. Expansion anchors and power-driven devices may be used when approved in writing by the Architect/Engineer. Utilize beam clamps for fastening to steel joists and beams and expansion anchors in masonry construction. When piping is run in joists, piping shall be top mounted on trapeze type hangers with each pipe individually clamped to trapeze hanger.

(3) Trapeze hangers shall be supported by steel rods of sufficient diameter to support piping from joists or concrete construction. Where desired or required, piping may be double mounted on trapeze hangers. Where conditions permit, trapeze hangers may be surface mounted on exposed joists by means of approved beam clamps, or to concrete construction by means of approved adjustable inserts or expansion anchors.

(4) Install all miscellaneous steel other than designed building structural members as required to provide means of securing hangers, supports, etc., where piping does not pass directly below or cross steel joists.

(5) Piping shall not be supported by the equipment to which it is connected. Support all piping so as to remove any load or stress from the equipment.

(6) Where piping, etc., is run vertically, approved riser clamps, brackets or other means shall be utilized at approximately 10'-0" center to center minimum and an approved adjustable base stand or fitting on concrete support base shall be utilized at the base of the vertical run.

(7) Where piping is run along walls, knee braced angle frames or pipe brackets with saddles, clamps, and rollers (where required) mounted on structural brackets fastened to walls or columns shall be used.

(8) Support all ceiling hung equipment, with approved vibration isolators.

(9) Where copper tubing is specified, hangers shall be of copper clad type when piping is uninsulated.

(10) Uninsulated piping hung from above shall be supported with ring and clevis type pipe hangers. Uninsulated piping mounted on trapeze and wall bracket type support shall be held in place with U-bolts. U-bolts shall allow for axial movement in the piping.

(11) All insulated piping shall be supported with clevis type and/or pipe roll hangers. Hangers shall be sized to allow the pipe insulation to pass through the hangers. Install insulation protection saddles at all hanger locations. Welded pipe saddles shall be installed at all hangers on piping 5" and larger. The pipe saddles shall be sized for the thickness of insulation used. Hangers shall fit snugly around outside of insulation saddles.

(12) Under no conditions will perforated band iron or steel wire driven hangers be permitted.

(13) In general, support piping at the following spacing:

a. Steel and copper piping - 5 feet intervals for piping 3/4" and smaller. 6 feet intervals for 1 ¼" and 1" pipe. 8-foot intervals for piping 1 ½" to 3". 10-foot intervals piping 3 ½" and larger.

b. PVC/HDPE piping – 4-foot intervals for piping 1 1/2" and smaller. 5-foot intervals for 2 and 2 ½" piping. 6-foot intervals for 3" pipe and larger.

c. Where the manufacturer of the pipe has more strict guidelines, the manufacturer's recommendations shall be followed.

END OF SECTION 202500

SECTION 202600 – MECHANICAL/ELECTRICAL VIBRATION CONTROLS

1. GENERAL

A. RELATED DOCUMENTS

(1) Drawings and general provisions of the Contract, including General and Supplementary Conditions, General Mechanical Provisions and Division 1 Specifications Sections, apply to this section.

B. MANUFACTURERS

(1) Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include:

Mason Industries
Vibration Eliminator Co., Inc.
Vibration Isolation Co., Inc.
Kinetics Noise Control
Vibration Management Corporation - Vimco

All Seismic restraint devices; isolators, calculations and seismic design shall be provided by a single vibration isolator manufacturer as listed above.

C. SUMMARY

(1) This Section includes vibration isolators, vibration isolation bases, and seismic restraints and snubbers for mechanical and electrical equipment, duct and piping systems.

Drawings and calculation
Certification of seismic restraint designs
Installation supervision

D. PROJECT CONDITIONS

(1) Building Classification Category is III (2018 KBC – Table 1604.5).

(2) Seismic Design Category: A

(3) Component Importance Factor is 1.0 for all Mechanical and Electrical Systems

a. The interrelationship of components and their effect on each other shall be considered so that the failure of any essential or non-essential architectural, mechanical or electrical component shall not cause the failure of another essential architectural, mechanical or electrical component.

(4) Duct restraints are not required if conditions of ASCE 7-05; Chapter 13 paragraph 13.6.7 are met.

(5) Piping restraints are not required if conditions of ASCE 7-05; Chapter 13; paragraph 13.6.8 are met.

(6) Fire Protection Sprinkler Systems: Refer to ASCE 7-05; Chapter 13, paragraph 13.6.8.2 and 13.6.8.3.

E. APPLICABLE CODES AND STANDARDS

(1) The Kentucky Building Code; 2013; Chapter 16, 17

(2) ASCE 7-05, Chapter 13.

F. SUBMITTALS

(1) Product Data: Indicate types, styles, materials, and finishes for each type of isolator and seismic restraint specified. Include load deflection curves.

(2) Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to the structure and to the supported equipment. Include auxiliary motor slides and rails, and base weights.

1. PRODUCTS

A. VIBRATION ISOLATORS

(1) Rubber Isolator Mounts: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements, with encapsulated top-and baseplates. Factory drilled and tapped top plate for bolted equipment mounting. Factory-drilled baseplate for bolted connection to structure. Color-code to indicate capacity range.

(2) Restraint Spring Isolators: Vertically restrained, freestanding, laterally stable, steel open-spring-type isolators.

(3) Housing: Welded steel or ductile iron. Factory-drilled baseplate for bolting to structure and bonded to a 1/4 –inch-(6mm) thick, rubber isolator pad attached to the baseplate underside. Provide adjustable equipment mounting and leveling bolt.

(4) Outside Spring Diameter: Not less than 80 percent of the compressed height of spring at rated load.

(5) Minimum Additional Travel: 50 percent of the required deflection at rated load.

(6) Lateral Stiffness: More than 0.8 times the rated vertical stiffness.

(7) Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

(8) Finishes: Baked enamel for metal components on isolators for interior use. Hot-dip galvanized for metal components on isolators for exterior use.

(9) Vertical Limit Stops: Where required or shown, provide resilient vertical limit stops to prevent spring extension due to wind loads or when weight is removed.

(10) Rubber Hangers: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements bonded to formed-steel housings with threaded connections for hanger rods. Color-code to indicate capacity range.

(11) Spring Hangers: Combination spring and elastomeric hanger with coil spring and elastomeric insert in compression.

(12) Frame: Formed steel, fabricated for connection to threaded rods and to allow for 30 degrees of angular hanger rod misalignment without binding or reducing isolation efficiency.

(13) Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.

(14) Minimum Additional Travel: 50 percent of the required deflection at rated load.

(15) Elastomeric Element: Molded, oil-resistant rubber or neoprene.

(16) All-directional acoustical pipe anchor shall consist of two sizes of steel tubing separated by a minimum ½" thick 60 durometer neoprene. Vertical restraint shall be provided by similar material arranged to prevent vertical travel in either direction. Allowable loads on the isolation material should not exceed 500 psi and the design shall be balanced for equal resistance in any direction.

(17) Seismic solid braces shall consist of steel angles or channels to resist seismic loads with minimum safety factor of 2 and arranged to provide all directional restraint. Seismic solid brace end connection shall be steel assemblies that swivel to the final installation angle and utilize two through bolts to provide proper attachment. Seismic solid brace assembly shall have anchorage pre-approval "R" number OSHPD in the state of California verifying the maximum certified load ratings.

(18) Housekeeping pad anchors shall consist of a ductile iron casting that is tapered and hexagonal, smaller at its base than at its top. The upper portion shall have holes for rebar to pass through. The anchor should be continuously threaded from top to bottom for the attachment of soleplates. Housekeeping anchors shall be attached to the structural slab using stud wedge anchors.

(19) Stud wedge anchors shall be manufactured from full diameter wire, not from undersized wire that was "rolled up" to create the thread. The stud anchor shall also have a safety shoulder, which fully support the wedge ring under load. The stud anchors shall have an evaluation report number from the I.C.B.O. Evaluation Service, Inc. verifying its allowable loads.

(20) Female wedge anchors are preferred in floor locations so isolators or equipment can be slid into place after the anchors are installed. Anchors shall be manufactured from full diameter wire, and shall have a safety shoulder to fully support the wedge ring under load. Female wedge anchors shall have evaluation report number from the I.C.B.O. Evaluation Service, Inc. verifying to its allowable loads.

B. VIBRATION ISOLATION BASES

(1) Fabricated Steel Bases: Structural-steel bases and rails designed and fabricated by the isolation equipment manufacturer. Include equipment static loadings, power transmission, component misalignment, and cantilever loadings.

(2) Fabricate bases to shapes required, with welded structural-steel shapes, plates and conforming to ASTM A 36 (ASTM A 36M). Include support brackets to anchor base to isolators units. Include pre-located equipment anchor bolts and auxiliary motor slide bases or rails.

(3) Design and fabricate bases to result in the lowest possible mounting height with not less than an inch (25-mm) clearance above the floor.

(4) Concrete-Filled Inertia Bases: Weld reinforcing bars to the structural frame. Pour concrete into base with relocated equipment anchor bolts.

(5) Weld steel angles on frame for outrigger isolation mountings, and provide for anchor bolts and equipment support.

(6) Configure inertia bases to accommodate equipment supported.

(7) Pump Bases: Size to support pump and piping elbows.

(8) Factory Finish: Manufacturer's standard corrosive-resistant finish.

3. EXECUTION

A. INSTALLATION

(1) Install and anchor vibration-, sound-, and seismic-control products according to manufacturer's written instructions and authorities having jurisdiction.

(2) Anchor interior mounts, isolators, hangers, and snubbers to vibration isolation bases. Bolt isolator baseplates to structural floors as required by authorities having jurisdiction.

(3) Filled concrete inertia bases, after installing base frame, with 3000-psig (20.7-Mpa) concrete, and trowel to a smooth, hard finish. Cast-in-place concrete is specified in Division 3.

(4) Isolate duct as follows:

a. Provide spring and neoprene hanger or floor spring mount on all duct discharge runs for a distance of 50' from the connected equipment. Spring deflection shall be a minimum of 0.75".

b. Provide pre-compressed spring and neoprene hanger or floor spring mount on all duct runs having air velocity of 1000 fpm or more. Spring deflection shall be a minimum of 0.75".

(5) Isolated piping as follows:

a. Horizontal pipe isolation: The first three pipe hangers in the main lines near the mechanical equipment shall be pre-compressed spring and neoprene type. Floor supported piping shall rest on spring type isolators. If piping is connected to equipment located in basements and hangs from ceilings under occupied spaces the first three hangers shall have 0.75" deflection for pipe sizes up to and including 3", 1 ½" deflection for pipe sizes up to and including 6", and 2 ½" deflection thereafter.

b. Riser isolation: Risers shall be suspended from spring and neoprene hangers or supported by floor spring isolators, all-directional acoustic pipe anchor, and pipe guide. steel springs shall be a minimum of 0.75" except in those expansion locations where additional deflection is required to limit load changes to +25% of the initial load. Submittals must include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on the building structure, spring deflection changes and seismic loads. Submittal data shall include certification that the riser system has been examined for excessive stresses and that none will exist in the proposed design.

B. SEISMIC CONTROL

(1) All mechanical systems are to be seismically restrained. Equipment buried underground is excluded but entry of services through the foundation wall is included. Equipment referred to below is typical (equipment not listed is still included in this specification).

(2) Ductwork, where seismically restrained, must be reinforced. Reinforcement shall consist of all additional angel on top of the ductwork that is attached to the support hanger rods. Ductwork is to be attached to the support hanger rods. Ductwork is to be attached to both upper angle and lower trapeze.

(3) Vibration Isolation Bases: Mount equipment on structural-steel bases or concrete inertia bases.

(4) Snubbers: Install the required number of seismic snubbers on each spring-mounted piece of equipment. Locate snubber as close as possible to the vibration isolators and bolt to supporting structure.

(5) Manufacturer shall provide installation instructions, drawings and trained field supervision to ensure proper installation and performance. Visit the project site before installation is begun and instruct installers in correct installation procedures for vibration isolation, seismic restraints and concrete pads. Observe installation of other work related to vibration isolation and seismic work, including concrete pad installations; and, after completion of other related work (but before equipment startup), shall furnish written report to Contractor listing observed inadequacies for proper operation and performance of vibration isolation work. Report shall cover the following:

a. Equipment installations (performed as work of other sections) on vibration isolators and Seismic restraints.

b. Piping connections including flexible connections.

c. Ductwork connections including provisions for flexible connections.

d. Passage of piping and ductwork which is to be isolated through walls and floors.

e. Installation of isolators and seismic restraints on duct and piping systems.

(6) Do not start-up equipment until inadequacies have been corrected in manner acceptable to Vibration Isolator and Seismic Controls Manufacturer.

(7) Spacing for restraints shall be as follows, except where lesser spacing is required to limit anchorage loads:

a. Ductwork and electrical services (conduit, bus ducts, cable trays, and ladder trays) transverse restraints shall occur at 30’ intervals (or at both ends of the duct run if less than specified interval) and longitudinal restraints shall occur at 60’ intervals (with at least one restraint per duct run). Transverse restraints shall be installed at each duct/electrical service turn and at each end of a duct/electrical run.

b. Walls including gypsum board non-bearing partitions, which have ducts running through them may replace a typical transverse brace. Provide channel framing around ducts and solid blocking between the duct and frame.

END OF SECTION 202600

SECTION 203100 - TESTING, BALANCING, LUBRICATION AND ADJUSTMENTS

1. GENERAL

   A. The General Conditions, Instructions to Bidders, Section 200100, and other Contract Documents are a part of this specification and shall be binding on all Mechanical Contractors. It shall be each Contractor's responsibility to apprize himself of all information pertinent to his work prior to submitting his proposal. No adjustments will be made in this Contract which is a result of failure to comply with this requirement.

   B. The Engineer, or his authorized representative, shall be notified by the Contractor twenty-four (24) hours in advance of any tests called for in these specifications or required by others. Any leaks or imperfections found shall be corrected and a new test run to the satisfaction of the Engineer or his authorized representative. Upon completion of a test, a written approval of that part of the work will be given to the Contractor. Only after written approval, signed by the Engineer, shall the Contractor apply insulation or paint or allow his work to be furred in. This written approval, however, does not relieve the Contractor of the responsibilities for any failure during the guarantee period. The expense of all tests shall be borne by the Contractor, along with all temporary equipment, materials, gauges, etc. required for tests.

2. PLUMBING

   A. Piping shall be tested before being insulated or concealed in any manner. Where leaks or defects develop, required corrections shall be made and tests repeated until systems are proven satisfactory.

   B. Water piping systems shall be subjected to a hydrostatic test of one hundred fifty pounds. The system shall be proven tight after a twenty-four (24) hour test.

   C. The house drain line, interior storm sewers, interior rainwater conductors, and all soil, waste and vent piping shall be subjected to a hydrostatic test of not less than a 10-foot head or an air test of not less than 5 lbs. per sq. inch using a mercury column gauge and shall hold for 15 minutes.

   D. Exterior sewer lines to the termination point outside the building shall be subject to a ten-foot hydrostatic test or an approved smoke test. These lines shall be subjected to a second test after 2 feet of backfill has been properly installed.

   E. After piping has been installed, the entire plumbing system, exclusive of the house sewer, shall be subjected to an air pressure test equivalent to one-inch water column and proven tight. The Contractor responsible shall furnish and install all of the test tees required, including those for isolating any portion of the system for tests.

   F. Thermometers and gauges shall be checked for accuracy. If instruments prove defective, they shall be replaced.

   G. The Contractor shall perform all additional tests that may be required by the Kentucky Department of Health or other governing agency.

   H. Set temperature control on water heaters and adjust tempering valves as required.

   I. Balance the water flow rate of each domestic hot water recirculating pump. Set the flow rate for each balancing valve in the recirculating hot water system. If flow rates are not indicated, contact the engineer for each balance valve GPM.

J. Any leaks or imperfections found shall be corrected and a new test run until satisfactory results are obtained. The cost of repair or restoration of surfaces damaged by leaks in any system shall be borne by the Contractor.

K. The compressed air system shall be tested for leaks for eight (8) hours at 250 PSI.

L. The natural gas piping shall be tested in accordance with requirements and/or recommendations of the local gas company.

M. Fuel oil piping shall be static tested at 250 PSI for eight (8) hours.

3. HEATING, VENTILATING AND AIR CONDITIONING

A. The Mechanical Contractor shall test all piping before being insulated or concealed in any manner. Where leaks or defects develop, required corrections shall be made and tests repeated until systems are proven satisfactory. Water piping systems shall be subjected to a hydrostatic test of not less than one hundred pounds and shall be proven tight after a twenty-four (24) hour test.

B. All motors, bearings, etc. shall be checked and lubricated as required during start-up procedures. All automatic, pressure regulating, and control valves shall be adjusted. Excessive noise or vibration shall be eliminated. Provide all start-up documents to Designer prior to any test and balance services.

C. System balancing, where required, shall be performed only by persons skilled in this work. The system shall be balanced as often as necessary to obtain desired system operation and results.

D. All fan belts shall be adjusted for proper operation of fans.

E. All deficiencies observed by the Test and Balance Contractor shall be reported immediately to the Engineer and Mechanical Contractor.

F. For the purpose of placing the heating, ventilating and air conditioning system in operation according to design conditions and certifying same, final testing and balancing shall be performed in complete accordance with AABC Standards for Total System Balance, Volume Six (2002), for air and hydronic systems as published by the Associated Air Balance Council. The following systems shall be test and balance:

(1) The supply, return and outside air duct systems associated with all AHUs as included in this project phase. Provide static pressure profiles thru each system. Static pressure profiles shall include all sections from the return duct inlet and supply duct outlet of the air handling unit. Show accurate representation of return, relief, outdoor and economizer damper locations. On units equipped with return air fans; show location and profile of the return fan.

(2) All AHU supply and return duct air leakage testing, and exhaust duct air leakage testing as required per Section 231200, *for duct systems installed in this bid package.*

~~*(3) The chilled water pumps and chilled water coils.*~~

(4) The baseboard heating system pumps and baseboard heating coils.

(5) Pressure testing of all AHU's to confirm compliance with the requirements of spec section 237314 - FACTORY BUILT CUSTOM INDOOR AIR HANDLING UNITS.

~~*(6) The hot water pumps and hot water coils.*~~

(7) Balance all supply, return and exhaust air grille to within 10% of design air flow rate.

(8) ~~*Balance all exhaust air fans and record inlet static pressure.*~~

~~*(9) Balance domestic hot water return system including all balance valves and record settings and flows.*~~

(10) Pressure test ductwork as required by sheet metal specification section 231200.

H. Provide a preliminary test report to the mechanical engineer immediately after the system is air balanced, or any initial phases are balanced. This report may be hand written. Anticipate visiting the site again after the engineer has reviewed the report. The engineer may request up to 15 additional static pressure measurements for any air handling system to help resolve any balancing deficiencies. Include five additional static pressure measurements for each exhaust air system.

I. The Test and Balance agency shall provide lifts, scaffolding, etc. as required to balance devices in areas with high ceilings. The Test and Balance agency may coordinate with the General Contractor or Mechanical Contractor to arrange for these items to be provided to access high devices, however, it is emphasized the Contractor is finally responsible for providing the means required to balance all devices.

J. Instruments used for testing and balancing of air and hydronic systems shall have been calibrated within a period of six months prior to balancing. All final test analysis reports shall include a letter of certification listing instrumentation used and last date of calibration.

K. Test and Balance agency is to provide sizing of fan or motor sheaves required for proper balance. The Mechanical Contractor will purchase and install all sheaves and belts as required. This includes new and existing equipment.

L. Four (4) copies of the complete test reports shall be submitted to the Consulting Engineer prior to final acceptance of the project. Preliminary test reports shall be submitted when requested.

M. The Contractor shall provide and coordinate their work in the following manner:

(1) Provide sufficient time before final completion date so that tests and balancing can be accomplished.

(2) Provide immediate labor and tools to make corrections when required without undue delay.

N. The Contractor shall put all heating, ventilating and air conditioning systems and equipment and range hood system into full operation and shall continue the operation of same during each working day of testing and balancing.

O. The test and balance contractor shall be present during the Engineer's final inspection of the building, or a separate project review date. The Engineer may request confirmation of the air balance report by asking for new measurements to be taken at that time. Any information in the test and balance report may be asked to be reconfirmed.

END OF SECTION 203100

SECTION 203200 - MECHANICAL MAINTENANCE

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

2. MECHANICAL MAINTENANCE CONTRACT

   A. In addition to all other work indicated and specified, the Contractor shall provide the necessary skills and labor to assure the proper operation for all equipment and controls provided under Division 20 for a period of one year after substantial completion of the contract as defined in these specifications.

   B. The Contractor shall receive calls for any and all problems experienced in the operation of the equipment provided and shall take steps to immediately correct any deficiencies that may exist.

   C. The Contractor shall provide monthly inspection of all equipment and record the findings on a check list hereinafter specified.

   D. All equipment that requires repairing shall be immediately serviced and repaired. Since the period of maintenance runs for one year concurrently with the warranty and guarantee, all parts and labor shall be furnished at no extra cost to the Owner.

   E. Control System - Once each month, the Control Sub-Contractor shall check all controls in the building to ascertain that they are functioning as designed and installed. This shall apply to all thermostats, aquastats, humidistats, freezestats, and firestats. This portion of the work shall be performed only by the Sub-Contractor that installed the controls.

   F. When emergency service is required beyond regular working hours to maintain the system in operation, the Contractor shall furnish such service.

   G. Failure on the part of the Contractor to comply with all or part of this section of his work, will be required to relinquish a portion of his original contract sum. In general, that cost will be determined by the cost incurred by the owners to have work accomplished which should have, by contract, been accomplished by the Contractor.

END OF SECTION 203200

SECTION 210100 - FIRE PROTECTION SYSTEM

1. GENERAL

A. The General Conditions, Instructions to Bidders, Section 200100, 1. A, and other Contract Documents are a part of this specification and shall be binding on the Contractor. It shall be the Contractor's responsibility to apprise himself of all information pertinent to his work prior to submitting his proposal. No adjustments will be made in this Contract which is a result of failure to comply with this requirement.

B. No Contractor, other than those regularly engaged in the installation of approved and franchised automatic sprinkler systems, will be considered or approved for the work under this section of the specifications. Bidders must have had not less than five (5) years experience in the fabrication and erection of such systems: wet, dry and rack storage types, and shall have completed installations similar and equivalent in scope to this system under approval by one or more of the recognized Underwriting Associations in the Insurance Field.

C. Before submitting bid, examine all Mechanical, Architectural, and Structural Drawings, visit the site and become acquainted with all conditions that may, in any way whatsoever, affect the execution of this work. Also, the Contractor shall coordinate with the rating bureau and insuring agency to verify adequacy of water supply for the proposed sprinkler system extension.

D. The Contractor shall take his own measurements and be responsible for exact size and location of all openings required for installation of this work. Figured dimensions where indicated are reasonably accurate and should govern in setting out work. Detailed method of installation is not indicated. Where variations exist between described work and approved practice, the Engineer shall be consulted for directive.

E. It is the intent of the Plans and Specifications to provide a general layout only and locate major equipment, piping, etc. Variations in head locations, pipe routing, etc., may be anticipated by the Contractor and shall be coordinated with all other trades and indicated on the drawings and descriptive literature called for hereinafter. It shall be the express responsibility of the Contractor to provide all required materials and equipment and perform all work required to install a complete and approved installation.

F. All materials and methods shall be in accordance with applicable codes, regulations and/or ordinances and meet approval of local inspection authority and the State Fire Marshal. Also, all work shall comply with the latest editions of the National Board of Fire Underwriters, National Fire Protection Association, OSHA Regulations, the National Building Code, the Life Safety Code, IMC Code and the Southern Building Code (Where applicable). The local insuring agency shall review plans prepared and submitted by the Contractor but shall have no authority to make changes once work has begun.

G. All work performed under this section shall be accomplished in close harmony with all other trades. All work not so coordinated shall be removed and reinstalled at the expense of the Contractor.

H. The Contractor shall submit a proposed layout to the Engineer prior to submittal to the Fire Marshal's Office.

2. SCOPE OF WORK

A. Furnish all material, labor, tools, equipment and supervision required for installation of a complete fire protection and stand pipe system as indicated on the project drawings. Include all necessary piping, sprinkler heads, test connections, valves, drains, cabinets, siamese connections, fire hydrants, fire pump, etc.

B. The Contractor shall provide flushing and sterilization of all water lines in accordance with current Kentucky Plumbing Codes, Rules and Regulations and shall make connection to domestic water mains in accord with current rules and regulations of the State Department of Sanitary Engineering and Division of Water.

C. Provide stand pipes with fire hose cabinets or fire valves as indicated or as required to meet the requirements of NFPA and the local fire authority.

D. Provide sprinklers in attics, overhangs, awnings, cooler/freezers, in accessible spaces and all other areas required by NFPA and the local fire authority.

E. Provide dry pipe systems or freeze proof heads as required to provide continuous coverage without freezing.

F. Provide seismic restraints in accordance with the Seismic Restraint specification section 202600.

3. WATER SUPPLIES AND SYSTEM LAYOUT CRITERIA

A. Where flow and pressure data are available, they are indicated on the project drawings. The Contractor shall independently verify all such information and notify the engineer of any discrepancies discovered prior to beginning the work. Where no flow information is indicted on the project drawings, the Contractor shall obtain it and indicate it on the shop drawing submittal. Piping systems shall be hydraulically sized based on the most conservative flow information obtained. No adjustments in the contract amount will be allowed for failure of the Contractor to obtain adequate flow information.

4. DRAWINGS AND DESCRIPTIVE LITERATURE

A. The Contractor shall prepare and submit to the Engineers, an electronic copy of detailed drawings indicating his proposed Automatic Sprinkler System. These drawings shall indicate minimally the following components when they are used in the system.

(1) Name and address of Owner, Architect and Engineers.
(2) Make and type of sprinkler heads (Catalog cuts).
(3) Make and type of fire department connection (Catalog cuts).
(4) Make and type of post indicator valve (Catalog cuts).
(5) Make and type of detector check valve (Catalog cuts).
(6) Make and type of electric alarm bell (Catalog cuts).
(7) Make and type of flanged check valve (Catalog cuts).
(8) Make and type of flanged gate valve (Catalog cuts).
(9) Make and type of automatic drains (Catalog cuts).
(10) Make and type of pipe hangers (1 catalog cut of each make and/or type).
(11) Make, type and electrical characteristics of:

a. The pressure sensing switch*.
b. The post indicator supervisory switch*.
c. The main gate valve supervisory switch*.

d. The flow switch*.
e. Air compressor.

(12) Make and type of fire pump (Catalog cuts).
(13) Make and type of jockey pump (Catalog cuts).
(14) Make and type of supervised O.S & Y valve.
(15) Make and type of indicating butterfly valve.
(16) Make and type of fire hose cabinets.
(17) Make and type of reduced pressure backflow preventer.

Note: All layouts and drawings are to be closely coordinated with the work of all other trades. The Engineers will, upon request, provide a complete set of Architectural, Structural, Mechanical and Electrical Plans and Specifications to aid the Contractor in this work.

*SPECIAL NOTE: 1) The items (indicated by asterisk) must be clearly coordinated with the Fire Alarm System supplier. 2) Supervisory switches located in wet locations (i.e., fire protection vault) shall be provided with NEMA 6 enclosures.

(18) On a set of drawings to the same scale as the drawings accompanying these specifications, indicate:

a. Each head location coordinated with lights, diffusers and other ceiling mounted device.
b. Location of all risers, mains, runout lines, etc.
c. Size of all risers, mains, runout lines, etc.
d. Location and type of pipe hangers.
e. All other information required by the Kentucky Department of Housing, Buildings and Construction.

The Contractor shall submit these drawings to the Engineer through the General Contractor/Construction Manager and Architect where applicable. The Contractor shall submit reviewed drawings to the Kentucky Department of Housing, Buildings and Construction for their review and approval. No work shall be done until drawings are approved by the Kentucky Department of HBC.

5. SYSTEM DRAINAGE

A. The entire Standpipe and Sprinkler System (except that part which is below grade and will not freeze) shall be installed so as to allow 100% drainage.

B. All sprinkler branch piping shall be installed so as to drain back to the main riser.

C. Approved 2" drawoff piping shall be provided on sprinkler risers with discharge piping running to nearest floor drain or open air.

D. Where sprinkler piping is trapped, an approved auxiliary draw-off shall be provided and neatly installed.

E. All draw-offs shall have a metal tag labeled "Sprinkler Drain."

6. INSPECTIONS AND TESTS

A. Furnish all labor, equipment and conduct all required tests in the presence of the Owner and Engineer or designated representative.

B. All piping and devices comprising the fire protection system shall be tested under hydrostatic pressure of not less than 200 PSI and maintained for not less than two (2) hours.

C. Upon completion of his work, the Contractor shall submit a written and signed certificate to the Engineers indicating that he performed the above prescribed tests and rectified all malfunctions arising there from.

7. PERMITS

A. The Contractor shall obtain and pay for all necessary state, municipal, county, city and other permits and fees and pay all State taxes which are applicable.

8. GUARANTEE

A. All workmanship, equipment and material shall be guaranteed in writing against defects from any cause, other than misuse, for a period of one year after date of final acceptance.

9. ACCEPTANCE CERTIFICATE

A. Upon completion, the Contractor shall submit to the Engineers, a properly filled out "Sprinkler Contractor's Certificate Covering Materials and Tests." (4 copies).

10. CLEANING

A. Upon completion of this work all debris, material, and equipment shall be removed from the building and premises; all piping shall be cleaned ready for finish painting. Note: Do not remove rust inhibitive primer specified hereinafter.

11. PAINTING

A. All fire protection piping, fittings, etc., shall have one factory or shop coat of rust inhibitive primer. The Contractor shall thoroughly clean all such items in areas where the piping will be exposed so as to readily receive the finish coat specified in the Architectural Division of Painting. Colors shall be as specified in Identification Section of these specifications.

12. PIPE LAYING

A. Bell holes shall be excavated accurately to size and barrel of pipe shall bear firmly on bottom of trench throughout its length. All foreign matter and dirt shall be removed from the inside of the pipe before it is lowered into its position in the trench, and it shall be kept clean by approved means during and after laying. At times when pipe laying is not in progress, the open ends of pipe shall be closed by approved means, and no trench water shall be permitted to enter the pipe. Cutting of pipe, where necessary, shall be done in a neat and workmanlike manner, without damage to pipe. Refer also to Excavation.

13. EQUIPMENT AND MATERIALS

A. Signs

Appropriate code approved and required signs shall be installed on all control valves, drains, inspector's test, etc., indicating the function, installation, etc. Signs shall be neatly affixed with rust inhibitive screws, rivets or where hung from piping; with stainless steel No. 14 AWG wire.

B. Finish

All exposed materials such as valves, fire department connections, sprinkler heads, fire pump test headers, etc., shall be brass or chrome-plated brass.

C. Check Valves

(1) 2-1/2" and over; listed and approved by UL and FM; marked SV-FM; 175# working pressure; 1 BBM; flanged; equivalent to Mueller, Scott or Lunkenheimer.

(2) 2" and under; 150# working pressure; bronze; screwed; equivalent to Jenkins, Scott or Lunkenheimer.

D. Pipe & Fittings

(1) Nipples and fittings shall be of same material, composition, and weight classification as pipe in which installed.

(2) Up to 2" (Interior) Schedule 40 ASTM A-53 black steel; 125# cast iron screwed fittings or Schedule 10, ASTM A-135 black steel with victaulic or similar type approved fittings.

(3) 2-1/2" and larger (Interior) Schedule 40 black steel with flanged, welded or victaulic (or similar) type approved fittings or Schedule 10, ASTM A-135 black steel with victaulic or similar type approved fittings.

(4) Exterior: Schedule 150 ductile iron with cement mortar lining and gasketed joints. Piping shall, be UL listed, Factory Mutual approved and NSF approved. No. 8 copper wire (tracer wire) shall parallel all exterior pipe.

(5) Dry Pipe System Piping: Same as standard system except Schedule 10 piping is not acceptable.

E. Clamps and Anchors

(1) Furnish and install approved clamps, as required, at all (45 degree) l/8 bends, (90 degree) 1/4 bends and flange and spigot pieces to the straight pipe to ensure permanent anchorage of all fire lines. Clamps, clamp rods, nuts, washers, and glands shall be coated with a quick drying coal tar bituminous paint after installation.

F. Hangers

(1) All piping shall be adequately and permanently supported in an approved manner on approved hangers (Submit with drawings).

G. Sleeves and Escutcheon Plates

(1) Furnish and install sleeves for pipes where piping penetrates masonry walls; exterior wall sleeves to be watertight. Fire and smoke stop all penetrations through fire and smoke walls and coordinate with General Contractor for locations.

(2) Furnish and install cast brass chrome plated split ring type escutcheons where piping penetrates walls, ceilings and floors, whether in finished areas or not.

H. Electric Wiring

(1) All electric wiring for the system which may be required shall be installed in accordance with the National Board of Fire Underwriters, and National Electric Code. The cost of this electric wiring shall be included under this Contract. All electrical wiring and conduit installed in fire protection pits shall be sealed watertight.

I. Inspection Test Connections & Pressure Gauges

(1) A 1" inspection test connection as required by the Kentucky Building Code. Discharge shall run to open air.

(2) Control valve for test connection shall be installed not over 7' above the floor.

(3) A pressure gauge at the inspection. Test connection at each location indicated on the Plans. Pressure gauges shall be 2-1/2" diameter and readable from the floor.

J. Gate Valves

(1) 2-1/2" and over; listed and approved by UL and FM; marked SV-FM; 175# working pressure; 1 BBM; OS&Y; flanged; cast iron discs; bronze seat rings; four-point wedging mechanism; equivalent to Mueller, Scott or Lunkenheimer.

(2) 2" and under; 150# working pressure; bronze; rising stem; screwed; bronze discs; bronze seat rings; two-point wedging mechanism; equivalent to Jenkins, Scott or Lunkenheimer.

K. Sprinkler Head Cabinet

(1) Furnish and install a cabinet, clearly labeled, with four (4) sprinklers of each type complete with required wrenches. Locate as directed by Engineer. Label "Sprinkler Heads."

L. Fire Department Connection

(1) Furnish and install a fire department connection with threads as approved by the local fire department; cast brass polished and chromium plated; with connection sizes and lettering as directed by the local authority having jurisdiction; Units shall be Acron Brass or equal single 4" nozzle, clapper, etc.

M. Fire Hose Valve

(1) Manufacturer. The products specified hereunder shall be Crocker or equivalent by Elkhart, Central Sprinkler, Kidde, or other nationally recognized manufacturer of hose valves conforming closely to specification requirements. Valve shall be with cap and chain. All connections shall be 2½" or as required by the local authority.

N. Detector Check Valve

(1) Furnish and install detector check valve as required by the local authority. It shall be listed and approved by Underwriter Laboratories and Associated Factory Mutual Laboratories; 175# working pressure; IBBM; flanged; with tapped bosses each side for by-pass meter trimming; equivalent to Viking, Badger or Grinnell.

(2) The Contractor shall contact the servicing water company and ascertain their policy pertaining to the by-pass water meter; if not furnished by water company. The Contractor shall furnish and install the by-pass meter and trimming as detailed on the drawings.

O. Sprinkler Heads

Gem, Grinnell, Star, Viking, Reliable, Central or approved equivalent as follows:

(1) Where piping is exposed: "Standard up right."

(2) Where piping is concealed above finished ceilings, provide two pieces, semi recessed, white plated sprinkler heads with removable escutcheon.

(3) Install sprinkler head guards where heads are subject to physical abuse. Heads located below seven (7) feet above floor, etc.

(4) Sprinkler head degree ratings shall be determined by the area serviced in accord with current Codes and Standard Practices. Indicate degree ratings on submitted Shop Drawings.

(5) The Contractor shall submit to the Engineer for inspection, one (1) sample of each type of sprinkler head, proposed to be used on the project.

(6) Where heads are installed in a tile ceiling, they shall be installed in the middle of the tiles, at half or quarter points along the length of the tiles. Install sprinkler heads at quarter points of center scoured 2' X 4' ceiling tiles.

(7) Provide high temperature heads around range hoods, kitchen equipment, kilns, boilers, water heaters and other heat producing equipment.

(8) **Light hazard occupancies only –** Install quick response heads.

P. Electric Alarm Bell

(1) Furnish and install an electric alarm bell.

Q. Flow Indicator Switches

(1) Furnish and install flow indicator switches as required by NFPA 13. All flow indicator switches shall be UL approved. Coordinate with Fire Alarm System supplier/installer. Provide a set of dry contacts on each flow switch for interface to the Control System if this control point is specified in the Controls Section.

R. Tamper Switches for Water Shut-Off Valves

(1) Furnish and install tamper switches where required by NFPA 13. All tamper switches shall be UL approved. Coordinate with fire alarm system supplier/installer. All tamper switches

located in fire protection pits shall be waterproof, capable of operating beneath water similar to Potter PTS Series and be NFPA approved.

S. Preaction System

(1) Provide a Single Interlocked Preaction cabinet with electric release containing all hydraulic and electrical components required for the control of a preaction system. The cabinet shall include the following:

a. Self-contained unit (with control panel) in sturdy free-standing 14-gauge steel cabinet, measuring:

1) 71"x36"x20" (180x91x51cm) for 1 ½", 2" & 3" systems

2) 71"x46"x24" (180x117x61cm) for 4" & 6" systems

b. Textured rust proof coating, inside and outside, fire red, oven baked polyester powder on phosphate base.

c. Two locked access doors to reduce front area required for opening, easily removable without tools to allow easy installation & servicing.

d. Individual access doors for the hydraulic and electrical sections and the emergency release (unlocked) with a neoprene gasket to avoid vibrations.

e. Deluge Valve, complete with Schedule 40 galvanized steel trim rated at 250 psi.

f. Integrated control panel, with emergency batteries in a top enclosure including a sprinklers storage rack.

g. Field wiring terminal strips integrated with the cabinet for connection of field wiring for detection system, audible devices, auxiliary contacts and power supply for air compressor.

h. Pressure gauges to indicate water supply pressure, priming water pressure and air pressure of the system.

i. Release trim with solenoid valve and each supervisory device required.

j. Schedule 40 steel pipe header with grooved ends to be connected to supply water.

k. Schedule 40 steel pipe drain manifold of 2" diameter for drain connections. Open drain cups in the cabinet and multiple drain manifolds will not be accepted.

(2) The cabinet assembly must be pre-assembled, pre-wired and factory tested under ISO-9001 conditions. It shall also be c-UL-us Listed, FM and MEA Approved as an assembled unit.

(3) Complete and functioning system shall meet all applicable codes, as listed below:

a. NFPA 13 (Installation of Sprinkler Systems)

b. NFPA 25 (Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems)

c. NFPA 72 (Standard for the Installation, Maintenance, and Use of Protective Signaling Systems)

d. NFPA 72E (Standard on Automatic Fire Detectors)

e. KBC (Kentucky Building Code)

f. National Building Code

g. National Fire Code

h. National Electrical Code

(4) Provide a complete electrical detection system including: system tubing, wiring, smoke detectors, signaling devices and connections to auxiliary functions. Provide detection and alarm indicating devices (24 Vdc bell, horn or strobe) to be compatible with the release control panel. A bell or a horn should be provided near the cabinet.

(5) Provide an internal air compressor as required for supervisory air. The air supply must be regulated and of the proper size in order to be able to restore normal system air pressure within 30 minutes. Size compressor as required for specific project. 120VAC, 60Hz. Air compressor and supervisory trim shall be factory installed inside the cabinet and adjusted for the required configuration.

(6) Sprinkler heads for the preaction system shall be as allowed by NFPA 13 for preaction systems and as specified in these specifications.

(7) The installation of the Preaction system must meet all established standards and be according to all applicable laws, regulations and codes. The proper operation and coordination for the system's installation, including the automatic sprinkler system, detection system, signaling system and initial start-ups are all under the responsibility of the contractor.

(8) The contractor must plan and organize a training session of at least two hours for the building maintenance staff, in the presence of building owner or his representative. The training session must include the normal operation, emergency procedures and system maintenance.

(9) Testing and Verifications of the system shall be as follows:

a. Hydrostatic tests must be performed on the entire sprinkler piping system, as required by NFPA 13.

b. In addition to the standard hydrostatic test, an air pressure leakage test at 40 psi (2.8 bars) shall be conducted for 24 hours. Any leakage that results in a loss of pressure in excess of 1 1/2 psi (0.1 bar) during the 24 hours shall be corrected.

c. A drain test using the auxiliary drain valve fully open (drain located on water supply side, deluge valve inlet) must be performed to make sure that no back pressure in drain piping exists, which could affect the proper operation of the preaction system.

d. An air supply test must be performed, to confirm that normal air pressure can be restored within 30 minutes.

e. The verification of the fire alarm system must be done in accordance with the NFPA 72.

(10) An inspection report and a certificate must be supplied to the engineer at the completion of the project. All tests results shall be registered in a booklet to be included with the inspection report.

(11) Acceptable Manufacturers: Reliable, Viking or Fire Flex.

14. GUARANTEE

A. All workmanship, equipment and material shall be guaranteed in writing against defects from any cause, other than misuse, or vandalism, for a period of one year after date of final acceptance.

END OF SECTION 210100

SECTION 210200- FIRE PUMPS

1.00 PART 1 - GENERAL

1.01 Description of Work

A. Provide pumps for fire suppression.

1.02 Section Includes

A. Single Stage, Double Suction, 6x5x17 SSC Horizontal Splitcase Fire Pump

RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Specification Sections, apply to this Section.
- Section 200300 - Submittals
- Section 220060 – Plumbing Pipe and Fittings
- Section 200100 - Mechanical General Requirements
- Section 250100 - Electric Motors
- Section 260501 - Electrical General Requirements
- Section 210200 - Fire Pump Controllers
- Section 210200 - Jockey Pumps
- Section 210200 - Controller – Jockey Pump

1.03 Quality Assurance

A. All equipment or components of this specification section shall meet or exceed the requirements and quality of the items herein specified, or as denoted on the drawings.

B. The fire pump shall be assembled by the pump manufacturer. An assembler of fire pumps not engaged in the design and construction of fire pumps shall not be considered as a fire pump manufacturer. The manufacturer shall assume “Unit Responsibility” for the complete fire pump. Unit responsibility shall be defined as responsibility for interface and successful operation of all system components supplied by the pumping system manufacturer.

C. Ensure pump pressure ratings are at least equal to system’s maximum operating pressure at point where installed, but not less than specified.

D. The manufacturer shall have a minimum of 20 years’ experience in the design and construction of fire pump systems.

E. The manufacturer shall carry a minimum product liability insurance of $2,000,000 per occurrence, with an aggregate product liability of $5,000,000.

F. Equipment provider shall be responsible for providing certified equipment start-up and, when noted, an in the field certified training session. This pump start-up shall be by the pump manufacturer or a certified factory-trained representative per NFPA 20, Section 11-2. This start-up shall include verification of proper installation, system initiation, adjustment and fine tuning. Start-up shall not be considered complete until the sequence of operation, including all alarms, has been sufficiently demonstrated to the owner or owner’s designated representative. This job site visit shall occur only after all hook-ups, tie-ins, and terminations have been completed and

signed off on the manufacturer's start-up request form.

1.04 Product Handling

A. Protection: Use all means necessary to protect equipment before, during, and after installation in accordance with manufacturer's storage, installation and maintenance instructions.

1.05 Regulatory Requirements

A. National Fire Protection Association (NFPA 20)
B. Factory Mutual (FM)
C. Institute of Electrical and Electronic Engineers (IEEE)
D. National Electrical Manufacturers Association (NEMA)
E. American Society for Testing and Materials (ASTM)
F. National Electric Code (NEC)
G. Occupational Safety and Health Administration (OSHA)
H. ANSI/HI standards
I. Underwriters Laboratories, Inc.

1.06 Submittal

A. Submit each item in this article according to the Conditions of the Contract and Specifications Sections

B. Submit manufacture's installation instructions under provisions of General Conditions.

C. Product Data including certified performance curves and rated capacities of selected models, weights (shipping, installed, and operating), furnished specialties, and accessories. Indicate pump's operating point on curve.

D. Hanging and support requirements should follow the recommendations in the manufactures installation instructions.

E. The fire pump shall be submitted with the Fire Protection Drawings to the State for review and approval.

1.07 Operation and Maintenance Data

A. All equipment or components of this specification section shall meet or exceed the requirements and quality of the items herein specified, or as denoted on the drawings.

1.08 Delivery, Storage, and Handling

A. Deliver materials to the site in such a manner as to protect the materials from shipping and handling damage. Provide materials on factory provided shipping skids. Materials damaged by the elements should be packaged in such a manner that they could withstand short-term exposure to the elements during transportation. Store materials in clean, dry place and protect from weather and construction traffic. Handle carefully to avoid damage.

1.09 Warranty:

A. Provide a minimum one (1) year warranty from the date of Substantial Completion.

1.10 Commissioning

A. This section specifies a system or a component of a system being commissioned as defined in Commissioning Specifications.

2.00 PART 2 - PRODUCTS

A. The specifying engineer reserves the right to specify a primary supplier/lead spec manufacturer on all supplied schedule and specification documents. These primary suppliers have lead their respective industry in research and development and their products have had proven track records in the field. These primary suppliers, in the opinion of this engineering firm, produce a superior product to the other manufactures.

2.01 Single Stage, Double Suction, Horizontal Splitcase 6x5x17 SSC Fire Pumps

A. Manufacturer

Contractor shall furnish and install an Patterson supplied by Vulcan Fire Systems that is UL listed and FM approved double suction horizontal split-case pump, Model 6x5x17 SSC, for fire suppression. The pump(s) shall conform to the standards of NFPA 20 latest edition for the Installation of Centrifugal Fire Pumps. Acceptable manufacturers include AC Fire Pump, Peerless, Synchro, Paterson.

B. Double Suction Horizontal Split-case Pump

1. The pump will provide a rated capacity of 1,000 GPM and a differential pressure of 85 PSI. At 150% of rated capacity, the pump shall develop at least 65% of its rated head and shall not exceed 140% of the rated head at zero capacity. The pump shall be tested at the factory and a test curve shall be submitted showing the performance and horsepower requirements based on this test before final acceptance.

2. The pump shall be a single stage, double suction, horizontally split case design, in cast iron bronze fitted construction with packing bearing directly on a bronze shaft sleeve. The casing shall be (close-grained cast iron ASTM A48 Class 35A for working pressures up to 175 psig), (ductile iron for working pressures up to 400 psig), and shall be of axially-split design with suction and discharge flanges and mounting feet cast integral with the lower half casing. Tapped and plugged holes shall be provided for priming, vent drain and gauge connections. The pump internals shall be capable of being serviced by removing the upper half casing without disturbing the piping connections or packing area. Flanges shall be 125# or 250# per ANSI B16.1 Standard. Suction and discharge shall be on a common centerline in both horizontal and vertical planes.

3. The impeller shall be of the enclosed double suction type made of bronze ASTM B584-875 non-overloading in operating characteristics utilizing the motor service factor, statically or dynamically balanced. The impeller shall be keyed to the shaft and positioned axially by the shaft sleeves, which are, in turn, locked in place by shaft nuts.

4. The shaft shall be made of SAE-1045 Steel or better, and of ample size to operate under load with a minimum of deflection. Shaft shall not be threaded anywhere inside the pump casing.

5. The shaft sleeve shall be made of bronze ASTM B584-932 and shall be locked in place by threaded, bronze shaft sleeve nuts. An “O”-ring shall be furnished under the sleeve to prevent leakage.

6. Stuffing box housing/Bearing brackets shall be made of cast iron ASTM A48 Class 25A or Class 30A separate from the casing. Stuffing boxes shall not be split, but machined of one concentric piece to ease sealing. Stuffing box/bearing brackets will be drilled and tapped for drain connection. The stuffing box shall consist of graphited acrylic yarn packing, and a split type gland to permit removal and access to packing. Ample space shall be provided for re-packing the stuffing box.

7. Piping, valve and seal cages (if necessary) can be supplied to provide packing lubrication and shall be mounted on the upper half of the casing. Flush from an external source shall also be possible for lubrication and/or cooling.

8. Casing rings shall be made of bronze ASTM B584-932 and shall be installed with an anti-rotation device and designed to restrict leakage across the ring fit.

9. Bearings shall be grease lubricated ball type, single row inboard, double row outboard, selected to carry radial and thrust loads. The outboard bearing shall be retained by a bearing locknut and lockwasher. (Snap rings are not acceptable). The bearings, (inboard and outboard) shall be replaceable without opening the pump casing.

10. Bearing housings are made of cast iron ASTM A48 Class 25A or Class 30A, bolted to the ends of the bearing bracket/stuffing box and shall be male-female fitted for a full 360 degrees to assure positive alignment. The housings shall provide a fit for the inboard bearing that allows freedom for thermal expansion while the outboard bearing shall be clamped in place to take all thrust loads and keep the rotating element in its proper axial location. Openings for adding new grease and draining old grease shall be provided.

11. Baseplate shall be steel with or without drip pan, sufficiently rigid to support the pump and the driver. Final alignment of pump and driver shall be made after grouting and installation, and shall be approved by customer prior to operation.

12. Coupling shall be of the manufacturer's choice and of the flexible type. Coupling hubs shall be secured to the driver and driven shafts by a set screw located over the key.

13. Coupling guard shall be the can type, all metal guard rated per ANSI B15-1, Section 8 and OSHA 1910-219 compliant.

14. The driver shall be mounted with the pump on a baseplate at the pump manufacturer's plant and shipped as one unit.

15. Pump rotation shall be clockwise or counterclockwise when viewed from the driver.

16. Nameplates and other data plates shall be all corrosion resistant and suitably secured to the pump.

17. Pump manufacturer shall be ISO9001 certified.

2.02 Accessories

A. The 6x5x17 SSC Horizontal Splitcase Fire Pump shall be furnished with the following fittings as standard:

1. ¾" pilot operated casing relief valve (250 GPM through 2500 GPM)
2. ¾" automatic air release valve
3. 4" dial, liquid filled suction and discharge gauges

B. Other fittings and accessories will include the following:

1. Eccentric suction reducer (if required)
2. Concentric discharge increaser (if required)
3. 6” flush mount test header assembly with four (4) 2 ½” Hose Valves, finish to be polished chrome
4. 6” low suction control valve

2.03 Fire Pump Controller

A. Manufacturer
The electric fire pump controller and automatic power transfer switch will be manufactured by Firetrol and supplied by Vulcan Fire Systems, Inc. The electric fire pump controller will have a ViZi Touch operator interface. The fire pump controller shall be rated for 460v, 3 Phase, 60 Hz operation.

B. Listing and Approval
The electric fire pump controller and automatic power transfer switch shall meet the latest NFPA 20 requirements, be listed with UL (in accordance with UL218, UL1008 and CSA C22.2 No. 14 Industrial Control Equipment). approved by FM Global (in accordance with approvals Class 1321/1323).

C. Starting Method
The electric fire pump controller and automatic power transfer switch shall be a full-service combined manual and automatic type suitable for reduced voltage solid state starting of the electric fire pump motor.

D. Short Circuit Withstand Rating
The short circuit withstand rating of the electric fire pump controller and automatic power transfer switch shall be 100 kA RMS at 200V - 480V or 50 kA RMS at 600V.

E. Enclosure
The standard enclosure shall be NEMA type 2 (IP31). The enclosure shall incorporate a bottom entry gland plate for normal and alternate power and/or motor lead entrance. The gland plate shall be field removable and meet the same NEMA rating of the enclosure. Lifting lugs shall be provided.

F. Power Circuit Components
The electric fire pump controller and automatic power transfer switch shall be supplied with an across the line electric motor starter and the following power components for both the normal and alternate (emergency) power supply:
1. Voltage surge arrestor for normal
2. Motor rated combination isolating switch and circuit breaker assembly. Both the isolating switch and circuit breaker shall be rated not less than 115% of the motor full load current.
3. The circuit breaker overcurrent sensing shall be non-thermal type, magnetic only.
4. Locked rotor protector set to automatically trip the circuit breaker within 8 to 20 seconds at 600% of full load current. The locked rotor protector shall be factory calibrated, set and tested.
5. An automatic power transfer switch mechanically held and electrically operated. Manual operation of the transfer switch shall be provided by means of manual operating handle.

G. Operational Components
The electric fire pump controller and automatic power transfer switch shall be supplied with the following externally flange mounted components approved to match the NEMA rating of the enclosure:

1. Common operating handle for the isolating switch and the circuit breaker assembly for normal power
2. Common operating handle for the isolating switch and circuit breaker assembly for alternate (emergency) power
3. Mechanically interlocked with the enclosure door to prohibit access to the interior in the “ON” position
4. One “Emergency Start” and run handle mechanism, latchable in the “ON” position

H. Touch Screen Operator Interface

The electric fire pump controller and automatic power transfer switch shall be supplied with a 4.2” LCD color touch screen (HMI technology) operator interface powered by an embedded microcomputer with software PLC logic. The operator interface’s touch screen shall allow navigation through the various operating screens. The following keypad type pushbuttons shall be provided:

1. Start
2. Stop
3. Run Test
4. Navigation
5. Help
6. Home
7. Alarm(s)
8. Settings/Configuration
9. History/Statistics

The touch screen operator interface shall graphically display:

1. Normal and alternate (emergency) power voltage and amperage readings of all three (3) phases, simultaneously and independently displayed with true RMS technology
2. Transfer switch status
3. Motor starting transition
4. Motor stopped/running
5. Type of starting cause
6. Actuation mode
7. Type of controller
8. Method of shutdown
9. Time and date
10. Pump room temperature (*F or *C)
11. System pressure in five (5) different user selectable units of measure
    a. PSI
    b. kPA
    c. Bar
    d. Feet of Head
    e. Meter of Water

The touch screen operator interface shall allow for the program and display of:

1. Cut-in and Cut-out pressure settings
2. Minimum run period timer
3. Sequential start timer
4. Periodic test timer

The user shall be able to select the language of operation on-site

Contextual HELP screens shall be accessible to the user while navigating through the operator interface

I. Condition and Alarm Visual Indicators

The touch screen operator interface shall visually indicate alarms and differentiate the criticalness by color code:

1. Normal and alternate (emergency) power phase reversal
2. Normal and alternate (emergency) power phase loss
3. Locked rotor
4. Fail to start
5. Transfer switch trouble
6. Normal and alternate (emergency) power loss
7. Service required
8. Undercurrent
9. Overcurrent
10. Under voltage
11. Over voltage
12. Phase unbalance
13. Periodic test cut-in not reached
14. Periodic test solenoid valve check
15. Faulty pressure transducer
16. Low water level
17. Low system (discharge) pressure
18. Pump on demand
19. Over pressure
20. Under pressure
21. Alternate (emergency) power isolating switch “OFF”
22. Alternate (emergency) power circuit breaker open
23. Low pump room temperature

J. Pressure and Event Recording

The fire pump controller’s touch screen operator interface shall be capable of logging pressure data and operational events with time and date stamp. It shall be able to display the last 500 operational events and display the pressure data in text and/or graphic form. Under regular maintained operation, pressure data and operational events can be stored in memory for up to 5 years. The data shall also be retrievable and downloadable to a flash memory disk via the USB port accessible to the user without having to open the controller door. General system information, events and alarms include the following:

1. Last service statistics
    a. Powered since
    b. On time
    c. Motor last run
    d. Motor run time
    e. Motor start count
    f. Minimum, maximum, average system PSI
    g. Minimum, maximum, average pump room temperature
    h. Generator last run
    i. Generator run time
    j. Transfer switch transfer count
2. All time statistics
    a. First power up
    b. First start up
    c. On time
3. Power statistics
    a. Voltage between phases with date stamp
    b. Amperage between phases with date stamp

K. Wetted Parts (Pressure Transducers)
The electric fire pump controller and automatic power transfer switch shall be supplied with two (2) pressure transducers and run test solenoid valve assembly. The pressure sensing line connection to the pressure transducer shall be ½" FNPT. The second pressure transducer is provided as a backup to the primary setup. This assembly shall be rated 500psi (calibrated at 0-300psi) working pressure and be externally mounted with a protective cover. The electric fire pump controller's operator touch screen programming shall be designed to switch pressure transducers in the event of a primary failure.

L. Service/Flow Testing Capabilities
The electric fire pump controller's touch screen operator interface shall have the capability of scheduling maintenance reminders. It shall also have the capability of inputting pump flow test data, generate and display the pump curve and store this information in memory for the lifetime of the controller.

M. Connection for External Devices
The electric fire pump controller and automatic power transfer switch shall provide terminals for the connection for the following external devices:
1. Manual remote start device
2. Automatic remote start device
3. Deluge valve start
4. Generator start signal
5. System shall integrate into the Building Management System (BACnet)

N. Alarm Contacts for Remote Indication
SPDT dry alarm contacts rated for 8A – 250VAC for remote indication shall be provided for the following conditions:
1. Power or phase failure and/or circuit breaker in open position
2. Phase reversal
3. Pump run (2x)
4. Common pump room alarm (field re-assignable)
5. Common motor trouble (field re-assignable)
6. Emergency power isolating switch in the "OFF" position
7. Transfer switch in normal position
8. Transfer switch in emergency position
9. Field programmable

Removable alarm contact terminals shall be provided.

O. Audible Alarm
A 4" alarm bell rated for 85dB at 10ft (3m) shall sound during boot up and internal communication error.

2.04 Jockey Pump

A. The contractor shall install a vertical inline, multiple stage jockey pump manufactured by Grundfos and supplied by Vulcan Fire Systems. The jockey pump will be installed in accordance with NFPA 20.

B. The jockey pump shall be rated at 10% of the flow (GPM) and 15 PSI greater than the differential pressure of the main fire pump. The jockey pump shall be rated for 460v, 3 Phase, 60 Hz operation.

2.05 Jockey Pump Controller

A. Manufacturer

The jockey pump controller shall be manufactured by Firetrol and supplied by Vulcan Fire Systems. The jockey pump controller shall be rated for 460v, 3 Phase, 60 Hz.

B. Approval and Listings

The jockey pump controller shall meet the requirements of UL508A and CSA.

C. Enclosure Rating

The standard enclosure shall be NEMA 2

D. Operational Components

The jockey pump controller shall be supplied with the following door mounted components approved to match the NEMA rating of the enclosure:

1. One main disconnect switch complete with door interlock and padlock provision in the “OFF” position
2. One Hand-Off-Auto rotary type selector switch

The following control components shall be mounted inside the controller:

1. One magnetic across-the-line motor contactor rated for the jockey pump motor horsepower
2. One thermo magnetic motor protector complete with short circuit and motor overload protection

E. Microprocessor Logic

The jockey pump controller shall be supplied with a microprocessor to perform the automatic sequence of operation. The microprocessor shall be mounted inside the jockey pump controller and have a high luminosity LED digital display which shall display the following:

1. System Pressure
2. Cut-in pressure setting
3. Cut-out pressure setting
4. Minimum run period timer
5. Delay start timer

The system pressure indication shall be continuously displayed. The microprocessor shall allow the system pressure, cut-out and cut-in settings to be displayed in either PSI, Bar, kPa, meter of head, or feet of head.

F. Pressure Sensing Device
The jockey pump controller shall be supplied with a 316 stainless steel pressure transducer rated for fresh water operational between 0 and 300psi. The pressure transducer shall be used to display the pressure in the sprinkler system and also control the automatic start circuit. The pressure transducer shall be installed inside the controller directly mounted to a bulkhead allowing for an external connection to the sprinkler system sensing line

3.00 PART 3 - EXECUTION

3.01 Coordination

A. Coordinate installations with other contractors, specifically Division 26 and 28, to insure that a complete, operable system meeting the intent of these specifications and the plans that are provided.

B. Coordinate voltage on fire pumps, fire pump controllers, jockey pumps, and jockey pump controllers with electrical drawings.

3.02 Installation

A. Installations to be done by a licensed sprinkler contractor in the Commonwealth of Kentucky

B. Provide and install fire pump systems in accordance with NFPA 20 2010 edition, NFPA 25, these specifications, and as shown on the contract drawings

C. Prior to start-up, test all piping connections to insure that they are adequate

D. Prepare and test pumps to assure that it meets capacity as specified in these specifications. A factory representative shall be made available, on the project site, to check installation, provide flow acceptance testing, start-up, and demonstrate to the owner's representative(s) the proper operation and maintenance of each fire pump system.

3.03 Startup

A. Major equipment and system startup and operational tests shall be scheduled and documented in accordance with Commissioning section.

3.04 Functional Performance Tests

A. Major equipment and system startup and operational tests shall be scheduled and documented in accordance with Commissioning.

3.05 Owner Training

A. Provide training to the owner by a factory representative. Training shall be a minimum of eight (8) hours on site and the engineer shall be notified one (1) week in advance of the training. Training shall only occur when the systems are complete and 100% functional. All training shall be video taped.

END OF SECTION 210200

SECTION 220100 - PLUMBING SPECIALTIES

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work specified in this section.

   B. The Contractor shall provide all equipment and specialties complete with trim required and connect in a manner conforming to the State Building Code.

   C. The Contractor shall obtain exact centerline rough-in dimensions between partitions, walls, etc. as required for lay-out of his rough-in work. All work shall be roughed-in so that all exposed piping will be straight and true without bends or offsets.

   D. Prior to final inspection, test by operation at least twice, all equipment.

   E. Prior to final inspection, remove all stick-on labels, dirt, grease, other removable stampings, lettering, etc. from equipment and specialties and thoroughly clean same.

   F. All equipment and specialties shall be installed as recommended by the manufacturer in a neat and workmanlike manner. Unacceptable workmanship shall be removed and replaced at the installing Contractor's cost.

   G. All pipes, valves, fittings, fixtures, etc. for use in potable water systems 2” and below shall comply with federal lead-free requirements that the lead content of wetted surfaces cannot exceed 0.25% by weight.

2. DRAINAGE SPECIALTIES

   A. GENERAL

      (1) Provide all drainage specialties indicated, specified and/or required to provide complete and acceptable removal of all storm, sanitary, waste, laboratory waste, etc. from the building and into approved receptors.

      (2) Drainage specialties shall be on non-electrolytic conduction to the material to which they are connected.

      (3) Drainage specialties shall be installed in a manner so as to ensure no leakage of toxic or odorous gases or liquids and shall have traps and/or backflow preventers where required. Nor shall they allow backflow into other or existing systems.

   B. CLEANOUTS - INTERIOR (CO)

      (1) In addition to cleanouts indicated, provide cleanouts in soil and waste piping and storm drainage at the following minimum locations:

         a. At base of each stack.
         b. At fifty (50) foot maximum intervals in horizontal lines.
         c. At each change of direction of a horizontal line.

d. As required by current KBC.
e. As required to permit rodding of entire system. (If in doubt, contact Engineers.)

(2) Water closets, slop sinks and other fixtures with fixed traps shall not be accepted as cleanouts.

(3) Cleanouts and/or test tees concealed in inaccessible pipe spaces, walls and other locations shall have an eight (8) inch by eight (8) inch (minimum) access panel or cover plates shall be set flush with finished floors and walls and shall be key or screw driver operable.

(4) Access panels for cleanouts shall be of the Zurn, 1460 series or equivalent by Josam or Watts. They may, at the Contractor's option, be Perma-Coated steel, prepared to receive finish. The Contractor shall coordinate the finish of all access panels installed in finished areas with Architect.

(5) Cleanouts and access panels shall be sized so as to permit the entry of a full sized rodding head capable of one hundred percent circumferential coverage of the line served.

(6) Provide a non-hardening mixture of graphite and grease on threads of all screwed cleanouts during installation.

(7) Do not install cleanouts against walls, partitions, etc. where rodding will be difficult or impossible. Extend past the obstruction.

(8) In finished walls, floors, etc., ensure that cleanouts are installed flush with finished surfaces and, where required, grout or otherwise finish in a neat and workmanlike manner.

(9) Cleanouts shall be as manufactured by Zurn, Josam, Jay R. Smith, Watts, MIFAB, Ancon or equivalent, similar to the following:

a. Zurn, Z-1440 cleanouts or Z-1445 cleanout tee at base of exposed stack and at change in direction of exposed lines.

b. Zurn, Z-1440 cleanout or Z-1445-1 cleanout tee where stacks are concealed in finished walls

c. Zurn, ZN-1400-T cleanout with square scoriated top in finished concrete and masonry tile floors.

d. Zurn, ZN-1400-Tx cleanout with square recessed top for tile in vinyl and linoleum finished floors.

e. Zurn, ZN-1400-Z cleanout with round recessed top for terrazzo floors.

f. Zurn, Z-1400-HD cleanout with tractor cover for exterior locations. Provide concrete supporting pad crowned to shed water. Refer to drawings for pad size.

g. Mueller, No. D-731 or D-714, Nibco, Flage or equivalent for cleanouts in copper waste with cover plates and/or access panels listed for other cleanouts.

h. Threaded hex head type cleanouts of same materials as pipe for piping 2" and smaller.

i. Zurn, cleanout with round top with adjustable retainer for carpet area. Install flush with carpet.

C. FLOOR DRAINS

(1) Provide floor drains at locations indicated and/or as required by State Building Code. Install in a neat and workmanlike manner. Coordinate locations with appropriate persons or party to ensure floor pitch to drain where required.

(2) Install floor drains in strict accordance with manufacturer's recommendations and the State Plumbing Code unless otherwise indicated.

(3) Each floor drain located on floors above the lowest floor shall be provided complete with a three (3) foot by three (3) foot, four (4) pound sheet lead flashing and clamping collar or chlorinated polyethylene shower pan liner of 30 mil. Lead pans shall be given a heavy coat of asphaltum on bottom and sides before installation and a heavy coat on exposed surfaces (if any). After installation, provide one ply of fifteen (15) pound roofing felt beneath each pan.

(4) Ensure by coordination with the appropriate persons or party that spaces served by a floor drain(s) has a water seal extending at least three (3) inches from the floor of the space served on all floors above the lowest level.

(5) The floor drains shall be Zurn, Josam, Watts, Jay R. Smith, MIFAB, Sioux Chief or equivalent.

D. TRAP PRIMERS

(1) Provide trap primers for all floor drains and open receptacle. Acceptable Trap Primer Manufacturers included Zurn, Precision Plumbing Products and Sioux Chief.

(2) For trap primers, any unused openings shall be capped.

(3) Provide an isolation valve for all trap primers.

E. CLEANOUTS (EXTERIOR) (ECO)

Provide exterior cleanouts at each location indicated and, in the manner, indicated. Permanently set all exterior cleanouts centered in a 30" X 30" X 6" deep concrete pad. The top of the concrete pad shall be flush with finished grade. The top of the cleanout box shall be flush with the top of the pad and shall be stamped "CO."

F. ROOF DRAINS

(1) Coordinate location of primary and secondary roof drains with Architectural roof plans.

(2) Each drain shall be provided complete with a three (3) foot by three (3) foot, four (4) pound sheet lead flashing and clamping collar. Roof drains shall be installed in strict accordance with the drain manufacturers and roofing manufacturer’s instructions. Provide all accessories required for a complete installation.

3. WATER SUPPLY SPECIALTIES

A. GENERAL

(1) Provide all water supply specialties indicated, specified and/or required for the complete installation. Install in a neat and workmanlike manner in accordance with the manufacturer's recommendations and the State Plumbing Code.

(2) Where required by the State Plumbing Code, install code approved vacuum breakers in each water supply specialty.

B. FREEZEPROOF WALL HYDRANTS (FPWH)

(1) Provide code approved wall hydrants at each location indicated in a neat and workmanlike manner. Affix tight to walls and ensure that the feed piping is on the heated side of the building insulation blanket.

(2) Where hydrants are of handwheel type, remove handwheels and turn over to owners in an envelope labeled "Wall Hydrants" exterior upon completion of the project.

(3) Where hydrants have key operators, turn over at least two (2) keys in an envelope labeled "Wall Hydrants" to owners upon completion of the project.

(4) Where hydrants have lockable boxes, turn over at least two (2) keys in an envelope labeled "Wall Hydrants, Exterior" to owners upon completion of project.

(5) Mount all wall hydrants at least twenty (20) inches above finished exterior grade. Where this is not possible or practical, contact Engineers.

(6) Wall hydrants shall be as follows or equivalent:

a. Zurn 1300 or equivalent, 3/4", encased, flush, non-freeze wall hydrant with key lock and combination backflow preventer/vacuum breaker.

C. HOSE BIBBS (HB)

(1) Provide code approved hose bibbs with vacuum breakers and male threaded spouts at each location indicated and as follows:

(2) Do not install hose bibbs spaces which do not have existing planned or installed floor drains even if sill cocks are indicated for these areas.

(3) Hose bibbs shall be mounted at eighteen (18) inches above finished floor served.

(4) The hose bibb shall be Zurn or equivalent similar to the following:

a. Zurn Z1350-VB Model. Encased moderate climate wall hydrant for narrow wall installation. Complete with bronze body, all bronze interior parts, replaceable seat washer, screwdriver operated stop valve in supply, key operated control valve, and ¾ [19] IP female inlet and ¾ [19] male hose connection standard. Adjustable stainless-steel box furnished with hinged cover, cylinder lock and “WATER” stamped on cover. Provide with 3/4 adapter vacuum breaker.

D. BOILER DRAINS (BD)

Install 3/4-inch bronze body boiler drains, similar and equivalent to Nibco, No. 72 or 73, as indicated and at the following locations:

(1) At the low point of the plumbing system.

(2) On boiler low point.

(3) In each hot water heater and/or storage tank.

(4) At the low point of each hydronic system.

(5) On the water refrigeration machine (100 percent drainage).

(6) On each water storage tank.

(7) At each pump suction.

(8) At the low point of each isolatable section of any system carrying water.

NOTE: Install a code approved vacuum breaker where installation on to domestic water system.

E. WATER HAMMER ARRESTORS (WHA): Provide water hammer arrestors at each location indicated and/or as required to eliminate hydrostatic on the domestic water system. Provide at least one water hammer arrestor at all quick acting valve locations including:

Automatic Clothes Washers – Type “A”
Commercial Dishwashers – Type “B”
Sterilizers – Type “B”
Mop Basins (downstream of check valve) – Type “A”
Flush valve fixtures - Type “B” (Each toilet room with 1-3 flush valve fixtures shall have its own Type “B” water hammer arrestor.)

(1) Multiple Fixtures – Branch Line Less Than 20’ Long: The preferred location for a WHA is at the end of the branch line between the last two fixtures when the branch lines do not exceed 20’ in length, from the start of the horizontal branch line to the last fixture supply on this line.

(2) Multiple Fixtures – Branch Line More Than 20’ Long: On branch lines over 20’ in length, use two WHA’s whose capacities total the requirement of the branch. Locate one unit between the last and next to last fixture and the other unit approximately midway between the fixtures.

(3) Water hammer arrestors shall be PPP SC Series or equivalent. Water hammer arrestors shall be stainless steel, bellows type. Field fabricated capped cylinders shall not be acceptable.

(4) Note: Provide insulation unions where arrestors are of dissimilar material from the piping served.

MARK	MANUFACTURER & MODEL	SIZE	P.D.I. SIZE
TYPE "A"	PPP SC-500	1-11	A
TYPE "B"	PPP SC-750	12-32	B
TYPE "C"	PPP SC-1000	33-60	C
TYPE "D"	PPP SC-1250	61-113	D

F. PRESSURE REDUCING VALVES (PRV)

Install at each location indicated and/or as required to reduce domestic building water service to a maximum of eighty (80) PSIG code approved pressure reducing stations with by-pass. Install in a manner indicated or as required. Provide unions and stops for removal of station. PRV shall be adjustable from thirty (30) percent above or below reduced pressure. Where this cannot be attained with single stage, provide multi-staged reduction.

G. REDUCED PRESSURE BACKFLOW PREVENTERS (RPBP)

Watts #909 or equivalent reduced pressure backflow preventer. Provide with gate valves for isolation, FDA food grade strainer and air gap fitting. RPBP shall be UL listed.

H. DOUBLE CHECK VALVE ASSEMBLY

Watts #709, Watts #757, or equivalent double check valve assembly. Provide with FDA approved food grade strainer and gate valves for isolation. Assembly shall be UL listed.

4. GENERAL SPECIALTIES

A. VACUUM BREAKERS AND BACK FLOW PREVENTERS

Where required by the State Plumbing Code whether indicated or not, provide approved vacuum breakers or backflow preventers at the following locations.

(1) Where domestic water system connects to fire protection system.

(2) Where domestic water system connects to hydronic system.

(3) At any hose (threaded) tap on the domestic water system.

B. ROOF FLASHINGS

All plumbing vents or other plumbing passing thru the roof shall be flashed as approved by the State Plumbing Code and as recommended by the roofing manufacturer and/or Contractor.

C. GAS PRESSURE REGULATORS

Provide gas pressure regulators for all gas fired equipment. Regulators shall be installed in accordance with the requirements of NFPA 54 and/or International Fuel Gas Code, whichever is more stringent.

END OF SECTION 220100

SECTION 220200 - PLUMBING FIXTURES, FITTINGS AND TRIM

1. GENERAL

A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. The Contractor shall provide all fixtures complete with trim required and connect in a manner conforming to the State Plumbing Code.

C. The Contractor shall obtain exact centerline rough-in dimensions between partitions, walls, etc. as required for lay-out of his rough-in work. All work shall be roughed-in so that all exposed piping will be straight and true without bends or offsets.

D. All exposed piping or in casework below sinks, stops, traps, tailpieces, etc., shall be code approved chrome plated brass unless otherwise indicated or specified. Water supplies shall connect through walls with stops and chrome plated escutcheons with set screws.

E. All fittings, fixtures and trim shall be new unless otherwise indicated or specified. They shall also be of equivalent quality, dimensions, material, etc. as those specified. All faucets, shower heads, drains, levers, trim, etc. shall be constructed of metal and not plastic.

F. Handicapped fixtures shall be mounted as recommended by the State Building Code and ADA.

G. All fixtures shall be mounted as recommended by the manufacturer. Fixtures shall be rigidly mounted to walls and floors. Pay particular attention to flush valves and bracket concealed portion to building structure during rough-in. Loose, shaky flush valves, lavatories, etc. shall not be acceptable.

H. Prior to final inspection open all faucets and allow to run for fifteen (15) minutes, then remove all faucet aerators and thoroughly clean until smooth flow is obtained.

I. Prior to final inspection, test by operation at least twice:

(1) (Where applicable) adequate flow of hot and/or cold water at;

a. Shower Heads
b. All Faucets
c. Flush Valves and Tanks
d. Tub Drains
e. Hose Bibbs
f. Sill Cocks
g. All Other Valved Hot and/or Cold-Water Openings in the Plumbing System

(2) All toilet seats

J. Prior to final inspection, remove all stick-on labels, dirt, grease, other removable stampings, lettering, etc. from plumbing fixtures and thoroughly clean same.

K. All sink and lavatory traps shall have screw in plugs in the bottom for ease of cleaning and have mechanical fittings for ease of removal.

L. All fixtures shall be set level and true and shall be grouted into finished walls, floors, etc. in a neat and workmanlike manner with an approved waterproof non-yellowing grout for such service.

M. Special Note for Handicap Grab Rails: Coordinate top of shower valves, flush valves, flush tank, etc., with location of grab rails as shown on the architectural plans. The Contractor shall install all items to allow for installation, removal and service without removal of the grab bar.

N. All exposed drain pipes and domestic water piping under handicap accessible sinks and lavatories shall be insulated in accordance with ADA requirements and shall have a vinyl plastic covering over all insulation.

O. The Contractor shall obtain a copy of the casework shop drawings and confirm sinks, faucets, gas turrets, etc., will fit in the space provided. Additionally, in ADA applications with handicap sink base cabinets, the Contractor shall limit the total distance from the bottom of the sink to the bottom of the P-trap and coordinate waste pipe rough-in height to ensure the proper installation of the handicap sink base cabinet front closure panel. The Contractor shall not order sinks until he confirms no conflicts occur and shall adjust sink sizes if required. If the Contractor orders sinks, faucets, etc., that do not fit in the casework supplied, he shall replace them at no additional cost.

P. All lavatories, sinks, etc. shall be supplied with center rear drain outlets where necessary to avoid conflict with casework, handicapped kneeboards, etc. If the Contractor orders sinks that do not fit in the casework supplied, he shall replace them at no additional cost.

Q. All single supply faucets shall be provided with mechanical mixing valves unless otherwise noted. Mechanical mixing valves shall have hot and cold-water inlet connections, common outlet, in-line check valves, and adjustable temperature setting. Mixing valves shall be Moen model 104424 or equal. Provide one mixing valve per single supply faucet unless otherwise noted. Contractor shall provide all required connections and set mixing valve to required temperature.

R. All gooseneck faucets shall have rigid spouts, unless swing spouts are specified. If swing spouts are specified, the spout shall have a maximum swing of 140 degrees from side to side.

S. All plumbing fixtures shall comply with federal lead-free requirements that the lead content of wetted surfaces cannot exceed 0.25% by weight.

T. All water closet handles on ADA water closets shall be located on the approach side of the fixture.

2. FIXTURES AND TRIM

Available Manufacturers: Subject to compliance with requirements of manufacturers offering plumbing fixtures and trim. Plumbing fixtures and trim, which may be incorporated in the work include, but are not limited to, the following:

A. Plumbing Fixtures - Water Closet, Lavatory, Urinal, Bathtubs, Clinical Sink and Scrub Sink

American Standard, U.S. Plumbing Products
Eljer Plumbingware Div., Wallace-Murray Corp.
Kohler Co.
Crane Plumbing
Universal-Rundle
Toto
Zurn Co.
Sloan Fixtures

B. Plumbing Trim

American Standard, U.S. Plumbing Products
Chicago Faucet Co.
Kohler Co.
Delta Co.
T&S Brass & Bronze Work Co. (Commercial)
Zurn Co.
Just Co.
Speakman Co.
Moen Commercial

C. Flush Valves

Sloan Valve Co.
Zurn Co.
Approved equal; provide substitution information request to Engineer min. 10 days before bid date.

D. Fixture Seats

Bemis Mfg. Co.
Church Seat Co.
Olsonite Corp., Olsonite Seats

E. Water Coolers

Elkay Mfg. Co.
Halsey Taylor Div., King-Sealey Thermos Co.
Haws Drinking Faucet Co.
Western Drinking Fountains, Div. of Sunroc Corp.
Oasis Co.
Acorn AQUA

* Acceptable wall hung water coolers shall be equal to Oasis P8AM, Elkay EZS8 or Halsey Taylor HAC8FS. All other wall hung water coolers shall be subject to review of the Engineer.

F. Service Sinks and Mop Basins

American Standard, U.S. Plumbing Products
Eljer Plumbingware Div., Wallace-Murray Corp.
Fiat Products
Kohler Co.
Stern-Williams Co., Inc.
Florestone

G. Stainless Steel Sink

Elkay Mfg. Co.
Just Mfg. Co.
Moen, Div. of Stanadyne/Western
Sterling Co.

H. Fixture Carriers

Josam Mfg. Co.
Jay R. Smith
Tyler Pipe
Zurn Industries
Watts

I. Shower

Bradley Co.
Zurn Co.
Symmons Industries, Inc.
Chicago Faucets
Speakman Company
Powers
Acorn Co.
Moen Commercial

J. Shower Stalls

Clarion
Universal-Rundle
Aqua Bath
Aquarius
Aqua Glass
Acryline
Lasco Bathware

K. Washer/Dryer Connection Box

Guy Gray Co.
Wolverine Brass, Inc.

L. Emergency Fixtures - Eyewash, Showers

Bradley Co.
Speakman Co.
Guardian Co.

M. P-Trap Insulation Kit (Trap Wrap)

Truebro
Brocar
Plumberex

Note: Kitchen, Lab, Science Room Fixtures, Special Equipment, Etc.

Contractor to provide final plumbing connections to all of the equipment furnished by Owner including, but not limited to: chrome supplies, stops, continuous drains, drain tailpiece, Code compliant "P" traps and escutcheons.

3. FIXTURE SELECTION

A. Refer to drawings for fixture schedule.

END OF SECTION 220200

SECTION 220300 - PLUMBING EQUIPMENT

1. GENERAL

   A. All plumbing equipment shall comply with the latest provisions of KBC.

   B. Provide magnesium anodes for water heaters and storage tanks.

2. WATER HEATER

   A. Patterson Kelly or equivalent gas water heater; copper sheathed tin coated elements (75 watt/sq. in. maximum density); glass lined tank; foam insulation; magnesium anode rod; automatic over-heat control; enameled steel jacket; thermostat; 120/1/60; with ASME temperature and pressure relief valve; set temperature at 105°F. Refer to schedules on drawings for selections.

3. EXPANSION TANK (DOMESTIC WATER)

   A. Amtrol Therm-X-Trol expansion tank, pre-charged air chamber, stainless steel connection and heavy-duty butyl diaphragm. Refer to drawing's schedules for model number and tank size.

4. SUMP PUMPS

   A. ELEVATOR SUMP PUMPS (SP-1 & SP-2)

      (1) Weil, Zoeller, or approved equivalent submersible sump pump. Furnish with mercury switch level control. Provide with light duty iron grate to cover sump pit opening, completely. Refer to Schedule on drawings of selections.

   B. DUPLEX DEWATERING SUMP PUMP SYSTEM (SP-3)

      1. Two (2) Zoeller Model 6294; 480V volt 3 phase pump with 2" vertical discharge, 1.5 hp oil filled motor (4.8 FLA per pump), cast iron semi-open impeller, stainless steel shaft with tandem mechanical seals, thermal and seal fail sensors, powder coated epoxy cast iron housing, 25 foot power cord;

      2. Two (2) 2" guide rail assemblies consisting of base elbow, quick disconnect slide assemblies, and upper bracket. Sch. 40 stainless steel rail pipes,

      3. One (1) UL Listed 480-volt 3 phase duplex control panel with an electro-mechanical pump alternator, H-O-A toggle switches and run indicator lights for each pump, motor protector each pump three phase, high water alarm with light, horn and silence switch, control circuit transformer and breaker, and dry alarm contacts, all housed in a Nema 4X enclosure. Building management integration included.

      4. Includes three (3) 25' weighted, normally open mechanical float switches.

      5. One (1) 48" x 96" prefabricated fiberglass basin including anti-flotation flange, ¼" gas tight aluminum cover including a bolt down, gas tight access hatch, two (2) 2" discharge flanges, one (1) 3" vent flange, one (1) 10" inspection panel including 3 float cord grips for suspension of float switches; all internal discharge piping (2" Sch. 80 PVC), valves, fittings, guide rail assemblies, etc. are factory installed and one (1) 4" hub shipped loose for field installation of inlet.

      6. Start-up by factory representative once installation is complete.

5. RECIRCULATING DOMESTIC HOT WATER PUMPS

A. Thrush, Armstrong, Bell and Gossett or approved equivalent all bronze in-line centrifugal circulating pump with mechanical seals, drip proof motor and all required overloads, starters and disconnects. Refer to schedules on drawings for selections.

END OF SECTION 220300

SECTION 220400 - FUEL OIL STORAGE AND DISTRIBUTION SYSTEM

1. GENERAL

The Mechanical Contractor shall provide and install in strict compliance with all applicable codes and regulations and with manufacturer's recommendations, all components for a complete and functional Fuel Oil Storage and Distribution System as shown on the drawings or as specified herein, including, but not necessarily limited to the following:

A. Fuel oil storage tanks with all required appurtenances, connections, fill, vent, gauge sticks (1 per tank), etc.

B. All fuel oil supply, return, vent and fill piping.

C. Final connection of fuel oil supply piping to all fuel oil operated equipment: boilers, water heater and generator day tank, etc.

D. Fill all tanks and lines and perform initial equipment starts.

2. CERTIFICATIONS

The Contractor shall furnish the following notarized certifications to the Engineer upon completion of the appropriate phase of the work:

A. That the tank was surrounded with a minimum of 12" of pea gravel.

B. That an air test was performed and the installation found to be leak free.

C. That tank cover is 24" minimum.

D. That swing joints were used in the suction and return line at the tank.

E. That fuel oil lines were properly sleeved at floor, wall and foundation penetrations.

F. That the tank installation is sufficient to securely hold empty tanks in position.

3. FUEL OIL STORAGE TANKS

A. Furnish and install an underground steel storage tank with STI-P3 corrosion control system. Tank shall be in conformance with Underwriters Laboratories, Subject 58. Tank size as noted on drawings.

B. The corrosion control system shall be in strict accordance with STI-P3 specifications as applied by a licensee of Steel Tank Institute and shall have the STI-P3 limited twenty-year warranty against failure due to exterior corrosion. Tank shall bear UL and STI-P3 labels.

C. The tank excavation shall be free from material that may cause damage to the tank coating. Care shall be taken during installation that foreign matter is not introduced into the excavation or backfill.

D. The tanks shall be mounted on a concrete pad as shown on the drawings. That tank must not be placed directly on the pad. A layer of pea gravel, at least 12 inches deep, must be spread evenly over the dimensions of the pad to separate the tank from the pad.

E. Before placing the tank in the excavation, all dirt clods and similar foreign matter shall be cleaned from the tank, and areas of coating damages shall be repaired with a compatible coating.

F. Equipment to lift the tank shall be of adequate size to lift and lower the tank without dragging and dropping to ensure no damage to the tank or the coating. Tanks shall be carefully lifted and lowered by use of cables or chains of adequate length (not less than 45 degrees included angle) attached to the lifting lugs provided. A spreader bar should be used where necessary. Under no circumstances use chains or slings around the tank shell.

G. After the STI-P3 tank has been placed in the excavation, the anode lead wire attachment to the tank shall be checked to assure this connection has not been damaged. Where damaged, the connection must be re-established in strict accordance with STI-P3 specifications.

H. Hold Down Straps: Special care should be exercised when installing hold down straps to ensure that the straps are separated from the tanks by separating pad made of an inert insulating dielectric material. The separating pad should be at least 2 inches wider than hold down straps' width and must be carefully placed anywhere on the tank where hold down traps would come into direct contact with the tank shell.

I. Backfill consisting of pea gravel shall be placed along bottom sides of tank by shoveling and tamping to ensure the tank is fully and evenly supported around bottom quadrant. The backfill shall be deposited carefully around tank and to a depth over tank to avoid damage to coating.

J. The plugs at unused tank openings shall be removed, a pipe compound shall be added and the plugs shall be reinstalled in the unused openings. The dielectric bushings or flange isolation devices in STI-P3 tanks shall not be removed from openings. The plugs in tank openings which are to be used should not be overtightened as this may cause the bushing to unscrew with the plug. Care should be taken not to cross-thread or damage the non-metallic bushings when replacing plugs or installing required tank piping.

4. PIPE AND FITTINGS
   See Piping Section.

5. FUEL OIL SPECIALTIES
   By Oil Equipment Manufacturing Corp., Ohio Pattern Works, Sunstrand or Service Welding Company.

6. INSTALLATION
   Installation of Fuel Oil Storage and Distribution System shall comply with NFPA-30 of the National Fire Protection Code. (NFPA).

END OF SECTION 220400

SECTION 220600 - MEDICAL GAS PIPING SYSTEMS

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

   B. The Contractor shall provide all equipment and specialties complete with trim required and connect in a manner conforming to the NFPA and all other applicable codes.

   C. The Contractor shall obtain exact centerline rough-in dimensions between partitions, walls, etc., as required for lay-out of his rough-in work. All work shall be roughed-in so that all exposed piping will be straight and true without bends or offsets.

   D. All equipment and specialties shall be new unless otherwise indicated or specified. They shall also be of equivalent quality, dimensions, materials, etc., as those specified.

   E. All equipment and specialties shall be installed as recommended by the manufacturer.

   F. All equipment and specialties shall be installed in a neat and workmanlike manner. Unacceptable workmanship shall be removed and replaced at the installing Contractor's cost.

   G. Refer to applicable Division 26 sections for wiring and power.

2. DESCRIPTION OF WORK

   A. Extent of medical gas piping system work is indicated on the drawings and by requirements of this section.

   B. NFPA Compliance: Comply with requirements of NFPA Standard 99 Gas and Vacuum Systems. All portions of each system shall be listed by and bear the seal of UL, Inc., where a standard has been established for such.

   C. Comply with ANSI/AWS A5.8 - Specifications for Brazing Filled Metal regarding pipe joint make-up.

   D. Central Medical Gas and Vacuum Systems: Consisting of Oxygen, Nitrous Oxide, Nitrogen, Medical Air, Vacuum and Anesthesia Evacuation Services; complete, ready for operation, including all necessary piping, fittings, valves, cabinets, station outlets and inlets, equipment connections, rough-ins, ceiling services, gauges, alarms, headwall units, including low voltage wiring, nitrogen control panels, air compressors, vacuum pumps, electric motors and starters, receivers, air dryers, filters, pressure regulators, and all necessary parts, accessories, connections and equipment. Match station outlets and inlets.

   E. Related Work

      (1) Sealing around pipe penetrations to maintain the integrity of time rated construction.

      (2) Sealing around pipe penetrations through the floor and roof to prevent moisture migration.

      (3) Piping systems identification.

(4) Exposed piping and sleeves, and water piping, controls and accessories.

(5) Surgical service multi-purpose pendant.

(6) Alarm interface with main hospital alarm panel.

(7) Conduit.

(8) Control wiring.

(9) Electrical wiring and accessories.

(10) Electric motors.

(11) Motor starters.

(12) Prefabricated bedside patient units.

F. Quality Assurance

(1) Materials and Installation: In accordance with NFPA 99, and as specified.

(2) Equipment Installer: Show technical qualification and previous experience in installing medical gas equipment on three similar projects.

(3) Equipment Supplier: Show evidence of equivalent product installed at three installations similar to this project, that has been in satisfactory and efficient operation for three years.

(4) Independent Medical Gas System Testing Organization:

a. Testing agency that is financially independent of medical gas equipment manufacturer and supplier.

b. Provide names of three projects where testing of medical gases and systems has been performed by the testing agency. Include the name of the project, names of such persons at that project who supervised the work for the project owner, and a written statement that the projects listed required work of similar scope to that set forth in this specification.

c. Submit the testing agency's detailed procedure which will be followed in the testing of this project. Include details of the testing sequences, procedures for cross connection, tests, outlet function tests, ceiling column function tests, alarm tests, purity tests, etc., as required by this specification. For purity test procedures, include data on test methods, types of equipment to be used, calibration sources and method references.

(5) Certification: Provide documentation upon completion of the testing to include all test results, the names of individuals performing work for the testing agency on this project, detailed procedures followed for all tests, and a certification that all results of tests were within limits allowed by this section.

3. DRAWINGS AND DESCRIPTIVE LITERATURE

The Contractor shall prepare and submit to the Architect and/or Engineer, seven (7) copies of shop drawings including, but not limited to, the following list:

A. Manufacturer's Literature and Data

(1) Piping.

(2) Valves.

(3) Gauges.

(4) Switches (pressure and vacuum).

(5) Air compressor systems. (Provide certified compressor test data at start-up):

a. Compressor: Manufacturer and model.

1) Characteristic performance curves.

2) Compressor operating speed (RPM).

b. Capacity: Free air delivered at indicated pressure (SCFM).

1) Type of bearing in compressor.

2) Type of lubrication.

3) Type and adjustment of drive.

c. Electric Motors: Manufacturer, frame and type.

1) Speed of motors (RPM).

2) Current characteristics and horsepower of motors.

3) Receiver capacity and rating.

4) Control panel operational characteristics and wiring diagram.

d. Air Silencer: Manufacturer, type and model.

e. Air Filters: Manufacturer, type, model and capacity.

f. Pressure Regulators: Manufacturer and capacity.

g. Dew Point Monitors: Manufacturer, type and model.

h. Air Dryers: Manufacturer, type, model and capacity (SCFM).

i. Alarm Controls and Panels: Manufacturer, type and accessories.

(6) Vacuum Pump Systems (Provide certified pump test data at start-up):

a. Pumps: Manufacturer and model.

1) Pump performance curves.

2) Pump operating speed (RPM).

b. Capacity: Free air exhaust from 19 and 24 inches Hg. gauge vacuum (SCFM).

c. Capacity: Expanded air capacity at 19 and 24 inches Hg. gauge vacuum (ACFM).

1) Type of bearing in pump.

2) Type of lubrication.

3) Type and adjustment of drive.

d. Electric Motors: Manufacturer, frame and type.

1) Speed of motors (RPM).

2) Current characteristics and horsepower of motors.

3) Receiver capacity and rating.

4) Control panel operational characteristics and wiring diagram.

e. Silencers: Manufacturer, type and model.

B. Applicable Publications

(1) The publications listed below form a part of this specification to the extend referenced. The publications are referenced in the test by the basic designation only.

(2) Federal Specifications (Fed. Spec.):

WW-V-35C.....Valve, Ball

(3) American National Standards Institute (ANSI):

4. MEDICAL GAS PIPING MATERIALS AND PRODUCTS

A. General

Provide piping materials and factory-fabricated piping products of sizes, types, pressure ratings, and capacities as indicated on drawings. Provide materials and products complying with the latest NFPA 99. Provide fittings of materials which match pipe materials used in medical gas piping systems including equipment connection.

(1) Piping shall be hard-drawn seamless medical gas tube, Type K or L (ASTM B819), and bear one of the following markings: OXY, MED, OXY/MED, ACR/OXY, or ACR/MED. Mains and branches in piping systems shall be not less than 1/2 in. nominal size. Runouts to area alarm panels shall be permitted to be 1/4 in. nominal size.

(2) Brazing Alloy: Provide brazing that complies with the latest NFPA 99 Gas and Vacuum Systems.

(3) Threaded Joints: Provide threaded joints that complies with the latest NFPA 99 Gas and Vacuum Systems.

(4) Identification: The gas content of medical gas piping systems shall be readily identifiable by appropriate labeling with the name of the gas contained. Such labeling shall be by the means of metal tags, stenciling, stamping or with adhesive markers in a manner that is not readily removable. Labeling shall appear on the piping at intervals of not more than 20 ft (6 m) and at least once in each room and each story traversed by the piping system. Where supplementary color identification of piping is used, it shall be in accordance with the gases and colors indicated in CGA Pamphlet C-9, Standard Color-Marking of Compressed Gas Cylinders Intended for Medical Use.

(5) General Requirements for Central Supply Systems:

a. Piping systems, with the exception of nitrogen systems, shall be capable of maintaining 50-55 psig (345 380 kPa gauge) to all outlets at the maximum flow rate.

b. Piping systems that vary from the normal 50-55 psig (e.g., systems supplying gas to hyperbaric chamber or for driving medical tools), shall be capable of delivering at flows and pressures consistent with their intended use.

c. A nitrogen system shall be capable of delivering at least 160 psig (1.1 MPa gauge) to all outlets at maximum flow.

B. Basic Piping Specialties]

(1) General

Provide piping specialties complying with the latest NFPA 99 in accordance with the following listing:

a. Pipe Escutcheons.

b. Pipe Sleeves.

c. Sleeve Seals.

C. Basic Supports, Anchors and Seals

(1) General

Provide supports, anchors and seals complying with Division 48 in accordance with the following listing:

a. Adjustable swivel pipe rings for horizontal piping hangers and supports.

b. Two-bolt riser clamps for vertical piping supports.

c. Concrete inserts, C-clamps, and steel brackets for building attachments.

5. MEDICAL GAS SYSTEM COMPONENTS

A. General

Furnish and install per latest NFPA 99 requirements a complete oxygen, vacuum, medical air nitrous oxide, nitrogen, vacuum system, carbon dioxide systems, etc., including, but not limited to, the following list:

(1) Gauges

a. Pressure Gauges: Includes gauges temporarily supplied for testing purposes.

1) For Line Pressure Use Adjacent to Source Equipment: ANSI B40.1, pressure gauge, single, size 4-1/2, for compressed air, nitrogen and oxygen, accurate to within two percent, with metal case. Range shall be two times operating pressure. Dial graduations and figures shall be black on white background, or white on a black background. Gauge shall be cleaned for oxygen use, labeled for appropriate service, and marked "USE NO OIL." Install with gaugecock.

2) For All Services Downstream of Main Shutoff Valve: Manufactured expressly for oxygen use but labeled for appropriate service and marked "USE NO OIL," 1-1/2-inch diameter gauge with dial range 1-100 psig for oxygen, nitrous oxide and air, and 1-300 psig for nitrogen service.

b. Vacuum Gauges:

1) For vacuum line use adjacent to source equipment: ANSI B40.1, vacuum gauge, size 4-1/2" gauge for air, accurate to within two percent, with metal case. Range shall be 0-30 inches Hg. Dial graduations and figures shall be black on a white background, or white on a black background. Label for vacuum service. Install with gaugecock.

2) For vacuum service upstream of main shutoff valve: Provide 1-1/2-inch diameter gauge with steel case, Bourdon tube and brass movement, dial range 0-30 inches Hg.

c. All gauges shall be manufactured by Beacon Medaes, Powerex, Amico or equivalent.

(2) Pressure and Vacuum Switches and Relief Valves

a. General purpose, contact or mercury type, allowing both high and low pressure set points, with contact type provided with a protective dust cover; adjustable range set by inside or outside adjustment; switches activate when indicated by alarm requirements.

b. Each central supply system shall have a pressure relief valve set at 50% above normal line pressure, installed downstream of the pressure regulator and upstream of any shutoff valve. This pressure relief valve may be set at a higher pressure provided another pressure relief valve set at 50% above normal line pressure is installed in the main supply line. All pressure relief valves shall close automatically when excess pressure has been released. Pressure relief valves set at 50% above normal line pressure shall be vented to the outside if the total capacity of the supply system is in excess of 2000 cu ft (57 m3) of gas. Pressure relief valves shall be of brass or bronze and especially designed for the gas service involved.

c. The pressure relief valve downstream of the line pressure regulator in nitrogen systems, used to provide power for gas-drive medical tools, instruments, or other systems, that vary from the normal 50-55 psig (345-380 kPa gauge) line pressure (i.e., systems supplying medical gases to hyperbaric chambers), shall be set at 50 percent above line pressure or 200 psig (1.4 MPa gauge), whichever is lower.

d. All pressure and vacuum switches shall be manufactured by Beacon Medaes, Powerex, Amico or equivalent.

(3) VALVES

a. General

1) All valves shall comply with the latest NFPA 99 Gas and Vacuum Systems.

b. Ball

In line, other than zone valves in cabinets.

1) Three Inches and Smaller: Fed. Spec. WW-V-35, Type II, Class A, Style 1, with brazed connections. Three-piece, Buna-N or teflon seat seals, full flow, 300 psig minimum working pressure, with locking type handle.

c. Check

1) Three Inches and Smaller: Brass body, self-aligning, spring loaded ball type check mating with teflon cone seat.

(4) Medical Air Compressor Systems

a. Medical air compressors provide compressed air for patient use only. All components shall be provided by and the responsibility of one manufacturer and shall be factory packaged (pre-wired and pre-piped) on a steel base, or tank mounted. Completed system installation shall provide medical air quality equal to or better than the quality specified under ANALYSIS, TESTS.

b. Compressors: Provide quality of air equal to or better than the quality of the intake air, without the use of purification equipment. Multiplex such that design load is provided with the largest single unit out of service; design piping, accessories and controls to withstand 150 psig. Provide each compressor with automatic check valves as required for proper operation and the prevention of loss of pressure through the compressor. Provide manual shut-off valve downstream of the check valve for service to check valve and compressor without total system shutdown.

1) Reciprocating Type: Capable of delivering a minimum pressure of 125 psig, without oil lubrication, with bearings packed with non-petroleum based product and sealed for lifetime lubrication; piston compression and guide rings and piston skirts warranted for minimum 8,000 operating hours; rated for continuous dry, 24 hours per day, seven days per week.

c. Motor and Starter: Maximum 40EC ambient temperature rise motor, ball or roller bearing. Open drip proof construction, continuous duty rated with service factor of 1.15 or greater; sufficient capacity to drive compressors without exceeding the nameplate rating of the motor. Provide each motor with automatic, fully enclosed, magnetic starter or type specified in other specification sections.

d. Controls:

1) Automatic: Adjustable, pressure operated, automatic, electric switch to start and stop motor at receiver pressure indicated. Provide heavy duty alternator, automatic, operating on a timed basis, to alternate the compressors by time forced alliteration.

2) Unloading: Automatic device, to unload compressor under all startup conditions including following current failure while operating, as well as protect against receiver backpressure.

3) Control Panel: Housed in a NEMA ICS-6, Type 12 listed, dustproof enclosure; prewired to include all specified electrical, electronic and electro-pneumatic devices. Include wiring diagrams and operating descriptions in the cabinet. Include the following:

(a) Circuit breaker for each control and motor circuit.

(b) Hand-off automatic selector switch for each compressor.

(c) Hour meter for each compressor.

(d) Control circuit transformers.

(e) Magnetic motor starter for each compressor.

(f) Provide panel with external visual (lights: red for running, green for safe) and audible (horn/buzzer) signals. The signals provided include:

i. Compressor in operation (visual only).

ii. High temperature shutdown (visual and audible), with contacts for connections to external alarm.

iii. High receiver water level shutdown (visual and audible) with contact for connections to external alarm.

iv. Cancel button, which will silence an audible alarm, reactivate should a second alarm occur while the audible is silenced and reset automatically upon correction of the original condition.

(g) Complete panel assembly shall be UL listed.

e. Receiver Tank: Welded steel, galvanized, in compliance with ASME Section VIII, 125 psig working pressure stamped and certified. Equip with safety relief valve set at 120 psig, float type automatic drain, sight glass and pressure gauge. Provide receiver of sufficient capacity to ensure practical on/off operation of compressors.

f. Air Silencer: Finned dry type inlet filter/muffler, enclosed in a housing allowing easy removal of the element for inspection of replacement, with a nominal retention of 10 microns or less and muffling by a series of silencer tubes. Provide filter of sufficient size to minimize back pressure.

g. Air Filters: Provide duplex outlet filter sets, piped in parallel and provided with valves to bypass each filter set for element replacement without system shutdown. Size each filter set for no greater than five psig differential pressure switch, designed to withstand full line pressure on either side of diaphragm without damage, to indicate when pressure drop across filter sets rises to more than two psig above when clean and new. Wire switch to the master alarm panel.

1) Rough Filters: Maximum five-micron, 98% efficiency retainage.

2) Final Filters: For reciprocating compressors, coalescing type, 0.03 micron or less absolute retainage. For liquid ring compressors, 0.1 micron or less, 98% efficiency retainage.

(a) Odor and Taste Removal Filter: Activated charcoal, downstream of each final filter.

h. Pressure Reducing Regulators: Provide duplexed in parallel, valved for maintenance shutdown without service interruption. Brass or bronze body and trim, reduced pressure rang 0-125 psig adjustable, piston type, pilot operated, relieving. Delivered pressure shall vary not more than 1 psig for each 10 psig variation in inlet pressure.

i. Dew Point Monitor: With digital or gauge type display, locate sensor in the pipeline downstream of regulators for continuous monitoring at line pressure. Install with valved, normally closed by-pass to allow disconnection without system shutdown. Provide local non-cancelable visual and cancelable audible alarm and a signal to the master alarm panels to operate when pressure dew point rises above 39EF at 55 psig.

j. Air Dryer: Duplexed, each sized for 100% of design load, self-contained, refrigerated type, with counter current heat exchanger, hermetically sealed refrigeration system, moisture separator with automatic drain and all internal wiring and plumbing. House unit in factory standard corrosion resistant cabinet with access doors or panels as required for ease of service and maintenance. Dryer shall be capable of providing 35EF (2EC) pressure dewpoint at 100 psig inlet pressure, 100EF inlet temperature and 100EF inlet dewpoint under full load conditions and be properly sized to produce 35EF or better pressure dewpoint under full load at site conditions.

k. Special Requirements:

1) For Reciprocating Type Compressors:

(a) High temperature shut-down sensor, immediately downstream of the compressor discharge, to sense discharge air temperature above 350EF and shutdown affected unit. Provide visual and audible alarms and compressor circuit reset button on control panel, with contact for external signal. Wire to master alarm panel.
(b) Aftercooler: Water-cooled, with solenoid valve for cooling of airstream before it enters receiver tank. Provide water controls.

l. Warranty

1) Bare pump will be warranted 30 months from startup or 36 months from shipment, whichever comes first.

2) All other components will be warranted 12 months from startup or 18 months from shipment, whichever comes first.

m. All medical air compressor shall be manufactured by Powerex, Beacon Medaes, Amico or equivalent.

(5) Vacuum Pump Systems:

a. Claw Vacuum Pump Each pump shall be a rotary claw type vacuum pump, and shall be direct-driven through a shaft coupling by a C-face, TEFC electric motor.

b. Each vacuum pump shall be dry-running, featuring two claw-type, non-contacting rotors and shall not require any sealing fluid in the pumping chamber, assuring virtually maintenance-free operation.

c. Each vacuum pump shall include an internal relief valve, and a built-in, anti-suck-back valve mounted at the pump inlet.

d. Each pump within the system shall include a check valve, inlet and discharge flex connectors, a 5 micron inlet filter and a pump isolation valve.

e. Motor: The motor is continuous duty, C-face, TEFC, suitable for 208-230, or 460V, 3 phase, 60 hertz electrical operation.

f. Air Receiver: The system shall include an ASME rated air receiver. The tank shall be equipped with a vacuum gauge, a sight gauge, by-pass valves, and a manual drain.

g. VFD Control Panel: Variable Frequency Drive (VFD) control improves efficiency over a conventional “on/off” demand based system by more closely matching the pump speed to the changing load requirements. All VFD systems come standard with a Premium NFPA Control panel. The VFD and Premium NFPA Control Panel shall include a gateway server card and all features listed below:

1) PLC controller and a color touch screen panel which displays the operating status of the unit.

2) Building automation communication gateway with BacNet® protocol and Web server features. Web server s features include email notifications in case the system is in alarm or has achieved one its maintenance intervals and requires service.

3) Ethernet port for connection to BacNet® server or direct connection to facility Ethernet for viewing of system operations and status via device IP-address.

4) UL508A listed control panel in a NEMA 12 enclosure. The panel door will include: the HMI touch screen, an audible and visual alarms with an acknowledge button, VFD start/stop switch and an HOA switch for each pump.

5) Magnetic starters.

6) Vacuum transducer for process control.

7) Single point power connection.

8) Redundant 120Vac control transformers with fused primary and secondary protection.

9) System overload trip, high temperature conditions or maintenance intervals for the pump will result in visual and audible alarms.

h. Additional Requirements Options

1) Oxygen assured pumps - prepared for use in WAGD systems.

2) Internal tank lining for corrosion resistance.

3) Variable Frequency Drive (VFD) Control Panel – with Premium NFPA controls.

(6) Bulk Medical Gas System

(7) Cylinder Supply System with Reserve Supply

(8) Manifolds

(9) Pressure Regulator

(10) Pressure Relief Valve

(11) Changeover Actuating Switch

(12) Line Pressure Regulator

6. PURGING

A. After all medical gas piping systems have been tested, the source of the test gas shall be disconnected and the proper gas source of supply connected to each respective system. Following this connection and pressurization, all outlets shall be opened in a progressive order, starting nearest the source and completing the process of purge flushing at the outlet farthest from the source.

B. Purge gas shall be allowed to impinge upon a white cloth material at a minimum flow rate of 100 liters per minute until no evidence of discoloration is evident and the test gas used during the previous tests has been removed from the piping systems.

7. ANALYSIS

A. After completing the purge flushing of the piping in accordance with the latest NFPA 99, the flow of gas from each station outlet for oxygen, mixed gases containing oxygen and medical compressed air shall be tested with an oxygen analyzer to confirm the presence of the desired percentage of oxygen.

NOTE: Testing of outlets for other gases to confirm the presence of the designated gas is also required.

(1) Where mixtures are piped that involve a low concentration of one component, such as 95% oxygen and 5% carbon dioxide, an analyzer must be used having sufficient accuracy to properly indicate the mixture. This, in some cases, may require an analyzer specific to each component.

(2) The test specified in the latest NFPA 99, shall be conducted on the downstream portions of the medical gas piping system whenever a system is breached and whenever modifications are made or maintenance performed in anesthetizing locations or vital life support or critical area.

The only test required when the oxygen (pure or mixed) or medical compressed air portion of an existing piped medical gas system is repaired is an analysis test to assure that no cross-connection of gases has been created. This may seem unnecessary when replacing a broken outlet or zone valve, but it is very important to document that the correct gas is flowing out of a labeled outlet. There can be no compromises in patient safety with respect to gases that will be inhaled by patients.

Once verification and analysis have been conducted on a new or modified of a system, it does not have to be repeated until the system is again breached or modified.

B. Prior to the connection of any work to the systems, all tests shall be successfully performed. After connection to the systems and before use for patient care, the tests in the above sections shall be successfully completed.

C. The final connection shall be leak tested with the source gas at the normal operating pressures. This pressure shall be maintained until each joint has been examined for leakage by means of soapy water or other equally effective means of leak detection safe for use with oxygen.

8. INSTALLATION AND TESTING OF MEDICAL GAS SYSTEM

A. In accordance with the latest NFPA 99

Before installation, all piping, valves, fittings and other components for all nonflammable medical gas systems shall be thoroughly cleaned of oil, grease and other readily oxidizable materials as is for oxygen service. After cleaning, particular care shall be exercised in the storage and handling of such material. Such material shall be temporarily capped or plugged to prevent recontamination before final assembly. Just prior to final assembly, such material shall be examined internally for contamination and shall be recleaned if necessary.

(1) Piping, valves, fittings and other components may be especially prepared in a facility equipped to clean, rinse and purge the material in accordance with the requirements of the latest NFPA 99 or may be prepared on the job site in accordance with NFPA 99. Trichloroethylene shall not be used in any cleaning operation at the job site. Carbon tetrachloride shall not be employed in any cleaning operation.

a. Piping, valves, fittings and other components that have been especially prepared shall have been cleaned in accordance with the provisions of CGA Pamphlet G-4.1, Cleaning

Equipment for Oxygen Service. Such material shall be delivered capped or plugged and shall be inspected prior to final assembly as required in the latest NFPA 99. If necessary, recleaning shall be done in accordance with NFPA 99.

b. Piping, valves, fittings and other components prepared at the job site shall be cleaned by washing in a hot alkaline cleaner-water solution, such as sodium carbonate or trisodium phosphate (proportion of one pound to three gallons of water). Scrubbing shall be employed where necessary to ensure complete cleaning. After washing, the materials shall be thoroughly rinsed in clean, hot water.

B. Comply with other specification section for exposed piping and sleeves.

C. Keep open ends of tube capped or plugged at all times. Wash and rinse unplugged, partially completed piping system in accordance with Article, Cleaning of Piping, Valves and Fittings.

D. Cut piping square and accurately with a tube cutter (sawing not permitted) to measurements determined at place of installation. Ream tube to remove burrs, being careful not to expand tube and so no chips of copper remain in the tube. Work into place without springing or forcing. Bottom tube in socket so there are no gaps between tube and fitting. Exercise care in handling equipment and tools used in cutting or remaining of tube to prevent oil or grease being introduced into tubing. Where contamination has occurred, rewash affected items in accordance with Article, Cleaning of Piping, Valves and Fittings.

E. Spacing of Hangers: Shall comply with the latest NFPA 99, but shall in no case be greater than 10 feet.

F. Rigidly support valves and other equipment to prevent strain on tube or joints.

G. Take care not to anneal copper tube while brazing. Braze only while purging the interior tube with nitrogen, minimum U.S.P. or Grade B as specified in CGA G-10.1.

All brazed joints in the piping shall be made up using brazing filler allows that bond with the base metals being brazed and that comply with Specification for Brazing Filler Metal, ANSI/AWS A5.8 and the latest NFPA 99.

H. Do not bend tubing. Use fittings.

I. Install pressure and vacuum switches to be easily accessed and provide access panel where installed above plaster ceiling.

J. Apply pipe labeling during installation process and not after.

K. Pipe compressor intake to a source of clean ambient air as indicated in the latest NFPA 99.

L. After initial leakage testing is completed, allow piping to remain pressurized with testing gas until testing agency perform final tests complying with the latest NFPA 99.

M. Penetrations

(1) Fire Stopping: Where pipes pass through fire partitions, fire walls, smoke partitions, or floor, install a fire stop that provides an effective barrier against the spread of fire, smoke and gases as

specified in other sections. Completely will and seal clearances between raceways and openings with the fire stopping materials.

(2) Waterproofing: At floor penetrations, completely seal clearances around the pipe and make watertight with sealant as specified in other sections.

9. CERTIFICATION AND TESTS

A. Cross connection certification shall be the responsibility of the Contractor and shall be as follows:

(1) Cross-connection testing and certification of the medical-gas system shall be performed by medical gas testing agency.

(2) Medical-gas system shall be tested in accordance with the latest NFPA 99.

(3) In addition to cross-connection testing, this specification shall require the medical gas testing agency to test each individual pipeline system component for performance to design specifications and the Contractor make any necessary adjustments to ensure a complete and working system.

(4) In the event the cross-connection test indicates contaminated or cross connected medical gas systems, it shall be the responsibility of the Contractor to correct the problems at no additional cost to the Owner. This procedure shall be repeated until the cross-connection test proves positive and is hence certified.

B. Tests

(1) Initial Tests: Blowdown, and high and low-pressure leakage tests as required by the latest NFPA 99, with documentation.

(2) Medical Gas Testing Agency Shall Perform the Following:

a. Perform and document all cross-connection tests, labeling verification, supply system operation and valve and alarm operation tests as required by and in accordance with NFPA 99 and the procedures set for in prequalification documentation.

b. Verify that the systems, as installed, meet or exceed the requirements of NFPA 99 and this specification and that the systems operate as required.

c. Piping Purge Test: For each positive pressure gas system, verify cleanliness of piping system. Filter a minimum of 3.5 cubic feet (100 liters) of gas through a clean white 0.45-micron filter at a minimum velocity of 3.5 scfm (100 1pm). Filter shall show no discoloration and shall accrue no more than 0.1 mg of matter. Test each zone at the outlet most remote from the source. Perform test with the use of an inert gas a described in CGA P-9.

d. Piping Purity Test: For each positive pressure system, verify purity of piping system. Test each zone at the most remote outlet for dew point, carbon monoxide, total hydrocarbons (as methane) and halogenated hydrocarbons and compare source gas. The two tests must in no case exceed variation as specified in Paragraph, Maximum Allowable Variation. Perform test with the use of an inert gas.

e. Source Contamination Test: Analyze each pressure gas source for concentration of contaminants, by volume. Take samples for air system test at the intake and at a point immediately downstream of the final filter outlet. The compared tests must in no case exceed variation as specified in Paragraph, Maximum Allowable Variation. Allowable concentrations are below:

1) Dew Point: Air - Minus 18°C atmospheric
All Others - Minus 45°C atmospheric

2) Carbon Monoxide: - 10 ppm

3) Carbon Dioxide: Air - 1000 ppm
All Others - 300 ppm

4) Gaseous Hydrocarbons: Air - 5 ppm (as methane)

5) Halogenated Hydrocarbons: Air - 2 ppm

f. Analysis Test:

1) Analyze each pressure gas source and outlet for concentration of gas, by volume.

2) Make analysis with instruments designed to measure the specific gas dispensed.

3) Allowable concentrations are within the following:

(a) Oxygen - 99(+)% Oxygen

(b) Nitrous Oxide - 99(+)% Nitrous Oxide

(c) Nitrogen - Less than 1% Oxygen or 99(+)% Nitrogen

(d) Medical Air - 19.5% to 23.5% Oxygen

g. Maximum Allowable Variation: Between comparative test results required as follows:

1) Dew Point - 2°C

2) Carbon Monoxide - 2 ppm

3) Total Hydrocarbons as methane - 1 ppm

4) Halogenated Hydrocarbons - 2 ppm

END OF SECTION 220600

SECTION 230100 - PUMPS

1. GENERAL

A. The Contractor's attention is directed to the General and Special Conditions, General Provisions - Mechanical and to all other contract Documents as they apply to this branch of the work. Attention is also directed to other sections of the specifications which affect the work of this section and which are hereby made a part of the work specified herein.

B. All required motor starters shall be furnished with the respective pump.

C. Electric motors shall be furnished with the pumps and shall be of the size and type scheduled or otherwise specified. All motors shall be UL labeled and shall comply with applicable NEMA standard.

D. Shop drawings shall be submitted as required by Section 200300 and shall include complete pump specifications, installation and start-up instructions, current and accurate pump performance curves with the selection points clearly indicated, maintenance data and spare parts lists.

E. Pumps shall be factory tested, cleaned and painted prior to shipment. Size, type, capacity and electrical characteristics are listed in the pump schedule.

F. Insofar as possible, all pumps shall be by the same manufacturer.

G. Pump shall have data plate indicating horsepower, voltage, phase, ampacity, pressure head, and flow rate.

H. Special notes for pumps controlled by variable frequency drives:

(1) Supplier shall provide the largest non-overloading impeller size for the specified pump motor horsepower, regardless of the specified pump head given on the pump schedule(s).

(2) Pumps less than 100 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. One shaft grounding ring and related hardware shall be provided on drive end or non-drive end of motor per manufacturer’s instructions. These shall be factory mounted and installed on the exterior of the motor to allow for visual inspection. Ground motor frame per manufacturer’s instructions. Install kit in strict accordance with manufacturer’s instructions.

(3) Pumps greater than 100 HP to 1000 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. Provide shaft grounding ring on drive end and non-drive end of motor per manufacturer’s instructions. Additionally, provide insulated bearing journals to further reduce risk of current dissipation through bearings. Ground motor frame per manufacturer’s instructions. Install kit in strict accordance with manufacturer’s instructions.

2. MATERIAL

A. BASE MOUNTED PUMPS

(1) Type: Horizontal, base mounted, end suction, single stage, flexible coupled, 175 PSI working pressure.

(2) Pump Body: Cast iron, flanged gauge and drain tappings, bronze fitted.

(3) Shaft: Stainless steel. Refer to special notes for pumps controlled by VFD's above for shaft grounding kit specification.

(4) Bearing: Re-lubricatable ball bearing. Provide insulated bearing journals for pumps greater than 100 HP.

(5) Seal: Mechanical, carbon ring with ceramic seal.

(6) Motor: open, drip proof, re-lubricatable ball bearing. Minimum efficiency per NEMA Premium Induction Motor Efficiency.

(7) Impeller: Enclosed, balanced.

(8) Base: Structural steel.

(9) Coupling: Flexible with coupling guard.

(10) Manufacturers: Subject to compliance with the specified and scheduled requirements. Pumps by the following manufacturers will be considered:

Armstrong/Aurora
Bell and Gossett
Patterson
Taco

(11) SELECTIONS:

Refer to the schedule on the plans for base-mounted pump selections.

B. CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS

1) Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Armstrong Pumps Inc.
(b) Bell & Gossett.
(c) Patterson Pump Co.
(d) TACO Incorporated.

2) Description: Factory-assembled and -tested, centrifugal, overhung-impeller, close-coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally or vertically.

3) Pump Construction:

(a) Casing: Radially split, cast iron, with threaded gage tappings at inlet and outlet, replaceable bronze wear rings, and threaded companion-flange connections.

(b) Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For constant-speed pumps, trim impeller to match specified performance.
(c) Pump Shaft: Stainless steel.
(d) Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless-steel spring, and bellows and gasket. Include water slinger on shaft between motor and seal.
(e) Seal: Packing seal consisting of stuffing box with a minimum of four rings of graphite-impregnated braided yarn with bronze lantern ring between center two graphite rings, and bronze packing gland.
(f) Pump Bearings: Oil lubricated; bronze-journal or thrust type.

4) Motor: Single speed and rigidly mounted to pump casing.

(a) Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
(b) Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Division 23 Section "Common Motor Requirements for HVAC Equipment."

i. Enclosure: Open, dripproofRetain "Enclosure Materials," "Motor Bearings," "Unusual Service Conditions," "Efficiency," "NEMA Design," and "Service Factor" subparagraphs below if options are available from pump manufacturers and are different from default requirements specified in Division 23 Section "Common Motor Requirements for HVAC Equipment." Consider each subparagraph and retain only those that vary from default requirements.
ii. Enclosure Materials: Cast iron
iii. Motor Bearings: grease-lubricated ball bearings.

3. EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.

C. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PUMP INSTALLATION

A. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.

B. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.

C. Equipment Mounting: Install base-mounted pumps on cast-in-place concrete equipment bases.

1. Coordinate sizes and locations of concrete bases with actual equipment provided.

2. Construct bases to withstand, without damage to equipment, seismic force required by code.

3. Construct concrete bases 4 inches (100 mm) high and extend base not less than 6 inches (150 mm) in all directions beyond the maximum dimensions of base-mounted pumps unless otherwise indicated or unless required for seismic-anchor support.

3.3 ALIGNMENT

A. Engage a Reliable Manufacturing Implementation Certified (RMIC) certified representative to perform vibration analysis and alignment service.

B. Comply with requirements in Hydronics Institute standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt motor to base frame. Do not use grout between motor feet and base frame.

C. Comply with pump and coupling manufacturers' written instructions.

D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Check piping connections for tightness.

3. Clean strainers on suction piping.

4. Perform the following startup checks for each pump before starting:

a. Verify bearing lubrication.

b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.

c. Verify that pump is rotating in the correct direction.

5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.

6. Start motor.

7. Open discharge valve slowly.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps.

END OF SECTION 230100

SECTION 230200 - HVAC EQUIPMENT AND HYDRONIC SPECIALTIES

1. GENERAL

A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

B. The Contractor shall provide in complete working order the following heating, ventilation and air conditioning equipment located as indicated and installed, connected and placed in operation in strict accordance with the manufacturer's recommendations. All equipment shall be factory painted and, where applicable, factory insulated and shall, where such standards exist, bear the label of the Underwriters Laboratory.

C. Each subcontractor shall be responsible for their own completion of System Verification Checklists/Manufacturer’s Checklist.

D. Factory startup is required for all HVAC equipment. In general, as part of the verification process, equipment suppliers shall perform start-up by their factory authorized technicians and shall complete and submit start-up reports/checklists. This shall include air handling units, boilers, chillers, cooling towers, VFDs, etc.

E. All HVAC equipment shall comply with the latest provisions of ASHRAE Standard 90 and/or International Energy Conservation Code 2012, whichever is more stringent.

F. Installation of all heating, ventilating and air conditioning systems shall be performed by a master HVAC contractor licensed in the state the work will be performed.

G. Note to Suppliers and Manufacturers Representative furnishing proposals for equipment for the project:

(1) Review the Controls Section of these Specifications (if applicable) to determine controls to be furnished by the equipment manufacturer, if any. The Contractor shall provide all controls with equipment unless specifically listed otherwise.

(2) Review the section of these specifications entitle: SHOP DRAWINGS, DESCRIPTIVE LITERATURE, MAINTENANCE MANUALS, PARTS LISTS, SPECIAL KEYS, TOOLS, ETC., and provide all documents called for therein.

(3) Ensure that the equipment which you propose to furnish may be installed, connected, placed in operation and easily maintained at the location and in the space allocated for it.

(4) Determine from the Bid Documents the date of completion of this project and ensure that equipment delivery schedules can be met so as to allow this completion date to be met.

(5) Where manufacturers’ temperature controls are specified, they shall be in full compliance with International Mechanical Code Section 606 including automatic smoke shut down provisions.

(6) Provide factory start-up on site by a factory representative (not a third-party contractor) for all HVAC equipment, including pumps, VFDS, boilers, chillers, cooling towers, heat pumps, rooftop units, etc. Submit factory start-up reports to the Engineer.

(7) Provide training to the Owner by a factory representative for each type of equipment. Training shall be a minimum of eight (8) hours on site and the Engineer shall be notified one (1) week in advance of the training. Training shall only occur when the systems are complete and 100% functional. All training shall be video taped.

(8) Review the Section on Motor Starters and Electrical Requirements for Mechanical Equipment.

(9) Requirements for motors controlled by variable frequency drives:

a. All motors shall be inverter duty rated.

b. Motors less than 100 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. One shaft grounding ring and related hardware shall be provided on drive end or non-drive end of motor per manufacturer's instructions. These shall be factory mounted and installed on the exterior of the motor to allow for visual inspection. Ground motor frame per manufacturer's instructions. Install kit in strict accordance with manufacturer's instructions.

c. Motors greater than 100 HP to 1000 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. Provide shaft grounding ring on drive end and non-drive end of motor per manufacturer's instructions. Additionally, provide insulated bearing journals to further reduce risk of current dissipation through bearings. Ground motor frame per manufacturer's instructions. Install kit in strict accordance with manufacturer's instructions.

(10) Type 1 kitchen exhaust hoods shall be provided with a heat sensor per IMC 2006, section 507.2.1.1, to enable the exhaust and make-up air system automatically upon detection of heat.

(11) Equipment incorporating energy recovery wheels shall be provided with an aluminum wheel with molecular sieve desiccant, 4 angstrom maximum sieve size. Wheels shall be certified in accordance with ASHRAE 84 or ARI 1060 standards.

(12) All condensate producing equipment shall be provided with a condensate trap as recommended by the equipment manufacturer and a condensate overflow switch.

(13) Provide low ambient and all required controls and accessories on all HVAC equipment to ensure they can provide cooling during the winter season.

(14) All outdoor HVAC equipment shall be provided with hail guards.

(15) Provide a complete air tight enclosure with opening door that seals air tight for all filters on air moving equipment.

(16) All equipment shall be furnished for a single point electrical connection unless specifically excluded as a requirement.

2. EQUIPMENT

A. VENTILATING FANS

(1) Ventilating fans shall be of the type, capacity, size, etc. here-in-after scheduled. Catalog numbers are listed as design criteria only. Alternate selections will be accepted provided quality,

function, etc. are equivalent. All fans shall be UL listed, complete with all required disconnects and starters and shall be AMCA rated and certified. Model numbers listed are Greenheck, acceptable alternates are Penn, Carnes, Acme, Shipman, Jenn-Aire and Loren-Cook. The Architect shall select the color for all exposed fans.

(2) Selection

Refer to the schedule on the plans.

B. HYDRONIC SPECIALTIES

(1) Manufacturers

Subject to compliance with the specified and scheduled requirements the following manufacturers will be considered, but not limited to:

Hoffman
Amtrol/Thrush
Armstrong/Aurora
Bell & Gossett
Patterson
Taco
Victaulic
Wheatley

(2) Combination Air/Dirt Separators

A. Manufacturers:

1. Spirotherm, Inc. (model VDT, VHT, VDN or VHN)

2. Approved equivalent – confirm with Engineer prior to bidding

B. Full flow coalescing type combination air eliminator and dirt separator shall be fabricated steel, rated for 150 psig working pressure, stamped and registered in accordance with ASME Section VIII, Division 1 for unfired pressure vessels, and include two equal chambers above and below the inlet / outlet nozzles.

C. Selection shall be based upon system flow with pipe size as a minimum. In no case shall entering velocity exceed 10 feet per second.

D. Unit shall include internal structured elements filling the entire vessel to suppress turbulence and provide air elimination efficiency of 100% free air, 100% entrained air, and 99.6% dissolved air at the installed location. Dirt separation efficiency shall be a minimum of 80% of all particles 30 micron and larger within 100 passes. The elements must be fabricated by the manufacturer and consist of a copper core tube with continuous wound copper wire medium permanently attached and followed by a separate continuous wound copper wire permanently affixed.

E. Each unit shall have a separate venting chamber to prevent system contaminants from harming the float and venting valve operation. At the top of the venting chamber shall be an integral full port float actuated brass venting mechanism.

F. Units shall include a side tap valve to flush floating dirt or liquids and for quick bleeding of large amounts of air during system fill or refill.

G. Unit shall be manufactured with a removable lower head for internal inspection.

H. Unit shall be manufactured with internal magnets.

1. Magnet(s) shall be positioned at the centerline of the inlet and outlet nozzles for maximum effectiveness during normal operation.

a. Units sized 2” through 6” shall have one magnet

b. Units with 8” though 12” shall have two magnets

2. Magnet(s) shall be removable from the vessel.

3. Magnet(s) shall be made of high-strength Neodymium alloy.

4. Magnet(s) shall be disengaged for dirt blowdown by means of a spring-loaded pull, without requiring removal of the magnet from the vessel or isolating the unit from the system.

5. Magnet option shall be provided with 360° rotatable blow down valve.

(3) Expansion Tank

The tank shall be constructed in accordance with the ASME Code for unfired pressure vessels and shall be suitable for 125 PSI water working pressure and 340ºF maximum water temperature. The tank shall be a pre-charged, heavy duty butyl rubber diaphragm-type pressure vessel complete with standard tire charging valve. Refer to the plans for mounting orientation. Capacities shall be as scheduled on the drawings.

(4) Factory-Assembled Drops

Contractor has the option to utilize pump drop assemblies in lieu of traditional method consisting of flexible connectors and flanged components. Pump Drops shall consist of orange enamel coated assembly, consisting of a flange for pump connection that shall be rated for a pressure greater than or equal to the piping pressure rating of the system. Refer to specification section 201300 - ,PIPE, PIPE FITTINGS AND PIPE SUPPORT. Standard of Acceptance: Victaulic Series 380/381/385/26.

Suction Vibration Isolation Pump Drop: Factory assembled grooved end vibration pump suction drop for pipe sizes 3” through 12”. Consisting of a suction diffuser with stainless steel basket and diffuser, Vic-300 butterfly valve with offset stem for 360-degree circumferential seating, and pipe spool with thermometer and or pressure ports. Assembly is installation-ready, with flexible couplings to accommodate vibration attenuation and stress relief. Assembly rated for working pressure to 300-psig.

Discharge Vibration Isolation Pump Drop: Factory assembled grooved end vibration pump discharge drop for pipe sizes 3” through 12”. Consisting of tri-service valve assembly, which includes a 779 spring-actuated check valve and Vic-300 butterfly valve with offset stem for 360-degree circumferential seating, and pipe spool with thermometer and pressure ports. Assembly is installation ready, with flexible couplings to accommodate vibration attenuation and stress relief. Assembly rated for working pressure is 300-psig.

(5) Suction Diffusers

Provide at the inlet of each base mounted pump, a suction diffuser as manufactured by Bell and Gossett, Victaulic, Thrush, or approved equivalent. Each suction diffuser shall be equipped with a disposable fine mesh start-up strainer and an adjustable support foot to carry weight of inlet piping. Victaulic Series 731 G, W731G, Bell and Gossett Suction Diffuser, or equal.

(6) Flexible Connections

Provide at the inlet and discharge side of each base mounted pump, at each connection to major equipment requiring vibration isolation and where shown on plans, a flexible connector, Metraflex Metrasphere or Engineer approved equal. Flexible connectors shall be of the flexible neoprene and nylon or EPDM and suitable for 225 PSI working pressure and 230°F temperature. Couplings shall be installed per the manufacturer's recommendations, in close proximity to the source of the vibration.

Alternatively, in lieu of a flexible connector, three (3) Victaulic Style 77 flexible couplings may be used on suction side and discharge side of base mounted pumps (six Victaulic flexible couplings per pump).

(7) Pressure Reducing Valve

Provide at the point of connection of the domestic water line to the hydronic system and where shown on the plans, a pressure reducing valve by Thrush, Bell and Gossett, or Engineer approved equivalent. Such pressure reducing shall be provided with an inlet strainer and shall be set to maintain a pressure of 4 PSI in excess of that at the highest point in the hydronic system. Each pressure reducing valves shall be line sized.

(8) Vacuum Breaker

Provide, where shown on the plans, a vacuum breaker as manufactured by Huffman, Jackson or Engineer approved equivalent.

(9) Manual Air Vents

Provide, where shown on the plans, at each rise in piping and where required a manual air vent.

(10) Automatic Air Vents

Provide automatic air vents where noted on the plans.

(11) Expansion Loops

Expansion loops shall be Metaflex Metra loops or Engineer approved equivalent. Install with pipe guides and anchors as recommended by the manufacturer in all piping runs 75 feet long or greater and also where indicated on the plans.

Alternatively, in water piping systems, use adequate numbers of Victaulic Style 77 flexible couplings in header piping to accommodate thermal growth and contraction, and as required for the elimination of expansion loops. (In accordance with Victaulic recommendations and as approved by the Engineer). Where expansion loops are required in Victaulic piping systems, use Victaulic flexible couplings on the loop(s).

2. FACTORY START-UP REPORTS

A. Provide factory start-up on site by a factory representative (not a third-party contractor) for all HVAC equipment, including rooftop units. Submit factory start-up reports to the Engineer. The Mechanical Contractor and the Controls Contractor shall have a representative on site to correct all deficiencies noted by the factory representative. For each deficiency noted, documentation of corrective action taken shall be submitted to Engineer.

B. At a minimum, the report submitted to the Engineer shall include the following data:

(1) Air Handling Units

a. Verify economizer operation
b. Verify operating per sequence of control
c. Discharge air temperature sensor calibration
d. Discharge static pressure
e. Dirty filter differential pressure switch function
f. Outside air temperature sensors calibration
g. Return air temperature sensor calibration
h. Airflow monitoring station calibration
i. VFD response to pressure sensors or other DDC input
j. Smoke detection shut down
k. Freeze protection sequence
l. Fan bearings lubrication
m. Fan not vibrating
n. Fan motor volts / amps
o. Check drive belt tension
p. Check sheave alignment
q. Coils clean
r. Dampers operating properly
s. Filters clean
t. Fan rotation direction

3. WATER TREATMENT

A. SCOPE

Provide a one-year water treatment program for all water loop systems (heating water, chilled water, processed chilled water). The one-year period shall start from the date of substantial completion. The program shall minimize corrosion, scaling, and prevent biological fouling of the piping system.

B. QUALIFICATIONS

Chemicals, service, and equipment shall be supplied by a single water treatment company for undivided responsibility. The water treatment chemical and service supplier shall be a recognized specialist, active in the field of commercial/industrial water treatment for at least 5 years, whose major business is in the field of industrial water treatment. The water treatment company shall have regional water analysis laboratories, service department, and full-time representatives located within the trading area of the job site or facility.

Water treatment company shall be Bluegrass Kesco, Nalco, American Water Treatment, or approved equal.

C. SERVICE

Provide quarterly field service and Owner consultation. System water or fluid shall be tested for proper chemical parameters, clarity, and biological activity. If needed, provide chemical addition. Provide any laboratory and technical assistance required to achieve a successful program.

D. CHEMICALS

Provide one year's supply of the recommended chemical for scale and corrosion protection of the closed loop recirculating system. If needed, provide separate chemical to control microbiological growth in the system. Formulations shall not contain any ingredients which are harmful to system materials of construction.

E. PHASED PROJECTS

Provide multiple trips, testing, treatment, chemicals, etc. as required to accommodate phased projects. Systems that will be constructed and brought on-line in phases shall be treated at the completion of each phase. Under no circumstance shall any portion of the system operate with untreated heat transfer fluid.

F. EQUIPMENT

(1) Bypass Feeder

Provide one 5-gallon bypass chemical feeder for each system. Neptune DBF-5HP or approved equivalent.

(2) HPS Loop Filter LF-1

Harmsco HUR series fluid filter. Refer to schedule on the drawings for selection. Provide with a total of three sets of filter cartridges.

G. REPORTS

A summary of water or fluid quality and treatment shall be provided in writing to the Owner and Engineer after each quarterly site visit. Results of quarterly biological activity tests shall also be provided to the Owner and Engineer.

H. GENERAL

The heating/cooling systems for this contract are hydronic systems and there are several precautions which must be observed during its installation. The Contractor is advised to read all of the manufacturer's instructions prior to commencing the installation.

I. SYSTEM START-UP

The Contractor shall include as a part of his work a factory system fill and start-up by an authorized Factory Representative of the unit manufacturer.

J. CLEANING AND FLUSHING HYDRONIC PIPING SYSTEMS

(1) During construction, extreme care shall be exercised to prevent all dirt and other foreign matter from entering the pipe or other parts of the system. Pipe stored on the project shall have the open ends capped and equipment shall have all openings fully protected. Before erection, each piece of pipe, fitting or valve shall be visually examined and all dirt removed.

(2) After the system is complete it shall be thoroughly cleaned before placing in operation to rid the system of dirt, biological contamination, piping compound, loose mill scale, oil and any and all other material foreign to the water.

(3) Before chemical cleaning and sterilization of the entire system, the building loops shall be flushed and purged until free of dirt, debris, and air. During the chemical cleaning and sterilization process the supply and return run-outs shall be temporarily connected together at each coil location.

(4) After purging of the system the Contractor shall add an approved system cleaning solution at the recommended concentration to the entire system. Circulate the system with cleaner for the time recommended by the chemical manufacturer. After prescribed circulation time, flush the system until cleaner is removed.

(5) After chemical cleaning, the entire system shall be sterilized. Introduce a solution of sodium hypochlorite to achieve a chlorine residual of 25 to 50 ppm. Maintain this chlorine level for 12 to 24 hours. Flush out system until chlorine residual in system equals that of the makeup water.

(6) After the system has been completely cleaned and sterilized as specified herein, the individual coils shall be connected permanently to the supply and return runouts and the system filled for operation under normal closed loop conditions. Within 48 hours of the completion of the sterilization implement a water treatment program to passivate all metal surfaces.

END OF SECTION 230200

SECTION 230300 - CONDENSATE DRAINAGE SYSTEM (FOR COOLING EQUIPMENT)

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this section of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

   B. The Contractor shall provide a complete condensate drainage system to carry all condensate discharge from all cooling equipment from the building. Condensate system shall be installed in accordance with IMC. Provide condensate overflow switch for all condensate producing equipment.

   C. Pipe installation and fabrication shall be in accordance with the section of these specifications entitled PIPE, PIPE FITTINGS AND PIPE SUPPORT and as hereinafter specified.

   D. All piping shall be installed concealed, unless specifically noted otherwise and shall be installed under slabs or underground only when specifically indicated.

   E. Lines installed in ceiling spaces shall be held at the maximum possible elevation and shall be coordinated with all other trades to avoid conflicts.

   F. Condensate drain lines shall be pitched 1/4 inch per foot and installed with cleanout plugs at each change in direction and/or at thirty (30) foot intervals. Where this minimum pitch cannot be attained, contact Engineers.

   G. Horizontal runs of condensate drain lines shall be supported at six (6) foot intervals maximum, or more frequently where required to prevent sags and low spots.

   H. Lengths of horizontal lines shall be held at a minimum due to potential lint collection.

   I. Provide condensate traps in accordance with the manufacturer’s recommendations.

2. MATERIAL

   A. Refer to Section of these Specifications entitled: PIPE, PIPE FITTINGS AND SUPPORT.

3. INSULATION

   A. Refer to Section of these Specifications entitled: INSULATION - MECHANICAL.

END OF SECTION 230300

SECTION 230500 - COMMON WORK RESULTS FOR HVAC, REFRIGERANT MANAGEMENT

Part 1 GENERAL INFORMATION AND PURPOSE

1.01 UNIVERSITY OF KENTUCKY REFRIGERANT MANAGEMENT PLAN (RMP)

1. The purpose of the University of Kentucky's Refrigerant Management Plan (RMP) is to establish the institutional framework necessary for the University to comply with Title VI of the Clean Air Act (CAA), Stratospheric Ozone Protection. The U.S. Environmental Protection Agency (EPA) developed specific regulations contained in 40 CFR 82, Protection of Stratospheric Ozone, to comply with the CAA. Although there are multiple subparts to regulation 40 CFR 82, the University is subject to 40 CFR 82, Subpart B, Servicing of Motor Vehicle Air Conditioners; 40 CFR 82, Subpart F, Recycling and Emissions Reduction; and 40 CFR 82, Subpart H, Halon Emissions Reduction. These regulations establish requirements for the service, maintenance, repair, and disposal of appliances containing ozone depleting substances (ODS) or non-ODS substances.

2. Appliances that contain ODS or non-ODS substances (refrigerants) throughout the University include air conditioners, refrigerators/freezers, HVAC, chilled water fountains, chillers, motor vehicles, and in the case of halons, fire and explosion protection equipment. The University requires all employees, contractors, or vendors that handle, order, service, maintain, repair, or dispose of refrigerants, refrigerant appliances, or halons to comply with this program.

Part 2 REQUIREMENTS

1. Ensure refrigerants are not knowingly released or disposed of during installation, maintenance, service, repair, disposal, or recovery.

2. Ensure only certified technicians are used for work that is reasonably expected to violate the integrity of the refrigerant circuit.

3. Provide Environmental Management Department, Air Quality Compliance Manager (AQCM), with copies of technician's certifications that conducted installation, maintenance, or removal of appliance.

4. Complete and submit form AQ-FORM-101 to AQCM when installing refrigerant appliances, other than small appliances.

5. Complete and submit form AQ-FORM-201 or AQ-FORM-301 to AQCM when conducting maintenance/service/repair on appliances containing 50 pounds or more of class I, class II, or a blend of class I and class II refrigerant per circuit.

6. Complete and submit form AQ-FORM-401 to AQCM when disposing of appliances with more than 5 pounds of refrigerant per circuit.

Part 3 FORMS

AQ-WI-101

WORK INSTRUCTIONS

NEW REFRIGERANT APPLIANCE

Reference Procedure:
AQ-PROC-100

Purpose:
The purpose of these instructions is to collect and maintain required data from a new appliance (or existing appliance not previously inventoried) contained on form AQ-FORM-101 and either enter or supply the data to be entered in SAP (where available on Lexington campus) or submitted to AQCM for submittal into SPHERA to maintain inventory records.

Scope:
The instructions apply to all University employees, contractors, and vendors that install or maintain refrigerant appliances, other than small appliances. A small appliance is one which contains equal to or less than 5 pounds of refrigerant per circuit.

Responsible Personnel:
Environmental Management – Air Quality Compliance Manager
University, Contractor, and Vendor 40 CFR 82, Subpart F Certified Technicians

Supporting Documents:
AQ-FORM-101

Work Instructions:

1. University staff that enter new appliance information into the SAP tracking system must collect the information on form AQ-FORM-101. Use of the actual form is not required as long as the data is entered in SAP.
2. Departments or buildings that own and operate refrigerant appliances not maintained through PPD, MCPPD, or Athletics must complete form AQ-FORM-101 and submit to the AQCM whenever installing new appliances. The AQCM will enter the information into the SPHERA refrigerant software.
3. Contractors and vendors must complete form AQ-FORM-101 whenever installing new appliances and submit to University staff for entry into SAP. For University property not maintained through SAP, the form must be submitted to the Department or building operator, which must forward the information to the AQCM.
4. The AQCM must run weekly reports from SAP to retrieve new equipment to add into SPHERA.

5. As appliances are added into SAP and SPHERA, an appliance identification number will be assigned and future work or disposal will rely on that identifier to manage the appliance.
6. All records, EPA requests, and reports must be maintained for three years. Additionally, the information collected for a new appliance on AQ-FORM-101, must be kept until three years after appliance is retired.

END OF SECTION 230500

SECTION 230800 - COMMISSIONING OF HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes commissioning process requirements for the following HVAC&R systems, assemblies, and equipment:

1. Energy supply systems, including central-plant steam supply.
2. Heat generation systems, including hot-water boilers and het recovery chillers.
3. Cooling generation systems, including chilled-water systems and central plant chilled water supply.
4. Distribution systems, including air distribution (heating and cooling) systems, steam distribution systems, heating-water distribution systems, chilled-water distribution systems, exhaust systems, air-handling units.
5. Terminal and packaged units, including unit heaters, fan-coil units, finned-tube radiation, variable air volume units.
6. Vibration and sound systems, including sound attenuation, vibration isolation devices
7. Controls and instrumentation, including BAS, energy monitoring and control system.
8. Systems testing and balancing verification, including heating-water piping systems], chilled-water piping systems, domestic hot-water circulating systems, supply-air systems, return-air systems, exhaust-air systems

B. Related Requirements:

1. Section 019113 "General Commissioning Requirements" for general commissioning process requirements and Commissioning Coordinator responsibilities.

1.3 DEFINITIONS

A. BAS: Building automation system.

B. DDC: Direct digital controls.

C. HVAC&R: Heating, Ventilating, Air Conditioning, and Refrigeration.

D. "Systems," "Subsystems," "Equipment," and "Components": Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, equipment, and components.

E. TAB: Testing, adjusting, and balancing.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For BAS and HVAC&R Testing Technician.

B. Construction Checklists: See related Sections for technical requirements for the following construction checklists:

1. Vibration controls for HVAC&R piping and equipment.
2. Instrumentation and control for HVAC&R.
3. Heating-water piping and accessories.
4. Cooling-water piping and accessories.
5. Steam and condensate piping and accessories.
6. Refrigerant piping.
7. Metal ducts and accessories.
8. Fans.
9. Particulate air filtration.
10. Air-handling units.
11. Fan Coil Units.
12. Boilers.
13. Chillers.
14. Pumps.

1.5 QUALITY ASSURANCE

A. BAS Testing Technician Qualifications: Technicians to perform BAS construction checklist verification tests, construction checklist verification test demonstrations, commissioning tests, and commissioning test demonstrations shall have the following minimum qualifications:

1. Journey-level or equivalent skill level with knowledge of BAS, HVAC&R, electrical concepts, and building operations.
2. Minimum three years experience installing, servicing, and operating systems manufactured by approved manufacturer.
3. International Society of Automation (ISA) Certified Control Systems Technician (CCST) Level I.

B. HVAC&R Testing Technician Qualifications: Technicians to perform HVAC&R construction checklist verification tests, construction checklist verification test demonstrations, commissioning tests, and commissioning test demonstrations shall have the following minimum qualifications:

1. Journey-level or equivalent skill level. Vocational School four-year program graduate or an Associates degree in mechanical systems, air conditioning, or similar field. Degree may be offset by three years' experience in servicing mechanical systems in the HVAC industry. Generally, required knowledge includes HVAC&R systems, electrical concepts, building operations, and application and use of tools and instrumentation to measure performance of HVAC&R equipment, assemblies, and systems.
2. Minimum three years experience installing, servicing, and operating systems manufactured by approved manufacturer.
3. One of the following:

    a. National Environmental Balancing Bureau (NEBB) Certified Testing, Adjusting, and Balancing Technician.
    b. Associated Air Balance Council (AABC) Certified Test and Balance Technician.

c. Owner retains the right to waive NEBB or AABC Certification.

C. Testing Equipment and Instrumentation Quality and Calibration: For test equipment and instrumentation required to perform HVAC&R commissioning work, perform the following:

1. Submit test equipment and instrumentation list. For each equipment or instrument, identify the following:

a. Equipment/instrument identification number.
b. Planned commissioning application or use.
c. Manufacturer, make, model, and serial number.
d. Calibration history, including certificates from agencies that calibrate the equipment and instrumentation.

2. Test equipment and instrumentation shall meet the following criteria:

a. Capable of testing and measuring performance within the specified acceptance criteria.
b. Be calibrated at the manufacturer's recommended intervals with current calibration tags permanently affixed to the instrument being used.
c. Be maintained in good repair and operating condition throughout the duration of use on this Project.
d. Be recalibrated/repaired if dropped or damaged in any way since last calibrated.

D. Proprietary Test Instrumentation and Tools:

1. Equipment Manufacturer's Proprietary Instrumentation and Tools: For installed equipment included in the commissioning process, test instrumentation and tools manufactured or prescribed by equipment manufacturer to service, calibrate, adjust, repair, or otherwise work on its equipment or required as a condition of equipment warranty, perform the following:

a. Submit proprietary instrumentation and tools list. For each instrument or tool, identify the following:

1) Instrument or tool identification number.
2) Equipment schedule designation of equipment for which the instrument or tool is required.
3) Manufacturer, make, model, and serial number.
4) Calibration history, including certificates from agencies that calibrate the instrument or tool, where appropriate.

b. Include a separate list of proprietary test instrumentation and tools in the operation and maintenance manuals.
c. HVAC&R proprietary test instrumentation and tools become the property of Owner at the time of Substantial Completion.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 GENERAL TESTING REQUIREMENTS

A. Certify that HVAC&R systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents and approved Shop Drawings and submittals.

B. Certify that HVAC&R instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents and approved Shop Drawings and submittals, and that pretest set points have been recorded.

C. Certify that TAB procedures have been completed and that TAB reports have been submitted, discrepancies corrected, and corrective work approved.

D. Set systems, subsystems, and equipment into operating mode to be tested according to approved test procedures (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).

E. Measure capacities and effectiveness of systems, assemblies, subsystems, equipment, and components, including operational and control functions to verify compliance with acceptance criteria.

F. Test systems, assemblies, subsystems, equipment, and components operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and response according to acceptance criteria.

G. Construction Checklists: Prepare and submit detailed construction checklists for HVAC&R systems, subsystems, equipment, and components.

1. Contributors to the development of construction checklists shall include, but are not limited to, the following:

a. HVAC&R systems and equipment installers.
b. TAB technicians.
c. HVAC&R instrumentation and controls installers.

H. Perform tests using design conditions, whenever possible.

1. Simulated conditions may, with approval of Architect, be imposed using an artificial load when it is impractical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by Commissioning Coordinator and document simulated conditions and methods of simulation. After tests, return configurations and settings to normal operating conditions.
2. Commissioning test procedures may direct that set points be altered when simulating conditions is impractical.
3. Commissioning test procedures may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are impractical.

I. If tests cannot be completed because of a deficiency outside the scope of the HVAC&R system, document the deficiency and report it to Owner. After deficiencies are resolved, reschedule tests.

J. If seasonal testing is specified, complete appropriate initial performance tests and documentation and schedule seasonal tests.

K. Coordinate schedule with, and perform the following activities at the direction of, Commissioning Coordinator.

L. Comply with construction checklist requirements, including material verification, installation checks, start-up, and performance tests requirements specified in Sections specifying HVAC systems and equipment.

M. Provide technicians, instrumentation, tools, and equipment to complete and document the following:

1. Performance tests.
2. Demonstration of a sample of performance tests.
3. Commissioning tests.
4. Commissioning test demonstrations.

3.2 TAB COMMISSIONING TESTS

A. TAB Verification:

1. Prerequisites: Completion of "Examination" Article requirements and correction of deficiencies, as specified in Section 230593 "Testing, Adjusting, and Balancing for HVAC."
2. Completion of "Preparation" Article requirements for preparation of a TAB plan that includes strategies and step-by-step procedures, and system-readiness checks and reports, as specified in Section 230593 "Testing, Adjusting, and Balancing for HVAC."
3. Scope: HVAC&R air systems and hydronic piping systems.
4. Purpose: Differential flow relationships intended to maintain air pressurization differentials between the various areas of Project.
5. Conditions of the Test:

    a. Commissioning Test Demonstration Sampling Rate: As specified in "Inspections" Article in Section 230593 "Testing, Adjusting, and Balancing for HVAC."
    b. Systems operating in full heating mode with minimum outside-air volume.
    c. Systems operating in full cooling mode with minimum outside-air volume.
    d. For measurements at air-handling units with economizer controls; systems operating in economizer mode with 100 percent outside air.

6. Acceptance Criteria:

    a. Under all conditions, rechecked measurements comply with "Inspections" Article in Section 230593 "Testing, Adjusting, and Balancing for HVAC."
    b. Additionally, no rechecked measurement shall differ from measurements documented in the final report by more than two times the tolerances allowed.
    c. Under all conditions, where the Contract Documents indicate a differential in airflow between supply and exhaust and/or return in a space, the differential relationship shall be maintained.

END OF SECTION 230800

SECTION 231100 - REGISTERS, GRILLES, DIFFUSERS AND LOUVERS

1. REGISTERS, GRILLES AND DIFFUSERS

   A. GENERAL

      Alternate R, G & D selections, other than manufacturers and models listed below, will be accepted, provided quality, function and characteristics are equivalent. Acceptable alternates are Price, Titus, Metalaire, Carnes, Anemostat, Kruegar, and Tuttle & Bailey. Shop drawings shall identify and list all characteristics of each device exactly as scheduled herein. Finishes shall be selected by the Architect. If Architect elects not to select color, all colors shall be off-white. Factory color samples shall be submitted with shop drawings.

   B. SELECTION

      Refer to the Selections Scheduled on the Drawings.

2. LOUVERS

   A. GENERAL

      Alternate louver selections, other than manufacturer and model listed below, will be accepted, provided quality, function and characteristics are equivalent. Acceptable alternates are Ruskin, Air Balance, Airline, Airstream, Louvers and Dampers and Penn. Shop drawings shall identify and list all characteristics of each device exactly as scheduled herein. Finishes shall be selected by the Architect unless scheduled otherwise.

   B. LINTELS

      Provide lintels above all louvers as required. Refer to the lintel schedule in Specification Section 201100.

   C. SELECTION

      Refer to the Selections Scheduled on the Drawings.

END OF SECTION 231100

SECTION 231200 - SHEET METAL AND FLEXIBLE DUCT

1. GENERAL

A. The Contractor's attention is directed to the General and Special Conditions, General Requirements-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section, and which are hereby made a part of the work specified herein.

B. This branch of the work includes all materials, labor and accessories for the fabrication and installation of all sheet metal work as shown on the drawings and/or as specified herein. Where construction methods for various items are not indicated on the drawings or specified herein, all such work shall be fabricated and installed in accordance with the recommended methods outlined in the latest edition of SMACNA's HVAC Duct Construction Standards, Metal and Flexible, and its subsequent addenda. HVAC duct systems shall be fabricated and installed in accordance with the SMACNA duct construction standards (SMACNA-HVAC and SMACNA-Seismic) including Appendix B of the Seismic Restraint Manual Guidelines for Mechanical Systems. These references and plate numbers shall be used by the Engineer for required sheet metal thicknesses and final acceptance of methods of fabrication, hanging, accessories, etc. All equipment furnished by manufacturers shall be installed in strict accord with their recommended methods.

C. Ductwork shall be constructed and installed per the latest edition of the International Mechanical Code.

D. Ductwork shall be kept clean at all times. Ductwork stored on the job site shall be placed a minimum of 4" above the floor and shall be completely covered in plastic. Installed ductwork shall be protected with plastic to prohibit dust and dirt from entering the installed ductwork, air handling unit, terminal devices, etc. Provide temporary filters on all return grilles and duct openings if the units are running prior to the building being satisfactorily cleaned. Do not install the ductwork if the building is not "dried-in". If this is required, the open ends of duct shall be covered in plastic to protect. The Owner/Engineer shall periodically inspect that these procedures are followed. If deemed unacceptable, the Contractor shall be required to clean the duct system utilizing a NADCA certified Contractor.

Prior to purchase and fabrication of ductwork (shop fabricated or manufactured), the Contractor shall coordinate installations with new and existing conditions. Notify the Engineer if there are any discrepancies for resolution.

E. Provide a SMACNA duct cleanliness level "C" per the latest SMACNA standards. [Refer to LEED / Healthcare Requirements]

F. If separate filter grilles are specified for an HVAC unit the Contractors shall remove any unit mounted filters and blank off the unused filter access opening with sheet metal and seal air tight.

G. Wall Penetrations: Where ducts penetrate interior or exterior walls, the walls shall be sealed air tight. Refer to the sleeving, cutting, patching, and repairing section of the specifications for additional requirements.

H. Duct dimensions indicated are required inside clear dimensions. Plan duct layouts for adequate insulation and fitting clearance.

I. Prior to purchase/shipment of the ductwork, manufacturer shall provide as part of the submittal process scaled, field coordinated AutoCAD drawings of the complete system to be furnished.

Drawings will indicate all system components including fittings, ductwork and manifolds. Drawings shall be available in an electronic format.

2. LOW PRESSURE DUCTWORK

A. General (Low Pressure)

(1) Double turning vanes shall be installed in all square turns and in any other locations indicated.

(2) Provide a “high efficiency” type take-off with round damper (Flexmaster STOD-B03 or approved equal) for all round duct branches from a rectangular main to a GRD. Refer to the detail on the drawings for all installation requirements.

(3) Cross-break all ducts where any duct section dimension or length is 18" or larger.

(4) Air volume dampers shall be installed in each duct branch takeoffs and/or where indicated, whichever is more stringent. All such dampers shall be accessible without damage to finishes or insulation and shall be provided where required for proper system balance.

(5) Splitter dampers shall be provided in all rectangular supply air duct tees. Damper blade operator shall extend a minimum two inches thru the insulation.

(6) Unless otherwise dimensioned on the drawings, all diffusers, registers and grilles shall be located aesthetically and symmetrically with respect to lighting, ceiling patterns, doors, masonry bond, etc. Locate all supply, return and exhaust diffusers and grilles in the locations shown on the architectural reflected ceiling plan.

(7) Ducts shall be hung by angles, rods, 18 ga. minimum straps, trapezes, etc., in accordance with SMACNA's recommended practices. Duct supports shall not exceed 12 ft intervals. There shall be no less than one set of hangers for each section of ductwork. Where ductwork contains filter sections, coils, fans or other equipment or items, such equipment or items shall be hung independently of ductwork with rods or angles. Do not suspend ducts from purlins or other weak structural members where no additional weight may be applied. If in doubt, consult the structural engineer.

(8) Provide approved flexible connectors at inlet and outlet of each item of heating and cooling equipment whether indicated or not. Install so as to facilitate removal of equipment as well as for vibration and noise control.

(9) All ductwork connections, fittings, joints, etc., including longitudinal and transverse joints, seams and connections shall be sealed. Seal with medium pressure, smooth-textured, water based duct sealant. Sealant shall be UL 181B-M listed, UL 723 classified, NFPA 90A & 90B compliant, permanently flexible, nonflammable, and rated to 15” wg. Apply per manufacturer's recommendations. Contractors shall ensure no exposed sharp edges or burrs on ductwork.

(10) All angular turns shall be made with the radius of the center line of the duct equivalent to 1.5 times the width of the duct.

(11) Miscellaneous accessories such as test openings with covers, latches, hardware, locking devices, etc., shall be installed as recommended by SMACNA and/or as indicated. Test openings shall be placed at the inlet and discharge of all centrifugal fans, coils, VAV boxes, fan

sections of air handling units, at the end and middle of all main trunk ducts and where indicated. All such openings shall be readily accessible without damage to finishes.

(12) Whether indicated or not, provide code approved, full sized fire dampers at all locations where ductwork penetrates fire rated walls. Fire stop rating shall meet or exceed the rating of the wall. Provide an approved access panel at each fire damper located and sized so as to allow hand reset of each fire dampers. All such fire dampers and access panels shall be readily accessible without damage to finishes. Refer to Architectural Plans for locations of fire rated walls. All access doors shall be 16"x16" or as high as ductwork permits and 16" in length.

(13) The Contractor who installs the sheet metal shall furnish to the Air Balancing Contractor, a qualified person to assist in testing and balancing the system.

(14) All fans and other vibrating equipment shall be suspended by independent vibration isolators.

(15) The interior surface of the ductwork connecting to return/exhaust air grilles shall be painted flat black. The ductwork shall be painted a minimum of 24" starting from the grille.

B. Materials (Low Pressure Single Wall)

(1) Ductwork, plenums and other appurtenances shall be constructed of the following:

a. Steel sheets, zinc coated, Federal Specification 00-S-775, Type I, Class E & ASTM A93-59T with G-90 zinc coating or aluminum alloy sheets 3003, Federal Specification AA-A-359, Temper H-14. Utilize Aluminum in MRI Scan Rooms or NMR Room applications.

b. Any ductwork exposed to view (electrical rooms, elevator machine rooms, etc.) shall be double wall and constructed of galvanized steel. Galvanized metal shall be prepped and clean prior to painting. Coordinate with General Contractor.

(2) Ductwork, plenums and other appurtenances shall be constructed of the materials of the minimum weights or gauges as required by the latest SMACNA 2” W.G. Standard or the below table, whichever is more stringent. When gauge thickness differs, the heavier gauge shall be selected. The below table shall serve as a minimum:

	ROUND DUCT	RECTANGULAR DUCT	
DIA., INCHES	GAUGE	WIDTH, INCHES	GAUGE
3 TO 12	26	UP TO 12	26
12 TO 18	24	13 TO 30	24
19 TO 28	22	31 TO 54	22
29 TO 36	20	55 TO 84	20
37 TO 52	18	85 AND ABOVE	18

C. Miscellaneous (Low Pressure)

(1) Un-insulated Flexible ductwork (for Return Air and Exhaust Air only)

a. Un-insulated flexible ductwork shall be corrugated aluminum. No sections shall be greater than five feet in length. Ductwork shall be UL rated and in accordance with IMC.

b. Flexible ductwork installed in a return or exhaust or other negative static pressure application shall be rated for installation in negative pressure systems.

c. Provide Titus “FlexRight” or equal flexible duct bracing at each diffuser connection utilizing flexible ductwork.

(2) Insulated Flexible Duct – Steel or Aluminum (Use Only Where Indicated)

a. Flexible duct shall be a factory-fabricated assembly consisting of an all steel or aluminum material. Plastic with spiral wire flexible duct is not permitted.

b. All supply flexible duct shall be insulated with 1 ½ inch blanket of glass wool with an outer moisture barrier. The insulation assembly shall have a flame spread of not more than 25 and a smoke development rate of not over 50.

c. Flexible duct shall be rated for 10 inches W.G. static pressure.

d. A single length of flexible duct shall not exceed 4’0”.

e. The minimum bend radius shall be 1 ½ times the duct diameter. The radius shall be measured to the inside edge of the flexible duct.

f. Total offset in any run of flexible duct shall not exceed 90 degrees.

g. Provide a minimum of one hanger of each run of flexible duct. The hanger must be strapped around the flexible duct and secured to the structure above. Hangers shall not be attached to other mechanical or electrical objects. Hangers may be attached to an approved trapeze. Ceiling grid shall not be used to fabricate a trapeze. Support hangers shall be installed horizontal. Screws shall not be used to penetrate the flexible duct to attach the hanger.

h. Flexible duct shall be secured to the rigid duct and appliance with a nylon adjustable, self-locking, strap and a minimum of three sheet metal screws. The flexible duct shall be sealed airtight at each connection with self-adhesive aluminum tape. Fiber or cloth duct tape is not permitted to seal rigid or flexible duct.

i. All flexible duct shall be pressure tested by a testing and balancing agency to ensure the installation is airtight.

j. Provide Titus “FlexRight” or equal flexible duct bracing at each diffuser connection utilizing flexible ductwork.

(3) Flexible Connectors: Duro-Dyne, Ventfabrics, Inc., U.S. Rubber or equivalent; conforming to NFPA Pamphlet No. 90-A; neoprene coated glass fabric; 20 oz. for low pressure ducts secured with snap lock.

(4) Turning Vanes: Duro-Dyne or equivalent fabricated as recommended by SMACNA: noiseless when in place without mounting projections in ducts. All turning vanes shall be double blade type.

(5) Splitter Damper: Splitter damper shall be constructed of 16-gauge galvanized steel. Provide with operating hardware by Ventfabrics, Inc. to include damper blade bracket, ball joint bracket and operator shaft. Operator shall extend two inches from duct to allow for external insulation, where required. Regulator shall seal operator shaft air tight. Install hardware as recommended by manufacturer.

(6) Access Doors; In Ductwork: Flexmaster TBSM, Air Balance, Vent Products or equal. Access doors for rectangular ducts shall be 16"x16" where possible. Otherwise install as large an access door as height permits by 16" in length. Door shall be 1” thick double-wall insulated with continuous hinge and cam lock. Provide in ducts where indicated or where required for servicing equipment whether indicated or not. Provide a hinged access door in duct adjacent to all fire, smoke and control dampers for the purpose of determining position. Access doors shall also be provided on each side of duct coils (water, electric, steam, etc.) and downstream side of VAV boxes and CAV boxes.

(7) Architectural Access Doors in Ceilings or Walls: Provide where required to access equipment, dampers, valves, filters, etc. Provide Kees D Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 16 gauge galvannealed steel for door and frame. In finished areas, provide with primed steel with 1” border to accept architectural specified finish. In Mechanical, Electrical, or service spaces, provide brushed satin finish with 1” border. Door shall include three (3) screwdriver operated cam latches and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to ensure a complete project.

(8) Security Architectural Access Doors in Walls: Provide where required to access equipment, dampers, valves, filters, etc.Provide Kees SSAP Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 12-gauge steel for door and frame. In finished areas, provide with primed steel with 1” border to accept architectural specified finish. In Mechanical, Electrical, or service spaces, provide brushed satin finish with 1” border. Door shall include key-operated cylinder dead bolt lock (coordinate cylinders and keys with Owner to match facility standards) and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors and straps. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to ensure a complete project.

(9) Volume Dampers (Rectangular): Ruskin, Model MD35 or Empco, Air Balance; Louvers and Dampers, Titus, Carnes, Cesco/Advanced Air, Creative Metals, United Air, Pottorf rectangular volume dampers. Frames shall be 4" x 1 "x 16-gauge galvanized steel. Blades shall be opposed

blade 16-gauge galvanized steel with triple crimped blades on 6” centers. Linkage shall be concealed in jamb. Bearings shall be ½” nylon. Maximum single section size shall be 48" wide and 72" high. Provide with Ventfabrics 2" high elevated dial regulator to avoid damper handle from conflicting with duct insulation. Provide permanent mark on dial regulator to mark air balance point.

(10) Volume Dampers (Round): Ruskin, Model MDRS25 or, Empco, Air Balance; Louvers and Dampers, Titus, Carnes, Cesco/Advanced Air, Creative Metals, United Air, Pottorff round volume dampers. Dampers shall be butterfly type consisting of circular blade mounted to axle. Frames shall be 20-gauge steel, 6" long. Damper blades shall be 20-gauge galvanized steel. Axle shall be 3/8"x6” square plated steel. Bearing shall be 3/8” nylon. Provide with Ventfabrics 2" high elevated dial regulator to avoid damper handle from conflicting with duct insulation. Provide permanent mark on dial regulator to mark air balance point.

(11) Fire Dampers: Fire dampers shall comply with IMC and shall be constructed and tested in accordance with UL Safety Standard 555. Each fire damper shall have a 1-1/2 or 3-hour fire protection rating as required by fire wall. Damper shall have a 165°F fusible link, and shall include a UL label in accordance with established UL labeling procedures. Fire damper shall be equipped for vertical or horizontal installation as required by the location shown. Fire dampers shall be installed in wall and floor openings utilizing 16-gauge minimum steel sleeves, angles, other materials, practices required to provide an installation equipment to that utilized by the manufacturer when dampers were tested at UL. Installation shall be in accordance with the damper manufacturer's instructions. All fire dampers shall be dynamic. Static fire dampers are not allowed. Provide velocity level and pressure level as required for application (if in doubt, contact Engineer). Fire dampers shall be Ruskin Type DIBD for 1-1/2-hour rating or Ruskin Type DIBD 23 for a 3-hour rating. *All fire dampers at horizontal assembly penetrations where concrete curbs are provided shall be based on Ruskin DFD35/OW (or Ruskin DFD35/OWSS for laboratory, pharmacy, and central sterile exhaust duct systems as described herein).* Other acceptable manufacturers are Air Balance, Prefco, Greenheck, Nailor, or Safe Air. Provide an access door for fire damper reset at all fire damper locations.

(12) Motor Driven Smoke Dampers – Air Foil Blade: Provide Ruskin SD60 smoke damper where required by the locations of smoke partitions or as shown on the plans, whichever is more stringent. Other acceptable manufacturers are Air Balance or Pottorff. All smoke dampers shall be three inches larger than HVAC duct in each direction. Frame shall be a minimum of 18-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Each smoke damper shall be classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close under HVAC system operating conditions) with pressures of at least the maximum possible of the HVAC system in the closed position, and the system maximum duct air velocity in the open position. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Actuator to be mounted outside of air stream. The pressure drop shall not be greater than .16" wg @ 2500 FPM when tested by an independent laboratory. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements.

(13) Motor Driven Fire/Smoke Dampers – Air Foil Blade: Fire damper shall be constructed and tested in accordance with UL Safety Standard 555. The damper shall be Ruskin FSD60. Other acceptable manufacturers are Air Balance or Pottorff. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Frame is to be a minimum of 16-gauge galvanized steel, rollformed into a structural hat shape channel. Frame seals shall consist of flexible, compression type stainless steel. The damper and actuator electric shall be rated to an elevated temperature or 250 degrees F or 350 degrees F. In addition, the damper must be factory supplied with actuator and sleeve to comply with the requirements of UL 555S. These dampers shall have been constructed and tested in compliance with U.L. Standard 555 and U.L. Standard 555S, current editions. The pressure drop shall not be greater than .25 in.wg. At 2500 fpm when tested by an independent laboratory. Each damper shall bear an approved U.L. label identifying its classification as a Dynamic Rated Fire Damper (Static Rated dampers are not acceptable), and shall further be classified by U.L. as a Leakage Rated Damper for use in Smoke Control Systems. Each damper shall have a 1-1/2-hour fire protection rating, 212EF U.L. Listed fusible link and a leakage class I. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Provide factory supplied caulked sleeve, 20 gauge on dampers through 84” wide and 18 gauge above 84" wide. Actuator to be mounted outside of air stream. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements.

(14) Motor Driven Control Dampers – Provide Ruskin Model CD50 air foil damper as shown on the plans. Frame shall be a minimum of 16-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, 6 inches wide. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Blade seals shall be equal to Ruskinprene. Leakage Rating shall be Pressure/Class 1.

3. MEDIUM PRESSURE DUCTWORK

A. General (Medium Pressure)

(1) All ductwork connections, fittings, joints, etc., shall be sealed. Seal with high velocity, smooth-textured, water based duct sealant. Sealant shall be UL 181B-M listed, UL 723 classified, NFPA 90A & 90B compliant, permanently flexible, non-flammable, and rated to 15” wg. Apply per manufacturer's recommendations.

(2) Ductwork shall be installed per SMACNA Medium or High-Pressure Manual, whichever is applicable. (Latest Edition shall apply.)

(3) All hanger straps shall be 18 ga. minimum with reinforcement angles installed in strict accordance with SMACNA. Flat oval ducts shall be installed with 2"x2"x1/4" angles on top and bottom ducts 18" wide and larger. Use 1"x1"x3/16" angles on ducts under 18" wide.

(4) Miscellaneous accessories such as test openings with covers, latches, hardware, locking devices, etc., shall be installed as recommended by SMACNA or the duct manufacturer, and/or as indicated. Test openings shall be placed at the discharge of all air handling units and at the

end and middle of all main trunk ducts and where indicated. All such openings shall be readily accessible without damage to finishes.

(5) Whether indicated or not, provide code approved, full sized fire dampers at all locations where ductwork penetrates fire rated walls. Fire stop rating shall meet or exceed the rating of the wall. Provide an approved access panels at each fire damper located and sized so as to allow hand reset of each fire damper. All such fire dampers and access panels shall be readily accessible without damage to finishes. Refer to Architectural Plans for locations of fire rated walls. Where access doors are installed in insulated ductwork, the access door shall be the insulated type.

B. Materials (Medium Pressure Single Wall)

(1) All round, rectangular, and oval medium pressure ductwork for systems above 1.5" W.G. shall be Eastern Sheet Metal, United McGill or Semco or equal with construction as required by the latest SMACNA Standard (Refer to required pressure rating of the duct system as outlined in the Duct Schedule of this spec section).

(2) Any ductwork exposed to view shall be double wall and constructed of galvanized steel. Galvanized metal shall be prepped and clean prior to painting. Coordinate with General Contractor.

Ductwork shall be spiral, lock-seam construction fabricated from galvanized steel meeting ASTM-527 standard. Ductwork shall be constructed of materials of the minimum weights or gauges as required by the latest SMACNA Standard (Refer to required pressure rating of the duct system as outlined in the Duct Schedule of this spec section) or the below table. When gauge thickness differs, the heavier gauge shall be selected. The below table shall serve as a minimum:

	ROUND DUCT (or Equivalent Round Diameter for Oval Ducts)	RECTANGULAR DUCT	
DIA., INCHES	GAUGE	WIDTH, INCHES	GAUGE
3 TO 14	26	UP TO 12	26
15 TO 26	24	13 TO 30	24
27 TO 36	22	31 TO 54	22
37 TO 50	20	55 TO 84	20
52 TO 60	18	85 AND ABOVE	18

(3) All medium pressure duct fittings shall be fabricated by the same manufacturer as the spiral pipe. Contractor or field fabricated fittings shall not be accepted. Duct fittings shall be constructed per the latest SMACNA standard (Refer to required pressure rating of the duct system as outlined in the Duct Schedule of this spec section) with continuous welds. Take-off fittings shall be combination type tees (Eastern Sheet Metal Model "CB" or equal). Straight or angle tees are not acceptable. Fittings shall be constructed of the following minimum gauges:

	ROUND DUCT (or Equivalent Round Diameter for Oval Ducts)	RECTANGULAR DUCT	
DIA., INCHES	GAUGE	WIDTH, INCHES	GAUGE
3 TO 50	20	UP TO 36	20
51 TO 60	18	37 TO 60	18
61 TO 84	16	61 AND ABOVE	16

(4) All single wall ductwork will be furnished with factory installed flanges equal to Eastern Sheet Metal Flange on all ductwork greater than 24 inches in size.

C. Miscellaneous (Medium pressure)

(1) Flexible Connectors: Duro-Dyne, Ventfabrics, U.S. Rubber or equivalent; conforming to NFPA Pamphlet No. 90-A or IMC, whichever is more stringent; neoprene coated glass fabric; 30 oz. for medium pressure ducts secured with bolted angles. Provide flexible connectors at inlet and outlet of air handling equipment to accommodate a minimum of three times the operating pressure of the system.

(2) Architectural Access Doors In Ceilings or Walls: Provide where required to access equipment, dampers, valves, filters, etc. Provide Kees D Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 16 gauge galvannealed steel for door and frame. In finished areas, provide with primed steel with 1” border to accept architectural specified finish. In Mechanical, Electrical, or service spaces, provide brushed satin finish with 1” border. Door shall include three (3) screwdriver operated cam latches and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to ensure a complete project.

(3) Security Architectural Access Doors in Walls: Provide where required to access equipment, dampers, valves, filters, etc. Provide Kees SSAP Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 12-gauge steel for door and frame. In finished areas, provide with primed steel with 1” border to accept architectural specified finish. In Mechanical, Electrical, or service spaces, provide brushed satin finish with 1” border. Door shall include key-operated cylinder dead bolt lock (coordinate cylinders and keys with Owner to match facility standards) and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors and straps. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to ensure a complete project.

(4) Fire Dampers: Fire dampers shall comply with IMC and shall be constructed and tested in accordance with UL Safety Standard 555. Each fire damper shall have a 1-1/2 or 3-hour fire protection rating as required by fire wall. Damper shall have a 165°F fusible link, and shall include a UL label in accordance with established UL labeling procedures. Fire damper shall be equipped for vertical or horizontal installation as required by the location shown. Fire dampers shall be installed in wall and floor openings utilizing 16-gauge minimum steel sleeves, angles, other materials, practices required to provide an installation equipment to that utilized by the manufacturer when dampers were tested at UL. Installation shall be in accordance with the damper manufacturer's instructions. All fire dampers shall be dynamic. Static fire dampers are not allowed. Provide velocity level and pressure level as required for application (if in doubt, contact Engineer). Fire dampers shall be Ruskin Type DIBD for 1-1/2-hour rating or Ruskin Type DIBD 23 for a 3-hour rating. Other acceptable manufacturers are Air Balance, Prefco, Greenheck, Nailor, or Safe Air. *All fire dampers at horizontal assembly penetrations where concrete curbs are provided shall be based on Ruskin DFD35/OW (or Ruskin DFD35/OWSS for laboratory, pharmacy, and central sterile exhaust duct systems as described herein).* Provide an access door for fire damper reset at all fire damper locations.

(5) Motor Driven Smoke Dampers – Air Foil Blade: Provide Ruskin SD60 smoke damper where required by the locations of smoke partitions or as shown on the plans, whichever is more stringent. Other acceptable manufacturers are Air Balance or Pottorff. Frame shall be a minimum of 18-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Each smoke damper shall be classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close under HVAC system operating conditions) with pressures of at least the maximum possible of the HVAC system in the closed position, and the system maximum duct air velocity in the open position. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Actuator to be mounted outside of air stream. The pressure drop shall not be greater than .16" wg @ 2500 FPM when tested by an independent laboratory. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements.

(6) Motor Driven Fire/Smoke Dampers – Air Foil Blade: Fire damper shall be constructed and tested in accordance with UL Safety Standard 555. The damper shall be Ruskin FSD60. Other acceptable manufacturers are Air Balance or Pottorff. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Frame is to be a minimum of 16-gauge galvanized steel, rollformed into a structural hat shape channel. Frame seals shall consist of flexible, compression type stainless steel. The damper and actuator electric shall be rated to an elevated temperature or 250 degrees F or 350 degrees F. In addition, the damper must be factory supplied with actuator and sleeve to comply with the requirements of UL 555S. These dampers shall have been constructed and tested in compliance with U.L. Standard 555 and U.L. Standard 555S, current editions. The pressure drop shall not be greater than .25 in.wg. At 2500 fpm when tested by an independent laboratory. Each damper shall bear an approved U.L. label identifying its classification as a Dynamic Rated Fire Damper (Static Rated dampers are not acceptable), and shall further be classified by U.L. as a Leakage Rated Damper for use in Smoke Control Systems. Each damper shall have a 1-1/2-

hour fire protection rating, 212EF U.L. Listed fusible link and a leakage class I. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Provide factory supplied caulked sleeve, 20 gauge on dampers through 84" wide and 18 gauge above 84" wide. Actuator to be mounted outside of air stream. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements

(7) Motor Driven Control Dampers – Provide Ruskin Model CD60 air foil damper as shown on the plans. Frame shall be a minimum of 16-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, 6 inches wide. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Blade seals shall be equal to Ruskinprene. Leakage Rating shall be Pressure/Class 1.

(8) Access Doors; In Rectangular Medium Pressure Ductwork: Flexmaster TBSM, Air Balance, Vent Products or equal. Access doors for rectangular ducts shall be 16"x16" where possible. Otherwise install as large an access door as height permits by 16" in length. Door shall be 1" thick double-wall insulated with continuous hinge and cam lock. Provide in ducts where indicated or where required for servicing equipment whether indicated or not. Provide a hinged access door in duct adjacent to all fire, smoke and control dampers for the purpose of determining position.

(9) Access Doors; In Round or Oval Medium Pressure Ductwork: All access doors in round or oval medium pressure ductwork shall be screw and gasketed type. Screws shall be maximum 4 inches on centers. Access door sizes shall be as follows:

DUCT DIAMETER	OPENING SIZE
3-4 inches	4" x 10"
5-6 inches	6" x 10"
7-24 inches	10" x 16"
26-36 inches	16" x 16"
Over 36 inches	16" x 22"

(10) Pressure Relief Doors: *[Designer edit if required]* Provide a pressure relief vent in the supply air ductwork at each air handling unit. It shall be located between the fan outlet and the first manual or automatic (i.e., fire, fire smoke, or any motorized) damper or closure device. It shall be sized to relieve the duct air pressure below the rated pressure construction of the ductwork and above the working pressure of the fan. The supply air relief door shall be Ruskin PRD18 or equal. Provide a vacuum relief vent in the return and/or outside air ductwork at each air handling unit. It shall be located between the air handling unit casing and the first manual or automatic damper or closure device. It shall be sized to relieve the duct vacuum below the rated construction of the ductwork and above the working negative pressure of the fan. The return air relief door shall be Ruskin NRD18 or equal. Automatic fan shutdown upon damper closure shall not be an acceptable protection for either overpressure or vacuum conditions. All duct pressure relief doors shall be of the automatic resetting type unless otherwise noted.

4. CENTRAL STERILE EXHAUST DUCT

A. All ductwork connected to EF20-SUR-2S (including upstream and downstream of air terminal units or flow control valves) shall be 22-gauge stainless steel duct with liquid tight continuous external weld of all seams and joints. Ductwork shall meet all SMACNA requirements for 6" w.g. pressure class ductwork. Provide dielectric connection between steel and any aluminum ductwork. All ductwork shall be sloped a minimum of 1/8" per foot so as to drain back toward the appliance served. Provide drain plugs at the bottom of each duct riser section.

5. LAB/PHARMACY EXHAUST DUCTWORK

A. *PVC Coated Galvanized Ductwork – All Lab Exhaust Duct Systems (including upstream and downstream of air terminal units or flow control valves) connected to the following exhaust fans: EF-PHM-5N, EF11-LAB-2N, EF22-LAB-0S*.

1. All exhaust ductwork down on the plans shall be 4 mil x 4 mil PVC Coated galvanized duct. Ductwork shall meet all SMACNA requirements for 6" w.g. pressure class ductwork. The duct shall be transported, stored, and installed in accordance with SMACNA Advanced Cleanliness standards. Any scratches or imperfections observed in the PVC coating shall be repaired per the manufacturers recommended procedure or removed from the jobsite. No flexible duct shall be allowed on Exhaust systems.

2. All devices located within the exhaust air stream shall be stainless steel or PVC Coated. This includes sound attenuators, screws, dampers, etc.

6. WATER HEATER AND BOILER FLUE STACKS

A. Location

(1) All flues shall be offset to provide, whether indicated or not, a minimum of 10' horizontal separation to any air intake. This distance shall be a 25' minimum on healthcare facilities.

B. Category II and Category IV Appliances (Positive and Negative Pressure Condensing Appliances)

(1) Metal-Fab Corr/Guard, Heat-Fab Saf-T Vent or other approved equal meeting the specification below:

The vent shall be of the double wall, factory-built type for use on condensing appliances or pressurized venting systems serving Category II, III, or IV appliances or as specified by the equipment manufacturer.

Maximum temperature shall not exceed 550°F.

Vent shall be listed for an internal static pressure of 6" w.g. and tested to 15" w.g.

Vent shall be constructed on an inner and outer wall with a 1" annular insulating air space.

The inner wall (vent) shall be constructed of AL29-4C superferritic stainless steel, .015 thickness for 6"-12" diameters and .024 thickness for 14"-24" diameters.

The outer wall (casing) shall be constructed of type 304 stainless steel. .018 thickness for 6”-12” diameters and .024 thickness for 14”-24” diameters.

Inner and outer walls shall be connected by means of spacer clips that maintain the concentricity of the annular space and allow unobstructed differential thermal expansion of the inner and outer walls.

Product shall carry the appropriate UL listing mark or label.

6” to 12” diameter vent shall have 1” clearance to combustibles at 550°F. 14” to 24” diameter vent shall have 5” clearance to combustibles at 550°F.

7. FLUE CAPS

A. Provide a flue cap on all flues. It shall be similar to the Breident positive downdraft eliminator style.

8. GENERATOR MUFFLER EXHAUST SYSTEM

A. Manufacturer shall provide factory-built modular universal stack/vent system tested and listed by Underwriters Laboratories Inc. UL Listings shall include:

a. UL 103 Standard for Building Heating Appliance Chimneys which may produce exhaust gas at temperatures not exceeding 1000˚F under continuous operating conditions and 1400˚F under intermittent condition when burning gaseous, solid, or liquid fuels as described in NFPA-211

b. Additional UL 103 Type HT 2100˚F burnout test for Solid Fuel.

c. UL 2561 1400˚F Chimney for appliances which may produce exhaust gas at temperatures not exceeding 1400˚F under continuous operating conditions and 1800˚F under intermittent conditions.

d. Additional UL 103/2561 pressure testing for positive pressure applications up to 90 inches W.C. after 1400°F continuous exposure.

B. CONSTRUCTION

A. The double wall fiber insulated exhaust system shall be constructed of all-stainless steel. The materials and construction of modular sections and accessories shall be as specified by the terms of the product’s UL listing.

B.

a. Type 444 or 316L stainless steel inner liner.

b. 3-¼” minimum thick fiber insulation.

c. Type 304 BA stainless steel outer jacket.

d. The entire exhaust system, including all accessories (connectors, hardware, anchor plate supports, guides, drains, and terminals), shall be stainless steel.

B. Inner flue shall have an overlapping male/female socket that protects the rolled flange with sealant against condensate and high-pressure cleaning. The inner joints shall be secured with vee bands on the inner and overlapping locking band on the outer jacket.

C. Exhaust system shall be designed to compensate for all temperature induced thermal expansion, installed to be gastight, and thus prevent leakage of combustion products into a building.

D. Exhaust system is based upon Jeremias Model DWFL+3. Detailed manufacturer's submittal drawings shall be provided for approval prior to installation of the exhaust system.

C. INSTALLATION

A. Roof and wall penetrations shall be factory insulated and UL listed as not to require air ventilation for safe installation around combustible materials.

B. Entire exhaust system from the appliance outlet to the termination point, including accessories shall be from one manufacturer, except where noted.

D. WARRANTY

A. The factory-built modular exhaust system shall be warranted against functional failure for a limited lifetime warranty.

B. Manufacturer shall provide ASHRAE flue sizing calculations confirming the inner diameter is in complete compliance with appliance manufacturer's installation instructions.

9. DUCT SCHEDULE

A. Supply Ducts:

(1) Ducts Connected to Fan Coil Units, Furnaces, Heat Pumps, downstream of Terminal Units/VAV boxes

:

a. Pressure Class: Positive 2-inch wg Refer to Low Pressure requirements as outlined in section 2 of this spec.
b. Minimum SMACNA Seal Class: C.
c. SMACNA Leakage Class for Rectangular: 24.
d. SMACNA Leakage Class for Round and Flat Oval: 12.

(2) Ducts Connected to Constant-Volume Air-Handling Units:

a. Pressure Class: Positive 6-inch wg Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: A.
c. SMACNA Leakage Class for Rectangular: 6.
d. SMACNA Leakage Class for Round and Flat Oval: 3.

(3) Ducts Connected to Variable-Air Volume Air-Handling Units:

a. Pressure Class: Positive 6-inch wg Refer to medium pressure standards as

outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: A.
c. SMACNA Leakage Class for Rectangular: 6.
d. SMACNA Leakage Class for Round and Flat Oval: 3.

B. Return Ducts:

(1) Ducts Connected to Fan Coil Units, Furnaces, Heat Pumps, downstream of Terminal Units :

a. Pressure Class: Negative 2-inch wg Refer to Low Pressure requirements as outlined in section 2 of this spec.
b. Minimum SMACNA Seal Class: C.
c. SMACNA Leakage Class for Rectangular: 24.
d. SMACNA Leakage Class for Round and Flat Oval: 12.

(2) Ducts Connected to Air-Handling Units:

a. Pressure Class: Negative 6-inch wg; Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: A.
c. SMACNA Leakage Class for Rectangular: 6.
d. SMACNA Leakage Class for Round and Flat Oval: 3

C. Exhaust/Relief Ducts:

(1) Ducts Connected to Exhaust Fans:

a. Pressure Class: Negative 6-inch wg Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: C.
c. SMACNA Leakage Class for Rectangular: 24.

(2) Ducts Connected to Air-Handling Units:

a. Pressure Class: Positive or Negative 4-inch wg Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: C
c. SMACNA Leakage Class for Rectangular: 24.

(3) Ducts Connected to Laboratory/Pharmacy/Central Sterile Exhaust Fans:

a. Pressure Class: Negative 10-inch wg Refer to Medium Pressure requirements as outlined in section 3 as well as requirements outlined in the appropriate duct sections of this spec.
b. Minimum SMACNA Seal Class: Welded seams, joints, and penetrations.
c. SMACNA Leakage Class: 3.

D. Outdoor Air Ducts:

(1) Ducts Connected to Air-Handling Units:

a. Pressure Class: Positive or Negative 4-inch wg Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: A.

c. SMACNA Leakage Class for Rectangular: 6.

E. Stairwell Pressurization Air Ducts:

(1) Ducts Connected to Stairwell Pressurization Fans:

a. Pressure Class: Positive or Negative 4-inch wg Refer to Medium Pressure requirements as outlined in section 3 of this spec.
b. Minimum SMACNA Seal Class: A.
c. *SMACNA Leakage Class for Rectangular: 6*.

12. Air Leakage Testing of the Ductwork Systems

A. It is the intent of this section to ensure the ductwork installed has minimal air leakage.

B. Air leakage testing shall be accomplished by an AABC or NEBB certified company. Refer to the Test & Balance specifications.

C. It is the intent to test all ductwork. The duct systems which will require testing are as follows:

(1) All supply air duct systems

(2) All return air duct systems.

(3) All stairwell pressurization duct systems.

(4) The following exhaust air duct systems:

a. Pharmacy exhaust connected to EF10_PHM_5N
b. Laboratory exhaust connected to EF11_LAB_2N
c. Isolation room exhaust connected to EF13_ISO_1S
d. Hot room exhaust connected to EF2_HTE_0S and EF5_HTE_1N

D. Do not insulate the supply air systems prior to testing.

E. The maximum allowable air leakage rate for each system tested must conform to SMACNA required leakage class rating as specified in section 11, DUCT SCHEDULE, of this spec.

F. The entire supply air ductwork system shall be tested with some exceptions. On VAV systems, the medium pressure ductwork upstream of the VAV boxes shall only be tested. Cap the duct at the inlet to the VAV box. On low pressure reheat system, all ductwork upstream of the hot water reheat coil shall be tested. The air volume damper and access door upstream of the reheat coil shall be included in the tested system. (Designer, edit above paragraph as required.)

G. All return and exhaust air sheet metal ductwork associated with the systems shall be tested. Flexible ductwork shall not be tested. Cap the main duct prior to the central equipment fan connection. Also cap the branch ducts which serve the diffusers, after the round branch air volume with sheet metal caps. Seal caps well to damper to avoid air loss at this location. This air loss, from the caps, is included in the noted leakage rate.

H. The noted allowable leakage rate is the total allowable. It shall include leakage associated with the following: (Note to Designer to edit.)

(1) All ductwork as described in above paragraphs.

(2) Access doors

(3) Volume dampers

(4) Relief air doors

(5) Smoke dampers

(6) Fire dampers

(7) Fire smoke dampers

(8) End caps used to seal ducts

I. If any duct system fails a test, the contractor shall reseal the system. It shall then be retested until the duct system meets the leakage allowable at no additional cost to the owner.

J. Carefully select the ductwork construction requirements and the type of duct sealant to be used as required to meet the leakage allowances. The sheet metal duct pressure classification is a minimum only. The contractor shall select the appropriate sheet metal pressure classification, duct sealant class and duct sealant materials to meet the project air leakage allowances.

K. A duct pre-installation conference shall be held prior to the installation of the ductwork. Present should be the owner's representative, engineer, Test & Balance Contractor, General Contractor, Mechanical Contractor, Sheet Metal Contractor, Insulation Contractor and the manufacturer's representative of the duct sealant to be used. At this meeting, the contractor shall advise all of the duct materials and sealant materials to be used to meet the air leakage allowances.

L. Whenever the systems are being leak tested by the Test & Balance Contractor, a representative from the Mechanical Contractor shall be present to assist.

END OF SECTION 231200

SECTION 23 1213 - FACILITY FUEL-OIL PUMPS

1.GENERAL

a.RELATED DOCUMENTS

1)Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

b.SUMMARY

1)Section Includes:

(a)Submersible fuel-oil storage tank pumps.
(b)Triplex fuel-oil pumps.
(c)Fuel-oil maintenance systems.

c.DEFINITIONS

1)Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

2)Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

3)Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

d.ACTION SUBMITTALS

1)Product Data: For each type of product.

(a)Include construction details, material descriptions, and dimensions of individual components and profiles.
(b)Include, where applicable, rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

2)Shop Drawings: For fuel-oil pumps.

(a)Include construction details and dimensions of individual components for fuel-oil pumps.
(b)Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

(c)INFORMATIONAL SUBMITTALS

3)Qualification Data: For qualified professional engineer.

4)Field quality-control reports.

5)Sample Warranty: For special warranty.

e.CLOSEOUT SUBMITTALS

1) Operation and Maintenance Data: For fuel-oil pumps and fuel-oil maintenance systems to include in emergency, operation, and maintenance manuals.

2. PRODUCTS

a. PERFORMANCE REQUIREMENTS

1) Maximum Operating-Pressure Ratings: 3-psig (21-kPa) fuel-oil supply pressure at oil-fired appliances.

2) Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

3) Listed and labeled for fuel-oil service by an NRTL acceptable to authorities having jurisdiction.

b. TRIPLEX FUEL-OIL TRANSFER PUMP SETS

1) Description: Comply with HI 3.1-3.5.

(a) Type: Positive-displacement, rotary type.
(b) Impeller: Steel gear with crescent
(c) Housing: Cast-iron foot mounted.
(d) Bearings: Bronze, self-lubricating.
(e) Shaft: Polished steel.
(f) Seals: Mechanical.
(g) Base: Steel.
(h) Pressure Relief: Built in.
(i) Discharge Check Valve: Built in.

2) Drive: Direct close coupled

3) Controls:

(a) Maintain minimum manifold pressure with outdoor-air temperature less than 60 deg F.
(b) Seven-day schedule.
(c) Stage multiple pumps to maintain pressure at a common supply manifold.
(d) Alternate pumps to equalize run time.
(e) Alarm motor failure.
(f) Manual reset dry-run protection.
(g) Stop pumps if fuel level falls below pump suction.
(h) De-energize and sound alarm for pump, locked-rotor condition.
(i) Sound alarm for open circuit and for high and low voltage.
(j) Lights shall indicate normal power on, run, and off conditions.

(k) Provide interface with future automatic control system to control and indicate the following:

i) Start/stop pump set when required by schedule, fuel-fired appliance operation, day tank level control, or weather conditions.
ii) Operating status.
iii) Alarm off-normal status.

4) Piping Furnished with Pumps: Steel with ferrous fittings and threaded or welded joints.

5) Strainers Furnished with Pumps: Duplex, basket type with corrosion-resistant-metal-screen baskets.

6) Capacities and Characteristics:

(a) Refer to plans and schedules

~~*c. FUEL MAINTENANCE SYSTEM*~~

~~*1)Description: Factory-fabricated and wired fuel maintenance system for fuel-oil filtration; with enclosure, filter, fuel-oil pump, and controls.*~~

~~*(a) System shall be FMG approved and listed and labeled by an NRTL acceptable to authorities having jurisdiction.*~~
~~*(b) Enclosure: NEMA 250, Type 3R, painted steel containing pumps, filters, accessories, and controls. Hinged door on the front of enclosure.*~~
~~*(c) Pump: Comply with HI 3.1-3.5, steel gear with crescent, positive displacement, direct coupled, rotary type.*~~
~~*(d) Materials: Cast-iron housing; bronze bearings; steel shaft; mechanical seals; and built-in, pressure relief bypass valve.*~~
~~*(e) Piping: Steel with malleable-iron fittings and threaded joints or wrought-steel fittings and welded joints.*~~
~~*(f) Spin-On, Replaceable, Multistage Filters:*~~

~~*i) Stage 1: 100-mesh strainer.*~~
~~*ii) Stage 2: Centrifuge to separate particulates and water from oil.*~~
~~*iii) Stage 3: Coalescing water and particulate filter.*~~
~~*iv) Stage 4: 30-micron particulate removal.*~~
~~*v) Stage 5: 10-micron particulate removal.*~~
~~*vi) Stage 6: Minimum 99.5 percent water removal with see-through bowl and water-sensor probe.*~~
~~*vii) Stage 7: 3-micron particulate removal.*~~

~~*(g) Programmable Logic Controller:*~~

~~*i) Alarm on maximum 15-in. Hg (51-kPa) vacuum at pump suction indicating plugged filter.*~~
~~*ii) Alarm on high water level in filter.*~~
~~*iii) Alarm leak in enclosure.*~~
~~*iv) Touch screen; with minimum 2-line, 20-character, backlit, LCD display.*~~
~~*v) Controller strip heater with thermostat.*~~

~~*(h) Interface with automatic control system is specified in Section 230900 "Instrumentation and Control for HVAC" to control and indicate the following:*~~

~~*i) Start/stop system when required by schedule.*~~
~~*ii) Operating status.*~~
~~*iii) Alarm off-normal status.*~~

~~*2) Capacities and Characteristics:*~~

~~*(a) Refer to plans and schedules*~~

d. MOTORS

1) Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

(a) Enclosure: Totally enclosed, fan cooled
(b) Enclosure Materials: Cast iron

3.EXECUTION

a. EXAMINATION

1) Examine roughing-in for fuel-oil pumps to verify actual locations of pump connections before equipment installation.

2) Proceed with installation only after unsatisfactory conditions have been corrected.

b. EARTHWORK

1) Comply with requirements in Section 312000 "Earth Moving" for excavating, trenching, and backfilling.

c. PREPARATION

1) Close equipment shutoff valves before turning off fuel oil to premises or piping section.

2) Comply with NFPA 30 and NFPA 31 requirements for prevention of accidental ignition.

d. FUEL-OIL PUMP INSTALLATION

1) Transfer Pumps:

(a) Install pumps with access space for periodic maintenance including removal of motors, impellers, and accessories.
(b) Set pumps on and anchor to concrete base.
(c) Pump Mounting:

i) Install base-mounted pumps on cast-in-place concrete equipment bases.

ii) Comply with requirements for vibration isolation devices specified in Section 202600 "Vibration Controls for HVAC."

2) Install two-piece, full-port ball valves at suction and discharge of pumps.

3) Install mechanical leak-detector valves at pump discharge.

4) Install Y-pattern strainer on inlet side of simplex fuel-oil pumps.

5) Install check valve on discharge of simplex fuel-oil pumps.

6) Install suction piping with minimum fittings and change of direction.

~~e.FUEL MAINTENANCE SYSTEM INSTALLATION~~

~~1)Install suction line, with foot valve, at one end of storage tank, 1 inch (25 mm) from the bottom of tank.~~

~~2)Install return line at the opposite end of storage tank from suction line.~~

f.LABELING AND IDENTIFYING

1)Install nameplates and signs on each fuel-oil pump. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment."

g.FIELD QUALITY CONTROL

1) Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

2) Perform the following tests and inspections with the assistance of a factory-authorized service representative:

(a) Start fuel-oil transfer pumps to verify for proper operation of pump, and check for leaks.
(b) Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3) Fuel-oil pumps will be considered defective if they do not pass tests and inspections.

4) Prepare test and inspection reports.

h.DEMONSTRATION

i) Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fuel-oil pumps and fuel oil maintenance and monitoring systems

END OF SECTION 231213

SECTION 232500 - HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following HVAC water-treatment systems:
   1. Biocide chemical-feed equipment and controls.
   2. HVAC water-treatment chemicals.

1.2 DEFINITIONS

A. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

B. TDS: Total dissolved solids.

1.3 PERFORMANCE REQUIREMENTS

A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or the environment.

B. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

C. Closed hydronic systems, including hot-water heating chilled water , shall have the following water qualities:
   1. pH: Maintain a value within 9.0 to 10.5.
   2. "P" Alkalinity: Maintain a value within 100 to 500 ppm.
   3. Boron: Maintain a value within 100 to 200 ppm.
   4. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
   5. Soluble Copper: Maintain a maximum value of 0.20 ppm.
   6. TDS: Maintain a maximum value of 10 ppm.
   7. Ammonia: Maintain a maximum value of 20 ppm.
   8. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm.
   9. Microbiological Limits:
      a. Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
      b. Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/ml.
      c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
      d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
      e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

D. Open hydronic systems, including condenser water, shall have the following water qualities:
   1. pH: Maintain a value within 8.0 to 9.1.
   2. "P" Alkalinity: Maintain a maximum value of 100 ppm.
   3. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
   4. Soluble Copper: Maintain a maximum value of 0.20 ppm.
   5. TDS: Maintain a maximum value of 10 ppm.
   6. Ammonia: Maintain a maximum value of 20 ppm.
   7. Free "OH" Alkalinity: Maintain a maximum value of 0 ppm

   8. Microbiological Limits:
      a. Total Aerobic Plate Count: Maintain a maximum value of 10,000 organisms/ml.
      b. Total Anaerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.

c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

9. Polymer Testable: Maintain a minimum value within 10 to 40.

1.4 ACTION SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for the following products:
1. Inhibitor injection timers.
2. pH controllers.
3. TDS controllers.
4. Biocide feeder timers.
5. Injection pumps.
6. Chemical material safety data sheets.

B. Shop Drawings: Pretreatment and chemical treatment equipment showing tanks, maintenance space required, and piping connections to HVAC systems. Include plans, elevations, sections, details, and attachments to other work.
1. Wiring Diagrams: Power and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer Seismic Qualification Certification: Submit certification that and components will withstand seismic forces defined in Section 23 05 48 "Vibration and Seismic Controls for HVAC Piping and Equipment." Include the following:
1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Other Informational Submittals:
1. Water-Treatment Program: Written sequence of operation on an annual basis for the application equipment required to achieve water quality defined in the "Performance Requirements" Article above.
2. Water Analysis: Illustrate water quality available at Project site.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For sensors, injection pumps, and controllers to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

A. HVAC Water-Treatment Service Provider Qualifications: An experienced HVAC water-treatment service provider capable of analyzing water qualities, installing water-treatment equipment, and applying water treatment as specified in this Section.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.8 MAINTENANCE SERVICE

A. Scope of Maintenance Service: Provide chemicals and service program to maintain water conditions required above to inhibit corrosion, scale formation, and biological growth for cooling, chilled-water piping heating, hot-water piping condenser-water piping and equipment. Services and chemicals shall be provided for a period of one year from date of Substantial Completion, and shall include the following:

1. Initial water analysis and HVAC water-treatment recommendations.
2. Startup assistance for Contractor to flush the systems, clean with detergents, and initially fill systems with required chemical treatment prior to operation.
3. Periodic field service and consultation.
4. Customer report charts and log sheets.
5. Laboratory technical analysis.
6. Analyses and reports of all chemical items concerning safety and compliance with government regulations.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

2.2 AUTOMATIC CHEMICAL-FEED EQUIPMENT

A. Inhibitor Injection Timers:
   1. Microprocessor-based controller with LCD display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
   2. Programmable timers with infinite adjustment over full range, and mounted in cabinet with hand-off-auto switches and status lights.
   3. Test switch.
   4. Hand-off-auto switch for chemical pump.
   5. Illuminated legend to indicate feed when pump is activated.
   6. Programmable lockout timer with indicator light. Lockout timer to deactivate the pump and activate alarm circuits.
   7. LCD makeup totalizer to measure amount of makeup and bleed-off water from two water meter inputs.

B. pH Controller:
   1. Microprocessor-based controller, 1 percent accuracy in a range from zero to 14 units. Incorporate solid-state integrated circuits and digital LCD display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
   2. Digital display and touch pad for input.
   3. Sensor probe adaptable to sample stream manifold.
   4. High, low, and normal pH indication.
   5. High or low pH alarm light, trip points field adjustable; with silence switch.
   6. Hand-off-auto switch for acid pump.
   7. Internal adjustable hysteresis or deadband.

C. TDS Controller:
   1. Microprocessor-based controller, 1 percent accuracy in a range from zero to 5000 micromhos. Incorporate solid-state integrated circuits and digital LCD display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
   2. Digital display and touch pad for input.
   3. Sensor probe adaptable to sample stream manifold.
   4. High, low, and normal conductance indication.
   5. High or low conductance alarm light, trip points field adjustable; with silence switch.
   6. Hand-off-auto switch for solenoid bleed-off valve.
   7. Bleed-off valve activated indication.
   8. Internal adjustable hysteresis or deadband.
   9. Bleed Valves:

a. Cooling Systems: Forged-brass body, globe pattern, general-purpose solenoid with continuous-duty coil, or motorized valve.
b. Steam Boilers: Motorized ball valve, steel body, and TFE seats and seals.

D. Biocide Feeder Timer:
1. Microprocessor-based controller with digital LCD display in NEMA 250, Type 12 enclosure with gasketed and lockable door.
2. 24-hour timer with 14-day skip feature to permit activation any hour of day.
3. Precision, solid-state, bleed-off lockout timer and clock-controlled biocide pump timer. Prebleed and bleed lockout timers.
4. Solid-state alternator to enable use of two different formulations.
5. 24-hour display of time of day.
6. 14-day display of day of week.
7. Battery backup so clock is not disturbed by power outages.
8. Hand-off-auto switches for biocide pumps.
9. Biocide A and Biocide B pump running indication.

E. Chemical Solution Tanks:
1. The existing solution tanks are to be used on the new cooling tower system..

F. Chemical Solution Injection Pumps:
1. Self-priming, positive-displacement; rated for intended chemical with minimum 25 percent safety factor for design pressure and temperature.
2. Adjustable flow rate.
3. Metal and thermoplastic construction.
4. Built-in relief valve.
5. Fully enclosed, continuous-duty, single-phase motor. Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."

G. Chemical Solution Tubing: Polyethylene tubing with compression fittings and joints except ASTM A 269, Type 304, stainless steel for steam boiler injection assemblies.

H. Injection Assembly:
1. Quill: Minimum NPS 1/2 (DN 15) with insertion length sufficient to discharge into at least 25 percent of pipe diameter.
2. Ball Valve: Two-piece, stainless steel as described in "Stainless-Steel Pipes and Fittings" Article below; and selected to fit quill.
3. Packing Gland: Mechanical seal on quill of sufficient length to allow quill removal during system operation.
4. Assembly Pressure/Temperature Rating: Minimum 600 psig (4137 kPa) at 200 deg F (93 deg C).

2.3 CHEMICALS

A. Chemicals shall be as recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment, and that can attain water quality specified in Part 1 "Performance Requirements" Article.

PART 3 - EXECUTION

3.1 WATER ANALYSIS

A. Perform an analysis of supply water to determine quality of water available at Project site.

3.2 INSTALLATION

A. Install chemical application equipment on concrete bases, level and plumb. Maintain manufacturer's recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor chemical tanks and floor-mounting accessories to substrate.

B. Install water testing equipment on wall near water chemical application equipment.

C. Install interconnecting control wiring for chemical treatment controls and sensors.

D. Mount sensors and injectors in piping circuits.

E. Install automatic chemical-feed equipment for condenser water and include the following:
   1. Install inhibitor injection pumps and solution tanks with injection timer sensing contacts in water meter.
      a. Pumps shall operate for timed interval on contact closure at water meter in makeup water supply connection. Injection pump shall discharge into boiler feedwater tank or feedwater supply connection at boiler.
   2. Install TDS controller with sensor and bleed valves.
      a. Bleed valves shall cycle to maintain maximum TDS concentration.
   3. Install pH sensor and controller with injection pumps and solution tanks.
      a. Injector pumps shall operate to maintain required pH.
   4. Install biocide feeder alternating timer with two sets of injection pumps and solution tanks.
      a. Injection pumps shall operate to feed biocide on an alternating basis.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Make piping connections between HVAC water-treatment equipment and dissimilar-metal piping with dielectric fittings. Dielectric fittings are specified in Section 23 21 13 "Hydronic Piping."

D. Install shutoff valves on HVAC water-treatment equipment inlet and outlet. Metal general-duty valves are specified in Section 23 05 23 "General-Duty Valves for HVAC Piping."

E. Confirm applicable electrical requirements in electrical Sections for connecting electrical equipment.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.

B. Tests and Inspections:
   1. Inspect field-assembled components and equipment installation, including piping and electrical connections.
   2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
   3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC systems' startup procedures.
   4. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
   5. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

6. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
7. Cap and subject piping to static water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
8. Repair leaks and defects with new materials and retest piping until no leaks exist.

C. Remove and replace malfunctioning units and retest as specified above.

D. At four -week intervals following Substantial Completion perform separate water analyses on hydronic systems to show that automatic chemical-feed systems are maintaining water quality within performance requirements specified in this Section. Submit written reports of water analysis advising Owner of changes necessary to adhere to Part 1 "Performance Requirements" Article.

E. Comply with ASTM D 3370 and with the following standards:
1. Silica: ASTM D 859.
2. Steam System: ASTM D 1066.
3. Acidity and Alkalinity: ASTM D 1067.
4. Iron: ASTM D 1068.
5. Water Hardness: ASTM D 1126.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment. Refer to Section 01 79 00 "Demonstration and Training."

END OF SECTION 232500

SECTION 233423 - HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Centrifugal roof ventilators.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Also include the following:
   1. Certified fan performance curves with system operating conditions indicated.
   2. Certified fan sound-power ratings.
   3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   4. Material thickness and finishes, including color charts.
   5. Dampers, including housings, linkages, and operators.
   6. Roof curbs.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.

1.3 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
   1. Roof framing and support members relative to duct penetrations.
   2. Size and location of initial access modules for acoustical tile.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. AMCA Compliance: Fans shall have AMCA-Certified performance ratings and shall bear the AMCA-Certified Ratings Seal.

C. UL Standards: Power ventilators shall comply with UL 705.

1.5 COORDINATION

A. Coordinate size and location of structural-steel support members.

Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

PART 2 - PRODUCTS

2.1 CENTRIFUGAL ROOF VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

B. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   1. Aerovent; a division of Twin City Fan Companies, Ltd.
   2. Greenheck Fan Corporation.
   3. Loren Cook Company.

C. Housing: Removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.
   1. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

D. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

E. Belt Drives:
   1. Resiliently mounted to housing.
   2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
   3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
   4. Pulleys: Cast-iron, adjustable-pitch motor pulley.
   5. Fan and motor isolated from exhaust airstream.

F. Accessories:
   1. Disconnect Switch: Non-fusible type, with thermal-overload protection mounted outside fan housing, factory wired through an internal aluminum conduit.
   2. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
   3. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.

G. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.
   1. Configuration: Built-in cant and mounting flange.
   2. Overall Height: 18 inches.

H. MOTORS
   1. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
   2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   3. Enclosure Type: Totally enclosed, fan cooled.

I. SOURCE QUALITY CONTROL
   1. Certify sound-power level ratings according to AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

2.2 PHARMACY & LABORATORY EXHAUST SYSTEMS

A. GENERAL

1.1 References:

A. Performance ratings: Conform to AMCA standard 210, 260 and 300. Fans must be tested in accordance with AMCA 210, 260 and 300 in an AMCA accredited laboratory and certified for air and sound performance. Fan shall be licensed to bear the AMCA ratings seal for air performance (AMCA 210), sound performance (AMCA 300), and induced flow fan for high plume dilution blowers (AMCA 260).

B. Fans shall be UL and CUL listed per UL 705 safety standard.

C. Fans shall meet the criteria of NFPA-45.

D. Classification for Spark Resistant Construction shall conform to AMCA 99.

1.2 Acceptable Manufacturers:

A. Basis-of-Design - The plans and specifications for the laboratory fume hood exhaust system are based on systems and equipment manufactured by Strobic Air Corporation.

B. The engineer and owner shall be the sole judges of quality and equivalence of equipment, materials, methods, and life cycle cost.

C. Only those systems specifically named in this specification or by addendum shall be considered for approval. Other systems submitted after the bid opening will be returned without review.

1.3 Submittals:

A. Submit shop drawings and product data sheets including performance data, fan performance curves, vibration levels, maintenance requirements and sound power levels.

B. Fan manufacturer shall furnish a certificate of guarantee stating that the fan, mixing plenum, outlet nozzle, acoustical silencer nozzle, stack extension if any, and all related accessories specified herein have been pre-tested at the factory and that the curves supplied in 1.3.1 have been de-rated for any and all system effects created by the accessories.

1.4 Warranty:

A. Fan manufacturer shall provide a 7 year parts warranty from time of purchase to include fan, plenum, motor and drive mechanisms including pillow blocks, sheaves, shafts, couplings and belts. This warranty shall be held solely by the fan manufacturer. It is unacceptable to extend the warranty of a provided component supplier (i.e. motors, dampers, actuators). All warranty claims shall be the sole responsibility of the fan manufacturer.

PART 2 - PRODUCTS

2.1 Mixed-flow induced dilution fans:

A. EF-1 - AMCA Certified Fan - Mixed flow induced dilution high plume fan, AMCA Arrangement 4, AMCA 99 Class "C" Spark Resistance, Fan Model Tested and Certified for AMCA 210, 260, and 300.

2.2 Fan Performance:

A. Fan Performance shall be as stated on the schedule. The Static Pressure stated on the schedule shall be at the inlet to the "Fan System" and does not include any losses of equipment provided by the fan manufacturer (i.e.: HRU, Filters, Silencers, etc…). All losses for the equipment provided by the fan manufacturer shall be detailed in the fan manufacturers technical proposal and or submittal.

B. Fan and all drive components shall have a combined bearing life of a minimum of L10 = 150,000 hours.

C. Fan dynamic balance not to exceed 0.5 mil, peak-to-peak for nominal 900RPM, 1200RPM, and 1800RPM fans, or 0.055 in/sec -peak for 1800 RPM, 0.035 in/sec - peak for 1200 RPM, and 0.030 in/sec-peak for 900 RPM fans measured at the blade pass area when operating at fan frequency. Vibration isolation shall be limited to rubber-in-shear pad type isolators unless otherwise specified.

D. Factory test reports detailing vibration levels at the blade pass area shall be provided. Vibration levels shall be reported in both the axial and radial direction. If fan vibration is greater than 0.5 mils peak-to-peak at the blade pass area, fan manufacturer shall be responsible for providing

vibration isolators on each fan and flexible connection at each duct inlet. Manufacturer shall add 0.5" additional static pressure to the fan system to compensate for losses through the flexible connection. Vibration isolators, 2" deflection seismic rated spring, must be installed on each individual fan with a minimum of four per fan. In addition, fan manufacturer shall be responsible for providing a method to repair or replace flexible connection or vibration isolators without shut down of the fan system. This includes any engineering, additional ductwork, and isolation dampers required to perform repairs while the system is still fully operational. Fan manufacturer shall also provide labor to change out or repair flexible connection and vibration isolators for a seven (7) year period from shipment.

E. The Acoustical Silencer Nozzle shall provide the attenuation values as specified in the following schedule. The published insertion loss values shall be obtained from an AMCA 300 test with the silencer installed on the fan specified. Ratings based on separate silencer and fan testing is not acceptable.

F. The fan supplied must meet the system exhaust CFM and the motor BHP shall not be larger than that shown on the fan schedule. The fan manufacturer shall also provide any additional money required for wiring changes or any other changes required for installation of the equipment. These additional charges shall be detailed on the proposal and include in its total value.

G. The static pressure shown on the schedule is based on the static pressure requirements at the inlet to the mixing box. Any system deviating from the basis of design shall include and detail in their proposal additional losses for flexible connectors, fan losses, elbows, mixing box, etc. that are not included in their fan curves. In addition any deviation from the basis of design shall be subject to requirements stated in sections 1.3.2, 2.1.8 and 2.1.23.

2.3 Fan Maintenance:

A. All fan motors shall be direct-drive.

B. Maintenance shall only be required on a minimum of 18 month intervals. This maintenance shall be limited to re-greasing of the motor bearings.

C. Extended motor lube lines of Teflon tubing covered with braided stainless steel shall be provided. Extended lube lines shall be mounted to a bracket located on the fan housing with grease relief fittings on each line.

2.4 Fan Construction:

A. Impellers shall be mounted directly to the motor shaft to provide Arrangement 4 Direct Drive. Motors shall be isolated from the primary exhaust air stream and shall be visible and accessible from the fan exterior for inspection and service. Models that are not Arrangement #4 will be rejected.

B. Mixed flow impellers shall consist of combination axial/backward curved blades and shall be of welded steel construction. The impellers shall have non-stall and non-overloading performance characteristics with aerodynamically stable operation at any point on the fan curves.

C. Stationary discharge guide vane sections shall be provided to increase fan efficiencies.

D. Fan shall be constructed to AMCA "C" standards per AMCA 99 with a non-ferrous inlet bell provided in order to reduce sparking in the event of a motor bearing failure.

E. Fan assemblies shall be designed for mounting on conventional roof curb without the need for guy wire supports.

F. Fans shall be modular construction and capable of being assembled on the roof.

G. Chemical resistant gaskets shall be provided at all companion flanged joints.

H. Fasteners shall be 316 stainless steel.

I. A bolted access door shall be provided for impeller inspection on each fan.

2.5 System Color:

A. Standard finish color to be gray.

2.6 Fan Coating:

A. All steel and aluminum surfaces components within the airstream that are not stainless steel or fiberglass must be surface prepped by phosphorus wash. These components must be coated with a high solids epoxy with low VOC

2.7 Touchup Paint:

A. Touchup Paint Kit

2.8 Nozzle:

A. Discharges shall include twin FRP nozzles with passive third central stacks that are capable of generating aspiration. The FRP shall be chemically and UV resistant.

B. Entrainment wind bands shall provide secondary induction of outside air. Induction shall take place downstream of the fan impeller and shall not influence BHP or static pressure requirements. Wind bands shall discharge up to 270% of the design flow rates. The manufacturer shall publish discharge volumes for all fans at specified primary exhaust flow.

2.9 Silencer:

A. The silencer shall be constructed with an outer shell of fiber reinforced plastic. The inner liner shall be perforated corrosion resistant steel. The silencer shall match the color of the fans. Acoustic media shall be isolated from the air stream by a non fibrous acoustical media.

2.10 Sound:

Fan Outlet Sound Data For Fan Model M33A20N100I4.
Number of Fans Running: 1 - With silencer, at 60Hz

Frequency	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz
Outlet Sound Power Levels	87	88	93	93	95	92	89	82
Dynamic Insertion Loss for outlet silencer	0	-4	-9	-11	-12	-13	-9	-4
Corrected Outlet Sound Power Levels	87	84	84	82	83	79	80	78

Corrections for 10 ft Distance	-17	-17	-17	-17	-17	-17	-17	-17
Sound Levels (10 ft)	70	67	67	65	66	62	63	61
'A' Scale Corrections	-26	-16	-9	-3	0	1	1	-1
dB'A' Spectrum (10 ft)	44	51	58	62	66	63	64	60

Net Sound Level at 10 ft: 71dB'A' (at 60Hz)

Frequency	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz
Outlet Sound Power Levels	87	88	93	93	95	92	89	82
Dynamic Insertion Loss for outlet silencer	0	-4	-9	-11	-12	-13	-9	-4
Corrected Outlet Sound Power Levels	87	84	84	82	83	79	80	78

Corrections for 50 ft Distance	-31	-31	-31	-31	-31	-31	-31	-31
Sound Levels (50 ft)	56	53	53	51	52	48	49	47

dB'A' Spectrum (50 ft)	30	37	44	48	52	49	50	46

Net Sound Level at 50 ft: 57dB'A' (at 60Hz)

2.11 Motor:

A. Electric motors shall be TEFC Mill & Chemical Duty , include shaft grounding (no explosion proof rating) to prevent shaft currents from prematurely fluting bearings on VFD driven systems, and a 1.15 service factor and an L10 bearing life of 150,000 hours. Premium Efficient motors shall have regreasable bearings with grease relief fittings in every NEMA frame. Fan motors shall be C-Face and Foot Mounted.

2.12 Disconnect Switch:

A. EF-1, EF-1 - A NEMA 4X non-fused disconnect switch shall be provided, mounted and wired to the motor.

PART 3 - ACCESSORIES

3.1 Plenum:

A. Inlet mixing plenums shall be provided by the fan manufacturer. Each plenum shall be sized to support the weight and performance requirement of the number of fans listed on the schedule. Unless otherwise specified, plenums shall be suitable for mounting on roof curbs. Safety screens shall be supplied over inlet of fan. All plenums shall be capable of supporting the fan(s) without guy wires or supports. The plenums shall include hinged access doors. The primary air inlets shall be located on the bottom or side as noted on construction drawings.

B. Fan and Mixing Box systems supplied by the manufacturer must have a footprint as shown on the drawings / schedule. Exhaust systems with larger footprints shall not be acceptable.

C. Fans and accessories shall have internal drain systems to prevent rain water from entering building duct system.

D. Single fan plenums shall be of continuously welded, heavy gauge steel construction. For single thickness plenums, coatings shall be the same as specified for the fans.

3.2 Plenum Coating:

A. All steel and aluminum surfaces components within the airstream that are not stainless steel or fiberglass must be surface prepped by phosphorus wash. These components must be coated with a high solids epoxy with low VOC

3.3 Vortex Breaker:

A. Vortex breakers shall be provided on all side inlet and multiple fan plenums.

3.4 Isolation Damper:

A. Aluminum Airfoil Opposed Blade Vertically Mounted, Coated (Spec D) - For use with a damper actuator.

3.5 Isolation Actuator:

A. Electric Isolation Actuator - Two position 24v electrical actuator. Fail safe spring close. Mounted directly on isolation damper control rod.

3.6 Bypass Damper:

A. Bypass dampers shall be provided with all mixing plenums for outside air with primary exhaust. Bypass damper(s) shall be sized to bypass the airflow capacity of one fan at the required static pressure of the system. Dampers will be opposed blade low leakage air foil control dampers with extended shaft for connection to an operator. The dampers shall be all aluminum construction unless otherwise specified. An acoustic louver shall be provided at the inlet to the bypass dampers on systems requiring sound attenuation.

3.7 Bypass Actuator:

A. The dampers shall be controlled by a 24v electric proportional control damper actuators shall be electronic direct-coupled type, which require no crank arm and linkage. Actuators must provide proportional damper control in response to a 2 to 10 VDC or, with the addition of a 500? resistor, a 4 to 20 mA control input from an electronic controller or positioner. Actuators shall have Brushless DC motor technology and be protected from overload at all angles of rotation. Actuators shall have reversing switch and manual override on the cover. Run time shall be constant and independent of torque. A 2 to 10 VDC feedback signal shall be provided for position indication.

3.8 Rain Hoods:

A. Rain hoods shall be provided with each damper.

3.9 Roof Curb:

A. A galvanized steel roof curb shall be provided to support the fans/plenums. The curb shall be minimum 14 gauge and canted for rigidity in wind loads. The curb shall include a rigid fiberglass liner and a wood nailer.

3.10 Variable Frequency Drive (VFD):

A. VFD shall be provided by the controls contractor and installed/wired by the electrical contractor.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install power ventilators level and plumb.

B. Secure roof-mounted fans to roof curbs with cadmium-plated hardware.

C. Install units with clearances for service and maintenance.

D. Label units according to requirements specified in Section 23 24 00 "Identification, Tags, Charts, Etc."

3.2 CONNECTIONS

A. Install ducts adjacent to power ventilators to allow service and maintenance.

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
   3. Verify that cleaning and adjusting are complete.
   4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
   5. Adjust belt tension.
   6. Adjust damper linkages for proper damper operation.
   7. Verify lubrication for bearings and other moving parts.
   8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
   9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
   10. Shut unit down and reconnect automatic temperature-control operators.
   11. Remove and replace malfunctioning units and retest as specified above.

C. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Prepare test and inspection reports.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.

D. Replace fan and motor pulleys as required to achieve design airflow.

E. Lubricate bearings.

END OF SECTION 233423

SECTION 233600 - AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Shutoff, single-duct air terminal units.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Hangers and supports shall withstand the effects of gravity loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible".

1.4 SUBMITTALS

A. Product Data: For each type of the following products, including rated capacities, furnished specialties, sound-power ratings, and accessories.
   1. Air terminal units.
   2. Liners and adhesives.
   3. Sealants and gaskets.

B. Shop Drawings: For air terminal units. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Hangers and supports, including methods for duct and building attachment and vibration isolation.

C. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

D. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 78 23 "Operation and Maintenance Data," include the following:
   1. Instructions for resetting minimum and maximum air volumes.
   2. Instructions for adjusting software set points.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

PART 2 - PRODUCTS

2.1 SHUTOFF, SINGLE-DUCT AIR TERMINAL UNITS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Anemostat Products; a Mestek Company.
   2. Environmental Technologies, Inc.
   3. Johnson Controls.
   4. Phoenix Controls Corporation.
   5. Titus.
   6. Trane; a business of American Standard Companies.
   7. Nailor.

B. Configuration: Volume-damper assembly inside unit casing with control components inside a protective metal shroud.

C. Casing: 0.034-inch (0.85-mm) steel, double wall.
   1. Casing Lining: Adhesive attached, 1-inch thick, coated, fibrous-glass duct liner complying with ASTM C 1071, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.
      a. Cover liner with nonporous foil and perforated metal.
   2. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
   3. Air Outlet: S-slip and drive connections.
   4. Access: Removable panels for access to parts requiring service, adjustment, or maintenance; with airtight gasket. Provide access panel to access reheat coil inlet surface.

D. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
   1. Maximum Damper Leakage: ARI 880 rated, 2 percent of nominal airflow at 3-inch wg (750-Pa) inlet static pressure.
   2. Damper Position: Normally closed.

E. Hydronic Coils: Hydronic coils for VAV boxes/terminal unit shall be duct-mounted, separate from the VAV box. Refer to section 238216 – Air Coils.

F. Direct Digital Controls: Bidirectional damper operators and microprocessor-based controller and room sensor. Control devices shall be compatible with temperature controls specified in Section 250200 "Instrumentation and Control for HVAC" and shall have the following features:
   1. Damper Actuator: 24 V, powered closed, spring return open.
   2. Terminal Unit Controller: Pressure-independent, variable-air-volume controller with electronic airflow transducer with multipoint velocity sensor at air inlet, factory calibrated to minimum and maximum air volumes, and having the following features:
      a. Occupied and unoccupied operating mode.
      b. Remote reset of airflow or temperature set points.
      c. Adjusting and monitoring with portable terminal.
      d. Communication with temperature-control system specified in Section 23 09 00 "Instrumentation and Control for HVAC."
   3. Room Sensor: Wall mounted with temperature set-point adjustment and access for connection of portable operator terminal.

2.2 VENTURI TRACKING PAIR

A. Manufacturers: Provide product by the following:
   1. Phoenix Controls
   2. Price.

B. Provide CAV and VAV tracking pair with shut off capability and ability to handle pressure sensor and alarm inputs.

C. Valves to be pressure independent with a 24 VAC power input.

D. Provide tracking pair controller per pair to maintain space pressure relationship as required on plans.

E. Provide BACnet interface for each controller to the building FMS.

2.3 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Steel Cables: Galvanized steel complying with ASTM A 603.

D. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

E. Air Terminal Unit Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

F. Trapeze and Riser Supports: Steel shapes and plates for units with steel casings; aluminum for units with aluminum casings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

B. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

C. Install wall-mounted thermostats.

3.2 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
   1. Where practical, install concrete inserts before placing concrete.
   2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
   3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes and for slabs more than 4 inches thick.
   4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes and for slabs less than 4 inches thick.

C. Hangers Exposed to View: Threaded rod and angle or channel supports.

D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.3 CONNECTIONS

A. Install piping adjacent to air terminal unit to allow service and maintenance.

B. Connect ducts to air terminal units according to Section 23 31 13 "Metal Ducts."

C. Make connections to air terminal units with flexible connectors complying with requirements in Section 23 33 00 "Air Duct Accessories."

3.4 IDENTIFICATION

A. Label each air terminal unit with plan number, nominal airflow, and maximum and minimum factory-set airflows. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for equipment labels and warning signs and labels.

3.5 STARTUP SERVICE

A. Perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
   3. Verify that controls and control enclosure are accessible.
   4. Verify that control connections are complete.
   5. Verify that nameplate and identification tag are visible.
   6. Verify that controls respond to inputs as specified.

END OF SECTION 233600

SECTION 235416 - DUPLEX STAINLESS STEEL FIRETUBE CONDENSING BOILERS

PART 1 – GENERAL

1.1 SCOPE

A. The work to be performed includes all new equipment, labor and materials required to furnish and install ultra high efficiency Fulton Vantage Condensing Hydronic Boilers as described in this product guide specification.

1.2 REFERENCES

A. ASME Section IV
B. CAN-13.1-77, Industrial and Commercial Gas Fired Packaged Boilers
C. CSD1, Controls and Safety Devices
D. CSA-CGA/AGA
E. GE GAP
F. NEC, National Electric Code
G. UL-795
H. UL-726
I. AHRI, BTS-2000

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data, including rated capacities of selected model, weights (shipping, installed and operating), installation and start-up instructions, and furnished accessory information.

B. Shop Drawings: Submit manufacturer's end assembly drawings indicating dimensions, connection locations, and clearance requirements.

C. Wiring Diagrams: Submit manufacturer's electrical requirements for the boiler including ladder type wiring diagrams for interlock and control wiring. Clearly differentiate between portions of wiring that are factory installed and portions to be field installed.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of condensing hydronic boilers with welded steel pressure vessels, whose products have been in satisfactory use in service for not less than twenty-five (25) years. The manufacturer must be privately owned and located in North American. The boilers must be manufactured in North America and be able to participate in projects that require a level of content for boiler materials. The specifying engineer, contractor and end customer must have the option to visit the factory during the manufacture of the boilers and be able to witness test fire and other relevant procedures.

B. The boiler shall have an ASME Section IV pressure vessel rated for a maximum allowable working pressure of 160 PSIG and a maximum allowable working temperature of 210˚F.

C. The flame safeguard control on the boiler shall provide full linkage-less operation with servo motors to control the supply of fuel and air to the boiler for combustion.

D. The entire boiler system and its installation shall conform to the manufacturer's instructions, applicable codes and associated National Board requirements.

E. The equipment shall be in strict compliance with the requirements of this specification and shall be the manufacturer's standard commercial product unless specified otherwise. Additional equipment features, details, accessories, etc. which are not specifically identified but which are a part of the manufacturer's standard commercial product, shall be included in the equipment being furnished.

1. Standard Items to be included with every boiler:
   i. Low Water cutoff probe
   ii. High and low gas pressure switches
   iii. Combustion air adapter
   iv. Operating and high temperature probes

F. The equipment shall be of the type, design, and size that the manufacturer currently offers for sale and appears in the manufacturer's current catalog.

G. The equipment shall fit within the allocated space, leaving ample allowance for maintenance and inspection.

H. The equipment shall be new and fabricated from new materials. The equipment shall be free from defects in materials and workmanship.

I. All units of the same classification shall be identical to the extent necessary to ensure interchangeability of parts, assemblies, accessories, and space parts wherever possible.

J. In order to provide unit responsibility for the specified capacities, efficiencies, and performance, the boiler manufacturer shall certify in writing that the equipment being submitted shall perform as specified.

1.5 WARRANTY

Standard Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within specified warranty period provided the boiler is installed, controlled, operated and maintained in accordance with the Installation, Operation and Maintenance Manual.

A.1 Warranty Period for the Pressure Vessel and Heat Exchanger: The boiler manufacturer shall warranty against failure due to:

i. Flue gas condensate corrosion, and/or defective material or workmanship for a period of ten (10) years, non-prorated, from the date of shipment from the factory.

ii. Thermal shock for the lifetime of the boiler.

A.2 Warranty Period for all other components: The boiler manufacturer will repair or replace any part of the boiler that is found to be defective in workmanship or material for a period of two (2) years, non-prorated, from the date of shipment from the factory.

PART 2 – PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. This specification is based on the Vantage Series boilers as manufactured by Fulton Heating Solutions, Inc. Equivalent units and manufacturers must meet all performance criteria, and will be considered upon prior approval.

B. Basis of Design: Fulton Heating Solutions, Inc. Vantage Condensing Hydronic Boiler Models:

Vantage VTG-6000DF (6,000,000 BTU/hr input)

Other acceptable manufacturers include:

Lochinvar

Cleaver-Brooks

C. The boiler manufacturer shall have the capability to construct an engineered system, skid mounted, for the above referenced boilers. This would include but is not limited to mounting any number of boilers in a common system with common piping headers for water supply, water return, fuel supply, and condensate disposal. Electrical panel boxes for the system must be available along with all wiring requirements. Other available components shall include hydronic pumps, air separators, expansion tanks, and various relevant valves and other accessories. The boiler manufacturer shall have the engineering capabilities for all aspects of the mechanical, electrical and control design aspects of the skid mounted system.

D. The boiler manufacturer shall have a factory authorized service training program, where technicians can attend a training class and ultimately be certified to perform start-up, maintenance and basic troubleshooting on the Vantage boiler. The boiler manufacturer shall have a minimum of ten (10) full time service technicians on staff.

2.2 BOILER CONSTRUCTION

A. The boiler shall be completely factory assembled as a self-contained unit. Each boiler shall be neatly finished, thoroughly tested, and properly packaged for shipping. The packaged boiler shall be listed and labeled to UL-795 and UL-726 standards for safety.

B. The pressure vessel design and construction shall be in accordance with Section IV of the ASME Code for heating boilers. The boiler shall comply with CSD-1 code requirements.

C. The firetube area of the heat exchanger where the flue gases will condense shall be constructed using duplex alloys of stainless steel. Austenitic stainless steels of the 300 series, such as 316L or 304, have a relatively high coefficient of linear expansion and thus are unacceptable. Ferritic stainless steels of the 400 series, such as 439, have a relatively low ultimate tensile strength and a relatively low pitting resistance equivalent number and thus are unacceptable.

D. The pressure vessel shell and furnace chamber shall be a minimum 3/8” thick steel, SA-53B ERW pipe or SA-516 Grade 70 plate. A dished head attached to the furnace chamber shall be SA-516 Grade 70 plate. Exhaust pipes attached to the furnace chamber shall be minimum 3” diameter Schedule 40 steel.

E. Boilers with heat exchangers using cast aluminum, cast iron or copper finned tube design platforms are unacceptable.

F. The pressure vessel shall be fully insulated with high temperature insulation.

G. The boiler shall be a fire tube design. The furnace location shall be such that all furnace components are within water-backed areas.

H. The dimensions of the boiler shall not be more than (Length x Width x Flange Height):

155 in x 50.5 in x 88.2 in (3937 mm x 1283 mm x 2240 mm)

The manufacturer shall be responsible for confirming that the submitted boiler meets the size, clearance, and installation requirements of the boiler room space, including all code-required service clearances for other equipment installed in this room.

2.3 BOILER DESIGN

A. External convection and radiation heat losses to the boiler room from the boiler shall be less than 0.5% of the rated boiler input.

B. The boiler shall have its efficiency witnessed and certified by an independent third party, and the efficiency must be listed on the AHRI directory (www.ahridirectory.org) for natural gas operation. The test parameters for efficiency certification shall be the BTS-2000 standard, with 80˚F return water temperature, 180˚F supply water temperature, steady state operation at full input firing capacity.

The certified thermal efficiency for natural gas/oil firing shall not be less than: 94.0% / 95.6%

C. The boiler shall be designed to operate natural gas firing.

D. The boiler shall have no minimum return water temperature when firing on natural gas and shall be capable of operating in condensing mode.

E. The boiler shall have no minimum return water temperature when firing on natural gas or propane.

F. A zero flow or low flow condition shall not cause any harm to the pressure vessel or heat exchanger of the boiler. Flow switches, dedicated circulator pumps, or primary/secondary piping arrangements are not required to protect the heat exchanger or pressure vessel from thermal shock or other system related considerations. Boilers requiring the use of flow switches or primary/secondary piping arrangements are unacceptable.

G. It shall be acceptable to install any number of boilers with as little as 1” side clearance on either side of the boiler.

H. It shall be acceptable to vent the boiler using sealed combustion (drawing in fresh air from the outdoors) or to draw air from the mechanical room itself.

1. The flue (exhaust) stack must be AL 29-4C or equivalent material UL-1738/C-UL S636 approved for Category IV condensing, positive pressure applications.
2. The air intake piping must be Schedule 40 PVC or equivalent.
3. The boiler shall be capable of operating with an exhaust draft not exceeding -0.04” W.C. and a combined air intake and exhaust venting pressure drop not exceeding +0.35” W.C.

I. Boilers requiring an intake or exhaust muffler for noise sensitive applications are unacceptable.

2.4 CONTROLS

A. The boiler control panel shall be constructed in a UL 508A approved panel shop.

B. The flame safeguard control shall be capable of linkage-less modulation and shall provide the following:

1. The control shall provide a 30-second pre-purge and post-purge time.

2. The control shall maintain a running history of operating hours, number of cycles, and the most recent six control lockouts.
3. The control is connected to a display module, which is capable of retrieving the information listed above.

C. The boiler shall be set up for a maximum 15:1 turndown when firing on natural gas. Any boiler claiming turndown greater than 15:1 must provide references for five (5) installations of similar capacity operating at the claimed turndown for at least (3) complete heating seasons.

D. Airflow shall be controlled by a butterfly valve connected to a precision servo-motor. Fuel flow shall be controlled by a butterfly valve for gas operation.

E. The burner shall be a forced draft flame retention type automatic burner. The burner housing shall be cast aluminum monobloc type construction. The burner mounting flange must support the burner weight on the boiler independent of any support. Burner shall be furnished with a stainless steel flame retention type of combustion head, capable of withstanding temperatures up to 1400F. This combustion head shall incorporate a diffuser and sleeve that is to direct excess air either around the flame or directly through the diffuser vanes. Adjustment to the diffuser insertion shall be made external to the burner and can be made while the burner is in full operation. Burner must have a flame inspection window positioned at the rear center of the burner housing. Flame shall be viewed without removing any covers. Burner shall come complete with a high efficiency, totally enclosed fan cooled motor (TEFC) and a dynamically balanced blower wheel. The blower wheel must be of the energy efficient, self-cleaning, reverse inclined fan blade type. The sound rating of the burner shall not exceed 80 dBa when measured at 3 feet from the burner.

F. The burner gas ignition system for the main gas shall utilize natural gas or as the fuel source. The gas pilot system components shall include spark ignited pilot assembly, 7000 Volt ignition transformer, pilot safety shut off valve, pilot gas pressure regulator and manual gas shutoff cock. The burner oil ignition system shall be by means of a separate 2 x 5000 Volt direct spark ignition system.

G. The burner shall be equipped with a single pole double throw air pressure switch that will not allow burner to start if there is insufficient combustion air, which is checked prior to each ignition attempt. Before the burner can start the airflow switch must be in the open position to prove the switch is not giving a false signal of sufficient combustion air pressure.

H. Boiler safety controls shall include:

1. Operating Temperature Controller for automatic start and stop.
2. High Limit Temperature Controller with manual reset.
3. One Low Water Cutoff Probe in the boiler shell.
4. Air Safety Switch to prevent operation unless sufficient combustion air is assured.
5. Flame detector to prove combustion.

I. All controls are to be burner or panel mounted and so located on the boiler as to provide ease of servicing the boiler without disturbing the controls. All controls shall be mounted and wired

according to UL requirements. Electrical power supplied shall be 208/230/460/3/60. A control circuit transformer shall be factory supplied, wired and mounted.

J. When multiple boilers are to be installed in a common hydronic loop, a Synex ModSync Boiler Sequencing System shall be used. Please refer to the specification for the ModSync for complete details of the parameters and capabilities associated with it.

2.5 MAIN FUEL TRAIN COMPONENTS

A. A factory mounted main gas train shall be supplied. The gas train shall be fully assembled, wired, and installed on the boiler and shall comply with CSD-1 code. Compliance with other codes is available upon request. The maximum pressure rating of the components shall not be less than one psi. The gas train shall consist of at least two manual shutoff valves, one gas pressure regulator, one automatic safety shutoff valve with prove of closure, one flow control valve, one high gas pressure switch, and one low gas pressure switch. The automatic safety shutoff valve and flow control valve may be the same valve. A pilot gas train, when supplied, shall comply with the same code and maximum gas pressure rating as the main gas train.

B. A factory mounted oil pump set shall be mounted to the boiler assembly and shall be directly driven by a motor independent from the combustion air motor. The oil pump must have an integral regulator to adjust the flow of oil to burner nozzles. There shall be three safety shut off valves (main safety, first stage, and second stage). All piping on the burner valve train must be factory installed. Field connections must be NPT. All wiring of oil train valves and switches must be done at the factory. All components factory installed on the boiler that will come into contact with the B100 Biodiesel shall be of the specific material required for this fuel.

C. The boiler shall not require a compressed air supply to fire on #2 fuel oil.

D. Standard CSD-1 fuel trains shall comply with IRI, which has been replaced by GE GAP. Normally open vent valves are no longer required between the safety shut off valves. NFPA 85 compliance shall be available from the factory to comply with local codes or regulations that specifically require a vent valve.

2.6 BOILER FITTINGS & TRIM

A. The boiler shall be supplied with an ASME Section IV safety relief valve. The safety relief valve size shall be in accordance with ASME code requirements.

B. The boiler shall be supplied with a temperature/pressure gauge to be mounted on the water outlet piping of the boiler.

C. A condensate drain connection shall be provided in the exhaust outlet. A Fulton condensate drain kit will be provided to collect and drain the flue gas condensate.

D. The water supply and return connections on the boiler shall be 150# flanged connections. The water connections shall not be designed to support any external structural load from the piping system.

E. The boiler shall come with lifting eyes and fork truck holes accessible for rigging.

F. Instructions for installation, operation and maintenance of the boiler shall be contained in a manual provided with each boiler.

G. A wiring diagram corresponding to the boiler configuration shall be included with each boiler.

H. A factory test fire report corresponding to the boiler configuration shall be included with each boiler.

2.7 EMISSIONS

A. When operating on Natural Gas, the boiler shall have CO emissions less than 50 ppm corrected to 3% O_2 and NO_x emissions less than 30 ppm corrected to 3% O_2, over the entire turndown range.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Equipment and materials shall be installed in an approved manner and in accordance with the boiler manufacturers' installation requirements.

B. The installer shall construct a level continuous concrete pad (min. 3 1/2 inches high) for the entire boiler system according to the boiler manufacturer's erecting instructions.

C. Assemble unit sections and parts shipped loose or unassembled for shipment purposes. Follow manufacturer's installation recommendations and instructions.

D. Install electrical control items furnished by manufacturer per wiring diagram provided by manufacturer.

E. Complete water piping installation as required by manufacturer for operation of system.

F. Provide air intake and exhaust piping, size and type as recommended by the manufacturer.

G. Provide boiler manufacturer recommendation manifold pipe and fittings from each boiler to nearest floor drain or as indicated.

3.2 FIELD QUALITY CONTROL

A. After boiler installation is completed, the manufacturer shall provide the services of a field representative for starting the unit and training the operator.

B. Arrange with National Board of Boiler and Pressure Vessel Inspectors for inspection of boilers and piping. Obtain certification for completed boiler units, deliver to Owner, and obtain receipt.

END OF SECTION 235416

SECTION 236416 - CENTRIFUGAL WATER CHILLERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Packaged, water-cooled, electric-motor-driven centrifugal chillers.

1.2 DEFINITIONS

A. BAS: Building automation system.

B. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.

C. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.

D. IPLV: Integrated part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and referenced to ARI standard rating conditions.

E. kW/Ton: The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons at any given set of rating conditions.

F. NPLV: Nonstandard part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by ARI 550/590 and intended for operating conditions other than the ARI standard rating conditions.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include refrigerant, rated capacities, operating characteristics, furnished specialties, and accessories.
   1. Performance at ARI standard conditions and at conditions indicated.
   2. Performance at ARI standard unloading conditions.
   3. Minimum evaporator flow rate.
   4. Refrigerant capacity of chiller.
   5. Oil capacity of chiller.
   6. Fluid capacity of evaporator, condenser.
   7. Characteristics of safety relief valves.
   8. Minimum entering condenser-fluid temperature.
   9. Performance at varying capacities with constant design condenser-fluid temperature. Repeat performance at varying capacities for different condenser-fluid temperatures from design to minimum in increments.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, load distribution, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Structural supports.
   2. Piping roughing-in requirements.

3. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
4. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.

B. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each chiller to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. ARI Certification: Certify chiller according to ARI 550 certification program.

B. ARI Rating: Rate chiller performance according to requirements in ARI 550/590.

C. ASHRAE Compliance:
1. ASHRAE 15 for safety code for mechanical refrigeration.
2. ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.

D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.

E. ASME Compliance: Fabricate and label chillers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, as applicable to chiller design. For chillers charged with R-134a refrigerant, include an ASME U-stamp and nameplate certifying compliance.

F. Comply with NFPA 70.

G. Comply with requirements of UL, and include label by a qualified testing agency showing compliance.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Ship chillers from the factory fully charged with refrigerant.

B. Ship each chiller with a full charge of refrigerant. Charge each chiller with nitrogen if refrigerant is shipped in containers separate from chiller.

C. Ship each oil-lubricated chiller with a full charge of oil.
1. Ship oil factory installed in chiller.

D. Package chiller for export shipping in totally enclosed crate with bagging.

1.8 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.

B. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of chillers that fail in materials or workmanship within specified warranty period.

1. Extended warranties include, but are not limited to, the following:
a. Complete chiller including refrigerant and oil charge.
b. Complete compressor and drive assembly including refrigerant and oil charge.
c. Refrigerant and oil charge.
d. Parts and labor.
e. Loss of refrigerant charge for any reason.

2. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS – HEAT RECOVERY CENTRIFUGAL CHILLER

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

B. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:
1. Carrier Corporation; a United Technologies company.
2. Trane; a division of American Standard.
3. YORK International Corporation.
4. Daikin.

2.2 MANUFACTURED UNIT

A. Description: Factory-assembled and -tested chiller complete with compressor, compressor motor, compressor motor controller, lubrication system evaporator, condenser, heat-reclaim condenser as indicated, controls, interconnecting unit piping and wiring, and indicated accessories.
1. Disassemble chiller into major assemblies as required by the installation after factory testing and before packaging for shipment.
2. For chillers with dual compressors, provide each compressor with a dedicated motor and motor controller, and provide for continued operation when either compressor-drive assembly fails or is being serviced.

B. Fabricate chiller mounting base with reinforcement strong enough to resist chiller movement during a seismic event when chiller is anchored to field support structure.

2.3 COMPRESSOR-DRIVE ASSEMBLY

A. Description: Single-stage or multistage, variable-displacement, centrifugal-type compressor driven by an electric motor.
1. Where indicated, provide oil-free compressor technology using a permanent magnet synchronous motor, magnetic bearings, integral variable frequency controller, and digital electronic controls.

B. Compressor:
1. Casing: Cast iron, precision ground.
2. Impeller: High-strength cast aluminum or cast-aluminum alloy on carbon- or alloy-steel shaft.

C. Drive: Direct- or gear-drive, open or hermetic design using an electric motor as the driver.
1. Gear Drives: For chillers with gear drives, provide single- or double-helical gear design continuously coated with oil while chiller is operating. Gears shall comply with American Gear Manufacturer Association standards.
2. Drive Coupling: For chillers with open drives, provide flexible disc with all-metal construction and no wearing parts to ensure long life without the need for lubrication.
3. Seals: Seal drive assembly to prevent refrigerant leakage.

D. Compressor Motor:
1. Continuous-duty, squirrel-cage, induction-type, two-pole motor with energy efficiency required to suit chiller energy efficiency indicated.
2. Factory mounted, aligned, and balanced as part of compressor assembly before shipping.

3. Motor shall be of sufficient capacity to drive compressor throughout entire operating range without overload and with sufficient capacity to start and accelerate compressor without damage.
4. For chillers with open drives, provide motor with open-dripproof enclosure.
5. Provide motor with thermistor or RTD in each of three-phase motor windings to monitor temperature and report information to chiller control panel.
6. Provide motor with thermistor or RTD to monitor bearing temperature and report information to chiller control panel.
7. Provide open-drive motor with internal electric heater, internally powered from chiller power supply.

E. Vibration Balance: Balance chiller compressor and drive assembly to provide a precision balance that is free of noticeable vibration over the entire operating range.
1. Overspeed Test: 25 percent above design operating speed.

F. Service: Easily accessible for inspection and service.
1. Compressor's internal components shall be accessible without having to remove compressor-drive assembly from chiller.
2. Provide lifting lugs or eyebolts attached to casing.

G. Economizers: For multistage chillers, provide interstage economizers.

H. Capacity Control: Modulating, variable-inlet, guide-vane assembly combined with hot-gas bypass, if necessary, to achieve performance indicated.
1. Maintain stable operation that is free of surge, cavitation, and vibration throughout range of operation. Configure to achieve most energy-efficient operation possible.
2. Operating Range: From 100 to 10 percent of design capacity.
3. Condenser-Fluid Unloading Requirements over Operating Range: Drop-in entering condenser-fluid temperature of 2.5 deg F for each 10 percent in capacity reduction.
4. Chillers with variable frequency controllers shall modulate compressor speed with variable-inlet, guide-vane control to achieve optimum energy efficiency.

I. Oil Lubrication System: Consisting of pump, filtration, heater, cooler, factory-wired power connection, and controls.
1. Provide lubrication to bearings, gears, and other rotating surfaces at all operating, startup, coastdown, and standby conditions including power failure.
2. Manufacturer's standard method to remove refrigerant from oil.
3. Oil filter shall be the easily replaceable cartridge type, minimum 0.5-micron efficiency, with means of positive isolation while servicing.
4. Refrigerant- or water-cooled oil cooler.
5. Factory-installed and pressure-tested piping with isolation valves and accessories.
6. Oil compatible with refrigerant and chiller components.
7. Positive visual indication of oil level.

2.4 REFRIGERATION

A. Refrigerant:
1. Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.

B. Refrigerant Flow Control: Manufacturer's standard refrigerant flow-control device satisfying performance requirements indicated.

C. Pressure Relief Device:
1. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
2. For Chillers Using low pressure refrigerant: Rupture disc constructed of frangible carbon.

3. For Chillers Using high pressure refrigerant: ASME-rated, spring-loaded, pressure relief valve; single- or multiple-reseating type. Pressure relief valve(s) shall be provided for each heat exchanger. Condenser shall have dual valves with one being redundant and configured to allow either valve to be replaced without loss of refrigerant.

D. Refrigeration Transfer: Provide service valves and other factory-installed accessories required to facilitate transfer of refrigerant from chiller to a remote refrigerant storage and recycling system. Comply with requirements in ASHRAE 15 and ASHRAE 147.

E. Refrigerant Isolation for Chillers Using high pressure refrigerant: Factory install positive shutoff, manual isolation valves in the compressor discharge line to the condenser and the refrigerant liquid line leaving the condenser to allow for isolation and storage of full refrigerant charge in the chiller condenser shell. In addition, provide isolation valve on suction side of compressor from evaporator to allow for isolation and storage of full refrigerant charge in the chiller evaporator shell.

F. Purge System:
1. For chillers operating at subatmospheric pressures (using low pressure refrigerant), factory install an automatic purge system for collection and return of refrigerant and lubricating oil and for removal of non-condensables including, but not limited to, water, water vapor, and non-condensable gases.
2. System shall be a thermal purge design, refrigerant or air cooled, equipped with a carbon filter that includes an automatic regeneration cycle.
3. Factory wire to chiller's main power supply and system complete with controls, piping, and refrigerant valves to isolate the purge system from the chiller.
4. Construct components of non-corrodible materials.
5. Controls shall interface with chiller control panel to indicate modes of operation, set points, data reports, diagnostics, and alarms.
6. Efficiency of not more than 0.02 lb of refrigerant per pound of air when rated according to ARI 580.
7. Operation independent of chiller per ASHRAE 147.

G. Positive-Pressure System:
1. For chillers operating at subatmospheric pressures (using R-123 refrigerant), factory install an automatic positive-pressure system.
2. During nonoperational periods, positive-pressure system shall automatically maintain a positive pressure for atmosphere in the refrigerant pressure vessel of not less than 0.5 psig adjustable up to a pressure that remains within the vessel design pressure limits.
3. System shall be factory wired and include controller, electric heat, pressure transmitter, or switch.

2.5 EVAPORATOR

A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from condenser.

B. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.

C. Designed to prevent liquid refrigerant carryover from entering compressor.

D. Provide evaporator with sight glass or other form of positive visual verification of liquid-refrigerant level.

E. Tubes:
1. Individually replaceable from either end and without damage to tube sheets and other tubes.

2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
3. Material: Copper.
4. Nominal OD: 3/4 inch.
5. Minimum Wall Thickness: 0.028 inch.
6. External Finish: Manufacturer's standard.
7. Internal Finish: Enhanced or smooth.

F. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.

G. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.

H. Water Box:
1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
2. Marine type for water box with piping connections. Standard type for water box without piping connections.
3. Provide water boxes and marine water-box covers with lifting lugs or eyebolts.
4. Hinged water boxes.
5. Hinged marine water-box covers.
6. Nozzle Pipe Connections: Welded, ASME B16.5, raised-face flange.
7. Thermistor or RTD temperature sensor factory installed in each nozzle.
8. Fit each water box with 3/4- or 1-inch drain connection at low point and vent connection at high point, each with threaded plug.

I. Additional Corrosion Protection:
1. Electrolytic corrosion-inhibitor anode.
2. Coat wetted surfaces with a corrosion-resistant finish.
3. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.

2.6 CONDENSER

A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from evaporator.

B. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.

C. Designed to prevent direct impingement of high-velocity hot gas from compressor discharge on tubes.

D. Provide condenser with sight glass or other form of positive visual verification of refrigerant charge and condition.

E. Tubes:
1. Individually replaceable from either end and without damage to tube sheets and other tubes.
2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
3. Material: Copper, copper-nickel alloy, stainless steel, or titanium.
4. Nominal OD: 3/4 inch.
5. Minimum Wall Thickness: 0.028 inch.
6. External Finish: Manufacturer's standard.
7. Internal Finish: Enhanced or smooth.

F. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.

G. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.

H. Water Box:
1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
2. Marine type for water box with piping connections. Standard type for water box without piping connections.
3. Provide water boxes and marine water-box covers with lifting lugs or eyebolts.
4. Hinged water boxes.
5. Hinged marine water-box covers.
6. Nozzle Pipe Connections: Welded, ASME B16.5, raised-face flange.
7. Thermistor or RTD temperature sensor factory installed in each nozzle.
8. Fit each water box with 3/4- or 1-inch drain connection at low point and vent connection at high point, each with threaded plug.

I. Additional Corrosion Protection:
1. Electrolytic corrosion-inhibitor anode.
2. Coat wetted surfaces with a corrosion-resistant finish.
3. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.

2.7 HEAT-RECLAIM CONDENSER

A. Description: Shell-and-tube design with water in tubes and refrigerant surrounding tubes within shell. Shell is separate from evaporator and condenser.

B. For heat recovery chiller HRC-5 only.

C. Shell Material: Carbon-steel rolled plates with continuously welded seams or seamless pipe.

D. Designed to prevent direct impingement of high-velocity hot gas from compressor discharge on tubes.

E. Tubes:
1. Individually replaceable from either end and without damage to tube sheets and other tubes.
2. Mechanically expanded into end sheets and physically attached to intermediate tube sheets.
3. Material: .
4. Nominal OD: 3/4 inch.
5. Minimum Wall Thickness: 0.028 inch .
6. External Finish: Manufacturer's standard.
7. Internal Finish: Enhanced or smooth.

F. End Tube Sheets: Continuously welded to each end of shell; drilled and reamed to accommodate tubes with positive seal between fluid in tubes and refrigerant in shell.

G. Intermediate Tube Sheets: Installed in shell and spaced along length of tube at intervals required to eliminate vibration and to avoid contact of tubes resulting in abrasion and wear.

H. Water Box:
1. Cast-iron or carbon-steel construction; arranged to provide visual inspection and cleaning of tubes from either end without disturbing refrigerant in shell.
2. Marine type for water box with piping connections. Standard type for water box without piping connections.
3. Provide water boxes with lifting lugs or eyebolts.
4. Hinged water boxes.
5. Hinged marine water-box covers.

6. Nozzle Pipe Connections: Welded, ASME B16.5, raised-face flange.
7. Thermistor or RTD temperature sensor factory installed in each nozzle.
8. Fit each water box with 3/4- or 1-inch drain connection at low point and vent connection at high point, each with threaded plug.

I. Additional Corrosion Protection:
1. Electrolytic corrosion-inhibitor anode.
2. Coat wetted surfaces with a corrosion-resistant finish.
3. Using same material as tubes, clad surfaces of end tube sheets in contact with fluid. Coat other wetted surfaces, including water boxes, with a corrosion-resistant finish.

2.8 INSULATION

A. Closed-cell, flexible elastomeric thermal insulation complying with ASTM C 534, Type I for tubular materials and Type II for sheet materials.
1. Thickness: 1-1/2 inches.

B. Adhesive: As recommended by insulation manufacturer.

C. Factory-applied insulation over all cold surfaces of chiller capable of forming condensation. Components shall include, but not be limited to, evaporator shell and end tube sheets, evaporator water boxes including nozzles, refrigerant suction pipe from evaporator to compressor, cold surfaces of compressor, refrigerant-cooled motor, and auxiliary piping.
1. Apply adhesive to 100 percent of insulation contact surface.
2. Before insulating steel surfaces, prepare surfaces for paint, and prime and paint as indicated for other painted components. Do not insulate unpainted steel surfaces.
3. Seal seams and joints to provide a vapor barrier.
4. After adhesive has fully cured, paint exposed surfaces of insulation to match other painted parts.

2.9 ELECTRICAL

A. Factory installed and wired, and functionally tested at factory before shipment.

B. Single-point, field-power connection to fused disconnect switch . Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.
1. Branch power circuit to each motor, electric heater, dedicated electrical load, and controls.
a. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
b. NEMA AB 1, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit-trip set point.
2. NEMA ICS 2-rated motor controller for auxiliary motors, hand-off-auto switch, and overcurrent protection for each motor. Provide variable frequency controller for each variable-speed motor furnished.
3. Control-circuit transformer with primary and secondary side fuses.

C. Terminal blocks with numbered wiring to match wiring diagram. Spare wiring terminal block for connection to external controls or equipment.

D. Factory-installed wiring outside of enclosures shall be in metal raceway except make terminal connections with not more than a 24-inch length of flexible metallic conduit.

E. Factory install and wire capacitor bank for the purpose of power factor correction to 0.95at all operating conditions for heat recovery chiller.
1. If capacitors are mounted in a dedicated enclosure, use same NEMA enclosure type as motor controller. Provide enclosure with service entrance knockouts and bushings for conduit.

2. Capacitors shall be non-PCB dielectric fluid, metallized electrode design, low loss with low-temperature rise. The kVAr ratings shall be indicated and shall not exceed the maximum limitations set by NFPA 70. Provide individual cells as required.
3. Provide each cell with current-limiting replaceable fuses and carbon-film discharge resistors to reduce residual voltage to less than 50 V within one minute after de-energizing.
4. Provide a ground terminal and a terminal block or individual connectors for phase connection.

2.10 MOTOR CONTROLLER

A. Enclosure: Factory installed, unit mounted, NEMA 250, Type 1, with hinged full-front access door.

B. Control Circuit: Obtained from integral control power transformer with a control power transformer of enough capacity to operate connected control devices.

C. Overload Relay: Shall be sized according to UL 1995 or shall be an integral component of chiller control microprocessor.

D. Solid-State, Reduced-Voltage Controller: NEMA ICS 2 for heat recovery chiller.
1. Surge suppressor in solid-state power circuits providing three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
2. Visual indication of motor and control status, including the following conditions:
   a. Controller on.
   b. Overload trip.
   c. Loss of phase.
   d. Starter fault.

E. Accessories: Devices shall be factory installed in controller enclosure unless otherwise indicated.
1. Externally Operated Disconnect: Nonfused disconnect switch. Minimum withstand rating shall be as required by electrical power distribution system, but not less than A.
2. Control Relays: Time-delay relays.
3. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
   a. Selectable, digital display of the following:
      1) Phase Currents, Each Phase: Plus or minus 1 percent.
      2) Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
      3) Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
      4) Three-Phase Real Power: Plus or minus 2 percent.
      5) Three-Phase Reactive Power: Plus or minus 2 percent.
      6) Power Factor: Plus or minus 2 percent.
      7) Frequency: Plus or minus 0.5 percent.
      8) Integrated Demand with Demand Interval Selectable from Five to 60 Minutes: Plus or minus 2 percent.
      9) Accumulated energy, in megawatt hours (joules), plus or minus 2 percent; stored values unaffected by power outages for up to 72 hours.
   b. Mounting: Display and control unit flush or semirecessed in instrument compartment door.
4. Phase-Failure, Phase-Reversal, Undervoltage Relays: Solid-state sensing circuit with adjustable undervoltage setting and isolated output contacts for hardwired connection.
5. Power Protection: Chiller shall shut down within six cycles of power interruption.

2.11 VARIABLE FREQUENCY CONTROLLER

A. For chillers CH-1, CH-2, and CH-3.

B. Motor controller shall be factory mounted and wired on the chiller to provide a single-point, field-power termination to the chiller and its auxiliaries.

C. Description: NEMA ICS 2; listed and labeled as a complete unit and arranged to provide variable speed by adjusting output voltage and frequency.

D. Enclosure: Unit mounted, NEMA 250, Type 1, with hinged full-front access door with lock and key.

E. Integral Disconnecting Means: NEMA AB 1, instantaneous-trip circuit breaker with lockable handle. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 65,000 A.

F. Technology: Pulse width modulated (PWM) output with insulated gate bipolar transistors (IGBT); suitable for variable torque loads.

G. Controller shall consist of a rectifier converter section, a digital/analog driver regulator section, and an inverter output section.
   1. Rectifier section shall be a full-wave diode bridge that changes fixed-voltage, fixed-frequency, ac line power to a fixed dc voltage. Silicon controller rectifiers, current source inverters, and paralleling of devices are unacceptable. Rectifier shall be insensitive to phase rotation of the ac line.
   2. Regulator shall provide full digital control of frequency and voltage.
   3. Inverter section shall change fixed dc voltage to variable-frequency, variable ac voltage, for application to a squirrel-cage motor. Inverter shall produce a sine-coded, pulse width modulated (PWM) output wave form and shall conduct no radio-frequency interference back to the input power supply.

H. Output Rating: Three phase; with voltage proportional to frequency throughout voltage range.

I. Operating Requirements:
   1. Input AC Voltage Tolerance: 460-V ac, plus 10 percent or 506 V maximum.
   2. Input frequency tolerance of 60 Hz, plus or minus 2 Hz.
   3. Capable of driving full load, without de-rating, under the following conditions:
      a. Ambient Temperature: 0 to 50 deg C.
      b. Relative Humidity: Up to 95 percent (non-condensing).
      c. Altitude: 1000 feet.
   4. Minimum Efficiency: 96 percent at 60 Hz, full load.
   5. Minimum Displacement Primary-Side Power Factor: 98 percent with harmonic filter.
   6. Overload Capability: 1.05 times the full-load current for 7 seconds.
   7. Starting Torque: As required by compressor-drive assembly.
   8. Speed Regulation: Plus or minus 1 percent.
   9. Isolated control interface to allow controller to follow control signal over a 10:1 speed range.
   10. To avoid equipment resonant vibrations, provide critical speed lockout circuitry to allow bands of operating frequency at which controller shall not operate continuously.
   11. Capable of being restarted into a motor coasting in either the forward or reverse direction without tripping.

J. Internal Adjustability Capabilities:
   1. Minimum Output Frequency: 6 Hz.
   2. Maximum Output Frequency: 60 Hz.
   3. Acceleration: 2 seconds to a minimum of 60 seconds.
   4. Deceleration: 2 seconds to a minimum of 60 seconds.
   5. Current Limit: 30 percent to a minimum of 100 percent of maximum rating.

K. Motor Protection: Controller shall protect motor against overvoltage and undervoltage, phase loss, reverse phase, overcurrent, overtemperature, and ground fault.

L. Automatic Reset and Restart: Capable of three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Controller shall be capable of automatic restart on phase-loss and overvoltage and undervoltage trips.

M. Visual Indication: On face of controller enclosure or chiller control enclosure; indicating the following conditions:
   1. Power on.
   2. Run.
   3. Overvoltage.
   4. Line fault.
   5. Overcurrent.
   6. External fault.
   7. Motor speed (percent).
   8. Fault or alarm status (code).
   9. Input kilowatts.
   10. Input kilowatt-hours.
   11. Output frequency (Hertz).
   12. Elapsed operating time (hours).

N. Operator Interface: At controller or chiller control panel; with start-stop and auto-manual selector with manual-speed-control potentiometer.

O. Control Signal Interface:
   1. Electric Input Signal Interface: A minimum of two analog inputs (0 to 10 V or 0/4-20 mA) and six programmable digital inputs.

P. Active Harmonic Distortion Filter: Factory mounted and wired to limit total voltage and current distortion to 3 percent.

Q. Cooling: Air, refrigerant, or water cooled.

R. Accessories: Devices shall be factory installed in controller enclosure unless otherwise indicated.
   1. Control Relays: Auxiliary and adjustable time-delay relays.

S. Chiller Capacity Control Interface: Equip chiller with adaptive control logic to automatically adjust the compressor motor speed and the compressor pre-rotation inlet vane position independently to achieve maximum part-load efficiency in response to sensor inputs that are integral to the chiller controls.

2.12 CONTROLS

A. Control: Standalone and microprocessor based, with all memory stored in nonvolatile memory so that reprogramming is not required on loss of electrical power.

B. Enclosure: Unit mounted, NEMA 250, Type 1, hinged or lockable; factory wired with a single-point, field-power connection and a separate control circuit.

C. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front of control enclosure. In either imperial or metric units selectable through the interface, display the following information:
   1. Date and time.
   2. Operating or alarm status.
   3. Fault history with not less than last 10 faults displayed.
   4. Set points of controllable parameters.
   5. Trend data.
   6. Operating hours.
   7. Number of chiller starts.
   8. Entering- and leaving-fluid temperatures of evaporator and condenser.
   9. Difference in fluid temperatures of evaporator and condenser.
   10. Fluid flow of evaporator and condenser.
   11. Fluid pressure drop of evaporator and condenser.
   12. Refrigerant pressures in evaporator and condenser.

13. Refrigerant saturation temperature in evaporator and condenser shell.
14. Compressor refrigerant suction and discharge temperature.
15. Oil temperature.
16. Oil discharge pressure.
17. Phase current.
18. Percent of motor rated load amperage.
19. Phase voltage.
20. Demand power (kilowatts).
21. Energy use (kilowatt-hours).
22. For chillers equipped with variable frequency controllers and harmonic filters, include the following:
    a. Output voltage and frequency.
    b. Voltage total harmonic distortion for each phase.
    c. Supply current total demand distortion for each phase.
    d. Inlet vane position.
    e. Controller internal ambient temperature.
23. Purge suction temperature if purge system is provided.
24. Purge elapsed time if purge system is provided.

D. Control Functions:
1. Manual or automatic startup and shutdown time schedule.
2. Entering and leaving chilled-water temperatures, control set points, and motor load limits.
3. Current limit and demand limit.
4. Condenser-fluid temperature.
5. Variable evaporator flow.
6. Heat reclaim (heat recovery chiller only).

E. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:
1. Low evaporator pressure or temperature; high condenser pressure.
2. Low evaporator fluid temperature.
3. High or low oil pressure.
4. High oil temperature.
5. High compressor-discharge temperature.
6. Loss of condenser-fluid flow.
7. Loss of evaporator fluid flow.
8. Motor overcurrent.
9. Motor overvoltage.
10. Motor undervoltage.
11. Motor phase reversal.
12. Motor phase failure.
13. Sensor- or detection-circuit fault.
14. Processor communication loss.
15. Motor controller fault.
16. Extended compressor surge.
17. Excessive air-leakage detection for chillers using R-123 refrigerant.

F. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.

G. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.

H. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.

I. Communication Port: RS-232 port, USB 2.0 port, or equivalent connection capable of connecting a printer and a notebook computer.

J. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display chiller status and alarms.
   1. Hardwired Points:
      a. Monitoring: On-off status, common trouble alarm electrical power demand (kilowatts) electrical power consumption (kilowatt-hours) power factor.
      b. Control: On-off operation, (see controls sequence).
   2. ASHRAE 135 (BACnet) communication interface with the BAS shall enable the BAS operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the BAS.

2.13 FINISH

A. Paint chiller, using manufacturer's standard procedures, except comply with the following minimum requirements:
   1. Provide at least one coat of primer with a total dry film thickness of at least 2 mils.
   2. Provide at least two coats of epoxy finish with a total dry film thickness of at least 4 mils.
   3. Paint surfaces that are to be insulated before applying the insulation.
   4. Color of finish coat to be manufacturer's standard .

B. Provide Owner with quart container of paint used in application of topcoat to use in touchup applications after Project Closeout.

2.14 ACCESSORIES

A. Flow Switches:
   1. Chiller manufacturer shall furnish a switch for each evaporator and condenser and verify field-mounting location before installation.
   2. Pressure Differential Switches:
      a. Construction: Wetted parts of body and trim constructed of Type 316 stainless steel.
      b. Performance: Switch shall withstand, without damage, the full-pressure rating of the heat exchanger applied to either port and exhibit zero set-point shift due to variation in working pressure.
      c. Set Point: Screw type, field adjustable.
      d. Electrical Connections: Internally mounted screw-type terminal blocks.
      e. Switch Enclosure: NEMA 250,.
      f. Switch Action: Double-pole, double-throw switch with one pole field wired to the chiller control panel and the other pole field wired to the BAS.

B. Vibration Isolation:
   1. Chiller manufacturer shall furnish vibration isolation for each chiller.
   2. Neoprene Pad:
      a. Two layers of 0.375-inch- thick, ribbed- or waffle-pattern neoprene pads separated by a 16-gage, stainless-steel plate.
      b. Fabricate pads from 40- to 50-durometer neoprene.
      c. Provide stainless-steel square bearing plate to load the pad uniformly between 20 and 40 psig with a 0.12- to 0.16-inch deflection.

2.15 CAPACITIES AND CHARACTERISTICS

A. Heat-Reclaim Condenser:
   1. Pressure Rating:
   2. Number of Passes:
   3. Fluid Type:
   4. Design Fluid Flow Rate:

5. Entering-Fluid Temperature:
6. Leaving-Fluid Temperature:
7. Fluid Pressure Drop:
8. Fluid Velocity:
9. Fouling Factor:

2.16 SOURCE QUALITY CONTROL

A. Perform functional run tests of chillers before shipping.

B. Factory performance test chillers, before shipping, according to ARI 550/590.
   1. Test the following conditions:
      a. Design conditions indicated.
      b. Reduction in capacity from design to minimum load in steps of 25 with condenser fluid at design conditions.
      c. Reduction in capacity from design to minimum load in steps of 25 with varying entering condenser-fluid temperature from design to minimum conditions in increments.
      d. At three point(s) of varying part-load performance to be selected by Owner at time of test.
   2. Allow Owner and Architect access to place where chillers are being tested. Notify Architect 14 days in advance of testing.
   3. Include all travel accommodations for one owner representative and one design team representative to travel to the test site and witness the test.
   4. One chiller is to be capacity tested at the factory before any chillers are shipped. If the chiller passes all of the tests, no further factory testing is required. If the chiller does not pass, all of the remaining chillers are to be factory tested and shown to pass at no additional cost to the owner.
   5. Prepare test report indicating test procedures, instrumentation, test conditions, and results. Submit copy of results within one week of test date.

C. For chillers using R-134a refrigerant, factory test and inspect evaporator and condenser according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

D. For chillers using R-123 refrigerant, factory test and inspect evaporator and condenser according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1. Pressure test fluid side of heat exchangers, including water boxes, to 1.5 times the rated pressure. Pressure proof test refrigerant side of heat exchangers to a minimum of 45 psig. Vacuum and pressure test for leaks.

E. For chillers located indoors, rate sound power level according to ARI 575.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine chillers before installation. Reject chillers that are damaged.

B. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting chiller performance, maintenance, and operations before equipment installation.
   1. Final chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CHILLER INSTALLATION

A. Install chillers on support structure indicated.

B. Equipment Mounting: Install chiller on concrete bases using elastomeric pads. Comply with requirements for vibration isolation devices specified in Section 23 05 48 "Vibration and Seismic Controls for HVAC Piping and Equipment."
   1. Minimum Deflection: 1/2 inch.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
   3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to supported equipment.

C. Maintain manufacturer's recommended clearances for service and maintenance.

D. Charge chiller with refrigerant and fill with oil if not factory installed.

E. Install separate devices furnished by manufacturer and not factory installed.

3.3 CONNECTIONS

A. Comply with requirements for piping specified in Section 23 21 13 "Hydronic Piping" Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to chiller to allow service and maintenance.

C. Evaporator Fluid Connections: Connect to evaporator inlet with shutoff valve, thermometer, and plugged tee with pressure gage. Connect to evaporator outlet with shutoff valve, balancing valve, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, flow meter, and drain connection with valve. Make connections to chiller with a flange or mechanical coupling.

D. Condenser-Fluid Connections: Connect to condenser inlet with shutoff valve, thermometer, and plugged tee with pressure gage. Connect to condenser outlet with shutoff valve, balancing valve, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, and drain connection with valve. Make connections to chiller with a flange or mechanical coupling.

E. Heat-Reclaim Condenser-Fluid Connections: Connect to condenser inlet with shutoff valve, thermometer, and plugged tee with pressure gage. Connect to condenser outlet with shutoff valve, balancing valve, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, and drain connection with valve. Make connections to chiller with a flange or mechanical coupling.

F. Refrigerant Pressure Relief Device Connections: For chillers installed indoors, extend separate vent piping for each chiller to the outdoors without valves or restrictions. Comply with ASHRAE 15. Connect to chiller pressure relief device with flexible connector and dirt leg with drain valve.

G. For chillers equipped with a purge system, extend separate purge vent piping for each chiller to the outdoors. Comply with ASHRAE 15 and ASHRAE 147.

H. Connect each chiller drain connection with a union and drain pipe, and extend pipe, full size of connection, to floor drain. Provide a shutoff valve at each connection.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

2. Verify that refrigerant charge is sufficient and chiller has been leak tested.
3. Verify that pumps are installed and functional.
4. Verify that thermometers and gages are installed.
5. Operate chiller for run-in period.
6. Check bearing lubrication and oil levels.
7. Verify that refrigerant pressure relief device is vented outside.
8. Verify proper motor rotation.
9. Verify static deflection of vibration isolators, including deflection during chiller startup and shutdown.
10. Verify and record performance of fluid flow and low-temperature interlocks for evaporator, condenser, and heat-reclaim condenser.
11. Verify and record performance of chiller protection devices.
12. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assembly, installation, and connection.

C. Prepare test and inspection startup reports.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain chillers. Video record the training sessions.

END OF SECTION 236416

SECTION 237314 - FACTORY BUILT CUSTOM INDOOR AIR HANDLING UNITS

PART 1 – GENERAL

1.1 SECTION INCLUDES

A. Design, performance criteria, controls, and installation requirements for indoor mounted Custom Air Handling Units.

1.2 REFERENCES

A. AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings
B. AMCA Publication 99 – Standards Handbook
C. AMCA Standard 203 – Field Performance Measurement of Fan Systems

Q. NFPA 70 – National Electric Code
R. NFPA 90A – Standard for the Installation of Air Conditioning and Ventilating Systems
S. UL 900 – Test Performance of Air Filters
T. UL 1995 – Standard for Heating and Cooling Equipment

1.3 SUBMITTALS

A. Submit shop drawings and product data in accordance with Division 1
B. Submittals shall include the following:
    1. Dimensioned plan and elevation view drawings, including motor starter and control cabinets, required clearances, and location of all field connections.
    2. Cabinet material, metal thickness, finishes, insulation and accessories.
    3. Ladder-type schematic drawing of the power and auxiliary utility field hookup requirements, indicating all items that are furnished by the manufacturer.
    4. Manufacturer's performance of each unit. Selection shall indicate, as a minimum, the following:
        a. Fan curves with system operating conditions indicated.

b. Certified coil performance ratings with system operating conditions.
c. Calculations required for base rail heights to satisfy condensate trapping requirements of cooling coil.
d. Filters with performance characteristics.
e. Rated load amp draw.
f. Approximate unit shipping weight.

1.4 OPERATION AND MAINTENANCE DATA

A. Include data on design, inspection and procedures related to preventative maintenance. Operation and maintenance manuals shall be submitted at the time of unit shipment.

1.5 QUALIFICATIONS

A. Manufacturer shall be a company specializing in the design and manufacture of custom air handling equipment and in business for no less than 15 years.
B. Each unit shall bear an ETL label, conforming to UL Standard 1995.
C. Units shall comply with the requirements of UL 1995 and NFPA 90.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, protect and handle products to site under the supervision of the owner in accordance with the manufacturers Operation and Maintenance Instructions.

1.7 SEQUENCING AND SCHEDULING

A. Coordinate work performed under this section with work performed under the separate installation contract.

1.8 WARRANTY

A. The complete unit shall be covered by a parts only warranty issued by the manufacturer covering the first year of operation. The warranty period shall start on the date of equipment startup or six months after the date of shipment, whichever occurs first.
B. The installing contractor shall provide labor warranty during the unit’s first year of operation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to the specification requirements listed herein, provide custom air handling units as manufactured by:
1. Air Flow Systems, Inc.
2. ClimateCraft
3. Nortek Air Solutions
4. Trane Custom
5. Air Enterprises

2.2 GENERAL

A. Units shall be completely factory assembled and tested with the exception of unit splits as required for shipping or installation requirements as indicated on the schedule and drawings. The equipment's cooling, heating, humidifying, ventilating, exhausting capacity and performance shall meet or exceed that shown on the schedule. Tags and decals to aid in service or to indicate caution areas shall be provided. Electrical wiring diagrams shall be attached to the control panel access doors. Operation and Maintenance manuals shall be furnished with each unit.

2.3 CABINET CONSTRUCTION

A. Cabinets shall be constructed in a watertight and airtight manner. The manufacturer's cabinet construction shall result in an ASHRAE/ANSI Standard 111 Leakage Class 5 rating, or better, as measured in accordance with AMCA Standard 210. A leakage rate as a percent of airflow shall only be submitted following calculation at specific project conditions. Maximum casing leakage (cfm/100 ft^2 of casing surface area) = CL X $P^{0.65.}$ Published leakage rates at generic conditions shall not be submitted.

B. Casing deflection shall not exceed L/200 (.0005" per inch) at 1.5 times the casing internal operating pressure at design airflow conditions, not to exceed 12" w. g., whichever is less. L is defined as the panel span taken at the panel seam joint.

C. The unit shall be constructed on an 8" welded structural ~~*tubular*~~ steel base. Base tubing shall be cold-formed carbon steel, electric resistance welded. Equipment using a die-formed sheet metal base is not acceptable. Formed intermediate cross members shall be constructed of hot rolled 12-gauge galvanized steel. After fabrication, the base frame shall be thoroughly cleaned and coated with high solids, polyamide epoxy paint system for superior corrosion resistance.

D. Units shipped in multiple sections shall be engineered for ease of field assembly. Gasket supplied with the unit shall be a high-quality weather resistant closed-cell EPDM sponge rubber. Each section shall include a permanent label to aid in proper field assembly. All gasket and necessary assembly hardware shall ship loose with unit. Floors shall be designed to deflect no more than 1/200 of span under operating conditions.

E. Floors

   a. Shall be fabricated of 3/16″ aluminum tread plate. All floor sheets seams shall be continuously welded and welded to the unit base structure with a 2" turned up lip at the perimeter.

   b. Floor seams at shipping splits shall be welded in the field by the installing contractor. The manufacturer shall provide 3/16" aluminum tread plate strips to cover the floor seams. The strip shall be continuously welded on both sides.

   c. Adiabatic humidifier sections shall have floors fabricated of 10-gauge 316 stainless steel. All floor sheets seams shall be continuously welded and welded to the unit base structure with a 2" turned up lip at the perimeter.

   d. Adiabatic humidifier section floor seams at shipping splits shall be welded in the field by the installing contractor. The manufacturer shall provide 10-gauge 316 stainless steel strips to cover the floor seams. The strip shall be continuously welded on both sides.

   e. All accessible sections without a drain pan shall have a 1.25" diameter floor drain piped through the unit base for drainage.

   f. Floors shall be insulated with a two-part polyurethane water impervious foam insulation. A 20-gauge G90 galvanized steel under liner shall be provided.

F. Wall and roof panels

   a. Panels shall be *4" thick* double wall construction. Panel joints shall be sealed with an industrial EPDM gasket to form a water and airtight seal.

   b. Panels shall be individually removable for service without removing the roof or compromising the integrity of the cabinet wall. Panels shall be joined with 5/16" bolts that can be removed and refastened. Panel attachment with screws is not acceptable. All panels shall utilize thermal break construction between the exterior panel and the interior liner and between the panels and the base and roof frames.

c. For long term durability, exterior panels shall be a minimum 16-gauge G60 galvanized steel *or aluminum* pre-painted with a baked-on polyester-ceramic paint system that passes a 1,000-hour ASTM B-117 salt spray resistance test and 3000-hour ASTM G-23 accelerated weathering test.

d. Interior liners shall be a minimum 20-gauge 304 stainless steel. Panel liners shall be of a single piece construction and attached to the exterior panels with a full thermal break. To allow for cleaning, no fasteners shall be used on the exposed liner surface. Single wall units are not acceptable.

e. Adiabatic humidifier section interior liners shall be a minimum 20-gauge 316 stainless steel.

G. Insulation

a. All wall and roof panels shall be insulated with an injected foam insulation with an R value of 6.6/inch. Panels shall be designed to deflect no more than 1/200 of span under operating design conditions when measured at the panel seam. Insulation shall fill the panel without voids. Panels shall have a minimum 20-gauge 304 stainless steel solid interior liner. The composite R-value of the 4" unit casing shall be no less than *R-17*.

H. Access doors shall be provided into all sections of the air-handling unit as indicated in the plan documents. Doors shall be sized as shown on plan drawings, shall be a minimum 3" thick with *R-17* polyurethane foam insulation and shall be double wall construction using the same material type as the corresponding section. Doors shall comply with the requirements of UL 1995 and NFPA 90. The door frame shall be 0.125" extruded 6063-T5 aluminum. Each door shall be mounted with adjustable die cast aluminum hinges. All doors and mounting frames shall incorporate a thermal break design and the doors shall seal to a replaceable extruded EPDM sponge rubber gasket. Doors shall open against static pressure or shall include a pressure relief feature on the door latch.

a. The door latch assembly shall consist of a roller cam compression arm with a chrome plated steel inner handle and glass fiber/nylon composite outer handle. One tool operated lock shall be provided on each fan section access door. All doors shall have a minimum of two latches.

b. A 10"x12" thermal pane viewing window with one wire mesh safety glass pane and one clear pane shall be provided. The frame shall have a no-through-metal thermal break design. Viewing windows shall be on all doors serving a lighted section. Windows on doors exposed to unit mounted UVC light shall use glass that is resistant to UVC transmission.

I. The entire unit, including walls, roof, doors, joints, and seams shall include thermal break construction. This construction shall be supported by tested performance producing no condensation on the exterior surface when the air tunnel temperature is 50°F DB under the following exterior conditions:

i. $(Th - 50) / (Th - Tdp) < 3.4$

b. Th = Ambient dry bulb temperature (°F) external to housing

c. Tdp = Ambient dew point temperature (°F) external to housing

2.4 FAN ASSEMBLIES – GENERAL

A. The fan shall be of the size and type specified in the unit schedule. To assure maximum performance, fans shall be supplied by a manufacturer specializing in fan design and production.

All fan assemblies shall be designed for heavy-duty industrial applications. Fan framing assemblies shall be fabricated from structural steel electrically welded to form a rigid, integral base. Individual fan assemblies shall be independently isolated.

All motors shall be NEMA design B with Class F insulation. Electrical characteristics and horsepower shall be as specified on the project schedule. All motors shall have a minimum service factor of 1.15. Motors shall have ball bearings. Motors shall be premium efficiency ODP type and shall be factory wired to a fan array motor overload panel. The motor shall be located within the unit and mounted on an adjustable heavy steel base. The motor base shall be fastened securely to the structural steel framing of the fan assembly.

All fans shall meet the minimum efficiency and maximum brake horsepower values as scheduled. All fans shall be selected to operate at a point no higher than 90% of the peak static pressure rating as defined by the fan performance curve at the selected operating speed. Manufacturer must ensure maximum fan RPM is below the first critical speed.

B. Each fan shall be provided with a factory installed airflow measuring device. Airflow device to be mounted out of the direct air stream so as not to affect system static pressure or sound performance. Sensor accuracy shall be +/- 3%. Factory installed assembly shall include flow sensors for field connection to a transducer provided by others.

C. The maximum individual fan size shall be 15 hp.

2.5 FAN ASSEMBLIES – DIRECT DRIVE FAN ARRAY

a) Fan Arrays shall be direct-drive, non-overloading SWSI plenum fans designed for industrial duty and suitable for continuous operation.

i) Fans shall be arranged in an array using one or more welded structural steel assemblies and shall be of the size and quantity specified in the unit schedule. Screwed or riveted frames are unacceptable. Fan assemblies shall be attached directly to base structural members.

ii) Fan wheels shall have a minimum of 12 airfoil blades for superior sound characteristics and shall be constructed of aluminum to reduce rotational weight and vibration. Fan blades shall be extruded aluminum for uniformity and improved vibration characteristics.

iii) Each fan and motor assembly shall be independently isolated within the structural assembly using 1-inch deflection spring isolators. Isolators shall be mounted in a three-point arrangement that provides both vertical and horizontal (thrust) isolation and shall not require field adjustment. If hard mounted or rubber in shear is used in place of internal spring isolations, external isolation of the entire air handling unit is required, no exceptions. Isolation system shall be seismic rated to withstand seismic forces in excess of 4G horizontally and vertically to satisfy specified IBC seismic requirements.

iv) A fan inertia base shall be provided or the fan structure shall exceed an equivalence of 2x mass of the total rotating parts of the fan array. Fan and motor assemblies shall be designed such that no natural frequencies exist within the operating RPM range of the fan, eliminating the need for “lockout” frequency settings in the variable speed drive. The purchasing contractor will be responsible for all costs associated with externally isolating any unit that does not include individual fan isolation.

v) All fan arrays shall meet the minimum motor efficiency, maximum brake horsepower and total motor horsepower values scheduled. All fans shall be selected to operate at a point no higher than 90% of the peak static pressure rating as defined by the fan performance curve at the selected operating speed. Manufacturer must ensure maximum fan RPM is below the first critical speed. Fans shall be Class 2 construction.

vi) All fan and motor assemblies shall be dynamically balanced by the manufacturer to a maximum allowable vibration of 0.040 inches per second at design RPM and a maximum 0.080 inches per second overall vibration limit to bring the fan balance in conformance to a BV-5 Grade G1 per ANSI/AMCA 204. In addition, the manufacturer shall insure that no critical frequencies exist in the fan operating range by varying motor speed in 1Hz increments from design RPM to 50% of design RPM.

b) Unloading

i) Fan curves shall be submitted with the system curve indicating the minimum system operating static pressure and the point of fan surge.

c) Motors

i) Electrical characteristics and horsepower shall be as specified on the project schedule.

ii) Motors shall be Premium Efficiency per NEMA MG1 Table 12-12 type, shall have NEMA Class F insulation, shall meet NEMA Standard MD-1 Inverter Duty rating and shall be designed to withstand 1600V peak voltage spikes and rise times ≥0.1 microseconds.

iii) Motors shall have grease lubricated ball bearings designed to deliver a minimum L10 life of 250,000 hours at full load and the maximum operating RPM of the associated fan. Grease zerks and spring-loaded grease relief valves shall be provided in each motor to allow easy bearing lubrication without damaging the seals due to over lubrication. Permanently lubricated bearings are allowed if a spare motor per fan array is provided.

iv) For efficient operation in a direct drive application, motors shall be capable of operating greater than 60HZ to at least the design operating speed of the fan.

v) Motors shall be factory wired to a motor control center for connection to a VFD. The motor control center shall include for each motor circuit a control device providing overload protection, short circuit protection and a manual disconnect means, and all circuits shall be wired to a common main panel terminal block. Each control device shall include an auxiliary output capable of providing remote notification of a motor failure. All motors shall operate at all times and be controlled in unison, maintaining a consistent and uniform airflow pattern over coils, filters and other devices.

vi) Each motor shall be provided with a shaft grounding device to harmlessly bleed potential induced shaft voltages to ground.

d) Warranty

i) All rotating parts shall be warranted by the unit manufacturer for a full five (5) years from date of unit start-up. Parts warranties provided by third parties are not acceptable.

e) Options

i) In the fan section, provide an overhead motor removal system to facilitate motor replacement. One of the two options below is to be provided.

(1) The assembly shall include a manually operated winch, capable of being easily moved to any motor location.

(2) A structural steel I beam for mounting a trolley to assist in fan motor removal. The beam system shall be mounted overhead of the fan and motor. The beam system shall be supported and mounted to the unit's base support system.

ii) Double wall, sound insulated perforated metal, acoustical baffle plates shall be provided on both side of each individual fan to provide acoustical attenuation.

iii) Ruskin BD6 aluminum gravity backdraft dampers shall be provided on the inlet of each fan to prevent recirculation of air in the event of motor failure.

2) Fan Array Controls

A. Fan arrays shall be controlled using a common control signal, such as the duct static control signal, to modulate the fan speed.

B. Each fan array in the air handling unit shall be provided with a factory installed airflow measuring instrument. Every fan in the array will have an airflow measuring device that is guaranteed by the unit manufacturer to have no impact on the fan airflow performance and will not increase the fan sound power. The output of the airflow measurement device on each fan shall be wired by the unit manufacturer back to a central processor mounted on the cabinet exterior that will add the flow from each fan to provide a total airflow for the fan array. Using one air flow measuring device and multiplying by the number of fans provided is not acceptable due to lack of accuracy.
The central processor shall be able to detect and report a fan failure. Auxiliary contacts

on the motor starters are not acceptable as fans can fail without tripping overloads. Current sensors wired into the central processors can be utilized.

C. Piezometric volume taps with pressure transducers are acceptable. Transducer accuracy shall be 1% of pressure reading from full scale down to 30% of full scale reading to improve accuracy to less than 0.5% of calculated flow from 100%-30% of flow. The square root linearization and conversion of the pressure signal to flow shall be done at the central processor. Acceptable pressure transducers are: MatrixMonitor™ Fan Sensor, Omega PX656, Greenheck FMS, Setra Model 239.

D. Measure the airflow back flowing through all failed fans in the array. The backflow shall be subtracted from the sum of the operating fans to provide an accurate delivered airflow for the entire fan array. The system measurement accuracy shall be ±5% of measurement throughout the entire operating range of the fan array down to 15% of design flow. Systems with accuracy rated as a percentage of full scale are not acceptable. The system shall adjust for changes in barometric pressure and temperature to maintain accuracy in changing atmospheric conditions and at any altitude. The system shall be able to measure airflow and report it in units of ACFM or SCFM as selected by the user.
The system shall have the capability to communicate to the BMS with discretely wired analog signals or through an RS485 two wire multi drop network using the BACnet protocols. All information available through the local keypad display unit shall be made available through the BANCet interface. At a minimum, there shall be two locally scalable 0 to 10 VDC signals to report airflow and array pressure rise to the BMS. In addition, there shall be three SPDT relay outputs to report on the condition of the fan array. One relay will switch when the control is energized, one will switch in the event of fan failure detection and one will switch if fan surge is detected.

E. In addition to fan failure detection the system shall also be able to detect and report when any fan is in surge. The system shall have self-diagnostic capabilities and be able to report measurement and system errors. Individual and total flow measurements, entering air temperature and fan array pressure rise shall be available at a unit mounted keypad display.

F. Unit manufacturer shall supply and mount for each fan in the air handler a tri-axial accelerometer used to measure fan vibration. The output of each accelerometer shall be processed in real time through a FFT processor to provide frequency domain vibration for each fan. The vibration readings shall be reported in velocity and available for a frequency range that is a minimum of 3 times the operational speed of the fans. The system shall be capable of checking the fan vibration against user selectable vibration limits and reporting when those limits are exceeded. Each fan vibration sensor will be tied back to the airflow monitor where the individual fan vibration levels can be displayed on the local keypad display and the alarms and data can be transmitted to the BMS through the ~~*MODBUS or*~~ BACnet communication link.

G. Each fan array in the air handler shall be equipped with a grease monitoring system to track the intervals between motor bearing greasing. The system shall monitor the motor shaft speed for every fan motor in the array and integrate this data over time to determine the optimum elapsed time between bearing greasing. The system shall maximize the time interval between motor bearing greases while maintain proper lubrication of the bearings to maximize the motor life. The system shall notify the operator when it is time to grease the motor bearings through a locally mounted keypad display. The system will also estimate the number of days remaining until the motor bearings need to be greased. The system shall be capable of reporting the grease life information to the BMS through an RS485 two wire multi drop network using the ~~*MODBUS or*~~ BACnet communication protocol.

H. ~~*If a BACnet communication interface is desired in lieu of using the standard MODBUS protocol,*~~ the BACnet interface shall be capable of the following protocols: BACnet

MS/TP, BACnet/IP, Modbus/TCP. The following BACnet points shall be available for viewing at the BAS system:

1. Supply fan array total airflow, pressure rise, average temperature, density, average speed, and operating hours left until motor bearings require lubrication.
2. Return fan array total airflow, pressure rise, average temperature, density, average speed, and operating hours left until motor bearings require lubrication.
3. Barometric pressure
4. Monitor board temperature
5. Relay 1 status – power
6. Relay 2 status – fan failure
7. Relay 3 status - warning

2.6 FAN ARRAY SPEED CONTROL AND MOTOR PROTECTION

A. Each variable air volume supply and return fan array shall be provided with an individual variable frequency drive as specified under another specification section.

B. For projects where a VFD controls more than one fan motor, the CAHU manufacturer shall provide, mount, and wire a ***single*** fan array power distribution panel. The power distribution panel shall have a NEMA 3R enclosure. It shall have a main disconnect switch on the incoming line voltage side, a combination motor overload / disconnect for each fan motor, and all necessary wire termination blocks and terminal strips. It shall have a 65,000-amp short circuit withstand rating.

2.7 UNIT SOUND POWER

A. Fan sound power levels (dB) for the unit shall not exceed values as specified on the equipment schedule.

B. Unit manufacturer shall provide certified inlet, supply and casing radiated, sound power levels based on the final unit configuration.

2.8 COILS

A. Provide complete coil section(s) with service access door(s) as shown on the plan drawings. Coil connections shall extend through the section casing for ease of installation. Coil connections must be sealed from both the inside and exterior surfaces of the panel with the sleeve of the inner seal covering the pipe within the depth of the panel, all to minimize leakage and condensation. An integral double wall stainless steel air seal which completely seals around the cooling coil casing and extends to the unit pressure bearing surface shall be provided. Air seals/safing materials that are mechanically fastened to the inner liner of the cabinet only shall be constructed of 16 gage materials to match the material type in the appropriate section and shall be gasketed and have fasteners every 3 inches.

B. Multiple, “stacked” coil arrangements must be constructed so as to allow independent removal of any coil without the removal of another within the coil bank.

C. All coils shall meet or exceed the capacities specified on the mechanical schedule and all water coil performances shall be certified in accordance with the AHRI Forced Circulation Air Heating and Air Cooling Coil certification program which is based on AHRI Standard 410. Face velocities shall not exceed those specified on the mechanical schedule.

D. All blow-through cooling coils shall have removable stainless-steel mist eliminators as manufactured by Mistop regardless of coil face velocity, no exception.

E. All cooling coil and heating coil sections shall include a double sloped drain pan constructed from 304L stainless steel. All corners shall be welded watertight. Coils shall rest on stainless steel supports. The pan shall have a minimum pitch of 2" from high point to the bottom of the drain outlet connection, providing at least a 1/8” per foot slope. The drain pan shall be

insulated with a 2-part sprayed on polyurethane, water impervious foam. Insulation shall be applied to the entire under side of the drain pan and coil section base assembly. If multiple stacked coils are used, intermediate drain pans are required. Intermediate pans shall be insulated and drained with 3/4" copper down-comers to the main pan. All drain pan openings shall be covered with walk-on aluminum grating for safety. Open drain pan openings are not acceptable.

F. Water coils shall be of a staggered tube design with high efficiency die formed corrugated plate-type fins for maximum performance. All coils shall be tested with 400 psig compressed air under clear water. Coils shall be designed to operate at 300 psig internal pressure and up to 250ºF. Tubes shall be 5/8" diameter, seamless *0.035"* wall copper, mechanically expanded into full drawn fin collars for a continuous compression bond over the full finned length for high efficiency performance. Cooling coil and heating casings shall be a minimum 16-gauge stainless steel. Coil casing reinforcements shall be required for fin lengths over 42". Coil fins shall be 0.0075" thick aluminum as a minimum, *spaced no more than 12 fins/inch*. Coils shall be serviceable using 0.25" M.P.T. drain and vent taps on the supply and return headers. Threaded seamless red brass coil connections shall be brazed to copper supply and return headers.

2.9 NEEDLEPOINT BI-POLAR IONIZATION DESIGN & PERFORMANCE CRITERIA

A. Each piece of air handling equipment, so designated on the plans, details, equipment schedules and/or specifications shall contain a Needlepoint Bipolar Ionization system with output as described here within.

B. The Needlepoint Bipolar Ionization system shall be capable of:

1. Effectively eliminating or inactivating microorganisms downstream of the Needlepoint Bipolar Ionization equipment (mold, bacteria, virus, etc.).

2. Controlling gas phase contaminants generated from human occupants, building structure and furnishings.

3. Capable of reducing static space charges.

4. All manufacturers shall provide documentation by an independent NELEC accredited laboratory that proves the product has minimum deactivation rates for the following pathogens given the allotted time and in a space condition:

   A. SARS-CoV-2 >98% in 60 minutes or less
   B. MRSA >96% in 30 minutes or less
   C. E.coli > 99% in 15 minutes or less
   D. TB > 69% in 60 minutes or less
   E. C.diff >86% in 30 minutes or less

5. Increasing the interior ion levels, both positive and negative, to a minimum of 2,500 ions/cm³ measured 5 feet from the floor.

C. The Needlepoint Bipolar Ionization system shall operate in a manner such that equal amounts of positive and negative ions are produced from a two-sided electrode housing that includes the required count of needlepoint brush clusters. Uni-polar ion devices shall not be acceptable.

1. Air exchange rates may vary through the full operating range of a constant volume or VAV system. The quantity of air exchange shall not be increased due to requirements of the air purification system.

2. Velocity Profile: The air purification device shall not have maximum velocity profile.

D. Humidity: Needlepoint Bipolar Ionization systems shall not require preheat protection when the relative humidity of the entering air exceeds 85%. Relative humidity from 0 - 100%, condensing, shall not cause damage, deterioration or dangerous conditions within the air purification system. Air purification system shall be capable of wash down duty.

E. Equipment Requirements:

1. Electrode Specifications (Needlepoint Bipolar Ionization):

a. Electrode housing must be a two-sided type with a minimum of 11 needlepoint brush clusters on each side of the bar, allowing free air flow across the electrodes for proper ion distribution into the air flow.

b. Each Needlepoint Bipolar Ionization system shall include the required number of electrodes and power generators sized to the air handling equipment capacity. Unit shall be capable of treating 6,000 CFM (C univ 6.0), 10,000 CFM (C univ10.0), 15,000 CFM (C univ15.0), or 20,000 CFM (C univ20.0). Bipolar ionization tubes manufactured of glass and steel mesh shall not be acceptable due to replacement requirements, maintenance, performance output reduction over time, ozone production and corrosion.

c. Unit and Electrodes shall generally be maintenance free, and it shall cycle polarity to enhance the self-cleaning capabilities of the unit with no moving parts involved. Any system requiring moving parts or routine cleaning, will not be allowed.

d. Electrodes shall be energized when the main unit disconnect is turned on and the fan is operating. Electrodes shall be made from carbon fiber to prevent oxidation over time.

e. Electrodes shall provide multiple needlepoint brush clusters with a minimum of 190 million ions per cubic centimeter per cluster. Devices with fewer than 22 needlepoint brush clusters (as is built into the C Univ6.0), 44 needlepoint clusters (as is built into the C Univ10.0), 66 needlepoint clusters (as is built into the C Univ15.0), 88 needlepoint clusters (as is built into the C Univ20.0) are not allowed unless multiple devices are used to equal the total number of ions produced per cubic centimeter as provided by the specified C units noted here in this section.

f. Devices with moving parts are not acceptable.

g. Each Device shall accept universal power supply and be capable of being powered by 24VAC, 110 VAC, or 240 VAC

F. Air Handler Mounted Units:

1. Where so indicated on the plans and/or schedules Needlepoint Bipolar Ionization system(s) shall be supplied and installed. The mechanical contractor shall mount the Needlepoint Bipolar Ionization Generator and wire it to the AHU control power (24VAC) as instructed by the Air Purification Manufacturer's instructions or line voltage subject to power available. Each unit shall be designed with an integral illuminated LED and dry contacts to prove ion output is operating properly. The dry contacts shall close to prove the ion generator is working properly and may be daisy chained in series such that only one dry contact per AHU is required to interface to the BAS. Dry contacts proving power has been applied in lieu of the ion output is actually operating, are not acceptable.

G. Ionization Requirements:

1. Needlepoint Bipolar Ionization device(s) shall be capable of controlling gas phase contaminants and shall be provided for all equipment listed above.

a. The Needlepoint Bipolar Ionization system shall consist of Needlepoint Bipolar Ionization system and power supply. The Needlepoint Bipolar Ionization system shall be installed where indicated on the plans or specified to be installed.

b. Ionization Output: The ionization output shall be controlled such that an equal number of positive and negative ions are produced.Imbalanced levels shall not be acceptable.

c. Ionization output from each electrode shall be a minimum of 190 million ions/cc when tested at 1" from each needle point brush. Single needlepoint devices are not allowed.

d. All manufacturers shall provide documentation by an independent NELEC accredited laboratory that proves the product has minimum deactivation rates for the following pathogens given the allotted time and in a space condition:

A. MRSA - >96% in 30 minutes or less
B. E.coli - > 99% in 15 minutes or less
C. TB - > 69% in 60 minutes or less
D. C. diff - >86% in 30 minutes or less

Manufacturers not providing the equivalent space deactivation rates shall not be acceptable. All manufactures requesting prior approval shall provide to the engineer independent test data from a NELEC accredited independent lab confirming deactivation rates and time meeting the minimum requirements stated in section 2.2 B, points 6A, 6B and 6C.

2. Ozone Generation:

a. The operation of the electrodes or Needlepoint Bipolar Ionization units shall conform to UL 867 ECVP 2998 Zero Ozone Emissions from Air Cleaners, first edition – 2016 with respect to ozone generation. There shall be no ozone generation during any operating condition, with or without airflow.

2.10 FILTERS (ALL EXCEPT HEPA)

A. Provide complete filter section(s) with filter racks and service access door(s) as shown on the plan drawings. Holding frames provided for medium efficiency applications will be accessible. Holding frames provided for high efficiency applications will be upstream accessible. Holding

frames shall be constructed from heavy gauge stainless steel and shall be equipped with polyurethane foam gaskets. Frames shall be installed with vertical stiffeners and appropriate frame-to-frame sealant to provide a rigid leak tight assembly. An integral air seal which completely seals around the filter frame assembly and extends to the unit pressure bearing surface shall be provided. Air seals/safing materials that are mechanically fastened to the inner liner of the cabinet only shall be constructed of 16 gage materials to match the material type in the appropriate section and shall be gasketed and have fasteners every 3 inches

Filter fasteners shall be capable of being installed without the requirement of tools, nuts or bolts. The holding frame shall be designed to accommodate standard size filters with the application of the appropriate fastener*. All frames shall be connected in a manner that does not provide protrusions into the filter installation/removal path.* The filter rack shall be designed to use standard 24"x24" and 12"x24" filters only. Odd sized filters are not allowed. Holding frame assemblies shall be sized to meet or exceed the face area specified by the mechanical schedule.

B. All filter racks shall be provided with Camfil C78 (or pre-approved equivalent) filter clips. Clip length shall be selected to match the filter being secured by the clip.

C. Gauges

a. A Magnehelic differential pressure gauge shall be provided factory installed for measuring the pressure drop across each filter type. The gauge shall be a diaphragm-actuated dial type, 4¾" O.D., with white dial, black figures and graduations and pointer zero adjustment.

D. Medium efficiency pleated filters shall be 2" thick MERV 8 as rated by ASHRAE Standard 52.1 test methods. Filter media shall be of the non-woven cotton fabric type. Filters shall be UL900 Class 2 listed. 100% outside air units shall have 4" thick MERV 8 filters.

E. High efficiency rigid filters shall be 12" deep, high capacity, pleated, totally rigid disposable type. Filters shall consist of micro-fine synthetic media laminated to a non-woven backing, media support grid, contour stabilizers and enclosing frame. The filter media shall have an average efficiency of MERV ~~*11, 13, 14, and 15*~~ ***16*** as rated by ASHRAE 52.1 test methods as shown on the equipment schedule. The enclosing frame shall be constructed of galvanized steel. It shall be constructed and assembled in such a manner that a rigid and durable enclosure for the filter pack is affected. The enclosing frame shall be equipped with protective diagonal support members on both the entering air and air leaving sides of the filters. The filters shall be UL900 Class 2 listed.

~~*2.11 HEPA FILTERS*~~

~~*A. Provide complete filter section with filter racks and service access door(s) as shown on the plan drawings. Holding frames shall consist of holding frame section, constructed of stainless steel of all welded construction and reinforcing flanges as an integral part of the holding frame to preclude the possibility of deflection of the sealing flange. Annular based dimples and mounting holes, gasket seals, receptacle guides, and removable swing bolt assemblies shall all be an integral part of the holding frame. Frames shall be installed with vertical stiffeners and appropriate frame-to-frame sealant to provide a rigid leak tight assembly. An integral air seal which completely seals around the filter frame assembly and extends to the unit pressure bearing surface shall be provided. The design of the frames shall be such that it will accommodate nominal 24"x24" HEPA filters (23⅝" x 23⅝" actual) in either 6" or 12" depth.*~~

~~*B. HEPA filters shall meet or exceed 99.97%, MERV 17 efficiency on 0.3-micron particles when tested with thermally generated D.O.P. in accordance with the latest industry and military standards. The clean static pressure shall be no greater than 1.0" W.G. when operated at rated airflow. The media shall be glass paper. Filters shall be factory constructed and assembled of galvanized steel frames, corrugated aluminum separators and 100% solid resin sealant.*~~

~~C. Gauges~~

~~a. A Magnehelic differential pressure gauge shall be provided factory installed for measuring the pressure drop across each filter type. The gauge shall be a diaphragm actuated dial type, 4¾" O.D., with white dial, black figures and graduations and pointer zero adjustment.~~

2.12 CONTROL DAMPERS

A. Mixing box and economizer outdoor air, return air, and exhaust air openings shall have factory mounted aluminum airfoil low-leak dampers. Damper shall be opposed (exhaust air) and parallel (outdoor air and return air) blade type. Damper frame shall be 0.125" thick aluminum hat channel. Damper shall meet the leakage requirements of ASHRAE Std. 90.1 and of the International Energy Conservation Code by leaking less than 3 CFM/sq. ft. at 1" of static pressure, and shall be tested in accordance with AMCA Standard 500-D.

B. The dampers shall be equal to Ruskin CD50.

2.13 AIR BLENDERS

A. Air blenders shall be manufactured by Blender Product, Inc. Series IV.

B. The air blenders shall be installed where shown on the CAHU details to enhance the mixing of outside air with return air to a mixing effectiveness required to eliminate freeze stat trips, minimize sensor error and enhance outdoor air distribution. Additionally, the air mixing device shall provide even airflow across filters, coils and control sensors.

C. The static mixer shall be capable of 70% range mixing effectiveness when mixing 25% outside air with 75% return air at one mixer diameter downstream of mixer.

D. Static air mixers shall be geometrically scaled to ensure consistent performance across full range of sizes offered. Mixers that are not geometrically scaled are not acceptable. Mixers shall be of counter rotational design.

E. Static air mixers shall be welded and mechanically fastened .080" or .125" thick aluminum. Static air mixers shall have bare aluminum finish.

2.14 ADIABATIC HUMIDIFIERS

A. The humidifier section interior liners and floor shall be constructed of solid 316 stainless steel as noted in the casing construction section.

B. All adiabatic humidifier sections shall include double sloped drain pans constructed from 316L stainless steel. All corners shall be welded watertight. Coils shall rest on stainless steel supports. The pan shall have a minimum pitch of 2" from high point to the bottom of the drain outlet connection, providing at least a 1/8" per foot slope. The drain pan shall be insulated with a 2-part sprayed on polyurethane, water impervious foam. Insulation shall be applied to the entire under side of the drain pan and coil section base assembly. All drain pan openings shall be covered with walk-on aluminum grating for safety. Open drain pan openings are not acceptable.

C. See the adiabatic humidifier specification section for the humidifier requirements.

2.15 ELECTRICAL POWER AND CONTROLS

A. Unit operating voltage shall be 460V, 3-phase, 60Hz. All wiring and electrical equipment supplied by the manufacturer shall conform to and be installed in accordance with the requirements of UL1995.

B. Each section provided with a service access door, or as indicated on the plan drawings, shall be equipped with a vapor proof LED service light. All lights shall be completely installed and wired to a single 60-minute timer switch. All switch boxes shall include a GFCI convenience receptacle. Lights and GFCI outlets shall be wired to a separate 115VAC power connection.

C. Provide copper wires, bus bars, and fittings throughout, except internal wire of the control transformer may be aluminum if copper termination is provided. Identify power supply

terminals with permanent markers. The maximum temperature of terminals shall not exceed 167°F (75°C) when the equipment is tested in accordance with its rating.

D. All wiring, 460VAC and 115VAC, shall be run in plated EMT and Liquid Tight conduit.

E. Mount a permanent nameplate on the unit to display the manufacturer, serial number and model number, date of manufacture, horsepower, current rating and voltage.

2.16 UNIT TESTING AND QUALITY CONTROL

A. The fans shall be factory run tested to insure design integrity and proper RPM. All electrical circuits shall be tested to ensure correct operation before shipment of unit. Units shall pass all quality control checks and be thoroughly cleaned prior to shipment.

PART 3 - EXECUTION

3.1 INSTALLATION

A. NOTE: Installation of this equipment shall be performed by a contractor yet to be selected. The equipment supplier and/or manufacturer shall provide all equipment, materials, labor, etc. required for installation and maintenance of this equipment, including required warranty work, inspections as noted herein, owner training, etc., to the installing contractor upon award of the installation.

B. Equipment rigging and assembly to be supervised by the manufacturer's representative. Provide for as long a period of time as is necessary to ensure proper assembly or onsite training but no less than 2 full days.

C. Adjust in alignment on concrete foundations, sole plates or other supporting structure. Level, grout, and bolt in place.

D. Coordinate electrical installation with electrical contractor.

E. Coordinate controls with control contractor.

F. Provide all appurtenances required ensuring a fully operational and functional system.

3.2 START-UP

A. Equipment start-up is to be supervised by the unit manufacturer's representative service organization. Physical connections and start-up are provided by the installing contractor. The start-up engineer shall conduct such operating tests as required to ensure that the unit is operating in accordance with design. Complete testing of all safety and emergency control devices shall be made. The start-up engineer shall submit a written report to the owner and manufacturer containing all test data recorded as required above and a letter certifying that the unit is operating properly.

B. Provide complete Operation & Maintenance Manuals with descriptive literature, model, and serial number of all equipment, performance data, manufacturer's instructions for operating and maintenance, lubrication recommendation and schedule, and winter shutdown procedure.

3.3 UNIT PRESSURE TESTING

A. The unit cabinet shall be tested in the field *by the test and balance contractor* after installation by the installing contractor to verify its cabinet leakage rating at design both positive and negative operating static pressure(s). Cabinet leakage shall not exceed a Leakage Class rating of 5 as defined by ANSI/ASHRAE Standard 111. Leak testing shall be performed by measuring the airflow pumped into and out of the air-handling unit at the cabinet design operating static pressure. All unit openings shall be sealed, and field testing shall occur after complete unit assembly and after all controls, power, and other final penetrations are made to the unit casing. The air shall then be pumped into and out of the unit until the appropriate operating pressures are achieved. Airflow measurements shall be performed in compliance with AMCA Standard 210. A detailed report, including all data and test methods, shall be

presented to the owner or his representative prior to equipment shipment. The Engineer shall be present during this testing.

END OF SECTION 237314

SECTION 238216 - AIR COILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following types of air coils that are not an integral part of air-handling units:
   1. Hot-water.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each air coil. Include rated capacity and pressure drop for each air coil.

B. Shop Drawings: Diagram power, signal, and control wiring.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ASHRAE Compliance:
   1. Comply with ASHRAE 15 for refrigeration system safety.
   2. Comply with ASHRAE 33 for methods of testing cooling and heating coils.
   3. Comply with applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

PART 2 - PRODUCTS

2.1 WATER COILS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Aerofin Corporation.
   2. Trane.
   3. McQuay
   4. York

C. Performance Ratings: Tested and rated according to ARI 410 and ASHRAE 33.

D. Minimum Working-Pressure/Temperature Ratings: 200 psig, 325 deg F.

E. Source Quality Control: Factory tested to 300 psig.

F. Tubes: ASTM B 743 copper, minimum 0.035 inch thick.

G. Fins: Aluminum, minimum 0.01 inch thick.

H. Headers: Seamless copper tube with brazed joints, prime coated.

I. Frames: Galvanized-steel channel frame, minimum 0.064 inch thick for slip-in or flanged mounting.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine ducts, plenums, and casings to receive air coils for compliance with requirements for installation tolerances and other conditions affecting coil performance.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before coil installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install coils level and plumb.

B. Install coils in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."

C. Straighten bent fins on air coils.

D. Clean coils using materials and methods recommended in writing by manufacturers, and clean inside of casings and enclosures to remove dust and debris.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to coils to allow service and maintenance.

C. Connect water piping with unions and shutoff valves to allow coils to be disconnected without draining piping. Control valves are specified in Section 23 09 00 "Instrumentation and Control for HVAC," and other piping specialties are specified in Section 23 21 13 "Hydronic Piping."

D. Connect steam piping with gate valve and union and steam condensate piping with union, strainer, trap, and gate valve to allow coils to be disconnected without draining piping. Control valves are specified in Section 23 09 00 "Instrumentation and Control for HVAC," and other piping specialties are specified in Section 23 22 13 "Steam and Condensate Heating Piping."

END OF SECTION 238216

SECTION 238219 - FAN COIL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes fan-coil units and accessories.

1.3 DEFINITIONS

A. BAS: Building automation system.

1.4 ACTION SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Wiring Diagrams: Power, signal, and control wiring.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fan-coil units to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 7823 "Operation and Maintenance Data," include the following:

1. Maintenance schedules and repair part lists for motors, coils, integral controls, and filters.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.7 COORDINATION

A. Coordinate layout and installation of fan-coil units and suspension system components with other construction that penetrates or is supported by ceilings, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

B. Coordinate size and location of wall sleeves for outdoor-air intake.

PART 2 - PRODUCTS

2.1 FAN-COIL UNITS

A. Acceptable Manufacturers:

1. Environmental Technologies, Inc.
2. International Environmental Corporation.
3. McQuay International.
4. Trane.
5. YORK International Corporation.

B. Description: Factory-packaged and -tested units rated according to ARI 440, ASHRAE 33, and UL 1995.

C. Coil Section Insulation: 1-inch thick, matte-finish, closed-cell foam complying with ASTM C 1071 and attached with adhesive complying with ASTM C 916.

1. Fire-Hazard Classification: Insulation and adhesive shall have a combined maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.

D. Main and Auxiliary Drain Pans: Stainless steel. Fabricate pans and drain connections to comply with ASHRAE 62.1. Drain pans shall be removable.

E. Chassis: Galvanized steel where exposed to moisture. Floor-mounting units shall have leveling screws.

F. Cabinet: Steel with baked-enamel finish in manufacturer's standard paint color as selected by Architect.

1. Horizontal Unit Bottom Panels: Fastened to unit with cam fasteners and hinge and attached with safety chain; with [integral stamped] [cast-aluminum] discharge grilles.

2. Steel recessing flanges for recessing fan-coil units into ceiling or wall.

G. Filters: Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.

1. Pleated Cotton-Polyester Media: 90 percent arrestance and 7 MERV.

H. Hydronic Coils: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch, rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain valve.

I. Fan and Motor Board: Removable.

1. Fan: Forward curved, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.

2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 23 0513 "Common Motor Requirements for HVAC Equipment."

3. Wiring Termination: Connect motor to chassis wiring with plug connection.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for piping and electrical connections to verify actual locations before fan-coil-unit installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install fan-coil units level and plumb.

B. Install fan-coil units to comply with NFPA 90A.

C. Suspend fan-coil units from structure with elastomeric hangers. Vibration isolators are specified in Section 23 05 48 "Vibration and Seismic Controls for HVAC Piping and Equipment."

D. Verify locations of thermostats, humidistats, and other exposed control sensors with Drawings and room details before installation. Install devices 48 inches (1220 mm) above finished floor.

E. Install new filters in each fan-coil unit within two weeks after Substantial Completion.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:

1. Install piping adjacent to machine to allow service and maintenance.

2. Connect fan coil unit piping connections to field-installed piping. Refer to piping schematics and manufacturer’s piping requirements for fittings, specialties, etc.

3. Connect condensate drain to indirect waste.
   a. Install condensate trap of adequate depth to seal against the pressure of fan. Install cleanouts in piping at changes of direction.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain fan-coil units. Refer to Section 01 7900 "Demonstration and Training."

END OF SECTION 238219

SECTION 238239 - UNIT HEATERS

1. GENERAL

A. RELATED DOCUMENTS

1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. SUMMARY

1. Section Includes:

a. Cabinet unit heaters with centrifugal fans and hot-water coils.

C. DEFINITIONS

1. BAS: Building automation system.
2. CWP: Cold working pressure.
3. PTFE: Polytetrafluoroethylene plastic.
4. TFE: Tetrafluoroethylene plastic.

D. ACTION SUBMITTALS

1. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.
2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

a. Plans, elevations, sections, and details.
b. Location and size of each field connection.
c. Details of anchorages and attachments to structure and to supported equipment.
d. Equipment schedules to include rated capacities, operating characteristics, furnished specialties, and accessories.
e. Location and arrangement of piping valves and specialties.
f. Location and arrangement of integral controls.
g. Wiring Diagrams: Power, signal, and control wiring.

E. CLOSEOUT SUBMITTALS

1. Operation and Maintenance Data: For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

F. MAINTENANCE MATERIAL SUBMITTALS

1. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

a. Cabinet Unit Heater Filters: Furnish one spare filter for each filter installed.

G. QUALITY ASSURANCE

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

2. PRODUCTS

A. UNIT HEATERS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Dunham-Bush, Inc.
   b. Indeeco.
   c. International Environmental Corporation.
   d. Markel Products; a division of TPI Corporation.
   e. McQuay International.
   f. QMark Electric Heating; a division of Marley Engineered Products.
   g. Trane.

2. Description: A factory-assembled and -tested unit complying with ARI 440.
3. Cabinet: Steel with factory prime coating, ready for field painting baked-enamel finish with manufacturer's standard paint, in color selected by Architect.

   a. Recessing Flanges: Steel, finished to match cabinet.
   b. Control Access Door: Key operated.
   c. Extended Piping Compartment: 8-inch wide piping end pocket.

4. Filters: Minimum arrestance according to ASHRAE 52.1 and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2 if required by schedule.
5. Hot-Water Coil: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.
6. Fan and Motor Board: Removable.

   a. Fan: Forward curved, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.
   b. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 23 05 13 "Common Motor Requirements for HVAC Equipment."
   c. Wiring Terminations: Connect motor to chassis wiring with plug connection.

7. Control devices and operational sequences are specified on drawings.
8. BAS Interface Requirements:

   a. Interface relay for scheduled operation.
   b. Interface relay to provide indication of fault at central workstation.

c. Interface shall be BAC-net compatible for central BAS workstation and include the following functions:

a. Adjust set points.
b. Cabinet unit heater start, stop, and operating status.
c. Data inquiry, including outdoor-air damper position, supply-air and room-air temperature.
d. Occupied and unoccupied schedules.

9. Electrical Connection: Factory wire motors and controls for a single field connection.

3. EXECUTION

A. EXAMINATION

1. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.
2. Examine roughing-in for piping and electrical connections to verify actual locations before unit heater installation.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

B. INSTALLATION

1. Install wall boxes in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Section 07 92 00 "Joint Sealants."
2. Install cabinet unit heaters to comply with NFPA 90A.
3. Suspend cabinet unit heaters from structure with elastomeric hangers and seismic restraints. Vibration isolators and seismic restraints are specified in Section 23 05 48 "Vibration and Seismic Controls for HVAC Piping and Equipment."
4. Install wall-mounting thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.
5. Install new filters in each fan-coil unit within two weeks of Substantial Completion.

C. CONNECTIONS

1. Piping installation requirements are specified in Section 23 21 13 "Hydronic Piping" Drawings indicate general arrangement of piping, fittings, and specialties.
2. Install piping adjacent to machine to allow service and maintenance.
3. Connect piping to cabinet unit heater's factory, hot-water piping package. Install the piping package if shipped loose.
4. Connect supply and return ducts to cabinet unit heaters with flexible duct connectors specified in Section 23 33 00 "Air Duct Accessories."
5. Comply with safety requirements in UL 1995.

D. FIELD QUALITY CONTROL

1. Perform the following field tests and inspections and prepare test reports:

a. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

b. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

E. ADJUSTING

1. Adjust initial temperature set points.
2. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

F. DEMONSTRATION

Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain cabinet unit heaters. Refer to Section 01 79 00 "Demonstration and Training."

END OF SECTION 238239

SECTION 238413 - HUMIDIFIERS

PART **1** GENERAL

1.1 Section Includes Low Pressure Nozzle and Evaporative Media Humidifier/Cooler

1.2 RELATED SECTIONS

1. Section 200100 - Common Work Results for HVAC.
2. *Section 238414 – Reverse Osmosis System. Note: the adiabatic humidifier and reverse osmosis water system shall be provided by the same manufacturer; no exceptions*.
3. Section 237314 – Custom Air Handling Units

1.3 REFERENCES

1. ANSI/NFPA 70 - National Electrical Code.
2. UL 998 – UL Standard for Safety for Humidifiers.

1.4 SUBMITTALS

1. Submit under provisions of Section 01300.
2. Product Data: Including but not limited to product descriptions, models, dimensions, component sizes, rough-in requirements, service sizes, and finishes. Include rated capacities, operating weights, furnished specialties, and accessories.
    1. Manufacturer's installation instructions.
    2. Operation and maintenance data.
    3. Minimum water quality requirements and water pressure requirements.
3. Shop Drawings: For each type of humidification system specified.
    1. Details of fabrication, installation of humidifiers.
    2. Piping details, plans, elevations, sections, details of components, and nozzle and media.
    3. Detail of humidifiers and adjacent equipment showing support locations, type of support, weight on each support, and required clearances.
    4. Wiring diagrams including power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.

1.5 QUALITY ASSURANCE

1. Manufacturer:
    1. Products manufactured in an ISO 9001 certified facility.
    2. For each product specified, provide components by single manufacturer throughout.
2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authority having jurisdiction, and marked for intended use.
3. Humidifiers: In compliance with UL 998 – UL Standard for Safety for Humidifiers.

1.6 COMMISSIONING

1. Commissioning of system or systems specified herein is required. Provide personnel and equipment to facilitate commissioning process.
2. Documentation and testing of these systems, as well as training of the Owner’s operation and

maintenance personnel, is required in cooperation with the Commissioning Authority.
3. Project Closeout is dependent on successful completion of all commissioning procedures, documentation, and issue closure.

1.7 DELIVERY, STORAGE, AND HANDLING

1. Deliver all materials in their original sealed containers bearing manufacturer's name and identification of product.
2. Do not store products in location with conditions outside manufacturer's absolute limits.
3. Materials delivered to the site shall be examined for concealed damage or defects in shipping. Defects shall be noted and reported to the Owner’s Representative in writing.

1.8 PROJECT CONDITIONS

1. Coordinate location and installation of humidifiers in ducts and air-handling units in the space it serves with the electrical, mechanical, and plumbing contractors. Revise locations and elevations to suit field conditions and to ensure proper humidifier operation.

1.9 WARRANTY

1. Manufacturer’s Standard Warranty: Two year warranty covers defects in materials and workmanship, commences on date of shipment.

PART 2 PRODUCTS

2.1 MANUFACTURERS

1. Acceptable Manufacturers
    1. Condair Ltd., Condair AG
    2. Neptronic
    3. Dristeem

2.2 IN-UNIT LOW PRESSURE NOZZLE

1. General:
    1. Pre-engineered system, for air handler/duct application, uses low pressure nozzle technology to directly inject fine mist into the airstream. Separate evaporative media is not allowed.
    2. Humidifier accepts reverse osmosis and de-ionized water (0.5-15µS).
    3. Low pressure nozzles to operate between 43.5 and 101.5 psi (3-7 bar).
    4. Evaporative media to be porous ceramic material designed for post evaporation and mist elimination.
    5. Electronic controller, which monitors the operation of the system, controls output levels and initiates self-cleaning and flush cycles to ensure hygienic operation.
    6. Humidifier powered by 200-240 volts single phase power supply.
    7. Hydraulic system to supply water to the low pressure nozzles with 7 stages of control. 15 or 31 stage control available as an option.
    8. Duct shall contain nozzle grid, connection hoses. Pumps, valves, controls, and other

mechanical components shall be provided in a separate module for installation external to the air stream.
9. Control panel includes Modbus, BACnet IP, and BACnet MSTP Slave interface for integration into building automation system. BACnet IP BTL certified, BACnet MSTP Master and LonWorks, available as options.
10. Central rack for mounting the control panel and hydraulic unit shall be provided.

2. Nozzle Grid:
    1. Pre-assembled nozzle grid sections with color coded nozzle assemblies for easy connection to staging solenoid valves.
    2. 316SS Low pressure nozzles with capacities of: 3.3 lb/hr (1.5 l/hr), 5.5 lb/hr (2.5 l/hr), 6.6 lb/hr (3.0 l/hr), 8.8 lb/hr (4.0 l/hr), or 11 lb/hr (5.0 l/hr)
    3. Nozzles spray angle can be adjusted into (4) positions to prevent condensing on AHU walls.
    4. Threaded nozzle connections. All other connections to be push fit quick connections.
3. Mist Eliminator:
    1. Additional droplet separator required if air velocity exceeds the allowable limit.
    2. DL without additional mist eliminator allows velocities operation up to 590 fpm (3.0 m/s).
    3. DL with additional mist eliminator allows velocities operation up to 787 fpm (4.0 m/s).
4. Management System:
    1. Microprocessor control using a proportional-integral method for interpreting analog signals from a humidistat and or building control systems.
    2. The controller determines which stages should be activated to meet humidification loads.
    3. The controller activates self-maintenance cycles. This includes controlled flushing of the water supply lines, and drain cycles to maintain cleanliness of the water loop.
    4. Control panel complete with on/off switch, auto drain switch, and LCD touch screen for fault, maintenance, and operational indication.
5. Control panel with backlit Touch Screen Display to have the following functionality:
    1. Service indicator and LED power on.
    2. Intuitive touch screen back-lit graphic display.
    3. Display of relative humidity and set point.
    4. Display of operating hours.
    5. Capacity output.
    6. Real-time date and time.
    7. Error history indication.
    8. Limited capacity adjustment.
    9. Inlet flush and line purging.
    10. Adjustable maintenance intervals and alarms.
    11. Remote relay testing.
    12. Modbus standard host protocol.
    13. Terminal block installed for easy field connections.
6. Humidity Control Methods:
    1. Humidistat/thermostat or BMS control.
    2. Accepts standard modulating control signals.
    3. On/Off, 24 VAC safety loop for On/Off control, air proving, and/or high limit.
7. Hydraulic Assembly:
    1. Packaged Hydraulic Assembly: Shall be installed external to airstream and include all components required for circulation water including; optional pump, Hygiene Plus Silver Ion canister, staging valves, sensors, and drainage system.
    2. A maximum of 31 stage control shall be available as an option, 7 stage standard and controlled by up to (5) 24Vdc solenoid valves.
    3. VFD controlled pump.
    4. Water jet pump to allow for draining of the nozzle supply lines.
    5. The hydraulic unit shall include a Hygiene Plus canister to actively dose the supply water with silver ions as a means of bacteria control.

6. Inlet valve, pressure gauge and sensor to ensure correct supply water pressure of 43.5-101.5 psi (3-7 bar).
7. Standard conductivity sensor to monitor supply water conductivity. Control panel to trigger alarm if conductivity increases above allowable limit.

8. Aerosol Breakdown and Hygiene Control:
    1. Management System capable of real-time flushing, purging and cleaning cycles via the Management System control panel. In the event of no call for humidity, humidifier shall drain all water from the nozzle supply lines.
    2. Humidifier Operation: Aerosol-free operation guaranteed under maximum air velocity of 787 fpm (4.0 m/s).
9. Optional Features/Accessories:
    1. VFD controlled booster pump.
    2. 31 Stage step control.
    3. Remote fault indication board.
    4. Leak detection sensor.
    5. H_2O_2 Hydrogen peroxide dosing system.
    6. Silicone free.
    7. Compressed air flushing connections.
    8. On/Off digital duct high limit humidistat.
    9. Air proving switch.

PART 3 EXECUTION

3.1 EXAMINATION

1. Examine ducts, air-handling units, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance.
2. Examine roughing-in for piping systems to verify actual locations of piping connections before humidifier installation
3. If preparation is the responsibility of another installer, notify Architect of deviations from manufacturer’s recommended installation tolerances and conditions.
4. Do not proceed with installation until substrates have been properly prepared and deviations are corrected.
5. Commencement of installation constitutes acceptance of conditions.

3.2 INSTALLATION

1. NOTE: Installation of this equipment shall be performed by a contractor yet to be selected. The equipment supplier and/or manufacturer shall provide all equipment, materials, labor, etc. required for installation and maintenance of this equipment, including required warranty work, inspections as noted herein, owner training, etc., to the installing contractor upon award of the installation.
2. Installing contractor shall install components plumb and level, in accordance with approved shop drawings, product installation details and manufacturer’s recommendations.
    1. Install humidifiers and components per manufacturers' instructions.
    2. Seal humidifier duct penetrations with flange.
    3. Install with required clearance for service and maintenance.

3.3 TESTING AND ADJUSTING

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections.

2. Test Results: Reported in writing to Architect.
    1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
    2. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation. Remove malfunctioning units, replace with new units, and retest.
    3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.4 TRAINING

1. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain humidifiers.
    1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
    2. Review data in maintenance manuals.
    3. Schedule training with Owner, through Architect, with at least seven days advance notice.

3.5 PROTECTION AND CLEANING

1. Protect humidification system components from damage until date of substantial completion.
2. Repair or replace damaged components that cannot be repaired.
3. Remove temporary protective coverings, excess materials.

END OF SECTION 238413

SECTION 238414 - REVERSE OSMOSIS WATER TREATMENT SYSTEM FOR ADIABATIC HUMIDIFIER SYSTEMS

PART 1 - GENERAL

1.1 WORK INCLUDED

1. Humidifier reverse osmosis water treatment system as indicated on drawings and as indicated on schedules.

1.2 QUALITY ASSURANCE

1. Certifications, C-UL US Listed.
2. ISO 9001-2008.

1.3 RELATED SECTIONS

1. 200100-Mechanical General Provisions
2. 238413-Humidifiers

1.4 SUBMITTALS

1. Submit product data under provisions of Section 23. Include product description, model, dimensions, connection sizes and precondition requirements. Include rated outputs, operating weights, furnished specialties, and accessories.
2. Submit manufacturer's installation instructions.
3. Submit operation and maintenance data.
4. Submit coordination drawings. Detail fabrication and installation of RO. Include piping details, plans, and adjacent equipment.
5. Submit minimum water quality requirements and water pressure requirements.

1.5 SCHEDULES

1. Refer to information contained in schedule[s] attached to this specification.
2. RO System shall be of type, capacity, and arrangement as listed in schedule[s]. RO system shall be provided by the adiabatic humidifier manufacturer to ensure that the RO system and humidifier are completely compatible. The RO water system shall provide the water type and quality necessary to ensure proper function of the adiabatic humidification system.
3. Include accessories listed in schedule[s] and those accessories required for type of unit.

PART 2 - PRODUCTS

2.1 MATERIALS AND COMPONENTS

1. The reverse osmosis water treatment system is configured to operate on softened and dechlorinated water.
2. Section Includes skid-mounted package including the following components:
    1. Water Softener
    2. Activated Carbon Filter
    3. Five (5) Micron Pre-filter
    4. Reverse Osmosis Unit

5. Storage Tank
6. Distribution Pump
7. Ultraviolet Sterilizer for Bacteria Control.
8. Instrumentation.
9. Interconnected piping, plumbing and connection fittings.

3. Provide a self-contained, skid-mounted, pre-piped and pre-wired component package to produce Reverse Osmosis (RO) water for humidification purposes. Components and configuration shall be as indicated on the drawings attached to this specification. Provide auxiliary (dry) contacts (normally open or normally closed) for signaling the building automation system.
4. Except as otherwise indicated, provide water treatment systems and ancillary equipment with manufacturer's standard materials and components as indicated by published product information, designed and constructed by manufacturer for complete installation. Site to provide power line, water to the unit and drain (not by humidifier manufacturer) and feedlines to secondary systems.
5. Acceptable Manufacturers: Subject to compliance with requirements, provide the product indicated on drawings/specifications or a comparable product by one of the following, which shall be the same as the adiabatic humidifier manufacturer (no exceptions):
    1. Condair Inc. / Condair Ltd.
    2. Condair Group AG
    3. Culligan
    4. Dristeem
    5. Neptronic
6. The pretreatment equipment shall be designed to remove particulates that can affect the operation of the reverse osmosis unit. The pretreatment equipment shall include the following components:
    1. Water Softener and brine tank.
    2. Activated Carbon Filter ML Systems
    3. Five (5) Micron Pre-filter

2.2 REVERSE OSMOSIS WATER TREATMENT PACKAGE

1. General: Provide reverse osmosis water treatment system of size and capacity as indicated on the schedule and delivering this from its holding tank at a pressure of 3 bars. The system uses a membrane separation process in which water molecules can pass through the membrane, while the majority of salts and minerals are retained and thereafter flushed out the drain. System shall be furnished as a package from the humidifier vendor to include combined distribution skid (RO water treatment system), storage tank, additional system hardware, controls, and all associated devices required for a complete and functioning water treatment system.
2. All equipment listed in this specification shall be factory provided by the manufacturer of the RO package (one of the listed manufacturers). The RO system specified herein shall be factory provided as a skid package. The equipment supplier must be able to provide a fully functional system including all water treatment equipment specified, instrumentation and controls, installation, start-up, owner training and the necessary turnover package including Operation and Maintenance manuals and drawings.
3. Units shall be complete, factory assembled, and tested; and of sizes, arrangements, capacities, and performance as scheduled and as specified in the schedules shown. Units stand-alone use for treating water.
4. Units shall be capable and designed for year-round, 24-hours-a-day operation; and requiring only connections of piping, utilities, and remote sensors, and controllers
5. All components exposed to water shall be made of corrosion resistant material
6. RO water storage tank shall include sterile breathing filter and low-water level cutout switch. RO Tank shall come with a 0.2 micron filter to restrict bacteria movement. The RO water storage tank shall be completely black and opaque, allowing no light to pass through and thus restricting bacterial growth due to light. No transparent or semi-transparent (White translucent) or other

tanks will be accepted.

7. Distribution skid and storage tank:
    1. Provide reverse osmosis skid assembly, fully factory built and tested. RO skid shall consist of the following principal components: one or more RO membranes, one or two RO pumps that pump raw water through the RO membrane at a pressure of 116-174 psi (8-12 bar) and into the RO water tank and one RO water transfer pump, which delivers pressurized RO water to the consumer at 3 bars. RO membranes, pumps and storage tanks are installed on a powder coated steel frame with vibration isolators.
    2. All components exposed to water are made of corrosion-resistant material. All hoses are steel-reinforced and drinking water-approved.
    3. Low-pressure cut-off switch: A pressure switch just after the inlet filter protects the RO pump from dry running.
    4. Both the transfer and RO pump are directly mounted on their electric motors. Power is supplied to the 3-phase asynchronous motors via a magnet-operated protective motor switch.
    5. The RO water storage tank shall be completely black and opaque, allowing no light to pass through and thus restricting bacterial growth. No transparent or semi-transparent (white-milky/semi-clear) or other tanks will be accepted
8. Water Softener: The purpose of the water softener is to remove mineral hardness from water. Softening shall be accomplished by an ion exchange process utilizing a high capacity cation exchange resin in the sodium exchange mode. Automatic regeneration shall be accomplished using a salt (brine) solution.
    1. A non-electric water softener (mechanical only) shall be provided as a pre-treatment to extend the life of the RO Membrane.
    2. A dual tank system shall be used to regenerate on-demand, while the other tank acts on standby and immediately switches over during period of regeneration.
    3. The system shall include two tanks. This duplex configuration shall be flexible to operate in alternating or parallel mode depending on installed program disc. In alternating mode, one tank will be on-line during service. In parallel mode, both tanks will be on-line during service. With either mode, during regeneration cycles, one tank shall provide water to service and to the regenerating tank. A water meter shall initiate system regeneration. The water meter shall measure the processed volume and be adjustable. Service flow shall be down-flow and regeneration flow shall be up-flow.
    4. A combination salt storage tank, with cover, and brine well shall be supplied as part of the system. The brine tank shall be large enough to hold salt for at least ten regenerations between refills. The brine tank shall be made of polyethylene or FRP.
    5. The regeneration control valve shall be top mounted (top of media tank), and manufactured from non-corrosive materials. Control valve shall not weigh more than four pounds. Control valve shall provide service and regeneration control for two media tanks. Inlet and outlet ports shall accept a quick connect, double O-ring sealed adapter. Interconnection between tanks shall be made through the regeneration valve with a quick connect adapter. Control valve shall operate using a minimum inlet pressure of 25 psi (1.7 bar). Pressure shall be used to drive all valve functions. No electric hook-up shall be required. Control valve shall incorporate four operational cycles including; service, brine draw, slow rinse, and a combined fast rinse and brine refill. Service cycle shall operate in a down-flow direction. The brine cycle shall flow up-flow, opposite the service flow, providing a countercurrent regeneration. Control valve shall contain a fixed orifice nozzle and self-adjusting backwash flow control. The control valve will prevent the by-pass of hard water to service during the regeneration cycle.
    6. A combination salt storage and brine production tank shall be manufactured of corrosion resistant, plastic. The brine tank shall have a chamber to house the brine valve assembly. The brine float assembly shall allow for adjustable salt settings and shall provide for a shutoff to the brine refill. The brine tank shall include a safety overflow connection to be plumbed to a suitable drain.
    7. Provide interconnecting plumbing and instrumentation.

9. Activated Carbon Filter: The purpose of the activated carbon filter is to remove chlorine, chloramines, tastes, and odors from the water. The media shall be a high capacity black granular carbon with rugged grain structure, high density and large surface area for efficient removal of chlorine/chloramine as well as other taste, odor, and color-causing organics. It shall work effectively over a wide pH range.
    1. The system shall include one tank. This simplex system is designed to operate in an up-flow mode. This configuration allows the unit to run in service without the need for a backwash cycle.
    2. The tanks shall be designed for a maximum working pressure of 125 psi (8.6 bar) and hydrostatically tested at 300 psi (20 bar). Tanks shall be made of polyethylene and reinforced with a fiberglass wrapping. Each tank shall include a 2.5 inch (6.35 cm) threaded top opening. Each tank shall be NSF approved. Upper and lower distribution system shall be of a slot design. Distributors will provide even flow of water.
    3. Each system shall include an activated, acid washed carbon. The media shall be between 8 and 16 Mesh in particle size.
10. Control Panel: Mounted on the main pump station frame, includes a manual on/off/auto switch, fault light indicator, service light indicator, and terminal connection for power and control wiring. Display to show required maintenance 48 hours before service is due. Connection glands for power and control wiring. The control unit which consists of a touch display and a PLC mounted in the IP rated electrical cabinet as well as a power board for the control of the high pressure pump and connection terminals for power supply. From the touch screen, the operator can view the status of the RO system, water levels in the tank, production, adjust alarm limits, view hour counters, view logged alarms. The pump station is electrically wired at the factory and the control panel must be tested at the factory prior to release.
11. Controls and Wiring: Factory-installed microprocessor type to control and monitor unit, communicate to central-control processor. The controller shall be connected to the building DDC control system via BACnet IP.
    1. The unit shall have a factory wired and unit mounted central, electrical control panel with a single power supply connection. All internal wiring shall be in accordance with the National Electrical Code. Unit shall have a non-fused main power disconnect and control components required for automatic operation based on signals from the humidity controls. Control panel shall have terminals for remote control devices.
12. Ultraviolet Water Disinfection System: An optional UV light can be provided to disinfect the water as it passes through the system. UV technology ensures a safe supply of water by using a non-intrusive, physical disinfection method. The flow rates of the UV light vary according to different standards. A flow rate of 11.0, 6.0, and 4.0 gallons per minute are recommended by US Public Health, VIQUA Standard, and NSF/EPA, respectively. Voltages vary from 100 - 240 volts, and the frequency varies from 50 to 60 Hertz. Power consumption is 30 Watts. More than 75% UV transmittance is output.
13. Mixed Bed Ion Exchange Resins, CO_2 dosing and Electrical Conductivity (EC) monitoring:
    1. Provide in the scope of work a modular add-on package which allows for the connection of one or two mixed bed ion exchange resin tanks (polishers), alarms for high conductivity, and CO_2 dosing to the RO tank for increasing the conductivity up to 5 µS/cm.
    2. The modular add-on electrical conductivity (EC) panel shall be added on to the existing pump station and frame. The EC add-on panel will be seamlessly connected to the pump skid, via existing embedded software from the main control panel, no additional or external software will be accepted.
    3. The EC add-on panel shall communicate to the primary control panel on the main pump skid via an Ethernet network cable (RJ45, CAT5 or CAT6), no other means of communication will be accepted.
14. The ion exchange resin tanks shall be furnished with the system to "polish" and demineralize the reverse osmosis water even further, producing deionized water. A conductivity of less than 0.1 µS/cm shall be achieved when passing the reverse osmosis water through the mixed bed filter.

The mixed bed resin shall contain anion and cations that will aid in demineralizing the water even further. To raise the conductivity above 5 µS/cm - CO2 shall be added to RO tank - no salts or minerals shall be introduced to the system to raise conductivity.

15. Self-cleaning module/kit of RO Tank (Clean-in-Place)
    1. Provide alongside the direct room system and main pump assembly a complete means of disinfection and cleaning in place module that periodically adds or doses the RO tank with a disinfection fluid.
    2. The modular self-cleaning add-on box shall comprise a self-priming diaphragm pump with direct digital dosing, a power / control box and a bottle of disinfection fluid.
    3. The pumping system shall incorporate pressure monitoring, integrated flow measurement, dosing timer and auto de-aeration. The Clean-in-Place add-on panel will be seamlessly connected to the pump skid, via existing embedded software from the main control panel, no additional or external software will be accepted.
    4. The add-on self-cleaning module panel shall communicate to the primary control panel on the main pump skid via an Ethernet network cable (RJ45, CAT5 or CAT6), no other means of communication will be accepted.
16. Transfer (Forwarding) Pump
    1. A forwarding pump shall be included with the system whereby the pump can transfer RO water to other uses outside of the intended primary humidification equipment.
    2. Forwarding pump shall be embedded onto the main pumping station and installed at the factory by the RO water treatment manufacturer.

PART 3 - EXCECUTION

3.1 Installation

1. NOTE: Installation of this equipment shall be performed by a contractor yet to be selected. The equipment supplier and/or manufacturer shall provide all equipment, materials, labor, etc. required for installation and maintenance of this equipment, including required warranty work, inspections as noted herein, owner training, etc., to the installing contractor upon award of the installation.
2. Install RO water treatment system and ancillary equipment per manufacturers' instructions. Turn-key installation should be provided by Reverse Osmosis water treatment/humidifier manufacturer.
3. Install with required clearance for service and maintenance.

3.2 Accessories

1. Install accessories in accordance with manufacturer's recommendations.

3.3 Commissioning

1. Start-up and commissioning of RO water treatment system and ancillary equipment should be completed by the manufacturer's field technician. 3.4 Field Test

1. A BactiQuant (BQ) Water Test, using an enzyme targeted analysis, shall be performed by a BQ Certified manufacturer's technician. The field test shall consist of, an enzyme activity which shall be measured by use of a highly sensitive fluorescence technology, and shall quantify the amount of microbial enzymes. The fluorescence signal shall be directly proportional to the content of bacteria. The BQ test shall be completed in less than 60 minutes with passed results, indicating a clean hygienic system. If test results shows BQ values higher than 57, the system must be disinfected according to manufacturer's instructions.
2.
3. The field test must be a verified method by the United States Environmental Protection Agency

(US-EPA). No Heterotrophic plate counts, nor ATP methods for bacterial test shall be accepted.

END OF SECTION 238414

SECTION 250100 - MOTOR STARTERS AND OTHER ELECTRICAL REQUIREMENTS FOR MECHANICAL EQUIPMENT

1. MOTOR STARTERS-GENERAL

   A. Where motor starters are required for mechanical equipment they are to be the responsibility of the Contractor furnishing the equipment as outlined herein.

   B. Motor starters shall be furnished by the Equipment Supplier with his equipment. Coordinate all requirements for starters with equipment suppliers and other trades.

   C. Motor starters shall be NEMA style. I.E.C.-style starters are not to be provided. Their sizing and installation shall be coordinated with the equipment manufacturer's requirements and in accordance with the National Electrical Code.

   D. Unless otherwise noted, provide combination starter/disconnects for all equipment requiring a starter.

2. ELECTRICAL REQUIREMENTS FOR MECHANICAL EQUIPMENT

   A. All mechanical equipment shall be provided for single point electrical connection unless specifically noted to the contrary. Refer to schedules and other sections of these specifications for further requirements. It is the responsibility of the Contractor to coordinate the electrical characteristics of all equipment with the electrical provisions indicated on the Contract Documents. The Contractor shall notify the Engineer in writing ten calendar days prior to bid of any discrepancy so a written clarification by Addendum may be made. If such notice is not given, the Contractor shall be responsible for any and all costs or delays associated with any changes required. Specification of equipment characteristics made during review of shop drawings shall not relieve the Contractor of this responsibility.

   B. The equipment manufacturer shall provide internally mounted fuses with his equipment, as required, to comply with the U.L. listing on the equipment name plate. (i.e., hermetically sealed compressors or equipment with name plate data that recommends or requires fuse protection.) See also, National Electrical Code, Article 440, and other applicable sections of the N.E.C.

   C. It is the Contractor's responsibility to furnish and install fusible or non-fusible disconnect switches or circuit breakers for disconnecting means as required by the Code for all electrically powered equipment. All power wiring from source, thru disconnecting means and motor starters to motor terminals or equipment junction box is to be furnished and installed by the Contractor. Each separate contractor engaged for the project shall coordinate with all other trades to ensure all necessary equipment and labor is included for fully functioning mechanical systems, installed per code requirements. Unless otherwise notes, provide combination starter/disconnects for all equipment requiring a starter.

   D. Final electrical connection of equipment shall be verified for proper voltage requirements in conjunction with the motor nameplate patch and actual wiring configuration. Any costs associated with damage to appliances motors, equipment, etc., connected to incorrect supply voltage shall be borne by the Contractor.

   E. Refrigeration condensing units with internal compressors shall be furnished with integral starter. The Contractor is to furnish and install a fusible disconnecting means with fuses sized to motor nameplate requirements. Coordinate wiring, mounting and style of disconnect switch at unit in field.

F. All interlock or other control wiring, unless specifically noted otherwise, is the responsibility of the Contractor.

G. All equipment shall be suitably enclosed. All enclosures for equipment shall be rated and approved for the environment in which it operates. (i.e., NEMA 1, NEMA 3R, NEMA 7, NEMA 12, etc.) Verify the requirement with the installation condition if not indicated on the plans.

H. Observe the following standards for manufacturers of equipment and selection of components.

(1) Starters, control devices and assemblies: NEMA, U.L. - (I.E.C. style not acceptable)

(2) Enclosures for electrical equipment: NEMA, U.L.

(3) Enclosed switches: NEMA, U.L.

(4) All electrical work, generally: National Electrical Code

(5) All electrical work in industrial occupancies: J.I.C. standards

(6) All electrical components and materials: U.L. listing required.

I. Where required, the Contractor is to provide mounting rails or channels to install starters with code-required clearances. Framing shall be solidly anchored by welding expansion shields in masonry or other approved anchorage. Frames are to be constructed of steel angles or pre-manufactured channel systems such as Unistrut, Kindorf or B-Line Company. Framing material shall be pre-finished with corrosion-resistant material or painted with two coats corrosion-resistant oil-based enamel.

3. REQUIREMENTS FOR MECHANICAL EQUIPMENT, 1/2 H.P OR LESS

A. This section describes requirements for small mechanical equipment such as (but not limited to) package terminal heating/cooling units, (water source heat pumps, etc.) VAV boxes, unit heaters, vertical and horizontal unit ventilators, exhaust fans, in-line fans, fan coil units, cabinet heaters and the like.

B. Small equipment with motor(s) of 1/2 H.P., single phase or less are generally not required to be furnished with NEMA-style starter(s), unless otherwise noted.

C. For such equipment, provide integral contactor or horsepower-rated relay where controlled by thermostat or other type of switch. Contactors or relays shall be as recommended by the manufacturer of the equipment, suitable for the service duty.

D. Provide transformer within unit as required to derive low voltage A.C. for thermostat control or derive from temperature controls panel, if available.

E. Provide internal fusing for unit motor and other loads in fuse block or in-line fuseholder. See also Article 2-B, this Section.

F. Where externally-mounted disconnecting means is required and would be impractical, unsightly or inappropriate in the judgment of the Engineer, disconnects shall be located within the unit. These disconnects may be fusible H.P.-rated snap switches or manual starters with overload elements, as required. Locate this and other electrical equipment within enclosure where easily accessible behind

access panel or door on unit, and as acceptable to the electrical inspector or local authority having jurisdiction. Refer to mechanical equipment schedules for further information.

G. Where fractional horsepower duplex pumps such as water circulators, sump pumps, etc. are provided, they shall be provided with alternators, cordsets, etc., as required for a complete installation.

4. REQUIREMENTS FOR MECHANICAL EQUIPMENT, 3/4 H.P. OR LARGER

A. This section describes requirements for mechanical equipment such as (but not limited to) exhaust fans, larger air handling units, cooling tower fans, water source heat pumps, chilled or hot water pumps, D.X. roof-top units, air compressors and the like.

B. Provide premium efficiency motors.

C. Equipment provided with motor(s) of 3/4 H.P. and larger, single or three-phase are required to be furnished with starters suitable for the load(s) specified. It is recommended that starters be furnished integrally with or mounted on equipment for field wiring by the Contractor. Where starters are furnished separate from equipment, furnish templates or rough-in diagrams to the appropriate contractor for his use in installation.

D. All starters shall be size 0 minimum. They shall be constructed and tested in accord with latest edition of NEMA standards. All starters shall be across-the-line magnetic type, unless indicated otherwise. On motors of 20 H.P. or greater rating, the supplier shall provide starters capable of limiting inrush currents. These shall be of the wye-delta, reduced voltage open-transition type, or electronic controlled, as required. Do not utilize closed transition starters unless specifically indicated.

E. Magnetic starters shall be furnished with the following characteristics and accessories as a minimum. See other sections of these specifications and mechanical schedules for further requirements.

(1) Contacts shall be silver-alloy, double-break type. Contacts shall be replaceable without removal of wiring or removal of starter from enclosure. Number of contacts shall be as required for service indicated. Contacts shall be gravity dropout type, positive operation.

(2) Coil voltage shall be 120 volts, A.C., 60 HZ or less, as required to suit control systems available voltages. Coils shall be of molded construction, rated for continuous duty. Provide coil clearing contact as required.

(3) Provide control transformer of adequate K.V.A. as required on all starters with line-to-line voltages higher than 120 volts A.C. Provide fuse block and slow-blow fuse to protect control transformer per NEMA, N.E.C. and U.L.

(4) Provide hand-off-auto selector switch in face of starter, wired into hand and off switch positions. Auto position (if needed) to be field wired as indicated on plans or schedules for automatic control. Provide a green run pilot light.

(5) Provide NEMA Class 20 resettable overload relays, accurately sized to the motor nameplate rating of the motor served and the temperature differential between motor and controller. Overloads shall be easily replaceable, and resettable without opening enclosure, via a push button or similar means. Class 10 or Class 30 overloads may be used, depending on the type of anticipated service.

(6) Provide at least one N.O. and one N.C. auxiliary contact (field-convertible to opposite operation) with each starter. Refer to mechanical details or schedules for additional requirements, if any. All starters shall have space for two additional single-pole contacts.

(7) All starters shall be thru-wiring type.

(8) Provide phase failure sensing relay to open starter coil circuit (on loss of one or more phases) on all three-phase starters controlling motors of 15 H.P. or larger.

(9) Provide power factor correction capacitors on motors of 15 H.P. or larger where predicted power factor based on manufacturer's data will fall below 0.90%. Capacitors shall be of the unit-cell type, in single enclosure with discharge resistors and tank overpressure circuit interrupter for safety.

5. REQUIREMENTS FOR WIRING

A. All wiring, including controls, interlock, miscellaneous power, sensors, thermostats, etc., shall be installed in metallic raceway systems that are in compliance with all Division 26 requirements of these Specifications, unless specifically noted otherwise. Open cabling systems will only be permitted where specifically permitted within the Division 26 Specifications and if less than 50 volts A.C. peak-to-peak or 50 volts maximum D.C.

B. Where open cabling is permitted, it shall be installed with proper support as specified in the Division 26 Specifications.

C. Where open cabling is permitted, and installed in environmental air plenum (return, relief, supply, etc.), the materials installed shall be in compliance with N.E.C. Articles 700, 725, 770 (for fiber optic), 780 and 800.

D. Where open cabling is permitted, it shall only be installed open in accessible spaces. Where concealed in walls, it shall be routed through raceways to outlet box(es) for the terminal device.

6. INVERTER DUTY MOTORS

A. Motors which are controlled by variable frequency drive shall be:

(1) NEMA MG-1 Part 31 rated for Inverter Duty.

(2) Furnished with shaft grounding kit for all motors:

a. Motors less than 100 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. One shaft grounding ring and related hardware shall be provided on drive end or non-drive end of motor per manufacturer’s instructions. These shall be factory mounted and installed on the exterior of the motor to allow for visual inspection. Ground motor frame per manufacturer’s instructions. Install kit in strict accordance with manufacturer’s instructions.

b. Motors Pumps greater than 100 HP to 1000 HP in size shall be furnished with shaft grounding kit, Aegis SGR Bearing Protection Ring or equal. Provide shaft grounding ring on drive end and non-drive end of motor per manufacturer’s instructions. Additionally, provide insulated bearing journals to further reduce risk of current

dissipation through bearings. Ground motor frame per manufacturer's instructions. Install kit in strict accordance with manufacturer's instructions.

END OF SECTION 250100

SECTION 26 0000

GENERAL ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.2 DESCRIPTION

A. Intent of drawings and Specifications is to obtain complete systems tested, adjusted, and ready for operation.

B. Except as otherwise defined in greater detail, the terms "provide", "furnish" and "install" as used in Division 26 Contract Documents shall have the following meanings:
   1. "Provide" or "provided" shall mean "furnish and install".
   2. "Furnish" or "furnished" does not include installation.
   3. "Install" or "installed" does not include furnishing.

C. Include incidental details not usually shown or specified, but necessary for proper installation and operation.

D. Check, verify and coordinate work with drawings and specifications prepared for other trades. Include modifications, relocations or adjustments necessary to complete work or to avoid interference with other trades.

E. Included in this Contract are electrical connections to equipment provided by others. Refer to Architectural, Mechanical, Plumbing, and final shop drawings for equipment being furnished under other sections for exact locations of electrical outlets and various connections required.

F. Information given herein and on drawings is as exact as could be secured but is not guaranteed. Do not scale drawings for dimensions.

G. Where architectural features govern location of work, refer to Architectural Drawings.

H. Perform work in "neat and workmanlike" manner as defined in ANSI/NECA 1, Standard Practices for Good Workmanship in Electrical Contracting.

1.3 RELATED WORK

A. Utility Services:
   1. Include costs for temporary service, temporary routing of service or other requirements of a temporary nature associated with utility service.

B. Temporary Services:
   1. Division 01 - Temporary Facilities and Controls.

C. Continuity of Service:

1. No service shall be interrupted or changed without permission from Architect and Owner. Obtain written permission before work is started.
2. When interruption of services is required, Architect, Owner and other concerned parties shall be notified and shall determine a time.

D. Demolition:
   1. Division 02 - Selective Demolition
   2. Perform required demolition to accomplish new work.
      a. Remove abandoned wiring to source of supply. Wiring and conduit shall be extended where necessary to maintain circuit continuity to areas beyond the demolition scope area.
      b. Remove exposed abandoned conduit, including abandoned conduit above accessible ceiling finishes. Cut conduit flush with walls and floors, and patch surfaces.
      c. Disconnect abandoned outlets and remove devices.
      d. Remove abandoned outlets if conduit servicing them is abandoned and removed.
      e. Provide blank cover for abandoned outlets that are not removed.
      f. Disconnect and remove electrical devices and equipment serving utilization equipment that has been removed.
      g. Disconnect and remove abandoned luminaries. Remove brackets, stems, hangers, and other accessories.
      h. Disconnect electrical systems in walls, floors, and ceilings scheduled for removal.
   3. Accomplish work in neat workmanlike manner to minimize interference; annoyance or inconvenience such work might impose on Owner or other Contractors.
   4. Unless otherwise noted, remove from premises materials and equipment removed in demolition work.
   5. Equipment noted to be removed and turned over to Owner, shall be delivered to Owner at place and time Owner designates.
   6. Where materials are to be turned over to Owner or reused and installed by Contractor, it shall be Contractor's responsibility to maintain condition of materials and equipment equal to that existing before work began. Repair or replace damaged materials or equipment at no additional cost to Owner.
   7. Where demolition work interferes with Owner's use of premises, schedule work through Architect, Owner and with other Contractors to minimize inconvenience to Owner. Architect must approve schedule before Contractor begins such work.

E. Cleaning and Repair
   1. Clean and repair all materials and equipment that remain or are to be reused.
   2. Panelboards.
      a. Clean exposed surfaces and check tightness of electrical connections.
      b. Replace damaged circuit breakers and provide closure plates for vacant positions.
      c. Provide typed circuit directory showing revised circuiting arrangement.
   3. Luminaires:
      a. Remove existing luminaries for cleaning.
      b. Use mild detergent to clean exterior and interior surfaces; rinse with clean water and wipe dry.
      c. Replace lamps and broken electrical parts.

F. Concrete Work:
   1. Provide cast-in-place concrete as required by Contract Documents unless otherwise noted.
   2. Concrete shall comply with Division 03 - Concrete.
   3. Provide anchor bolts, metal shapes and templates to be cast in concrete or used to form concrete as required for anchoring and supporting electrical equipment.

G. Painting:
   1. Furnish equipment with factory applied prime finish unless otherwise specified.
   2. If factory finish on equipment furnished by Contractor is damaged in shipment or during construction, refinish equipment to satisfaction of Owner.
   3. Furnish one can of touch up paint for each final factory-applied finish coat of product.

1.4 REQUIREMENTS OF REGULATORY AGENCIES

A. Rules and regulations of Federal, State and local authorities and utility companies, in force at time of execution of Contract shall become part of this specification.

1.5 REFERENCE STANDARDS

A. Agencies or publications referenced herein refer to the following:
   1. AEIC Association of Edison Illuminating Companies
   2. ANSI American National Standards Institute
   3. ASME American Society of Mechanical Engineers
   4. ASTM American Society for Testing and Materials
   5. BICSI Building Industry Consulting Services International
   6. EIA Electronic Industries Association
   7. FIPS Federal Information Processing Standards
   8. FCC Federal Communications Commission
   9. ICEA Insulated Cable Engineers Association
   10. IEEE Institute of Electrical & Electronics Engineers
   11. IESNA Illuminating Engineering Society of North America
   12. NEC National Electrical Code
   13. NECA National Electrical Contractors Association
   14. NEMA National Electrical Manufacturers Association
   15. NESC National Electrical Safety Code
   16. NETA National Electrical Testing Association
   17. NFPA National Fire Protection Association
   18. NIST National Institute of Standards & Technology
   19. OSHA Occupational Safety and Health Administration
   20. TIA Telecommunications Industries Association
   21. UL Underwriters Laboratories, Inc.

B. Work shall be in accordance with latest edition of codes, standards or specifications unless noted otherwise.

1.6 LISTING

A. Install materials bearing UL label or UL listing, unless UL label or listing is not available for that type of material.

B. Other nationally recognized testing agencies, acceptable to AHJ, are approved.

1.7 ENCLOSURES

A. Typical NEMA Enclosures and Usage
   1. NEMA 1 - Indoors. Falling dirt.
   2. NEMA 3R - Outdoors. Rain, snow, sleet.
   3. NEMA 4X - Outdoors. Rain, sleet, snow, wind blown dust. Hose down plus corrosion resistant.
   4. NEMA 7 - Indoors. Class I, Division 1 or 2, Groups A, B, C or D. (Flammable gas).
   5. NEMA 9 - Indoors. Class II, Division 1 or 2. Groups E, R, or G. (Combustible dust).
   6. NEMA 12 - Indoors. Falling Dirt. Falling liquids. Flying dust, lint and fibers. Oil or coolant seepage.

1.8 SUBMITTALS

A. Shop Drawings (Product Data):
   1. Refer to Division 01 - Submittal Procedures.
   2. Note that for satisfying submittal requirements for Division 26, "Product Data" is usually more appropriate than true "Shop Drawings" as defined in Division 01. However, the expression "Shop Drawings" is generally used throughout Specification.
   3. Submit shop drawings for equipment and systems as requested in respective specification sections. Submittals which are not requested may not be reviewed.
   4. Submittal tracking number is to include the respective specification number.
   5. Specifically mark general catalog sheets and drawings to indicate specific items submitted and its correlation to specific designation for product in drawings.
   6. Specifically indicate proper identification of equipment by name and/or number, as indicated in specification and shown on drawings.
   7. When manufacturer's reference numbers are different from those specified, provide correct cross-reference number for each item. Clearly mark and note submittal accordingly.
   8. Submit complete record of required components when luminaires, equipment and items specified include accessories, parts and additional items under one designation.
   9. Include wiring diagrams for electrically powered or controlled equipment.
   10. Submit electrical equipment room layouts drawn to scale, including equipment, raceways, accessories and required working clearances. Submit electrical equipment room layouts concurrently with electrical distribution equipment submittals.
   11. Where submittals cover products containing non-metallic materials, include "Material Safety Data Sheet" (MSDS) from manufacturer stating physical and chemical properties of components and precautionary considerations required.
   12. Submit shop drawings or product data as soon as practicable after signing contracts. Submittals must be approved before installation of materials and equipment.
   13. Submittals that are not complete, not permanent, or not properly checked by Contractor, will be returned without review.

14. "Coordination Drawings", which are normally prepared by Contractor to coordinate work among various trades and to facilitate installation, shall not be submitted for Division 26 work unless specifically requested in technical sections. These types of drawings typically include dimensioned piping, ductwork or electrical raceway layouts.
15. Unless specifically requested in Division 26 technical sections, submittals of coordination drawings will be returned without review.

B. Certificates and Inspections:
   1. Obtain and pay for inspections required by authorities having jurisdiction and deliver certificates approving installations to Owner unless otherwise directed.

C. Operation and Maintenance Manuals:
   1. Refer to Division 01 - Operation and Maintenance Data.
   2. Upon completion of work but before final acceptance of system, submit to Architect for approval, 3 copies of operation and maintenance manuals in loose-leaf binders. If "one copy" is larger than 2” thick or consists of multiple volumes, submit only one set initially for review. After securing approval, submit 3 copies to Owner.
   3. Organize manuals by specification section number and furnish table of contents and tabs for each piece of equipment or system.
   4. Manuals shall include the following:
      a. Copies of shop drawings
      b. Manufacturer's operating and maintenance instructions. Include parts lists of items or equipment, with component exploded views and part numbers. Where manufacturer's data includes several types or models, designate applicable type or model.
      c. CD ROM's of O&M data with exploded parts lists where available
      d. Phone numbers and addresses of local parts suppliers and service companies
      e. Internet/WEB page addresses where applicable
      f. Wiring diagrams
      g. Start up and shut down procedure
      h. Factory and field test records
      i. Additional information, diagrams or explanations as designated under respective equipment or systems specification section
   5. Instruct Owner's representative in operation and maintenance of equipment. Instruction shall include complete operating cycle on all apparatus.
   6. Furnish O&M manuals and instructions to Owner prior to request for final payment.

D. Record Documents:
   1. Refer to General Conditions of Contract and Division 01 - Project Record Documents. Prepare complete set of record drawings in accordance with Division 01.
   2. Use designated set of prints of Contract Documents as prepared by Architect to mark-up for record drawing purposes.

1.9 JOB CONDITIONS

A. Building Access:
   1. Arrange for necessary openings in building to allow for admittance of all apparatus.

B. Coordination:
   1. Equipment provided under other Divisions of these specifications.
      a. Motors
      b. Electrically powered equipment
      c. Electrically controlled equipment
      d. Starters, where specified
      e. Variable frequency drives, where specified
      f. Control devices, where specified
      g. Temperature Control wiring
   2. Provide the following devices required for control of motors or electrical equipment, unless noted otherwise:
      a. Starters
      b. Disconnect devices
      c. Control devices:
         1). Pushbuttons
         2). Pilot lights
         3). Contacts
      d. Conduit, boxes and wiring for Power wiring
      e. Conduit, boxes and wiring for Control wiring, except temperature control wiring
   3. Connect and wire equipment complete and ready to operate according to wiring diagrams furnished by various trades.
   4. Wire starters or other similar control devices furnished by others.
   5. This contractor's drawings and/or specifications show number and hp rating of motors furnished by others, together with their actuating devices. Should any change in size, hp rating, voltage, or means of control be made to any motor or other electrical equipment after Contracts are awarded, Contractor responsible for change shall immediately notify this Contractor. Additional costs due to these changes shall be responsibility of Contractor initiating change.
   6. Equipment and wiring shall be selected and installed for conditions in which it will be required to perform. (i.e., general purpose, weatherproof, rain tight, explosion proof, dust tight, or any other special type as required.)
   7. Comply with local utility motor starting requirements and provide starters for motors furnished by others as specified herein or under various trade sections of those specifications.

C. Cutting and Patching:
   1. Refer to General Conditions of the Contract and Division 01 - Cutting and Patching.
   2. Perform cutting and patching required for complete installation of systems, unless otherwise noted. Patch and restore work cut or damaged to original condition. This includes openings remaining from removal or relocation of existing system components.
   3. Provide materials required for patching unless otherwise noted.
   4. Do not pierce beams or columns without permission of Architect and then only as directed. If openings are required through walls or floors where no sleeve has been provided, hole shall be core drilled to avoid unnecessary damage and structural weakening.

5. Where alterations disturb lawns, paving, walks, etc., replace, repair or refinish surfaces to condition existing prior to commencement of work. This may include areas beyond construction limits.

D. Housekeeping and Cleanup:
   1. Refer to Division 01 - Closeout Procedures.
   2. As work progresses or as directed by General Contractor, periodically remove waste materials from building and leave area of work broom clean. Upon completion of work, remove tools, scaffolding, broken and waste materials, etc. from site.

1.10 WARRANTY

A. Refer to Division 01 for general warranty requirements.

B. Refer to technical sections for warranty requirement for each system.
   1. Where no warranty requirements are called out, warrant for 1 year after acceptance by Owner equipment, materials, and workmanship to be free from defect.

C. Repair, replace, or alter systems or parts of systems found defective at no extra cost to Owner.

D. In any case, wherein fulfilling requirements of any guarantee, if this contractor disturbs any work guaranteed under another contract, this contractor shall restore such disturbed work to condition satisfactory to Owner and guarantee such restored work to same extent as it was guaranteed under such other contract.

E. Warranty shall include labor, material, and travel time.

PART 2 - PRODUCTS

2.1 PRODUCT SUBSTITUTIONS

A. Refer to Division 01 - Product Requirements.

B. Produce substitutions are to be approved prior to submitting bids.

C. Refer to individual specification sections for specific substitution requirements related to that section.

D. The Engineer reserves the right to refuse product substitutions after the electrical subcontract has been awarded.

PART 3 - EXECUTION

3.1 GENERAL

A. Verify elevations and dimensions prior to installation of materials.

3.2 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the site under provisions of Division 01.

B. Store and protect products under provisions of Division 01

C. Store in clean, dry space.

D. Maintain factory wrapping or provide cover to protect units from dirt, water, construction debris, and traffic.

E. Handle in accordance with manufacturer's written instructions.

F. Handle carefully to avoid damage to components, enclosure, and finish. Lift only with lugs provided for the purpose.

G. Provide supplemental heat if required to prevent moisture contamination.

3.3 FLOOR, WALL, ROOF AND CEILING OPENINGS

A. Coordinate location of openings, chases, furred spaces, etc. with appropriate Contractors. Provide sleeves and inserts that are to be built into structure during progress of construction.

B. Remove temporary sleeves, if used to form openings, prior to installation of permanent materials. Utilize minimum 24 ga galvanized sheet metal for permanent sleeves above grade, interior locations unless otherwise noted.

C. Provide Schedule 40 carbon steel pipe with integral water stop for steel sleeves required below grade or to exterior.

D. Submit to Structural Engineer for review and approval size and location of core-drilled holes prior to execution.

E. Submit product data and installation details for penetrations of building structure. Include schedule indicating penetrating materials, (steel conduit, PVC conduit, cables, cable tray, etc.), sizes of each, opening sizes and sealant products intended for use.

F. Where penetrations of fire-rated assemblies are involved, seal penetrations with appropriate firestopping systems as specified in Section 26 0593 - Electrical Systems Firestopping.

G. Submit complete penetration layout drawings showing openings in building structural members including floor slabs, bearing walls, shear walls, etc. Indicate and locate, by dimension, required openings including those sleeved, formed or core drilled. Submit drawings for approval prior to preparing openings in structural member.

H. Provide 2" clearance around penetration openings intended for raceways and cables. Where fire resistant penetrations are required, size openings in accordance with written recommendations of firestopping systems manufacturer.

I. Seal non fire-rated floor penetrations with non-shrink grout equal to Embeco by Master Builders, or urethane caulk, as appropriate.

J. Seal non-rated wall openings with urethane caulk.

K. Where penetrations occur through exterior walls into building spaces, use steel sleeves with integral water stop, similar to type "CS" for poured wall openings or "modular" for cored and precast wall sleeves by Thunderline Corporation. Seal annular space between sleeves and pipe with "Link-Seal" modular wall and casing seals by Thunderline Corporation, or sealing system by another manufacturer approved as equal by Engineer. Sealing system shall utilize Type 316 stainless steel bolts, washers and nuts.

L. Finish and trim penetrations as shown on details and as specified.

M. Provide chrome or nickel plated escutcheons where raceways pass through walls, floors or ceilings and are exposed in finished areas. Size escutcheons to fit raceways for finished appearance. Finished areas shall not include mechanical/electrical rooms, janitor's closets, storage rooms, etc., unless suspended ceilings are specified.

3.4 EQUIPMENT ACCESS

A. Install raceways, junction and pull boxes, and accessories to permit access to equipment for maintenance. Relocate raceways or accessories to provide maintenance access at no additional cost to Owner.

B. Install equipment with sufficient maintenance space for removal, repair or changes to equipment. Provide ready accessibility to equipment and wiring without moving other future or installed equipment.

C. Access doors in walls, chases, or inaccessible ceilings will be provided under Division 08 - Access Doors and Frames, unless otherwise indicated. Access doors for equipment shall provide access for servicing, repairs and/or maintenance.

D. Provide necessary coordination and information to the Trade Contractor under Division 08 - Access Doors and Frames. This information shall include required locations, sizes and rough-in dimensions.

E. Locate electrical outlets and equipment to fit details, panels, decorating or finish at space. Architect reserves right to make minor position changes of outlet locations before work has been installed.

F. Verify door swings before installing room light switch boxes. Install boxes on latch side of door unless otherwise noted

3.5 EQUIPMENT SUPPORTS

A. Provide supporting steel not indicated on drawings as required for installation of equipment and materials including angles, channels, beams, hangers, etc.

B. Provide steel shell with plug type concrete anchors for attaching equipment to concrete. Plastic, rawhide or anchors using lead are not allowed.

C. Do not support equipment or luminaires from metal roof decking.

3.6 SUPPORT PROTECTION

A. In occupied areas, mechanical and electrical rooms and areas requiring normal maintenance access, guard certain equipment to protect personnel from injury.

B. Provide minimum 1/2" thick Armstrong Armaflex insulation or similar product applied with Armstrong 520 adhesive on lower edges of equipment, including bus duct, cable tray, pull boxes and electrical supporting devices suspended less than 7 ft above floors, platforms or catwalks in these areas.

C. Protect threaded rods or bolts at supporting elements as described above. Trim threaded rods or bolts such that they do not extend beyond supporting element.

3.7 ELECTRICAL SYSTEMS IDENTIFICATION

A. Refer to Section 26 0553 – Electrical Systems Identification.

3.8 ACCEPTANCE TESTING

A. Contractor shall perform acceptance testing. Contractor to subcontract testing to qualified testing agency if they cannot meet the requirements of Section 26 0813. Equipment to be tested is noted as "Testing by Electrical Contractor" in technical specification sections. Perform in accordance with Section 26 0812 – Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables or as outlined in technical specification sections.

B. When testing is to be witnessed by Architect/Engineer or Inspector, notify them at least 10 days prior to testing date.

C. When equipment or systems fail to meet minimum test requirements, replace or repair defective work or materials as necessary and repeat inspection and test until equipment or systems meet test requirements. Make repairs with new materials.

D. Contractor is responsible for certifying in writing equipment and system test results. Certification shall include identification of portion of system tested, date, time, test criteria and name and title of person signing test certification documents.

E. Maintain copies of certified test results, including those for any failed tests, at project site. At completion of project, include copies of test records and certifications in O&M Manuals.

3.9 START-UP

A. Systems and equipment shall be started, tested, adjusted, and turned over to Owner ready for operation. This includes "Owner-Furnished, Contractor-Installed" (OFCI) and "Contractor-Furnished, Contractor-Installed" (CFCI) systems and equipment.

B. Follow manufacturer's pre-start-up checkout, start-up, trouble shooting and adjustment procedures.

C. Contractor shall provide services of technician/mechanic knowledgeable in start-up and checkout of types of systems and equipment on project.

D. Provide start-up services by manufacturer's representative where specified or where Contractor does not have qualified personnel.

E. Coordinate start-up with all trades.

3.10 CLEANING

A. Clean systems after installation is complete.

B. Vacuum debris from panelboards, switchboards, motor starter and disconnect switch enclosures, junction boxes and pull boxes two weeks before energization and again prior to completion.

C. Where louvers are provided in switchgear or transformer enclosures, vacuum louvers free of dust and dirt.

D. Clean luminaire lenses and lamps at time of installation and clean lens exteriors just prior to final inspection.

E. Thoroughly clean equipment of stains, paint spots, dirt and dust. Remove temporary labels not used for instruction or operation.

END OF SECTION

SECTION 26 0513.16

MEDIUM-VOLTAGE, SINGLE- AND MULTI-CONDUCTOR CABLES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0526 – Grounding and Bonding for Electrical Systems

B. Section 26 0543.*10* – Underground Ducts and Raceways for Electrical Systems

C. Section 26 0553 – Electrical Systems Identification

D. Section 26 0593 – Electrical Systems Firestopping

E. Section 26 0812 – Power Distribution Acceptance Tests

F. Section 26 0813 – Power Distribution Acceptance Test Tables

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 - General Requirements.

1.3 DESCRIPTION

A. Section includes cables and related splices, terminations, and accessories for medium-voltage electrical distribution systems.

B. Cables are for use in wet or dry locations, conduit, or underground duct applications.

C. Conductors shall be rated to operate at conductor temperature of 105°C for continuous normal operation, 140°C for emergency overload conditions, and 250°C for short circuit conditions, based on 40°C maximum ambient temperature.

D. Conductor sizes in Section are based on copper wire and only copper wire shall be used.

1.4 REFERENCE STANDARDS

A. AEIC CS 8 – Specification for Extruded Dielectric Shielded Power Cables Rated 5 through 46kV.

B. IEEE 48 – Standard Test Procedures and Requirements for Alternating-Current Cable Terminations 2.5kV through 765kV.

C. IEEE 386 – Standard for Separable Insulated Connector Systems for Power Distribution Systems above 600 V (ANSI).

D. IEEE 404 – Standard for Extruded and Laminated Dielectric Shielded Cable Joints Rated 2500 – 500000 V (ANSI)

E. IEEE 576 – Recommended Practice for Installation, Termination, and Testing of Insulated Power Cable as Used in Industrial and Commercial Applications (ANSI)

F. ICEA S-93-639 – 5-46kV Shielded Power Cables for the Distribution and Transmission of Electrical Energy

G. ICEA S-94-649 – 5-46kV Concentric Neutral Cables Rated 5000 to 46000 Volts

H. ICEA S-97-682 – Utility Shielded Power Cables Rated 5000 to 46000 Volts

I. NFPA 70 – National Electrical Code

J. UL 1072 – Medium-Voltage Power Cable

1.5 SUBMITTALS

A. Product Data: For each type of cable indicated. Include splices and terminations for cable and cable accessories.
   1. Include cable drawings with the following data:
      a. Longitudinal cutback and cross-sectional view of cable.
      b. Identification and structure of cable components.
      c. Dimensions of cable components in English and SI units.

B. Material Certificates: For each cable and accessory type, signed by manufacturer.

C. Manufacturer Testing Certificate: For each type and voltage class of cable indicated.

D. Certified Field Quality Control Test Reports per requirements in Section 26 0812 – Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables for each type and voltage class of cable indicated. Indicate applicable standards compliance. Interpret test results and corrective action taken for compliance with specification requirements.

E. Qualification Data: For testing agency.

F. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

G. Installation Guide: Include the following:
   1. Maximum allowable pulling tension (in pounds and newtons)
   2. Minimum allowable bending radius
   3. Recommended pulling compounds
   4. Splicing and termination instructions with diagrams, dimensions, and material lists
   5. Weight per 1,000 ft.
   6. Standard "packaging" of reels (i.e., lengths, lagging, banding, etc.)
   7. Reactance and AC resistance (ohms to neutral) of each size and voltage class of cable, both in magnetic and non-magnetic duct, based on 3-1/C cables or 1-3/C cable in one duct.

H. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of cables, splices, and terminations.
   2. Operation and Maintenance Data:

a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

1.6 QUALITY ASSURANCE

A. Installer: Engage cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable, having not less than 3 yrs experience as licensed electrician.

B. Regulatory Requirements:
1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Source Limitations: Obtain cables and accessories through one source from single manufacturer.

D. All cables shall be of a single type and configuration. Date of manufacture shall not precede contract date by more than one year.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Coordinate with manufacturer to provide protective covering over cable and reel to prevent damage during shipping, storage, or handling.

B. Store in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Cables:
1. General Cable / Prysmian Group
2. Okonite Company
3. Southwire Company
4. ~~Aetna Insulated Wire Company~~

B. Cable Splicing and Terminating Products and Accessories:
1. Raychem Corporation
2. RTE Components; Cooper Power Systems, Inc.

3. Prysmian Group
4. Thomas & Betts Corporation/Elastimold
5. 3M; Electrical Products Division
6. Approved equal

2.2 CABLES

A. Cable Type: MV105

B. Comply with UL 1072, AEIC CS 8, ICEA S-93-639, and ICEA S-97-682

C. Conductor: Copper

D. Conductor Stranding: Compact round, concentric lay, Class B

E. Strand Filling: Conductor interstices are filled with impermeable compound

F. Conductor Insulation: Ethylene-propylene-rubber (EPR)

G. Voltage Rating: 15kV

H. Insulation Thickness: 133 percent insulation level

I. Shielding: Copper tape, helically applied over semiconducting insulation shield. ~~12.5~~25% overlap ~~for 15KV and less, 25% over 15KV~~..

~~J. Shielding and Jacket: Corrugated copper drain wires embedded in extruded, chlorinated, polyethylene jacket~~

~~K.~~J. Cable Jacket: Chlorinated polyethylene, CPE. Color: black, unless otherwise designated

~~L.~~K. Cables utilizing combination insulation shield and jacket are acceptable.

~~M.~~L. Cable lengths shall be supplied with factory-installed, moisture-proof end seals on conductors on each end. Cable seals shall be rubber or plastic caps, and shall prevent moisture from seeping into cable ends.

~~N.~~M. Each cable reel shall be tagged with the following:

1. Manufacturer
2. Cable Size
3. Cable Type
4. Voltage Class
5. Manufacture Date
6. Cable Length
7. Tolerances
8. Reel Number
9. Customer Order No.
10. Customer Name

~~O.~~N. Surface Marking:

1. Cables shall be permanently printed (or imprinted) on jacket surface at regular intervals over entire length of cable with the following:
   a. Manufacturer's name
   b. Conductor size
   c. Voltage class
   d. Insulation type
   e. UL designation

~~P.~~O. Cables shall be constructed and rated for continuous and intermittent submersion in water and shall be suitable for installation in conduit and underground duct.

~~Q.~~P. Cable shield shall be capable of withstanding fault current indicated on drawings for 1/10 second.

2.3 SPLICE KITS

A. Connectors and Splice Kits: Comply with IEEE 404; type as recommended by cable or splicing kit manufacturer for application.

B. Splicing Products: As recommended, in writing, by splicing kit manufacturer for specific sizes, ratings, and configurations of cable conductors. Include components required for complete splice, with detailed instructions.
   1. Combination tape and cold-shrink-rubber sleeve kit with rejacketing by cast-epoxy-resin encasement or other waterproof, abrasion-resistant material.
   2. Heat-shrink splicing kit of uniform, cross-section, polymeric construction with outer heat-shrink jacket.
   3. Premolded, cold-shrink-rubber, in-line splicing kit.
   4. Premolded EPDM splicing body kit with cable joint sealed by interference fit of mating parts and cable.

2.4 SOLID TERMINATIONS

A. Shielded-Cable Terminations: Comply with the following classes of IEEE 48. Insulation class is equivalent to that of cable. Include shield ground strap for shielded cable terminations.
   1. Class 1 Terminations: Modular type, furnished as kit, with stress-relief tube; multiple, molded-silicone rubber, insulator modules; shield ground strap; and compression-type connector.
   2. Class 1 Terminations: Heat-shrink type with heat-shrink inner stress control and outer nontracking tubes; multiple, molded, nontracking skirt modules; and compression-type connector.
   3. Class 1 Terminations: Modular type, furnished as kit, with stress-relief shield terminator; multiple-wet-process, porcelain, insulator modules, shield ground strap; and compression-type connector.
   4. Class 1 Terminations, Indoors: Kit with stress-relief tube, nontracking insulator tube, shield ground strap, compression-type connector, and end seal.
   5. Class 2 Terminations, Indoors: Kit with stress-relief tube, nontracking insulator tube, shield ground strap, and compression-type connector. Include silicone-rubber tape, cold-shrink-rubber sleeve, or heat-shrink plastic-sleeve moisture seal for end of insulation whether or not supplied with kits.
   6. Class 3 Terminations: Kit with stress cone and compression-type connector.

B. Nonshielded-Cable Terminations: Kit with compression-type connector. Include silicone-rubber tape, cold-shrink-rubber sleeve, or heat-shrink plastic-sleeve moisture seal for end of insulation whether or not supplied with kits.

C. Cable Terminations:
   1. Product of one manufacturer and furnished in kit form compatible with insulation and conductor material for cable terminated.

D. Connecting Lugs:
   1. Connectors and terminals: Copper with uniform compression over entire contact surface.
   2. Terminals on conductors: Solderless terminal lugs.

2.5 SEPARABLE INSULATED CONNECTORS

A. Description: Modular system, complying with IEEE 386, with disconnecting, single-pole, cable terminators and with matching, stationary, plug-in, dead-front terminals designed for cable voltage and for sealing against moisture.

B. Terminations at Distribution Points: Modular type, consisting of terminators installed on cables and modular, dead-front, terminal junctions for interconnecting cables.

C. Load-Break Cable Terminators: Elbow-type units with **200A or 600A (refer to drawings)**, 15 KV class, 95 KV BIL load make/break and continuous-current rating; coordinated with insulation diameter, conductor size, and material of cable being terminated, with steel-reinforced hook-stick eye, grounding eye, and arc-quenching material. Include capacitance coupled test point on terminator body. Include cold shrinkable metallic shield adapter kit to ground metallic shielded cable. Include connection bus with parking stand for wall mounting.

D. Dead-Break Cable Terminators: Elbow-type unit with 600A continuous-current rating; designed for de-energized disconnecting and connecting; coordinated with insulation diameter, conductor size, and material of cable being terminated. Include test point on terminator body that is capacitance coupled.

E. Dead-Front Terminal Junctions: **200A or 600A (refer to drawings)**, 15 KV class, modular bracket-mounted groups of dead-front stationary terminals that mate and match with above cable terminators. Two-, three-, or four-terminal units as indicated, with fully rated, insulated, watertight conductor connection between terminals and complete with grounding lug, manufacturer's standard accessory stands, stainless-steel mounting brackets, and attaching hardware.
   1. Protective Cap: Insulating, electrostatic-shielding, water-sealing cap with drain wire.
   2. Portable Feed-Through Accessory: Two-terminal, dead-front junction arranged for removable mounting on accessory stand of stationary terminal junction.
   3. Grounding Kit: Jumpered elbows, portable feed-through accessory units, protective caps, test rods suitable for concurrently grounding three phases of feeders, and carrying case.
   4. Standoff Insulator: Portable, single dead-front terminal for removable mounting on accessory stand of stationary terminal junction. Insulators suitable for fully insulated isolation of energized cable-elbow terminator.

F. Test-Pont Fault Indicators: Applicable current-trip ratings and arranged for installation in test points of load-break separable connectors, and complete with self-resetting indicators capable of being installed with shotgun hot stick and tested with test tool.

~~G. Tool Set: Shotgun hot stick with energized terminal indicator, fault-indicator test tool, and carrying case.~~

~~2.6~~2.5 ARC-PROOFING MATERIALS

A. Tape for First course on Metal Objects: **0.254 mm(10 mil)**-thick, corrosion-protective, moisture-resistant, PVC pipe-wrapping tape.

B. Arc-Proofing Tape: Fireproof tape, flexible, conformable, intumescent to **8 mm(0.3")** thick, compatible with cable jacket.

C. Glass-Cloth Tape: Pressure-sensitive adhesive tape, **13 mm(1/2")** wide.

~~2.7~~2.6 SOURCE QUALITY CONTROL

A. Test and inspect cables according to Section 26 0812 – Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install cables according to IEEE 576.

B. Pull Conductors: Do not exceed manufacturer's recommended minimum installation temperature, maximum pulling tensions, and sidewall pressure values.
   1. Where necessary, use manufacturer-approved pulling compound or lubricant that will not deteriorate conductor or insulation.
   2. Use pulling means, including fish tape, cable, rope, and basket-weave cable grips that will not damage cables and raceways. Do not use rope hitches for pulling attachment to cable.
   3. Cut off cable damaged by cable grips or pulling make-ups so as to provide clean, undamaged cable for termination. Continuously record pulling tension during installation.
   4. Make attachment to cable by compression or epoxy filled pulling eye and provide break away (clutch) tension device.

C. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.
   1. Support cables and conductors in vertical raceways per requirements in Section 26 0529 - Hangers and Supports for Electrical Systems.

D. Install "buried-cable" warning tape per requirements in Section 26 0553 - Electrical Systems Identification.

E. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by longest route from entry to exit and support cables at intervals adequate to prevent sag. Fill lowest ducts first, avoid covering or blocking duct entrances and allow space for future cable installation.

F. Cut cable in clean, dry environment. Seal cut ends with waterproof seal immediately after cutting. Maintain a seal during and after pulling.

G. Install cable splices at pull points (accessible locations) and elsewhere as indicated; use standard kits.

H. Install terminations at ends of conductors and seal multi-conductor cable ends with standard kits. Do not install exterior terminations during inclement weather or damp atmospheric conditions.

I. Install stress cones at cable splices and terminations, grounded per cable and connector manufacturer recommendations.

J. Check phase rotation before connections are made to existing circuits. Clearly letter cable terminations. Identify phases with phase designations lettered on terminal boxes and other terminations throughout the system.

~~K. Install separable insulated-connector components as follows:~~

~~1. Protective Cap: At each terminal junction, with one on each terminal to which no feeder is indicated to be connected~~

~~2. Portable Feed-Through Accessory: Three~~

~~3. Standoff Insulator: Three~~

~~L.~~K. Arc Proofing: Unless otherwise indicated, arc proof medium-voltage cable at locations not protected by conduit, cable tray, direct burial, or termination materials. In addition to arc-proofing tape and/or manufacturer's written instructions, apply arc proofing as follows:

1. Clean cable sheath.
2. Wrap metallic cable components with 10 mil pipe-wrapping tape.
3. Smooth surface contours with electrical insulation putty.
4. Apply arc-proofing tape in one half-lapped layer with coated side toward cable.
5. Band arc-proofing tape with 1"-wide bands of half-lapped, adhesive, glass-cloth tape 2" o.c.

~~M.~~L. Seal around cables passing through fire-rated elements according to Section 26 0593 – Electrical Systems Firestopping.

~~N.~~M. Install fault indicators on each phase where indicated.

~~O.~~N. Ground shields of shielded cable at terminations, splices, and separable insulated connectors. Shields shall be grounded at both ends of cable run. Single point grounding will not be accepted. Ground metal bodies of terminators, splices, cable and separable insulated-connector fittings, and hardware. For grounding requirements, refer to Section 26 0526 – Grounding and Bonding for Electrical Systems.

~~P.~~O. Identify cables according to Section 26 0553 – Electrical Systems Identification.

3.2 FIELD QUALITY CONTROL

A. Perform cable acceptance tests on cable circuits after installing cables and before electrical circuitry has been energized. Splices and terminations required as part of this project are to be completed and acceptance tested as part of cable tests. For cables not spliced or terminated as part of project, ends should be clean, dry and long enough to eliminate leakage from conductor to ground along outer surface of cable.

B. Perform acceptance tests and damage investigations under constant supervision of Owner's representative. Contractor shall coordinate and provide labor, material, equipment, and services necessary to test each completed cable circuit.

C. Remove and replace defective cables and retest as required.

D. Refer to Section 26 0812 – Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables for visual and mechanical inspection and electrical tests. Certify compliance with test parameters.

END OF SECTION

SECTION 26 0516

OWNER-FURNISHED EQUIPMENT

PART 1 - GENERAL

1.1 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.2 DESCRIPTION

A. Section includes installation and testing of owner-purchased pieces of equipment, which are required in construction.

B. Owner-furnished equipment requiring work by Contractor is specified in the following Sections:
   1. Section 26 1116 - Secondary Unit Substations
   2. Section 26 1216 - Dry-Type, Medium-Voltage Transformers
   3. Section 26 1316 - Medium-Voltage Fusible Interrupter Switchgear
   4. Section 26 2200 - Low-Voltage Transformers
   5. Section 26 2300 - Low-Voltage Switchgear
   6. Section 26 2313 - Paralleling Low-Voltage Switchgear
   7. Section 26 2413 - Switchboards
   8. Section 26 2416.13 - Lighting and Appliance Panelboards
   9. Section 26 2416.16 - Distribution Panelboards
   10. Section 26 2416.19 - Isolation Panelboards
   11. Section 26 2500 - Enclosed Bus Assemblies
   12. Section 26 2550 - Generator Docking Station
   13. Section 26 2713 - Electrical Metering
   14. Section 26 2813 - Fuses
   15. Section 26 2816 - Enclosed Switches and Circuit Breakers
   16. Section 26 2913 - Enclosed Controllers
   17. Section 26 3213 - Diesel Engine Generators
   18. Section 26 3623 -Automatic Transfer Switches
   19. Section 26 4300 - Surge Protective Devices

C. Contractor shall be responsible for receipt of equipment from Owner, storage after receipt, installation, and electrical connection.

D. Owner-furnished equipment requiring work by the Contractor is shown on the drawings and schedules.

E. Owner-furnished, Contractor-installed equipment is labeled OFCI.

1.3 SUBMITTALS

A. Shop Drawings: Owner-supplied shop drawings of equipment furnished by Owner.

B. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory unopened packaging until ready for installation.

1.6 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 (NOT APPLICABLE TO THIS SECTION)

PART 3 - EXECUTION

3.1 INSTALLATION

A. Provide labor, materials and electrical connections for Owner-furnished equipment in accordance with contract drawings.

B. Install and connect Owner-furnished equipment as though it had been purchased by Contractor.
   1. This shall include:
      a. Receiving equipment at jobsite
      b. Rigging and setting equipment in place
      c. Making electrical connections
      d. Starting
      e. Testing

C. Install equipment in accordance with manufacturer's installation instructions.

D. Maintain equipment until facility is accepted by Owner.

E. Review Owner-supplied shop drawings of Owner-furnished equipment to ascertain that necessary labor and materials have been provided to install equipment and complete the system it serves.

END OF SECTION

SECTION 26 0519

LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0529 - Hangers and Supports for Electrical Systems

B. Section 26 0553 - Electrical Systems Identification

C. Section 26 0593 - Electrical Systems Firestopping

D. Section 26 0812 - Power Distribution Acceptance Tests

E. Section 26 0813 - Power Distribution Acceptance Test Tables

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes conductors and cables rated 600 V and less, connectors, splices, and terminations rated 600 V and less, sleeves and sleeve seals for cables.

B. Conductor and conduit sizes in these contract documents are based on copper wire, and only copper wire shall be used.

1.4 REFERENCE STANDARDS

A. ASTM A 53/A 53M – Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless.

B. ASTM B 1 – Standard Specification for Hand-Drawn Copper Wire.

C. ASTM B 8 – Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

D. NEMA WC 3 – Rubber-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy (ICEA S-19-81).

E. NEMA WC 5 – Thermoplastic-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy (ICEA S-61-402).

F. NEMA WC 70 – Non-Shielded Power Cable 2000 V or less for the Distribution of Electrical Energy (ICEA S-95-668).

G. NFPA 70 – National Electrical Code.

H. UL 44 – Thermoset-Insulated Wires and Cables.

I. UL 83 – Thermoplastic-Insulated Wires and Cables.

J. UL 486A-486B – Wire Connectors.

K. UL 486C – Splicing Wire Connectors.

L. UL 486D – Standard for Insulated Wire Connector Systems for Underground Use or in Damp or Wet Locations.

M. UL 486E – Standard for Equipment Wiring Terminals for Use with Aluminum and/or Copper Conductors.

N. UL 2196 – Standard for Tests for Fire Resistive Cables

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

C. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

D. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of components and circuits.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

B. Wire and cable boxes and reels shall bear the date of manufacture.
   1. Date of manufacture shall not precede contract date by more than one year.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Cerrowire

B. General Cable Corporation

C. Prysmian Group - Draka

D. Senator Wire & Cable Company

E. Southwire Company

2.2 DESCRIPTION

A. NEMA WC 70; single copper conductor insulated wire; 600V rated insulation; 90°C maximum operating temperature for dry and wet or damp locations.
   1. Thermoplastic-insulated wires and cables: NEMA WC 5, UL 83; Type THHN, THWN, THHW.
   2. Thermoset-insulated wires and cables: NEMA WC 3, UL 44; Type XHHW-2.
   3. Thermoset-insulated wires and cables: FT4, UL 2196, UL44; Type RHW-2.

2.3 REMOTE CONTROL AND SIGNAL CIRCUITS

A. Class 1
   1. Copper conductor, single insulated wire.
   2. Insulation type THHN, THHW rated 90°C, 600 V insulation class.
   3. Type XHHW-2 for ambient temperature less than 32°F.
   4. UL 83 listed, ASTM B 1 for solid conductors; ASTM B 8 for stranded conductors.

B. Classes 2 and 3
   1. Copper conductor, multiple twisted conductors covered with an overall non-metallic jacket unless otherwise noted.
   2. Insulation type XLE, rated 105°C, 300 V insulation class.
   3. UL listed for use in space in which circuits will be installed.

2.4 CONNECTORS, SPLICES, AND TERMINALS

A. Manufacturers:
   1. AFC Cable Systems, Inc.
   2. Burndy Division of Hubbell Incorporated
   3. Hubbell Power Systems, Inc.
   4. Ideal Industries, Inc.
   5. O-Z/Gedney; EGS Electrical Group LLC.

6. 3M; Electrical Products Division
7. Thomas and Betts Division of ABB
8. Tyco Electronics Corp.

B. Description: UL 486A-486B, UL 486C, UL 486D, UL 486E; factory-fabricated connectors, splices, and terminals of size, ampacity rating, material, type, and class for application and service indicated.

2.5 TERMINATIONS

A. Compression set, bolted or screw type lug, or direct to bolted or screw type terminal.

2.6 PLASTIC CABLE TIES

A. Nylon or approved; locking type; metallic ties not permitted.

PART 3 - EXECUTION

3.1 INSTALLATION OF CONDUCTORS AND CABLES

A. Install conductors in a raceway system, unless otherwise specified or indicated.

B. Install conductors only after:
1. Building interior is enclosed and weather tight.
2. Mechanical work likely to damage conductors has been completed.
3. Raceway installation is complete and supported.

C. Pull conductors into raceway at same time.

D. Neatly train and lace conductors inside boxes, equipment, and panelboards.

E. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

F. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer’s recommended maximum pulling tensions and sidewall pressure values. Do not use pulling compound on branch circuit conductors served by grounding isolation panelboards.
1. Lubricants shall be UL Listed

G. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips that will not damage cables or raceway.

H. Provide adequate support for conductors not in raceway. Do not support conductors from ceiling grid or from accessible ceiling support systems.

I. Support conductors in vertical raceways using OZ type "S" cable supports for 600 volt conductors.

J. Support conductors above 600 volts in vertical raceways using OZ type "R" cable supports.

K. Support cables and conductors in vertical raceways per requirements in Section 26 0529 - Hangers and Supports for Electrical Systems.

L. Identify and color-code conductors and cables according to Section 26 0553 - Electrical Systems Identification.

M. Wiring at Outlets: Install conductor at each outlet, with minimum 12” of slack.

N. Limit conduit fill to a maximum of 9 current-carrying conductors.

O. Install stranded conductors where conductors terminate in crimp type lugs. Do not place bare stranded conductors directly under terminal screws.

P. Install VFD input wiring, output wiring and control wiring in their own separate conduit systems.

3.2 CONDUCTOR MATERIAL APPLICATIONS

A. Feeders and Branch Circuits: Solid #12 AWG and smaller; stranded for #10 AWG and larger.

B. Minimum conductor sizes shall be as follows:
1. #12 AWG – Branch circuits of any kind.
2. #14 AWG – Remote control and signal systems, fire alarm system.
3. #10 AWG - Exit light circuits, emergency circuits, security lighting

C. Branch wiring length limitations:
1. 208Y/120 V circuits over 100’ in length: Increase wire size one size for each 100’ of length. Increase conduit size as required.
2. 480Y/277 V circuits over 150’ in length: Increase wire size one size for each 150’ of length. Increase conduit size as required.

3.3 CONDUCTOR INSULATIONS AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

A. Feeders: Type THHW, THWN, XHHW-2, rated 75°C for wet locations, single conductors in raceway.

B. Branch Circuits: Type THHN, XHHW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway.

C. 2-Hour Fire Resistive Cables: Type RHW-2, rated 90°C for dry and wet or damp locations, single conductors in raceway. Classified to UL 2196.

D. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh strain relief device at terminations to suit application.

E. Motor Circuit Branch Wiring Between Motor and VFD: XHHW-2

3.4 REMOTE CONTROL AND SIGNAL CIRCUITS

A. Sizing – #14 AWG minimum.

B. Installation:
1. Install cables in cable tray and cable rings.
2. Provide protection for exposed cables where subject to damage.
3. Support cables above accessible ceilings; do not rest on ceiling tiles.

4. Use suitable cable fittings and connectors.

3.5 CONNECTORS, SPLICES AND TERMINALS

A. Connectors:
   1. Aluminum and aluminum alloy connectors are not allowed to be used.
   2. Except where equipment is furnished with bolted or screw type lug, use compression set pressure connectors with insulating covers. Use compression tools and die compatible with connectors being installed.
   3. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
   4. Joints, taps and splices sizes No. 10 and smaller:
      a. Ideal-Nut Connectors or Scotchlok Spring connectors
   5. Joints, taps and splices sizes No. 8 and larger:
      a. Copper compression connectors
         1) Install with hydraulic compression tool.
   6. Joints, taps and splices sizes larger than No. 1:
      a. Tape with electrical tape to build up insulation level equivalent to cable insulation and cover with not less than two half lapped layers of plastic electrical tape.

B. Splices:
   1. Splice wires and cable only in accessible locations such as within junction boxes.
   2. Make splices to carry full capacity of conductors with no perceptible temperature rise.
   3. Splices are to be made with compression barrel connector where no taps exist or allowance for future taps is being made.
   4. Where the splice includes provisions for taps, use Burndy insulated Unitap. Locate in pull or junction box sized for all conductors to be spliced and tapped.
   5. Make below-grade splices in manholes and handholes watertight with pre-stretched or heat-shrinkable insulating tubing, or resin-filled insulator.
   6. Use electrical tape to build up insulation level equivalent to cable insulation and cover with not less than two half-lapped layers of plastic electrical tape, for joints, taps, and splices of #1 AWG conductors and larger.
   7. Plastic snap-on or piercing type mechanical splice insulators are not allowed.
   8. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.

C. Terminals:
   1. All terminals are to be compression type.
   2. Train wires to eliminate fanning of stands, crimp with proper tool and die.
   3. Insulate ends of spare conductors with electrical tape and identify spare circuit number where appropriate.
   4. Eye type crimped terminal for removable screw type terminal. Forked torque terminal when screw terminal cannot be removed.
   5. Torque screw termination per manufacturer's recommended values.
   6. Terminate motors connections using the following methods:

a. 300V and below: Use compression-set, insulted eye terminal for screw lug connections or barrel type cable to cable connections.

b. Above 300V: Use 3M 5300 series insulated motor lead splicing kit.

3.6 CABLE TIES

A. Neatly bundle conductors and cables together for support. Size cable ties sufficiently to accommodate the multiple cables being supported.

3.7 FIELD QUALITY CONTROL

A. Testing by Testing Agency.

B. Test 600-volt conductors and cables per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

C. Perform electrical acceptance testing on 600-volt feeders serving panelboards, switchboards and secondary voltage service entrance equipment.

1. Acceptance testing shall include the following:

a. Verify tightness of accessible bolted connections.

b. Perform insulation-resistance test on each conductor with respect to ground and adjacent conductors.

1) Applied potential to be 1000 volts DC for one minute.

2) Minimum insulation resistance shall be 50 megohms.

3) Correct deviations between adjacent phases and values below minimum.

c. Perform continuity test to insure correct cable connection.

D. Replace conductors and cables that are found defective, at no expense to Owner.

END OF SECTION

SECTION 26 0526

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0812 - Power Distribution Acceptance Tests

B. Section 26 0813 - Power Distribution Acceptance Test Tables

C. Section 26 4113 - Lightning Protection for Structures

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes methods and materials for grounding systems and equipment, as required by State Codes, NFPA 70, applicable portions of other NFPA codes, as indicated herein.
   1. Common ground bonding with lightning protection system.

B. Maximum resistance to ground shall be less than 5 ohms.

1.4 REFERENCE STANDARDS

A. TIA-607-B – Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

B. ASTM B 3 – Specification for Soft or Annealed Copper Wire

C. ASTM B 8 – Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard or Soft

D. ASTM B 33 – Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes

E. IEEE C2 – National Electrical Safety Code (ANSI)

F. NETA MTS – Maintenance Testing Specifications

G. NFPA 70 – National Electrical Code

H. NFPA 70B – Recommended Practice for Electrical Equipment Maintenance

I. NFPA 780 – Lightning Protection Systems

J. UL 96 – Lightning Protection Components

K. UL 467 – Grounding and Bonding Equipment

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Field Quality-Control Test Reports:
   1. Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.
   2. Test reports of resistance to earth. Each test report shall include:
      a. Date of test, soil moisture content, and soil temperature
      b. Test operator
      c. Instrument or other test equipment used
      d. Electrode designation or location
      e. Ground impedance in ohms
      f. Assumptions made - if required

C. Closeout Submittals:
   1. Operation and Maintenance Manuals: Include the following:
      a. Instructions for periodic testing and inspection of grounding system.
         1) Instructions to perform tests to determine if ground resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if they do not.
         2) Include recommended testing intervals.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70.
   2. Comply with UL 467 for grounding and bonding materials and equipment.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store products in clean, dry space. Protect from dirt, fumes, water, corrosive substances, and construction debris.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 CONDUCTORS

A. Insulated Conductors: Copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction, insulation color: green.

B. Bare Copper Conductors:
   1. Solid Conductors: ASTM B 3.
   2. Stranded Conductors: ASTM B 8.
   3. Tinned Conductors: ASTM B 33.
   4. Counterpoise and Bonding Conductor: Bare stranded conductor, size as indicated on drawings.

C. Grounding Bus: Horizontal rectangular bars of annealed copper, 1/4” by 2” in cross section; with insulators, length as indicated on drawings. Minimum length is 24”.

2.2 CONNECTORS

A. Listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction for applications in which used, and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, bolted pressure-type, with at least two bolts.
   1. Pipe Connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

D. Compression Connectors: Irreversible type.
   1. Manufacturer: Burndy YGA Series or Approved Equal

2.3 GROUNDING ELECTRODES

A. Ground Rods: Copper-clad, 3/4” in diameter by 10 ft in length.

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Exposed Bonding Conductors: Install solid conductor for #6 AWG and smaller and stranded conductors for #4 AWG and larger, unless otherwise indicated.

B. Equipment Grounding Conductors: Install solid conductor for #12 AWG and smaller and stranded conductors for #10 AWG and larger. Conductors are to have green insulation for #10 AWG and smaller and identified with green tape at terminations, boxes and splices for sizes #8 AWG and larger.

C. Underground Grounding Conductors: Install bare copper conductor. Sized as indicated on drawings.

1. Bury at least 24” below grade.
2. Ductbank Grounding Conductor: Bury 12” above ductbank when indicated as part of ductbank installation.

D. Grounding Bus: Install in electrical and communications rooms, in rooms housing service equipment.
   1. Install bus on insulated spacers 1”, minimum, from wall; 6” above finished floor in locations as indicated on drawings.

E. Conductor Terminations and Connections:
   1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors
   2. Underground Connections: Welded connectors, except at test wells and as otherwise indicated.
   3. Connections to Ground Rods at Test Wells: Bolted connectors
   4. Connections to Structural Steel: Welded connectors

3.2 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with feeders and branch circuits. Install for each branch circuit neutral originating from panelboards, including lighting circuits.

B. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:
   1. Feeders and branch circuits
   2. Lighting circuits
   3. Receptacle circuits
   4. Single-phase motor and appliance branch circuits
   5. Three-phase motor and appliance branch circuits
   6. Flexible raceway runs
   7. Armored and metal-clad cable runs

C. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

D. Duplex receptacles of any amperage: Install separate jumper between grounding terminal on device and metallic box.

E. Size of equipment grounding conductors for branch circuits: As indicated in NFPA-70, except minimum size shall be #12 AWG.

F. Size of branch panel feeder originating at switchboards/switchgear: As indicated in NFPA-70, except in no instance smaller than #8 AWG.

G. Signal and Communication Equipment: For telephone, alarm, voice and data, and other communication equipment, install insulated grounding conductor (sized as indicated on drawings) in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.

1. Telecom Grounding Bus: Terminate grounding conductor on grounding bus located in telecom room.
2. Terminal Cabinets: Bond cabinet grounding terminal to telecom grounding bus.
3. Cable Tray: Bond cable tray to telecom grounding bus.

H. Install grounding conductor from each standby-emergency generator to grounding electrode system. Provide flexible jumper between base and isolated generator.

I. Install equipment grounding conductor from secondary side of each transformer to grounding electrode system as required for separately derived system.

J. Install grounding for service entrance equipment room consisting of ground bus, ground conductors, and copperclad grounding rods arranged as indicated on drawings.

K. Install grounding conductor to luminaires hanging form conduit swivel hangers.

3.3 SEQUENCING, SCHEDULING

A. Permanently attach service grounds before permanent building service is energized.

B. Permanently attach equipment grounds prior to energizing equipment.

3.4 INSTALLATION

A. Connections: Exposed and visible for inspection at all times. Do not install insulation over ground connections.

B. Identify all grounding conductors by system and room number of termination at building grounding electrode point.

C. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

D. Common Ground Bonding with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.

E. Ground Rods: Install ground rods with the top 1 ft minimum below finished grade.
1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating, if any.

F. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes shall be at least 12” deep, with cover.
1. Test Wells: Install at least one test well for each service, unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor. Connections within well are to be reversible mechanical type.

G. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations, but if a disconnect-type connection is required, use a bolted clamp.

H. Grounding and Bonding for Piping:
1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes, using a bolted clamp connector or by bolting a lug-type connector to a pipe flange, using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end. Water pipe, by itself, is not an adequate grounding electrode and must be supplemented by another electrode system. Bond system together.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.

I. Bond medical gas piping at point of origin and at each floor of distribution to service entrance grounding bus bar.

J. Make grounding connections on surface that has been cleaned of paint, dirt, oil, etc., so that connections are bare metal to bare metal contact.

K. Make grounding connections tight with UL listed grounding devices, fittings, bushings, etc.

L. Ground Ring: Install a grounding conductor, electrically connected to building structure ground rod and to each indicated item, extending around the perimeter of area or item indicated on drawings.

M. Equipment Grounding Conductor: Terminate in panelboard at green wire ground bus.

N. Multiple Conductors on Single Lug: Not permitted. Terminate each grounding conductor on its own terminal lug.

O. Flexible Metallic Conduit, Non-Metallic Rigid Conduit, or Liquid Tight Flexible Conduit: Install green wire grounding conductor with phase conductors in conduit.

3.5 FIELD QUALITY CONTROL

A. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
1. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal at ground test wells. Make tests at ground rods before any conductors are connected.

B. Test grounding systems per requirements in Section 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Inspect completed system by commissioning authority, prior to backfilling.

END OF SECTION

SECTION 26 0529

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0533 – Raceway and Boxes for Electrical Systems

B. Section 26 1216 – Dry-Type, Medium-Voltage Transformers

C. Section 26 1316 – Medium-Voltage Fusible Interrupter Switchgear

D. Section 26 2200 – Low-Voltage Transformers

E. Section 26 2300 – Low-Voltage Switchgear

F. Section 26 2313 – Paralleling Low-Voltage Switchgear

G. Section 26 2413 – Switchboards

H. Section 26 2416.13 – Lighting and Appliance Panelboards

I. Section 26 2416.16 – Distribution Panelboards

J. Section 26 2419 – Motor-Control Centers

K. Section 26 2500 – Enclosed Bus Assemblies

L. Section 26 2816 – Enclosed Switches and Circuit Breakers

M. Section 26 2913 – Enclosed Controllers

N. Section 26 3213 – Diesel Engine Generators

O. Section 26 3623 – Automatic Transfer Switches

P. Section 26 5100 – Lighting Systems

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes the following:

1. Manufactured hangers and supports for individual raceways and cables, slotted channel and angle systems for multiple conduit runs, and most electrical equipment that is not floor mounted.

2. Construction requirements for concrete housekeeping pads for floor-mounted electrical equipment.

1.4 REFERENCE STANDARDS

A. AWS D1.1/D1.1M – Structural Welding Code-Steel.

B. ASTM A 36/A 36M – Carbon Structural Steel.

C. ASTM A 325 – Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

D. ASTM A 780 – Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

E. MSS SP-58 – Pipe Hangers and Supports - Materials, Design and Manufacture.

F. MSS SP-69 – Pipe Hangers and Supports - Selection and Application.

G. MFMA-4 – Metal Framing Standards Publication.

H. NECA 1 – Standard Practices for Good Workmanship in Electrical Construction.

I. NECA 101 – Standard for Installing Steel Conduits (Rigid, IMC, EMT).

J. NFPA 70 – National Electrical Code.

K. SSPC-PA 1 – Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel slotted support systems.
   2. Raceway and cable supports.
   3. Support for conductors in vertical raceway.
   4. Structural steel for fabricated supports and restraints.
   5. Mounting, anchoring, and attachment components:
      a. Powder-actuated fasteners.
      b. Mechanical-expansion anchors.
      c. Concrete inserts.
      d. Clamps for attachment to structural steel.
      e. Through bolts.
      f. Toggle bolts.
      g. Hanger rods.

B. Shop Drawings: Include concrete anchors application, size, and placement. Include concrete inserts application, size, loading, and placement. Show fabrications and installation details and include calculations for the following:
   1. Trapeze hangers. Include product data for components.
   2. Steel slotted channel systems. Include product data for components.

3. Fabricated metal equipment support assemblies.

C. Welding certificates.

D. Schedule of hangers and support devices with support spacing.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, “Structural Welding Code – Steel.”

B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of 5 times the applied force.

B. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
   1. Finishes
      a. Metallic Coatings:
         1) Factory standard primed, galvanized of electroplated finish and applied according to MFMA-4, for indoor applications.
         2) Hot-dip galvanized after fabrication and applied according to MFMA-4, for outdoor applications.
      b. Painted Coatings: Manufacturer’s standard painted coating applied according to MFMA-4.
   2. Channel Dimensions: Selected for applicable load criteria.
   3. Manufacturers:
      a. Allied Support Systems; Power-Strut Unit.
      b. Cooper B-Line, Inc.; A division of Cooper Industries.
      c. ERICO International Corporation.
      d. GS Metals Corporation.
      e. Thomas & Betts Corporation.
      f. Unistrut; Tyco International, Ltd.
      g. Wesanco, Inc.
      h. National Pipe Hanger Corporation.
      i. Michigan Hanger Co., Inc.; O-Strut Division.
      j. Approved equal.

C. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

D. Raceway and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

E. Support for Conductors in Vertical Raceway: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suite individual conductors or cables supported. Body shall be malleable iron.

F. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

G. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
      a. Manufacturers:
         1) Hilti Inc.
         2) ITW Ramset/Red Head; A division of Illinois Tool Works, Inc.
         3) MKT Fastening, LLC.
         4) Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit
         5) Approved equal
   2. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
      a. Manufacturers:
         1) Cooper B-Line, Inc.; A division of Cooper Industries
         2) Empire Tool and Manufacturing Co., Inc.
         3) Hilti Inc.
         4) ITW Ramset/Red Head; A division of Illinois Tool Works, Inc.
         5) MKT Fastening, LLC.
         6) Approved equal
   3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
   4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
   5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
   6. Toggle Bolts: All-steel springhead type.
   7. Hanger Rods:
      a. MSS SP-58; threaded steel, with adjusting and lock nuts; electroplated zinc finish.
      b. MSS SP-58; nonmetallic, with adjusting and lock nuts.

2.2 FABRICATED METAL FRAMING EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section “Metal Fabrications” for steel shapes and plates; not be lighter than 12 gauge.

C. Finish: Electro-galvanized.

D. Manufacturers: Same as in paragraph 2.1.B.3 above.

2.3 CONTINUOUS INSERT CHANNELS

A. Length and support capabilities to be suitable for application.

B. Brackets, inserts and accessories suitable for channel insert selected.

C. Manufacturers:
1. Unistrut; Tyco International, Ltd.
2. Cooper B-Line, Inc.; A division of Cooper Industries
3. Michigan Hanger Co., O-Strut Division
4. Anvil International, Inc.
5. Approved equal

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.

B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NFPA 70.
1. Size steel hanger rods for individual hangers and trapeze supports as indicated in the following schedule. Total weight of equipment shall not exceed limits indicated.

Maximum Loads (lbs)	Rod Diameter (")	Maximum Pipe Size With Single Rod
730	3/8	2"
1130	1/2	3"
1818	5/8	5"

C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25% in future without exceeding specified design load limits.
1. Secure raceways and cables to these supports with single-bolt conduit clamps using spring friction action for retention in support channel.

D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2" and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.2 SUPPORT INSTALLATION

A. Comply with NECA 1 and NECA 101 for installation requirements, except as specified in paragraphs below.

B. Raceway Support Methods: In addition to methods described in NECA 1, raceways may be supported by openings through structure members, as permitted in NFPA 70.

C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.

D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
   1. To Wood: Fasten with lag screws or through bolts.
   2. To New Concrete: Bolt to concrete inserts.
   3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
   4. To Existing Concrete: Expansion anchor fasteners.
   5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4” thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4” thick.
   6. To Steel: Spring-tension clamps or beam clamps.
   7. To Light Steel: Sheet metal screws.
   8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.

E. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

F. Do not support raceway by other raceway.

G. Do not support equipment or raceway from metal roof decking or floor decking.

H. Do not impose weight of electrical equipment, raceways, or lighting fixtures on support provided for other trades or systems.

I. Do not support loads from bottom chord member of trusses or open web chord.

J. Suspend hangers by means of hanger rods. Perforated band iron and flat wire (strap iron) are not allowed.

K. Use conduit-mounting pedestals for piping on roof. Install bottom of pedestal flat on roof deck and insulate exterior of pedestal, flush and counter flush. Coordinate roof mounting methods with roof system installer to maintain roof warranty provided by roof system installer.

L. Minimize use of concrete anchors and inserts after concrete pour.

M. Punching, drilling, welding of building structural steel or welding attachment to building structural steel is not allowed, unless approved by structural engineer.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section “Metal Fabrications” for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE HOUSEKEEPING PADS

A. Construct concrete housekeeping pads for all floor-mounted electrical equipment.

B. Dimensions: 4” high and not less than 4” larger in both directions than supported equipment, so anchors will be a minimum of 10 bolt diameters from edge of the base.

C. Provide #4 steel reinforcement bars on 12” centers horizontally in both directions. Center the reinforcement vertically between the floor and the top of the pad, supported on chairs.

D. Dowel #4 reinforcement steel into existing floor slab using concrete epoxy.

E. Prepare existing concrete slab under equipment pad by rough grinding surface and applying latex concrete bonding agent.

F. Use 3000 psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section “Cast-in-Place Concrete.”

G. Anchor equipment to concrete housekeeping pad.
   1. Place and secure anchorage devices. Use supported equipment manufacturer’s setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   2. Install anchor bolts to elevations required for proper attachment to supported equipment.
   3. Install anchor bolts according to anchor-bolt manufacturer’s written instructions.

H. Coordinate with Architect installation of housekeeping pads on roof.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

T. UL 797 – Electrical Metallic Tubing-Steel

U. UL 870 – Wireways, Auxiliary Gutters, and Associated Fittings

V. UL 1242 – Electrical Intermediate Metal Conduit-Steel

W. UL 1660 – Liquid-Tight Flexible Nonmetallic Conduit

1.5 SUBMITTALS

A. Product Data:
   1. Raceways
   2. Fittings
   3. Wireways
   4. Indoor service poles
   5. Outlet boxes
   6. Pull and junction boxes
   7. Floor boxes
   8. Tap boxes
   9. Raceway seals

B. Manufacturer’s Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation and installation of product.

C. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual routing of raceways 2” and larger.

b. Record actual location and mounting heights of wireways, indoor service poles, floor boxes, tap boxes, outlet, pull and junction boxes.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements:
1. Comply with NFPA 70.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Protect PVC conduit from sunlight.

C. Comply with manufacturer's written instructions.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

PART 2 - PRODUCTS

2.1 RIGID METAL CONDUIT (RMC)

A. Rigid Steel Conduit (RSC): ANSI C80.1, UL 6; heavy wall galvanized steel, PVC coated where specified on drawings: NEMA RN 1 and verified by ETL to ETL PVC-001.

B. Intermediate Metal Conduit (IMC): ANSI C80.6, UL 1242; thinner wall, galvanized steel, PVC coated where specified on drawings: NEMA RN 1 and verified by ETL to ETL PVC-001.

C. Fittings (couplings, conduit bodies, connectors and bushings): NEMA FB 1, UL 514B; aluminum alloy; threaded; connectors with double locknuts and steel insulating bushings, thermoplastic insulating bushings; conduit bodies cover: stamped steel, with stainless steel screws and neoprene gaskets, PVC coated where PVC coated conduit is used.

D. Fittings Manufacturers: Cooper Crouse-Hinds; Carlon Electric Products; O-Z/Gedney; Appleton; Hubbell; Robroy Industries – Perma-Cote.

2.2 ELECTRICAL METALLIC TUBING (EMT)

A. ANSI C80.3, UL 797; galvanized steel tubing

B. Fittings (couplings, conduit bodies, and connectors): NEMA FB I, UL 514B; steel, watertight gland compression type connectors with double locknuts and insulated throat; conduit bodies cover: stamped steel, with stainless steel screws and neoprene gaskets. Indentor, drive-on, die-cast or pressure cast fittings not permitted.

C. Fittings Manufacturers: Same as manufacturers listed in 2.1.D.

2.3 FLEXIBLE METAL CONDUIT (FMC)

A. UL 1; interlocked steel

B. Fittings: NEMA FB I, UL 514B; steel, squeeze-type (screw on are not acceptable) or Tomic twist-in type in sizes not exceeding 3/4".

2.4 LIQUIDTIGHT FLEXIBLE METAL CONDUIT (LFMC)

A. UL 360; interlocked steel, with PVC jacket

B. Fittings: NEMA FB 1, UL 514B; steel, waterproof

C. Type: UA

2.5 RIGID NONMETALLIC CONDUIT (RNC)

A. NEMA TC 2, UL 651; Schedule 40 or 80 (as indicated) PVC, 90C rated. Material must have tensile strength of 7,000 psi at 73.4 deg. F., flexural strength of 11,000 psi and compressive strength of 8,000 psi

B. Fittings: NEMA TC 3, UL 651

2.6 METAL WIREWAYS

A. NEMA 250, UL 870; galvanized sheet metal troughs with hinged or removable cover, Type 1 for indoor and 3R for outdoor, unless otherwise indicated.

B. Size: cross section and length as indicated on drawings.

C. Fittings and Accessories: Couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mated with wireways as required for complete system.

D. Wireways Covers: Screw-cover type for indoor, flanged-and-gasketed type for outdoor.

E. Knockouts: none.

F. Finish: Manufacturer's standard enamel finish

G. Manufacturers: Same as listed in Section 2.9F.

2.7 INDOOR SERVICE POLES

A. Description: Freestanding, two compartments utility columns with receptacles for power branch circuits and provisions for communication outlets.

B. Materials: Main Body: Steel; cover plates: steel.

C. Accessories: Trim plates for closing ceiling opening; fittings available as standard accessories; foot: suitable for floor finish as indicated on drawings; top clamp: concealed, designed to fasten pole to inverted "T" grid ceiling suspension member.

D. Finish: as specified by Architect.

E. Manufacturers: Wiremold; Approved equal

2.8 OUTLET BOXES

A. Sheet Metal Outlet Boxes: NEMA OS 1, UL 514A; galvanized steel with stamped knockouts.
   1. Luminaire and Equipment Supporting Boxes: Rated for weight of equipment supported; 1/2" male fixture studs, where required
   2. Concrete Ceiling Boxes: Concrete type

B. Cast-Metal Outlet Boxes: NEMA FB 1, cast aluminum or cast iron (galvanized), Type FD, with gasketed cover and threaded hubs

C. Gangable type boxes are not allowed

D. Manufacturers: O-Z/Gedney; Raco; Cooper Crouse-Hinds; Approved equal

2.9 PULL AND JUNCTION BOXES

A. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1; galvanized steel

B. Cast-Metal, Pull, and Junction Boxes: NEMA FB 1; cast aluminum or galvanized, cast iron with ground flange, gasketed cover and stainless steel cover screws

C. Minimum size: 4" square by 2-1/8" deep for use with 1" conduit and smaller; 4-11/16" square by 2-1/8" for use with 1-1/4" conduit and larger

D. Masonry type boxes shall be used in masonry walls.

E. Sheet Metal Boxes Larger Than 12" in any direction: Hinged cover or a chain installed between box and cover.

F. Field-fabricated boxes not allowed without prior approval of local authority having jurisdiction.

G. Manufacturers: O-Z/Gedney; Raco; Cooper Crouse-Hinds; Hubbell-Weigmann; Hoffman; J&A Sheet Metal Inc. Austin Electrical Enclosures; Approved equal

2.10 FLOOR BOXES

A. Metal Floor Boxes: NEMA OS1; cast metal; fully-adjustable; Moisture-proof, with forged brass blank cover with each box and close up covers and/or carpet flanges as required for finished floor.

B. Poke-Through Fittings: Assembly comprising service fitting, poke-through component, fire stops and smoke barriers, and junction box for conduit termination.
   1. Fire Rating: 2hr
   2. Service Fitting Type: Flush
   3. Housing: brass flanges, flush with floor
   4. Configuration: as indicated on drawings
   5. Manufacturers: Hubbell; LeGrand

2.11 EXPANSION FITTINGS

A. Malleable iron, hot dip galvanized allowing 4" allowing 2" raceway movement.

B. Manufacturers: OZ/Gedney AX Series; or equivalent by manufacturer listed in 2.1.D.

2.12 RACEWAY PENETRATION SEALS

A. Thruwall and Floor Seals.

B. Manufacturers: New construction – OZ/Gedney FSK Series; existing construction – OZ/Gedney CSM Series; or equivalent by manufacturer listed in 2.1.D.

2.13 RACEWAY SEALING FITTINGS

A. For one through four conductors: Manufacturers: OZ/Gedney CSB Series; Approved equal

B. For greater than four conductors: Manufacturers: OZ/Gedney EYA Series with sealing compound; Approved equal

C. Low-temperature or hazardous locations: Manufacturers: OZ/Gedney EYA Series with sealing compound; Approved equal

2.14 CABLE SUPPORTS

A. Manufacturers: OZ/Gedney Type S; or equivalent by manufacturer listed in 2.1.D.

2.15 SLEEVES FOR RACEWAYS

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends, with integral water stop.

B. Integral Water Stop: Manufacturer: Thunderline Corporation; Approved equal
   1. High density polyethylene (HDPE). Type Century-Line engineered sleeve with end caps.
   2. Steel. Type WS engineered sleeve.

2.16 SLEEVE SEALS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and cable.
   1. Sealing Elements: EPDM interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.
   2. Pressure Plates: Carbon steel. Include two for each sealing element.
   3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate with Architect/Engineer size and location of required built-in openings in building structure, including those sleeved, formed or core drilled.

B. Coordinate with Architect/Engineer cutting, removing, or piercing general or mechanical insulation, fire-rated walls, ceilings or steelwork.

C. Verify with Architect/Engineer all surface raceway installations except in mechanical, electrical, and communications rooms.

D. Coordinate with Architect/Engineer exact locations of floor boxes, where shown on drawings, prior to rough-in.

E. Coordinate routing of any through-wall or through-roof conduits.

F. Coordinate sleeve selection and application with selection and application of firestopping specified in Section 26 0593 – Electrical Systems Firestopping.

G. Verify that exterior wall or wet location boxes are gasketed type cast boxes with matching cover.

H. Verify with manufacturer that “touch-up” paint kit **[and PVC-coating kit]** are available for use.

3.2 EXAMINATION

A. Examine surfaces to receive raceways and boxes for compliance with installation tolerances and other conditions affecting performance of raceway’s installation. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.3 INSTALLATION

A. Raceways:
   1. Comply with ANSI/NECA 1 and NFPA 70 for installation requirements applicable to products specified in Part 2 except where requirements on drawings or in this Section are stricter.
   2. PVC-coated raceways are to be installed by factory trained installers to factory installation standards and recommendations.
   3. Arrange raceways to maintain headroom and present neat appearance.
   4. Raceway routing is shown in approximate locations, unless dimensioned. Route to complete raceway installation before starting conductor installation.
   5. Keep raceways at least 12”away from parallel runs of fuels, steam, hot-water pipes or ductwork. Install horizontal raceway runs above water and steam piping. Install raceways level and square and at proper elevations: 6’-6” minimum headroom, except in exit pathways 7’-0” minimum headroom. Do not block access to junction boxes, mechanical equipment or prevent removal of ceiling panels, etc.
   6. Run raceways concealed in construction to avoid adverse conditions such as heat and moisture, to permit drainage, and to avoid materials and equipment of other trades, except where noted otherwise.
   7. Avoid exposed raceway runs. Run raceways exposed in mechanical and electrical rooms, or with specific approval in writing (from UK project manager) is obtained or specifically indicated. Run exposed raceways grouped and parallel or perpendicular to construction. Do not route exposed raceways over boilers or other high-temperature machinery or in contact with such equipment. Offset exposed raceways at boxes.
   8. Route raceways installed above accessible ceilings parallel or perpendicular to construction.
   9. Do not install raceways in structural or topping floor slabs, except where noted on the plans. Install raceway in structural or topping floor slabs, where noted on plans, as follows:
      a. Center raceways in structural slabs clear of reinforcing steel, except where crossing same, and spaced on centers equal or exceeding 3 times the raceway diameter. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement. Space raceways laterally to prevent voids in concrete.
      b. Outside diameter of raceway shall not exceed 1/3 the structural slab thickness.
      c. Obtain approval from Engineer for each run of raceway 1” or larger.

d. Do not run raceways through cast-in-place support elements without approval from the structural engineer.
e. Do not install raceways in topping slabs of 3" or less.
f. Locate raceways to avoid conflict with equipment, door bucks, partitions and other equipment bolted to floor.
g. Use concrete tight set screw conduit connectors.
h. Arrange stub-ups so curved portions of bends are not visible above finished slab. Install with an adjustable top or coupling threaded inside for plugs set flush with finished floor. Extend conductors to equipment with rigid steel conduit; use flexible metal conduit 6" above the floor. Install threaded plugs flush with floor for future equipment connections.
i. Change from nonmetallic raceway to RMC or IMC before rising above floor.

10. Cut raceways square using saw or pipecutter.
11. Use hydraulic one-shot raceway bender or factory elbows for bends in raceway larger than 1", unless sweep elbows required. Bend raceways according to manufacturer's recommendations. Do not use torches or open flame to aid in bend of PVC conduit.
12. Use raceway fittings compatible with raceways and suitable for use and environment.
13. Provide bushings on all raceways.
14. Raceways minimum sizes:
    a. Minimum raceway size 3/4".
    b. Minimum size for flexible metal conduit is 1/2" for undercabinet luminaires.
        1) Exception: Minimum size for flexible connection on individual factory wired luminaires is 3/8"
    c. Minimum size for liquidtight flexible metal conduit is 3/4".
15. Install empty raceways with 200 lb nylon pull cord; leave at least 12" of slack at each end of pull wire. Cap raceways at both ends.
16. Feed devices on same wall vertically from above or junction box in suspended ceiling.
    a. Boxes may be fed from adjacent boxes with conduit entering bottom of each box such that future boxes may be placed without conduit adjustment.
    b. Do not install horizontal bends in conduit around corners.
17. Raceways Supports:
    a. Independently support or attach raceway system to structural parts of construction. Suspended ceiling systems shall not be considered as structural parts of construction for raceway support. Do not attach raceways to piping system.
    b. Raceway supports for horizontal or vertical single runs:
        1) Hot dipped galvanized heavy-duty sheet steel straps, mineralac clamps or steel slotted support channel system with appropriate components.
    c. Raceway supports for horizontal and vertical multiple runs:
        1) Trapeze-type supports fabricated with steel slotted channel systems with appropriate components.
        2) Support horizontal runs with appropriately sized rods.
        3) Anchor vertical runs to structure.
    d. Vertical raceway runs 1-1/4" and larger passing through floors: Support at each floor with pipe riser clamps.
    e. Do not support raceways with wire, perforated pipe straps or plastic tie-wrap. Remove wires used for temporary support.

f. Secure raceways in metal stud walls to prevent rattling.
g. Arrange raceway supports to prevent misalignment during wiring installation.
h. Do not fasten raceways to corrugated metal roof deck.
i. For fasteners and supports, including steel slotted support systems, support devices, support spacing, support of conductors in vertical raceways, and hanger rod size, refer to Section 26 0529 – Hangers and Supports for Electrical Systems and NFPA 70.

18. Identify raceways per requirements in Section 26 0553 – Electrical Systems Identification.
19. Ground raceways per requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems.
20. Flexible Conduit Connections: Use maximum of 72” of flexible conduit for recessed and semi-recessed lighting fixtures, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
    a. Use LFMC in damp or wet locations subject to severe physical damage.
    b. Do not use LFMC in plenum spaces or within air handling equipment.
    c. Use FMC in dry locations not subject to severe physical damage.
21. Install PVC-coated raceways in areas with corrosive atmosphere as noted on plans.
22. Install stainless steel raceway clamps, mounting hardware, supports, hangers, etc., when located in wet areas.
23. Power and Communications Raceways: Minimum 12” separation when run parallel, cross perpendicular.

B. Wireways:
1. Install in accordance with manufacturer’s instructions.
2. Use screws, clips and straps to fasten raceway channel to surfaces.
3. Mount plumb and level.
4. Use suitable insulating bushings and inserts at connections to outlets and corner fittings.
5. Supports: Per manufacturer’s recommendations.
6. Close ends of raceway channel and unused conduit openings.

C. Indoor Service Poles:
1. Install wiring devices and communications outlets of type, quantity and spacing as indicated on drawings.
2. Maintain ground continuity throughout entire pole length per requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems.
3. Raceway receptacle faceplates shall be labeled with adhesive labels with 1/4” high lettering per requirements in Section 26 0553 – Electrical Systems Identification, at bottom of receptacle.
4. Neatly cut openings in ceiling panels. Install trim plate.

D. Boxes:
1. Install boxes to accommodate device indicated by symbol, in conformance with code requirements, number and size of conductors and splices and consistent with type of construction.
2. Install the appropriate cover on surface-mounted boxes:
    a. Raised device covers on 4 square and handy boxes.

b. Device covers that are square drawn or square cut on boxes in block.
c. Tile covers on boxes in tile.
d. Round drawn device covers on boxes in lath and plaster walls or dry wall only.
e. Set front edge of device boxes flush with finished wall surfaces except on walls of non-combustible materials where boxes may have maximum set back of 1/4". Secure flush-mounted box to interior wall and partition studs. Accurately position to allow for surface finish thickness.

3. Set outlet boxes parallel to construction and independently attached to same.
4. Do not install back-to-back and through-the-wall boxes. Install with minimum 6" horizontal separation between closest edges of the boxes. Install with minimum 24" separation in acoustic-rated walls and fire-rated walls.
5. Install multi-ganged boxes where 2 or more devices are in same location, unless otherwise noted.
6. Box Support:
   a. Mount boxes straight.
   b. Install horizontal bracing at top or bottom of box for 3 or more gang device boxes in stud walls.
   c. Install stud support one side, with short piece of stud, for up to 2 gang device boxes.
   d. Do not support boxes with tie-wire.
   e. For one and two gang box support, manufactured bracket supports shall be accepted alternate.
   f. Support boxes independently of raceways.
   g. Install adjustable steel channel fasteners for hung ceiling outlet box.
   h. Install stamped steel bridges to fasten flush-mounted outlet box between studs.
   i. Do not install boxes to ceiling support wires or piping systems.
7. Install partitions in multi-ganged boxes where different types of devices are installed, or devices installed operate at different voltages.
8. Mount boxes in block walls at block joint nearest to indicated height.
9. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall.
10. When boxes are installed in fire-resistive walls and partitions, limit penetrations to 16 sq in per penetration and not to exceed a total of 100 sq in per 100 sq ft of wall area. Use FireBlok fire suppression gaskets or fire stop putty pads acceptable to the fire marshal.
11. Pull and junction boxes: Install as shown, or as necessary to facilitate pulling of wire and to limit number of bends within code requirements. Install above accessible ceilings and in unfinished areas.
12. Install boxes to be permanently accessible.
13. Do not intermix conductors from more than one system in same junction box or pull box, unless shown or specifically authorized otherwise.
14. Adjust box location up to 10' prior to rough-in to accommodate intended purpose.
15. Orient boxes to accommodate wiring devices oriented as specified in Section 26 2726 – Wiring Devices.
16. Inaccessible Ceiling Areas: Install outlet and junction boxes no more than 6" from ceiling access panel or from removable recessed luminaire.

17. The drawings do not necessarily show every outlet, pull or junction box required. Add all required boxes as necessary.

E. Floor Boxes:
   1. Set floor boxes level and flush with finished floor surface.
   2. Install floor boxes and fittings to preserve fire-resistant rating of slabs and other elements, using materials and methods specified in Section 26 0593 – Electrical Systems Firestopping.

F. Expansion Fittings:
   1. Install raceway expansion and deflection fittings in all raceway runs embedded in or penetrating concrete where movement perpendicular to axis of the raceway may be encountered.
   2. Install raceway expansion fittings complete with bonding jumpers in raceway runs that cross expansion joints in structure and raceway runs mechanically attached to 2 separate structures.
   3. Install fitting(s) that provide expansion and contraction for at least 0.0004” per ft of length of straight run per °F of temperature change.
   4. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer’s written instructions for conditions at specific location at time of installation.

G. Raceway Penetration Seals:
   1. Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies.
   2. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway, using joint sealant appropriate for size, depth, and location of joint.
   3. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway penetrations. Install sleeves and seal with firestop materials. Comply with Section 26 0593 – Electrical Systems Firestopping.
   4. Roof-Penetration Sleeves: Seal penetration of individual raceways with flexible, boot-type flashing units applied in coordination with roofing work.
   5. Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1” annual clear space between pipe and sleeve for installing mechanical sleeve seals.
   6. Underground, Exterior-Wall Penetrations: Install cast-iron “wall pipes” for sleeves. Size sleeves to allow for 1” annual clear space between raceway and sleeve for installing mechanical sleeve seals.
   7. Sleeve-Seal Installation: Use type and number of sealing elements recommended by manufacturer for raceway material and size. Position raceway in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.
   8. Provide chrome- or nickel-plated escutcheons where raceways pass through walls, floors or ceilings and are exposed in finished areas. Size escutcheons to fit raceways for finished appearance. Finished areas shall not include mechanical/electrical rooms, janitor’s closets, storage rooms, etc., unless suspended ceilings are specified.
   9. Remove temporary sleeves, if used for form wall openings, prior to installation of permanent materials.

H. Raceway Sealing Fittings:

1. Install listed watertight seals to prevent the passage of moisture and water vapor through raceway, where raceway passes from interior to exterior of the building, where raceway passes between areas of different temperatures such as into or out of cold rooms, freezers and air handling units, where raceway enters room which at any time is subject to low or high temperatures and where raceway enters a room which at any time is subject to internal air pressures above or below normal.
2. Install watertight seals in interior of all raceways passing through building roof, ground floor slab (when the raceway does not extend beyond building footprint), or through outside walls of building above or below grade. Seal on the end inside building, using raceway sealing fittings manufactured for the purpose. Locate fittings at suitable accessible locations. For concealed raceways install each fitting in flush steel box with blank coverplate to match finish of adjacent plates or surfaces.
3. Seal raceways entering or passing through “hazardous (classified) areas” as defined in NFPA 70.

I. Sleeve Installation for Electrical Penetrations:
1. Coordinate sleeve selection and application with selection and application of firestopping specified in Section 26 0593 – Electrical Systems Firestopping.
2. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.
3. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
4. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies, unless openings compatible with firestop system used are fabricated during construction of floor or wall.
5. Cut sleeves to length for mounting flush with both surfaces of walls.
6. Extend sleeves installed in floors 2” above finished floor level.
7. Size pipe sleeves to provide 1/2” annular clear space between sleeve and raceway, unless sleeve seal is to be installed.

3.4 APPLICATION

A. Raceway uses permitted and not permitted per NFPA 70 requirements and as described below.

B. Rigid Metal Conduit (RMC) permitted to be installed as follows:
1. Installations below grade and in or under concrete slabs
2. All locations except corrosive atmospheres
3. Hazardous locations
4. Locations requiring mechanical protection
5. Stub up through slabs
6. Damp or wet locations
a. Mechanical rooms and loading dock shall be considered damp location.

C. Intermediate Metallic Conduit (IMC) permitted to be installed as follows:
1. Installation below grade and in or under concrete slabs
2. All locations, except corrosive atmospheres
3. Hazardous locations
4. Locations requiring mechanical protection

5. Damp or wet locations
    a. Mechanical rooms and loading dock shall be considered damp location.

D. PVC Coated Conduit permitted to be installed as follows:
1. In corrosive atmospheres or as noted on plans
2. Underground direct bury or encased in concrete
3. In exterior environments needing additional protection
4. Use PVC coated elbows

E. Electrical Metallic Tubing (EMT) permitted to be installed as follows:
1. Dry locations only
2. Interior partitions
3. Above suspended ceilings
4. In concrete slabs (where specifically approved)
5. Conduit Bodies (LB) for sizes 1 ½" and larger. Prohibited for 1 ¼" or less (unless specifically approved by Owner).

F. Flexible Metal Conduit (FMC) permitted to be installed as follows:
1. Use flexible metal conduit not over 4 ft in length for final connections for:
    a. Final connections to recessed luminaires in lengths not to exceed 6 ft.

G. Liquid Tight Flexible Metal Conduit (LFMC) permitted to be installed as follows:
1. Use liquid tight flexible conduit, not over 6 ft in length, for final connections to:
    a. Vibrating equipment (including transformers and hydraulic, pneumatic, electric solenoid, or motor-driven equipment) in wet locations.
    b. Instruments and control devices
    c. PVC coated LFMC is not allowed in environmental air plenum spaces or air handling equipment.

H. Rigid Nonmetallic Conduit (RNC) permitted to be installed as follows:
1. Direct burial, concrete encased
2. Direct burial, in sand fill on bottom and top
3. Corrosive atmospheres
4. Use steel elbow in concrete encased runs

I. One-half inch raceway permitted:
1. Between controller and its control or pilot device
2. Between lighting switch and nearest outlet for luminaire
3. Control wiring where mounted on equipment where conduit must follow contour of equipment
4. Protective and signal systems where noted
5. Where shown on plans

3.5 CONDUIT COLORS

A. Conduits shall be pre-painted in the following colors for the systems identified:
1. Life Safety Branch – Yellow

2. Critical Branch – Orange
3. Normal Branch – White
4. Equipment Branch – Silver
5. Fire Alarm System – Red
6. HVAC Controls – Green
7. Data/Communications – Blue
8. Access Control – Purple

B. Paint all conduit/wiremold/junction boxes to match surface, except in mechanical rooms.

3.6 RACEWAY WIRING METHODS

A. Underground: Install galvanized rigid steel conduit or thickwall nonmetallic conduit encased in concrete; threaded conduit fittings for steel; primed and solvent glue fittings for PVC.

B. In Slab: Install electrical metallic tubing; concrete tight set screw conduit fittings; install cast metal boxes.

C. Outdoor Locations, Above Grade: Install galvanized rigid steel conduit or intermediate metal conduit; threaded conduit fittings; install cast metal or nonmetallic outlet boxes with threaded hubs.

D. Wet and Damp Indoor Locations: Install galvanized rigid steel conduit or intermediate metal conduit; threaded conduit fittings; install cast metal or nonmetallic outlet, junction, and pull boxes with threaded hubs. Install flush mounting outlet boxes in finished areas.

E. Concealed and Exposed Dry Locations Not Subject to Damage: Install electrical metallic tubing; install sheet metal boxes; install flush mounting outlet boxes in finished areas.

F. Exposed Subject to Damage: Install galvanized rigid steel conduit or intermediate metal conduit; threaded conduit fittings; install cast metal boxes with threaded hubs. Open public spaces such as parking garages and common areas are considered subject to damage.

G. Hazardous Locations: Install galvanized rigid steel conduit; threaded conduit fittings; install cast metal boxes.

3.7 FIELD QUALITY CONTROL

A. Inspect raceway, boxes, indoor service poles, and wireways for physical damage, proper alignment, supports and seismic restraints, where applicable.

B. Replace any damaged component of the raceway system, or install new raceway system.

C. Inspect components, wiring, connections and grounding.

3.8 REPAINTING

A. Repair damage to galvanized finishes with manufacturer-supplied zinc-rich paint kit. Leave remaining paint with Owner.

B. Repair damage to PVC or paint finishes with manufacturer-supplied touch-up coating. Leave remaining coating with Owner.

3.9 ADJUSTING

A. Adjust flush-mounted boxes pre-pour and after-pour to be flush with finished materials.

B. Install knockout closures in unused openings in boxes.

C. Align adjacent wall-mounted outlet boxes for switches and similar devices.

D. Adjust outlet boxes to allow luminaires to be positioned as indicated on drawings.

3.10 CLEANING

A. Clean interior and exterior of boxes, wireways, and indoor poles to remove dust, debris and other material.

END OF SECTION

SECTION 26 0533.13

SURFACE RACEWAY SYSTEM

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0553 – Electrical Systems Identification

D. Section 26 2726 – Wiring Devices

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes surface metallic raceway system for branch circuits and other low-voltage wiring.

B. Surface raceway system shall consist of raceway bases, appropriate fittings, and device mounting plates necessary for a complete installation.

C. The lengths of the raceways shown on drawings are illustrative and diagrammatic only and are not accurate. Raceways shall be provided completely installed to match lengths of cabinets and shelving as indicated on drawings.

1.4 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting

B. NFPA 70 – National Electrical Code

C. UL 5 - Surface Metal Raceways and Fittings

1.5 SUBMITTALS

A. Product Data: Catalog cuts of components.

B. Shop Drawings:
   1. Complete layout, with locations of raceway components.
   2. Grounding, branch circuiting, and wiring including locations of service entrances.
   3. Receptacle types, manufacturers, and spacing.
   4. Receptacle labeling with proper voltage, phase, circuit and panelboard designations, as indicated on drawings.
   5. Communication faceplate types, manufacturers and labeling.

C. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Closeout Submittals:
   1. Project Record Documents
      a. Record actual locations of surface raceways with receptacle types, locations and circuits identified.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain surface raceways from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory unopened packaging until ready for installation.

B. Comply with manufacturer's written instructions.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Metallic Raceways:
   1. Hubbell
   2. Wiremold, Division of Legrand

2.2 FABRICATION

A. UL 5

B. Fabrication:

1. **[Steel] [Aluminum] [Stainless Steel]**
2. Suitable for use in dry interior locations only.
3. Two-piece with base and snap-on cover
4. Base: **[single compartment] [two compartments with fixed dividers]** and cover plate, as indicated on drawings
5. Sizes:
   a. 2-7/8” wide by 1-7/8” deep
      1) Hubbell HBL3000 series
      2) Wiremold Series 3000
   b. 4-3/4” wide by 1-3/4” deep
      1) Hubbell HBL4750 series
      2) Wiremold Series 4000
   c. 4-3/4” wide by 3-9/16” deep
      1) Wiremold Series 6000
   d. 6-3/4” wide by 2-11/50
      1) Hubbell 6750 Series
6. Covers with cutouts for device plates as shown on drawings.
7. Device plates with flange to overlap joint of adjacent cover.

C. Material:
   1. Steel/Stainless Steel Raceways: Galvanized steel, minimum thickness 0.040”
   2. Aluminum Raceways: Alloy 6063-T6 extruded aluminum, minimum thickness 0.078”
   3. Fittings: Same material and metal thickness as linear raceway components.

D. Finish:
   1. Steel Raceway:
      a. Electrostatically painted
      b. Manufacturer’s standard **[gray] [ivory]** color.
   2. Aluminum Raceways:
      a. Satin anodized 0.004” thick.
   3. Fittings: Color to match linear raceway components.

E. Accessories:
   1. Fittings: Available as standard accessories, including external corner units, internal corner units, flat units, blank end units, internal and external elbows, coupling for joining raceway sections, and device mounting brackets and plates.
   2. Wire Clips: One for every 2 linear ft of indicated raceway configuration.
   3. Corner elbows and tee fittings, to maintain 2” cable bend radius that meets requirements for communications pathways and specifications for fiber optic, coaxial, and high-performance twisted-pair cabling.
   4. Device Mounting Brackets and Plates: Plastic device mounting brackets and trim plates allowing installation of indicated wiring devices, and communications outlets horizontally in raceways; trim cover sized to overlap device cut-out in raceway, concealing seams; finished to match linear raceway components; plastic compatible with UL 94; brackets and plates, to match raceway width, and with device mounting holes.

F. Communications Outlets and Accessories:
   1. Cabling Type: Per requirements in Section 27 1000 – Structured Cabling and Section 27 1500 – Communications Horizontal Cabling.
   2. Mounting faceplates and bezels: Faceplates configuration per requirements in Section 27 1000 Structured Cabling and Section 27 1500 – Communications Horizontal Cabling.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate cover plate openings with the wiring devices contained within.

B. Provide manufacturer's 'touch-up' paint kit.

C. Coordinate surface raceways installation with casework shop drawings to match lengths of cabinets and shelving.

D. Verify location of raceways with architectural interior elevation drawings.

3.2 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect/Engineer of unsatisfactory preparation before proceeding.

3.3 INSTALLATION

A. Install in accordance with ANSI/NECA 1 and manufacturer's instructions.

B. Install flathead screws, clips and straps to fasten surface raceways to substrates, ensuring they are permanently and mechanically anchored. Double-sided adhesive is not acceptable. Mount plumb and level. Use suitable insulating bushings and inserts at connections to outlets and corner fittings.

C. Install wiring devices and communications outlets of type, quantity and spacing as indicated on drawings.

D. Mount raceways on wall or casework parallel to or at right angles to structure and casework.

E. Feed raceways mounted on walls from a backbox through a wall box connector. Determine point of feed in field and complete wiring connections.

F. Install a chase nipple extension between outlet box on wall and raceway when raceway mounted to support channel for modular casework.

G. Maintain ground continuity throughout entire raceway length per requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems.

H. Install appropriate backbox extension rings where raceway is mounted to steel slotted channel or by some other method, stood off from wall.

I. Raceway receptacle faceplates shall be labeled with adhesive labels in accordance with requirements in Section 26 0553 – Electrical Systems Identification, for 15A, 20A and 30A receptacles.

J. Reinforce each cover section for every 30A receptacle in raceway with two 4-40 Phillips counter-sunk steel screws attached to enclosure near top and bottom of receptacle.

K. Identify communication outlets per requirements in Section 27 0553 – Communications Systems Identification.

L. Raceway base shall be secured using screws. Securing with double-sided adhesive is not acceptable.

3.4 FIELD QUALITY CONTROL

A. Inspect surface raceways for physical damage and proper alignment.

B. Inspect components, wiring, connections, installation, and grounding.

3.5 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.6 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 26 0543.10

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0526 - Grounding and Bonding for Electrical Systems

B. Section 26 0533 - Raceway and Boxes for Electrical Systems

C. Section 26 0543.13 - Excavation and Backfill

D. Section 26 0553 - Electrical Systems Identification

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes conduits, ducts, and duct accessories for direct buried and concrete encased for underground distribution for electrical power and communications.

B. The terms duct and duct bank, as used in this Section, are defined as follows:
   1. Duct: A single underground conduit, encased in concrete or direct buried.
   2. Duct Bank: Two or more ducts run together.

1.4 REFERENCE STANDARDS

A. ANSI C2 – National Electrical Safety Code

B. ANSI C80.1 – Rigid Steel Conduit-Zinc Coated (GRC)

C. ASTM F512 – Specification for Smooth-Wall Poly (Vinyl Chloride) (PVC) Conduits and Fittings for Underground Installation

D. NEMA TC2 – Electrical Polyvinylchloride (PVC) Conduit

E. NEMA TC3 – PVC Fittings for Use with Rigid PVC Conduit and Tubing

F. NEMA TC6&8 – PVC Plastic Utilities Duct for Underground Installation

G. NEMA TC9 – Fittings for PVC Plastic Utility Duct for Underground Installation

H. NFPA 70 – National Electrical Code

I. UL 651 – Schedule 40 and 80 Rigid PVC Conduit

J. UL 651A – Type EB and A Rigid PVC Conduit and HDPE Conduit

K. UL E53373 – Underground Fiber Reinforced Epoxy Conduit (FRE)

L. ULG – Electrical Rigid Metallic Conduit-Steel

1.5 SUBMITTALS

A. Product data for the following:
   1. Duct bank materials, including spacers and miscellaneous components
   2. Ducts and conduits and their accessories, including elbows, end bells, bushings, seals, bends, fittings, plugs, pull tape, and solvent cement
   3. Warning tape

B. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

C. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual routing of conduits and duct banks.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with NFPA 70
   2. Comply with ANSI C2
   3. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Deliver ducts to project site with end capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 CONDUITS

A. Size: As indicated on drawings

B. Type: As indicated in Section 26 0533 - Raceway and Boxes for Electrical Systems
   1. Where PVC raceways are allowed to be directly buried:
      a. Concrete encasement required where ducts pass under roadways and parking lots.
      b. Concrete encasement within 10’ of entering foundation wall or passing below or within structural elements.

2.2 NONMETALLIC DUCT ACCESSORIES

A. Duct Accessories:
   1. Duct Spacers: Factory-fabricated rigid PVC interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling. Horizontal and vertical locking separation between ducts as shown on drawings.
   2. Plugs: Closure plugs or caps of same material as conduit at ends of unused sections.
   3. Pull Tape: Nylon pull tape with measurement markings in uniform lengths in each empty duct.

B. Grounding:
   1. Steel grounding bushings.

C. Warning Tape: Underground line warning tape specified in Section 26 0553 - Electrical Systems Identification.

D. Solvent Cement and Primer: Recommended by conduit manufacturer.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate layout and installation of ducts with final arrangement of other utilities, site grading, and surface features as determined in the field.

B. Coordinate elevations of ducts and duct bank entrances into terminations with final locations and profiles of ducts and duct banks as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations from those indicated as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Architect.

C. Adjust the depth of electrical utilities to avoid existing utilities with no change to contract price.

D. [Utility Coordination: When duct lines are being constructed for use by a utility serving the project, consult with them for duct size and quantity, minimum bending radii, maximum distance between pulling points, grounding details, termination arrangement, and other criteria.]

E. Duct Bank Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures.

1. Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.
2. Drawings shall be signed and sealed by a qualified professional engineer.

3.2 EXISTING UTILITIES

A. The existing utilities shown on contract drawings have been plotted from available records. No guarantee is made as to accuracy of locations indicated, and is shown for the benefit of Contractor.

B. Contact all serving utility companies and have them locate their lines prior to commencing work. Telephone local locating contractor 48 hours prior to commencing work. Coordinate with Owner all existing utility lines prior to commencing work.

C. Protect shown, visible and located utilities from damage. Promptly repair all active shown, visible and located utilities damaged by construction. This repair shall be made solely at the expense of the Contractor.

D. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies to shut off services if lines are active.

3.3 PROJECT CONDITIONS

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
   1. Notify Construction Manager no fewer than 5 days in advance of proposed interruption of electrical service.
   2. Do not proceed with interruption of electrical service without Construction Manager's written permission.

3.4 DUCT INSTALLATION

A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.

B. PVC Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane. Do not use conduit that requires the use of couplings for straight runs. Use acceptable PVC terminal adapters when joining PVC conduit to metallic fittings or rigid metal conduit.

C. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least 5ft outside the building wall without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Section 26 0533 - Raceway and Boxes for Electrical Systems.

D. Expansion Fittings: Provide suitable expansion fittings or other suitable means to compensate for expansion and contraction for raceways crossing expansion joints in structures or concrete slabs between two adjacent structures and between a duct bank and structure. Provide for the high rate of thermal expansion and contraction of PVC conduit by providing PVC expansion joints as

recommended by manufacturer and as required. Refer to structural drawings for location of expansion joints in structures.

E. Sealing: Provide watertight entrance sealing device where an underground conduit enters a structure through a concrete roof or membrane waterproofed wall or floor.

F. Fire Stops: Provide fire stop openings around electrical penetrations to maintain fire-resistance rating, where underground raceways penetrate fire-rated walls or floors.

G. Pulling Cord: Install 100 lb test nylon cord in ducts, including spares. Identify with tags at each end and at any intermediate pull point the origin and destination of each spare duct. Provide a removable permanent cap over each end of each spare duct.

H. Concrete Encased Ducts: Support ducts on duct spacers.
   1. Spacer Installation: Space spacers close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 ft of duct. Secure spacers to earth and to ducts to prevent floating during concreting. Stagger spacers approximately 6” between tiers. Tie entire assembly together using tie wires and reinforcing steel. Install base and intermediate spacers at every coupling point of each duct line for a separation horizontally and vertically per NEC.
   2. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
      a. Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer’s written recommendations, or use other specific measures to prevent expansion-contraction damage.
      b. Terminate each pour in a vertical plane if more than one pour is necessary, and install reinforcing rod dowels as shown on drawings.
   3. Pouring Concrete: Space concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces.
   4. Reinforcement: Reinforce concrete-encased duct banks where they cross disturbed earth and where indicated. Arrange reinforcing bars and ties without forming conductive or magnetic loops around ducts or duct groups. Size reinforcing bars and wire ties as indicated on drawings.
   5. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms of materials and in a manner acceptable to Architect.
   6. Warning Tape: Bury warning tape approximately 12” above all concrete-encased ducts and duct banks. Align tape parallel to and on the centerline of duct bank. Provide an additional warning tape for each 12” increment of duct bank width over a nominal 36”.
   7. Place duct banks on an undisturbed soil base if possible. Where concrete encased duct bank is installed over an extensive area of disturbed earth such that within the periphery of a building, provide a separate concrete base under the duct bank to ensure stability of raceways during installation. Allow this base to set before duct bank is installed.

I. Direct Buried Duct Banks:
   1. Support ducts on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

2. Space spacers close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 ft of duct. Secure spacers to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6" between tiers.
3. Excavate trench bottom to provide firm and uniform support for duct bank. Prepare trench bottoms as specified in Section 26 0543.13 - Excavation and Backfill.
4. Install backfill as specified in Section 26 0543.13 - Excavation and Backfill.
5. After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4" over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction as specified in Section 26 0543.13 - Excavation and Backfill.
6. Warning Tape: Bury warning tape approximately 12" above all concrete-encased ducts and duct banks. Align tape parallel to and on the centerline of duct bank. Provide an additional warning tape for each 12" increment of duct bank width over a nominal 36".

J. Stub-Ups:
1. Use manufactured rigid steel conduit elbows for *all elbows,* stub-ups at poles and equipment and at building entrances through floor.
   a. Couple steel conduits to PVC ducts with adapters designed for this purpose.
   b. Stub-Ups to Equipment: For equipment mounted on outdoor concrete pads, extend steel conduit horizontally a minimum of 5 ft from edge of equipment pad or foundation. Encase in concrete for concrete encased ducts. Install insulated grounding bushings on terminations at equipment.

K. Arrangement and Routing:
1. Arrange multiple duct runs substantially in accordance with details shown on drawings. Locate underground ducts where indicated on drawings and grade to the elevations shown on civil drawings.
2. Make minor changes in location or cross-section as necessary to avoid obstructions or conflicts. Where duct runs cannot be installed substantially as shown because of conditions not discoverable prior to digging of trenches, refer the condition to the Construction Manager for written instructions before further work is done.
3. Maintain a 12" minimum separation between ducts and other systems in parallel runs. Do not place ducts over valves or couplings in other piping systems. Refer conflicts with these requirements to the Construction Manager for written instructions before further work is done.

3.5 EARTHWORK

A. Excavation and Backfill: Comply with Section 26 0543.13 - Excavation and Backfill, do not use heavy-duty, hydraulic-operated compaction equipment.

3.6 CONCRETE

A. Concrete: 3000 psi, 28-day strength, complying with Division 03 – Concrete, where concrete encased.

3.7 GROUNDING

A. Ground underground ducts according to Section 26 0526 - Grounding and Bonding for Electrical Systems.

3.8 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Demonstrate capability and compliance with requirements on completion of installation of underground ducts.
   2. Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80% fill of duct. If obstructions are indicated, remove obstructions and retest.

B. Preparation for pulling in conductors:
   1. Do not install crushed or deformed raceways. Avoid traps in raceways where possible. Take care to prevent the lodging of plaster, concrete, dirt, or trash in raceways, boxes, fittings, and equipment during the course of construction. Make raceways entirely free of obstructions or replace them. Ream all raceways, remove burrs, and clean raceway interior before introducing conductors or pull wires.
   2. Immediately after installation, plug or cap all raceway ends with watertight and dust-tight seals until the time for pulling in conductors.

C. Do not backfill underground direct buried and concrete encased ducts until the Engineer has inspected them. Notify Engineer 48 hr in advance of duct concrete pour, or backfill of direct buried ducts.

3.9 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

END OF SECTION

SECTION 26 0543.13

EXCAVATION AND BACKFILL

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0543.*10* - Underground Ducts and Raceways for Electrical Systems

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section lists methods and materials for trench excavation and backfill for electrical and communications conduits in duct banks. Refer to Section 26 0543.*10* – Underground Ducts and Raceways for Electrical Systems.

1.4 DEFINITIONS

A. Backfill: Soil material or controlled low-strength material used to fill an excavation.

B. Excavation: Removal of material encountered above sub-grade elevations and to lines and dimensions indicated.

C. Duct: A single underground conduit encased in concrete or direct buried.

D. Duct Bank: Two or more ducts run together.

E. Fill: Soil materials used to raise existing grades.

F. Sub-grade: Surface or elevation remaining after completing excavation, or top surface of fill or backfill immediately below sub-base, drainage fill, or topsoil materials.

G. Utilities: On-site underground ducts and duct banks as well as underground services within buildings.

1.5 SUBMITTALS

A. Submit list of materials to be used for backfill.

1.6 QUALITY ASSURANCE

A. Pre-excavation Conference: Conduct conference at project site to comply with requirements in Division 01 Section “Project Coordination.”

PART 2 - PRODUCTS

2.1 FILL MATERIAL

A. Type 1 Fill:
1. Material from excavation separated from materials, which do not compact by tamping and rolling. No stones larger than 3” and no building, organic, or corrosive or frozen materials and no lumps larger than 6”.

B. Type 2 Fill:
1. Sand or gravel materials with none larger than 2” and of that portion passing the #4 sieve less the 5% to pass #200 sieve.

C. Type 3 Fill:
1. Gravel of rounded to sub-angular shape, screened, which will pass 3/4” sieve and retained on #4 sieve.

D. Type 4 Fill:
1. Pit run rock or gravel with maximum stone size of 1”.

E. Type 5 Fill:
1. Pea gravel, screened, which will pass 3/8” sieve and retained on #4 sieve.

2.2 CRUSHED ROCK

A. Crushed Rock: 1-1/4” minus, unless smaller is required for bedding material.

2.3 SAND

A. Sand: Clean and washed building sand.

2.4 TOPSOIL

A. Topsoil: Equal in quality to that removed.

2.5 SOD

A. New Sod: Mature, densely rooted grass free of weeds and objectionable grasses.

2.6 PLANTS

A. Plants: Obtained from a commercial nursery and be similar to those replaced.

PART 3 - EXECUTION

3.1 PREPARATION

A. Establish grade lines and locations of roadways and sidewalks, grade beams, and pile caps. Provide necessary stakes and batter boards.

B. Verify elevations of existing utilities prior to excavation for new ducts.

C. Verify locations of vaults and manholes with civil drawings

D. Coordinate excavation and backfill with Section 31 2000 – Earth Moving.

3.2 EXCAVATION

A. Provide excavation for underground work, including ducts, vaults, manholes, handholes, pull boxes, unless otherwise shown or specified. Lay duct in open trench, except when Architect gives written permission for tunneling.

B. Excavate trench 24” wider than duct or duct bank dimensions and 3”below bottom of duct.

C. Include clearing, tree removal, grubbing, pavement removal, substructure removal such as walls, footings, and piers, and all incidental work such as tunneling, sheet piling, shoring, underpinning, pumping, bailing, and transportation. Coordinate excavation extending beyond construction limits with Construction Manager and Owner.

D. Do not provide blasting on this project without written permission of Architect and Owner.

E. Remove all excess excavation material from site, unless directed otherwise.

F. Over excavate 3” and fill with 3” of sand, where trench bottom is rock, or rocky, or contains debris larger than 1”, or material with sharp edges.

G. Perform all crossings of concrete or asphalt after surface material has been saw cut to required width and removed.

H. Conform to utility company requirements for excavation and vault installation in addition to contract document requirements where excavations are for installing utility company’s ducts and vaults.

3.3 ROCK EXCAVATION

A. Use mechanical methods to remove rock in trenches for underground ducts.

B. Refer to Geotechnical Report available from Architect/Engineer for data on rock.

C. Include rock excavation in the Bid, unless otherwise indicated.

3.4 INSTALLATION

A. Keep underground ducts to proper line and grade and sealed to prevent entrance of animals or foreign matter.

B. Provide bracing and sheet piling as necessary to support trenches. Comply with Local Regulations, applicable provisions of OSHA Regulations on trenching, or with provisions of “Manual of Accident Prevention in Construction” published by Associated General Contractors of America.

C. Do not lay duct in water.

D. Keep trench free from water until duct joint material has hardened and concrete encasement is in place.

E. Do not increase the contract cost due to presence of ground water in soil or necessity of sheet piling or bracing trenches. Adjust contract cost when sheet piling is left in place, on written order of Owner.

F. Do not remove sheet piling until trench is substantially backfilled. Cut off sheet piling left in place not less than 2 ft below new, finished grade.

G. Place underground ducts on 3" compacted bedding of sand. Shape bedding for clearance for joints and fittings, tamped in place and graded evenly to ensure uniform bearing for the full length of duct. Do not support duct by blocking, planking or mounding of bedding material.

H. Install lines passing under foundations with minimum of 3"clearance to concrete and ensure there is no disturbance of bearing soil.

3.5 BACKFILL

A. Backfill around ducts by hand to depth of 12" above top of duct with Type 5 fill in 6" layers. Compact backfill thoroughly with compactor of suitable weight or with approved mechanical tamper. Do not use flooding or jetting with water.

B. Place backfill from 12" above duct to elevation of subgrade in layers not exceeding 8" in depth with Type 3, 4 or 5 fill.

C. Conform excavation, duct laying, backfilling, grading and surfacing, as herein specified, when excavation occurs on public property or areas beyond the property line. Comply with additional requirements for public utility or other authorities. Check with each utility and incorporate cost of any additional requirements in base bid.

D. Backfill around vaults and handholes to be free of debris larger than 1-3/4" in all directions to 1 ft from vault.

E. Provide 6" of pea gravel or sand bedding for vaults and handholes larger than 3'-0" x 3'-0". For smaller handholes, provide 3" pea gravel or sand.

F. Other backfill shall be free of debris larger than 6" in diameter.

G. Place backfill material so as to obtain a minimum degree of compaction of 95% of maximum density at optimum moisture content. Moisten backfill material as required to obtain proper compaction.

H. Broken pavement, concrete, sod, roots, and debris shall not be used for backfill.

3.6 DEWATERING

A. Provide, operate, and maintain all pumps or other dewatering equipment required for control of water in trenches and excavations for electrical and communications site work during the entire construction period.

3.7 SHORING

A. Provide as required by trenching and excavating to secure site work. Comply with applicable safety regulations.

3.8 FINISHING

A. On completion of trenching and backfilling operations, restore grades to original elevation or to new sub-grade elevation.

B. Replace surfaces to existing conditions when trenching is through existing areas or beyond construction limits.

C. Use 6” of topsoil and sod to match existing elevations in landscaped areas or as otherwise approved by Landscape Architect.

3.9 SURFACE FINISHING

A. Refinish every disturbed surface to its original condition.

B. Replace planted materials not surviving 90 days after contract acceptance at Contractor’s own expense.

C. Return after 1 year and re-fill, compact and refinish settled areas to grade.

M. Section 26 2500 – Enclosed Bus Assemblies

N. Section 26 2713 – Electrical Metering

O. Section 26 2726 – Wiring Devices

P. Section 26 2816 – Enclosed Switches and Circuit Breakers

Q. Section 26 2913 – Enclosed Controllers

R. Section 26 3213 – Diesel Engine Generators

S. Section 26 3623 – Automatic Transfer Switches

T. Section 28 3113 – Fire Detection and Alarm Systems

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 - General Requirements.

1.3 DESCRIPTION

A. Section includes the following:
   1. Identification for raceways
   2. Identification for conductors and communication and control cable
   3. Underground-line warning tape
   4. Warning labels and signs
   5. Instruction signs and posted drawings
   6. Equipment identification nameplates
   7. Wiring devices identification

B. Refer to the respective Division 26 Sections, and Sections in other Divisions that specify electrical components, for additional electrical identification requirements.

1.4 REFERENCE STANDARDS

A. ANSI A13.1 – Scheme for the Identification of Piping Systems

B. ANSI C2 – National Electrical Safety Code

C. ANSI Z535.4 1998 – National Standards for Product Safety Signs and Labels

D. 29 CFR – Labor, Part 1910 – Occupational Safety and Health Standards, Section 1910.145 – Specifications for Accident Prevention Signs and Tags

E. NFPA 70 – National Electrical Code

F. UL-510 - Polyvinyl Chloride, Polyethylene, and Rubber Insulating Tape

1.5 SUBMITTALS

A. Product Data: For each electrical identification product indicated.

B. Nameplate Schedule: Prior to making nameplates, submit a complete schedule to Architect for approval indicating nameplate size, lettering size, color and actual nameplate information.

1.6 QUALITY ASSURANCE

A. Comply with ANSI A13.1 and ANSI C2.

B. Comply with ANSI Z535.4-1998

C. Comply with NFPA 70.

D. Comply with 29 CFR 1910.145.

1.7 COORDINATION

A. Coordinate identification names, abbreviations, colors, and other features with requirements in Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and Operation and Maintenance Manual, and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout project.

B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

C. Coordinate installation of identifying devices with location of access panels and doors.

D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 RACEWAY IDENTIFICATION

A. Fire Alarm Conduit
1. Material: Refer to Section 26 0533 – Raceways and Boxes for Electrical Systems and Section 28 3113 – Fire Detection and Alarm Systems
2. Identification: Raceways are to be factory applied permanent red in color for entire length and circumference.
3. Junction box covers are to be factory or field applied permanent red paint.

B. Conduit and Raceway colors:
1. Refer to Section 26 05 33 – Raceways and Boxes for Electrical Systems.

C. Raceways and Armored Cable over 600V
1. Paint “DANGER HIGH VOLTAGE [12,470 VOLTS]” with permanent red paint on black background.
2. Paint is to be water and corrosion resistant for indoor and outdoor applications.
3. Letters are to be 2” high for 4-5” raceways, 1” high for 3” raceways.

D. Raceways 600V and under
1. Identify circuits on raceways upon leaving panel. Identify empty conduits as “SPARE”.
2. Identify raceways with black permanent marker.

2.2 CONDUCTOR AND COMMUNICATION- AND CONTROL-CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend.

B. Lettered ID Marking Tape Manufacturers: Brady USA, Ideal, Marking Services, Inc. (MRI), Seton, or approved equal.

C. Color-Coding Electrical Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils thick by 1” to 2” wide.
1. UL-510 listed, self adhesive, vinyl electrical tape

D. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

2.3 UNDERGROUND-LINE WARNING TAPE

A. Manufacturers: Brady USA, Ideal, Marking Services, Inc. (MRI), Seton, or approved equal.

B. Description: Permanent, bright-colored, continuous-printed, polyethylene tape.

1. Not less than 6” by 4 mils thick.
2. Compounded for permanent direct-burial service.
3. Embedded continuous metallic strip or core.
4. Printed legend shall indicate type of underground line.
5. Black letters on yellow background.

2.4 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. Self-Adhesive Warning Labels: Factory printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment, unless otherwise indicated.

C. Self-Adhesive Arc Flash Warning Labels: Industrial grade, made of durable polyester with over-laminate to withstand harsh environments (UV rays, scratches and most chemicals).
   1. Manufacturer: Seton or approved equal

D. Baked-Enamel Warning Signs for Interior Use: Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application. Nominal size, 7” x 10”.

E. Metal-Backed, Butyrate Warning Signs for Exterior Use: Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with galvanized-steel backing; and with colors, legend, and size required for application. Nominal size, 10” x 14”.

F. Warning label and sign shall include, but are not limited to, the following legends:
   1. Multiple Power Source Warning: “DANGER – ELECTRICAL SHOCK HAZARD – EQUIPMENT HAS MULTIPLE POWER SOURCES.”
   2. Workspace Clearance Warning: “WARNING – OSHA REGULATION – AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES.”
   3. Emergency System Warning: “WARNING – EMERGENCY SYSTEM – DO NOT LEAVE SWITCH IN THE “OFF” POSITION.”
   4. Automatic Start Warning: “WARNING – EQUIPMENT MAY START AT ANY TIME.”
   5. Arc Flash Labels: Per ANSI Z535.4 and NFPA 70 ART 110.16, the signal word WARNING appearing in black letters on an orange background, with second line below (Arc Flash and Shock Hazard) in black letters on white background and third line below (Appropriate PPE Required) in black letters on white background. Include the following information on the label:
      a. Equipment name
      b. Available bolted current
      c. Flash protection boundary distance
      d. Incident energy level at 18” expressed in cal/cm^2
      e. Personnel protective equipment (PPE) class
      f. Voltage shock hazard
      g. Limited shock approach boundary
      h. Restricted shock approach boundary
      i. Prohibited shock approach boundary

2.5 INSTRUCTION SIGNS AND POSTED DRAWINGS

A. Instruction Signs: Engraved, laminated acrylic or melamine plastic, minimum 1/16” thick for signs up to 20 sq in and 1/8” thick for larger sizes.
   1. Engraved legend with black letters on white face.
   2. Punched or drilled for mechanical fasteners.

B. Posted Drawings: Print electrical riser diagrams on 20 lb bond paper. Reduce drawings to approximately 1/2 size. Contact Engineer to obtain updated original plans for printing.

2.6 EQUIPMENT IDENTIFICATION NAMEPLATES

A. Indoor
   1. Engraved, Three-layer, Laminated Acrylic or Melamine Nameplate: Self adhesive backed. White letters on a black background, except emergency power equipment nameplates are to have white letters on a red background. Minimum letter height shall be 3/8” unless noted otherwise.

B. Outdoor
   1. Engraved, Three-layer, Laminated UV Resistant Acrylic or Melamine Nameplate: Attached with non corrosive mechanical fastener or other permanent method to maintain compliance with NEMA rating of enclosure. White letters on a black background, except emergency power equipment nameplates are to have white letters on a red background. Minimum letter height shall be 1/2” unless noted otherwise.

2.7 WIRING DEVICES IDENTIFICATION

A. Refer to Section 26 2726 – Wiring Devices for requirements.

PART 3 - EXECUTION

3.1 APPLICATION

A. Accessible Raceways and Metal-Clad Cables More Than 600 V: Identify with “DANGER – HIGH VOLTAGE 12,470 VOLTS” in permanent paint red letters on black background at least 2” high on 4-5” conduit, 1” high letters on metal clad cable and 3” conduit. Repeat identification at 10 ft maximum intervals and at each termination.
   1. Identify covers of exposed junction and pull boxes with red paint. Stencil the legend “DANGER – HIGH VOLTAGE 12,470 VOLTS” in red letters 2” high.
   2. Print identification so it can be seen from all exposed sides of raceway and cable.

B. Junction Boxes and Pull Boxes: Identify Panel/Circuit of all conductors passing through box on junction box cover with black permanent marker.

C. Power-Circuit Conductor Identification: For conductors #8AWG and larger, use UL-510 vinyl color-coding conductor tape indicating voltage and phase. Smaller conductors are to utilize factory colored insulation only.

D. Branch Circuit Conductors: Identify conductor source and circuit number at load terminations, and junction boxes using cloth tape and permanent ink. Identify circuit number only at source termination using pre-printed wrap-around identification tape.

E. Equipment Grounding and Bonding Conductor Identification: For conductors #1/0 and larger, use green UL-510 vinyl conductor tape. Smaller conductors are to utilize factory colored insulation only.

F. Isolated Ground Conductor: All conductors are to have factory green insulation with yellow stripe. Field applied color coded tape identification is not allowed.

G. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, signal, sound, intercommunications, voice, and data connections.
   1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
   2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
   3. Coordinate identification with project drawings, manufacturer's wiring diagrams, and Operation and Maintenance Manual.

H. Locations of Underground Lines, Duct Banks, and Direct Buried Conduits and Conductors: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.

I. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Comply with 29 CFR 1910.145 and apply self-adhesive warning labels. Identify system voltage with black letters on an orange background. Apply to exterior of door, cover, or other access to equipment.
   1. Equipment with Multiple Power or Control Sources: Apply to door or cover of equipment including, but not limited to, the following:
      a. Automatic Transfer Switches
      b. Double Ended Equipment
      c. Generator Distribution Equipment
      d. Fire Pump Disconnects
   2. Equipment Requiring Workspace Clearance According to NFPA 70: Unless otherwise indicated, apply to door or cover of equipment but not on flush panelboards and similar equipment in finished spaces.
   3. Arc Flash Warning Labels: install per NFPA 70E for each switchgear, switchboard, panelboard, motor control center, industrial control panel (every enclosure that may contain energized conductors or components). Locate labels so they are visible to the personnel before examination, adjustment, servicing, or maintenance of the equipment.
   4. Available Fault Current Labels: install per NFPA 70 for each piece of service entrance equipment. Locate labels so they are visible to the personnel before examination, adjustment, servicing or maintenance of the equipment.

J. Instruction Signs and Posted Drawings:
   1. Operating Instructions: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend printed in all capital letters of 12 pt size minimum where instructions are needed for system or equipment operation.
   2. Emergency Operating Instructions: Install instruction signs with white legend on a red background with minimum 3/8" high letters for emergency instructions at equipment used for bypass operations, load shedding, manual throw over, etc.

K. Equipment Identification Nameplates: On each unit of equipment, install unique designation nameplate that is consistent with wiring diagrams, schedules, and Operation and Maintenance Manual. Apply nameplates to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.

1. Nameplate Instructions:
   a. Indoor Equipment: Engraved, laminated acrylic self adhesive backed. Unless otherwise indicated, provide a single line of text with 3/8" high letters on 1-1/2" high nameplate; where 2 lines of text are required, use nameplates sized 2" high.
   b. Outdoor Equipment: Engraved, laminated UV resistant acrylic nameplates with 1/2" high letters. Outdoor equipment labels are to be factory applied with non-corrosive mechanical fasteners or other permanent method to maintain compliance with NEMA rating of enclosure.
   c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
2. Install nameplates for equipment including, but not limited to, the following:
   a. Panelboards, electrical cabinets, and enclosures
   b. Access doors and panels for concealed electrical items
   c. Electrical switchgear and switchboards, including each device
   d. Transformers
   e. Electrical substations
   f. Emergency system boxes and enclosures
   g. Motor-control centers, including each device
   h. Disconnect switches
   i. Enclosed circuit breakers
   j. Motor controllers
   k. Pushbutton stations
   l. Automatic Transfer Switches
   m. Contactors
   n. Remote-controlled switches, dimmer modules, and control devices
   o. Battery inverter units
   p. Battery racks
   q. Power-generating units
   r. Voice and data cable terminal equipment
   s. Master clock and program equipment
   t. Intercommunication and call system master and staff stations
   u. Television/audio components, racks, and controls
   v. Fire alarm control panel and annunciators
   w. Security and intrusion-detection control stations, control panels, terminal cabinets, and racks
   x. Monitoring and control equipment
   y. Uninterruptible power supply equipment

z. Terminals, racks, and patch panels for voice and data communication and for signal and control functions

aa. Non-concealed junction box covers of auxiliary electrical systems

L. Nameplates shall indicate equipment identification and shall be same as indicated on contract documents. Voltages shall be shown on panelboard nameplates.

3.2 INSTALLATION

A. Verify identity of each item before installing identification products.

B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

C. Apply identification devices to surfaces that require finish after completing finish work.

D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

E. Install non-adhesive signs and plastic nameplates parallel to equipment lines; attach non-corrosive mechanical fasteners appropriate to the location and substrate. Attach in a method that does not compromise the NEMA rating of enclosure.

F. Posted Drawings and Operating Instructions: Mount drawings and operating procedures on the wall immediately adjacent to the piece of equipment for which the instructions apply. If sufficient wall space is available, mount directly to one of the sheet metal panels of the equipment. Cover document with clear plexi-glass and aluminum frame. Mount frame to wall in a manner that will allow removal to update document.

G. Warning Signs: Install warning signs where there is hazardous exposure or danger associated with access to or operation of electrical facilities. Provide text of sufficient clarity and lettering of sufficient size to convey adequate information at each location; mount permanently in an appropriate and effective location. Comply with ANSI A13.1 standard color and design.

1. Operational Tags: Where needed for proper and adequate information on operation and maintenance of electrical systems, provide tags of plasticized card stock, either preprinted or hand printed to convey the message; example: “DO NOT OPEN THIS SWITCH WHEN BREAKER IS CLOSED.”

H. System Identification Color Banding for Conductors: Each color band shall completely encircle conductor. Locate bands at source and load terminations and at all junction and tap boxes.

I. Color-Coding for Phase and Voltage Level Identification, 600 V or Less: Use colors listed below for ungrounded conductors.

1. Colors for 208/120 V Circuits:
   a. Phase A (left bus in panelboard): Black
   b. Phase B (center bus in panelboard): Red
   c. Phase C (right bus in panelboard): Blue
   d. Neutral: White with stripe to match corresponding phase conductor color
   e. Equipment Ground: Green
2. Colors for 480/277 V Circuits:
   a. Phase A (left bus in panelboard): Brown

b. Phase B (center bus in panelboard): Orange
c. Phase C (right bus in panelboard): Yellow
d. Neutral: Gray with stripe to match corresponding phase conductor color
e. Equipment Ground: Green

3. Colors for Isolation Panelboard branch circuit wiring:
   a. Isolated Conductor #1 – Orange with at least one distinctive colored stripe other than white, green, or gray along the entire length of the conductor along entire length of conductor.
   b. Isolated Conductor #2 – Brown with at least one distinctive colored stripe other than white, green, or gray along the entire length of the conductor along entire length of conductor

4. Field-applied, Color-Coding Conductor Tape: Apply no more than 2" wide using multiple turns. Apply last two runs of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings where possible.

J. Underground-Line Warning Tape: See Section 26 0543*.10* – Underground Ducts and Raceways for Electrical Systems for installation instructions.

K. Painted Identification: Prepare surface and apply paint according to paint manufacturer's instructions. Do not use cleaning solvents that will harm surface to be painted.

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes computer based, fault current, arc flash, and overcurrent protective device coordination studies for an electrical distribution system, based on actual equipment supplied. Set protective devices based on results of the protective device coordination study.
   1. Coordination of series-rated devices is permitted only where indicated on drawings.

B. Furnish field information and data needed for the studies.

C. Available fault current and electrical equipment interrupting capacity indicated on drawings are based on the short circuit study performed during design as part of the construction documents.

D. Provide studies and reports prior to manufacture of the electrical distribution equipment.

E. Equipment submittal will not be approved until the coordination study is complete and the equipment submittals indicate compliance with the study recommendations.

1.4 REFERENCE STANDARDS

A. ANSI C57.12.10 – American National Standard for Transformers-230 kV and Below 833/958-8333/10 417 kVA, Single-Phase, and 750/862-60 000/80 000/100 000 kVA, Three-Phase, w/o Load Tap Changing; and 3750/4687-60 000/80 000 kVA with Load Tap Changing-Safety Requirements

B. ANSI C57.12.22 – American National Standard for Transformers-Pad-Mounted, Compartmental-Type, Self-Cooled, Three-Phase Distribution Transformers with High-Voltage Bushings, 2500 kVA & Smaller: High-Voltage, 34 500 GrdY/19 920 V & Below; Low Voltage, 480 V & Below-Requirements

C. ANSI C57.12.40 – American National Standard for Secondary Network Transformers-Subway and Vault Types (Liquid Immersed)-Requirements

D. ANSI C57.12.90 – General Requirements for Liquid-Immersed Distribution Power and Regulating Transformers

E. ANSI C57.96 – Distribution and Power Transformers, Guide for Loading Dry-Type (Appendix to ANSI C57.12 Standards)

W. NFPA 70C – Hazardous Locations Classification

X. NFPA 70E – Standard for Electrical Safety in Workplace

1.5 SUBMITTALS

A. Product Data: Computer software program to be used for studies. Include specific software version for owner record.

B. Product Certificates:
   1. Coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 399.
   2. Arc flash calculations computer software programs, certifying compliance with IEEE 1584.

C. Qualification Data: For coordination study specialist.
   1. Submit qualifications of the organization proposed for performing the study. Include description of the equipment and computer-based computation methods or programs used and the names and experience histories of the personnel who will perform the study.

D. Other Action Submittals: Subsequent to having approval for system protective devices submit the following **[in digital format]**:
   1. Electrical one-line drawing drafted in computer software program with component names.
      a. Drawing minimum text height of 3/32”. Maximum paper size 30”x42”. Provide multiple drawing sheets as required.
   2. Fault current study report
   3. Equipment evaluation report

4. Coordination study input data, including completed computer program input data sheets
5. Coordination Study Report
6. Arc Flash Study and Report
7. Arc Flash labels
8. Serving utility information with utility letterhead, including but not limited to:
    a. Protective device part numbers/settings
    b. Maximum available 1P and 3P fault
    c. Line conductor sizes/lengths
    d. Transformer impedance
    e. Serving voltage
9. Provide copy of Owner's electrical safety program if site specific standards vary from instructions noted in this project specification. All software files, including report documents and system study native files (including relevant library files), to allow review and future use of files
10. Sample energized work permit form

1.6 QUALITY ASSURANCE

A. Perform studies using computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.

B. Coordination Study Specialist Qualifications: An organization experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
    1. Perform study under the direct supervision and control of a Registered Professional Electrical Engineer licensed in the Commonwealth of Kentucky, with a minimum of 5 yrs recent experience in performing protective device coordination studies, arc flash calculations, and electrical system analysis. Final report shall be signed and sealed by said engineer.

C. Comply with IEEE 242 for short circuit currents and coordination time intervals.

D. Comply with IEEE 399 for general study procedures.

E. Comply with IEEE 1584 for arc flash calculations.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Computer Software Developers: Subject to compliance with requirements, provide products by one of the following:

B. Basis of Design Product:
    1. SKM Systems Analysis, Inc.
    2. CYME International, Inc.
    3. EDSA Micro Corporation
    4. ETAP

2.2 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

A. Comply with IEEE 399 and IEEE 1584.

B. Analytical features of fault current study computer software program shall include “mandatory,” “very desirable,” and “desirable” features as listed in IEEE 399 Table 7-4.

C. Computer software program shall be capable of plotting and diagramming time-current characteristic curves as part of its output. Computer software program reports device settings and ratings of all overcurrent protective devices and demonstrates selective coordination by computer-generated, time-current coordination plots.

D. Arc Flash Calculations: Software program capable of calculating Arc Flash Incident Energy (AFIE) levels and flash protection boundary distances.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices for coordination are indicated on drawings.

B. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

C. Provide the study based on the actual electrical equipment supplied for the project.

3.2 POWER SYSTEM DATA

A. Gather and tabulate the following input data to support coordination study:
   1. Product Data for overcurrent protective devices specified in other Division 26 Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with power riser diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
   2. Impedance of utility service entrance(s).
   3. Power Riser Diagrams: In hard copy and electronic copy formats, showing the following:
      a. Circuit breaker and fuse-current ratings and types
      b. Relays and associated power and current transformer ratings and ratios
      c. Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios
      d. Generator kilovolt amperes, size, voltage, and source impedance
      e. Cables: Indicate conduit material, sizes of conductors, conductor material, insulation, and length
         1). Prior to equipment purchase, utilize conservative lengths (up/down included) based on planned conduit routing to validate equipment ratings. Final study to utilize contractor provided as-built lengths to confirm equipment ratings.
      f. Busway ampacity and impedance

g. Motor horsepower and code letter designation according to NEMA MG 1
h. Load current that is the basis for sizing continuous ratings of circuits for cables and equipment

4. Data sheets to supplement power riser diagrams, cross-referenced with tag numbers on diagrams, showing the following:
   a. Special load considerations, including starting inrush currents and frequent starting and stopping
   b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability
   c. Motor full-load current, locked-rotor current, service factor, starting time, type of start, and thermal-damage curve
   d. Generator thermal-damage curve
   e. Ratings, types, and settings of utility company's overcurrent protective devices
   f. Special overcurrent protective device settings or types stipulated by utility company
   g. Time-current characteristic curves of devices indicated to be coordinated
   h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers
   i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays
   j. Panelboards, switchboards, automatic transfer switch, switchgear, busways, ampacity, and interrupting rating in amperes rms symmetrical
      1). Automatic transfer switch withstand rating to comply with UL 1008. Equivalent trip curves are not accepted for specific breaker rated equipment – exact breaker and associated trip unit must be listed on UL certification.

3.3 FAULT CURRENT STUDY

A. Calculate maximum available short circuit current in amperes rms symmetrical at circuit breaker positions of electrical power distribution system. Provide calculation for a current immediately after initiation and for a three-phase bolted short circuit at the following:
   1. Switchgear and switchboard bus
   2. Medium-voltage controller
   3. Motor control center
   4. Distribution panelboard
   5. Branch circuit panelboard
   6. Disconnect switches
   7. Automatic transfer switch
   8. Manual transfer switch
   9. Equipment fed by Variable Frequency Drive (VFD)
   10. Industrial control panels including air handling equipment, elevator controllers, etc.

B. For standard non-bypass Pulse Width Modulation VFDs, a line short circuit condition may be ignored.

C. Verify mechanical equipment served meets or exceeds maximum short circuit available.

D. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for project. Include studies of system switching configurations and alternate operations that could result in maximum fault conditions.
   1. Model the entire electrical distribution system from utility company point of connection to circuit breakers in 208 V distribution panels at secondary side of distribution transformers. Include mechanical HVAC equipment, motor driven equipment feeder circuits, and elevator feeder circuits.
   2. Model shall include components of the distribution system which would be exposed to fault current levels of 10,000 A symmetrical on a calculated basis.

E. Calculate momentary and interrupting duties on basis of maximum available fault current.

F. Perform calculations to verify interrupting ratings of overcurrent protective devices in compliance with IEEE 141, IEEE 241 and IEEE 242.
   1. Transformers:
      a. ANSI C57.12.10
      b. ANSI C57.12.22
      c. ANSI C57.12.40
      d. IEEE C57.12.00
      e. IEEE C57.96
   2. Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.20.1
   3. Low-Voltage Fuses: IEEE C37.46

G. Study Report:
   1. Show calculated X/R ratios and equipment interrupting rating (5-cycle) fault currents on power riser diagrams in report. List other output values from computer analyses, including momentary (1/2-cycle), interrupting (5-cycle), and 30-cycle fault current values for 3-phase, 2-phase, and phase-to-ground faults.

H. Equipment Evaluation Report:
   1. Prepare report on adequacy of overcurrent protective devices and conductors by comparing fault current ratings of devices with calculated fault current momentary and interrupting duties.
   2. For 600V overcurrent protective devices, ensure interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
   3. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in standards to 1/2-cycle symmetrical fault current.
   4. Verify adequacy of phase conductors at maximum 3-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure short circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
   5. Notify Owner/Engineer promptly of discrepancies, problem areas, or inadequacies and provide recommendations for problem resolution.

3.4 COORDINATION STUDY

A. Perform coordination study using approved computer software program. Prepare a written report using results of fault current study. Comply with IEEE 399.
   1. Calculate maximum and minimum 1/2-cycle short circuit currents.
   2. Calculate maximum and minimum interrupting duty (5 cycles to 2 seconds) short circuit currents.
   3. Calculate maximum and minimum ground-fault currents.

B. Comply with NFPA 70 for overcurrent protection of circuit elements and devices.

C. Comply with IEEE 141, IEEE 241, IEEE 242 recommendations for fault currents and time intervals.

D. Transformer Primary Overcurrent Protective Devices:
   1. Devices non-operational in response to the following:
      a. Inrush current when first energized
      b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
      c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
   2. Protect transformers according to IEEE C57.12.00, for fault currents by device settings.

E. Protect motors served by voltages more than 600 V according to IEEE 620.

F. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate equipment withstands the maximum short circuit current for a time equivalent to tripping time of primary relay protection or total clearing time of fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short circuit current. Verify adequacy of phase conductors at maximum three-phase bolted fault currents, equipment grounding conductors, and grounding electrode conductors at maximum ground-fault currents.

G. Include voltage classes of equipment from utility's incoming line protective device down to and including each panelboard. The phase and ground overcurrent protection shall be included as well as settings for other adjustable protective devices.

H. Selective Coordination: Overcurrent devices installed upstream and downstream of automatic transfer switches and/or associated with NEC Article 700 Emergency and 701 Legally Required loads shall be selectively coordinated from source of supply (both normal and emergency sources) through final device. Change specific circuit breakers (type, frame, trip-unit, etc.) and equipment bus rating as necessary to meet this requirement. Selective coordination of the system indicated on the one-line diagram is based on Schneider, Caterpillar, and RussElectric equipment.
   1. Additionally, provide selective coordination for ground fault through-out.

I. Coordination Study Report: Prepare a written report indicating results of coordination study:
   1. Tabular Format of Settings Selected for Overcurrent Protective Devices:
      a. Device tag

b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values
c. Circuit breaker sensor rating; and long-time, short-time, and instantaneous settings
d. Fuse-current rating and type
e. Ground-fault relay-pickup and time-delay settings
f. Manufacturer and type of device
g. Range of adjustments and recommended settings

2. Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate adequate time separation exists between devices installed in series, drawn to show the boundaries of device operation on log-log scale graphs, including power utility company's upstream devices. Where time current curves do not explicitly illustrate selective coordination but breakers have been tested and documented as being selectively coordinated, submit manufacturer's literature to substantiate device coordination. Include on curve sheet a title and legend identifying portion of the system covered. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:
   a. Device tag
   b. Voltage and current ratio for curves
   c. Three-phase and single-phase damage points for each transformer
   d. No damage, melting, and clearing curves for fuses
   e. Cable damage curves
   f. Transformer inrush points, full-load amps, and damage curves
   g. Maximum fault current cutoff point
   h. Generator decrement curve and full-load amps
3. Plot characteristics where applicable:
   a. Medium- and low- voltage fuses including minimum melt, total clearing and damage bands
   b. Low-voltage circuit breaker trip devices
   c. Transformer full-load current, magnetizing inrush current, and ANSI transformer withstand parameters
   d. Ground-fault protective devices
   e. Motor starting characteristics and motor damage points
   f. Generator short circuit decrement curve and generator damage point
   g. Conductor damage curves
   h. Electric utility's protective devices
   i. Medium-voltage equipment relays
4. Zone-Selective Interlocking (ZSI): Where a switchboard or switchgear is equipped with zone-selective interlocking, provide both restrained and un-restrained settings for all main (source) and tie breakers that are part of the zone-interlocking scheme. Include both settings in tabular format and in coordination curves.
5. Energy-reducing maintenance switch: Where a circuit breaker is equipped with an energy reducing maintenance switch, provide both normal and "maintenance mode" settings for the breaker. Include both settings in tabular format and in coordination curves.
6. Notify Owner/Engineer promptly of discrepancies, problem areas, or inadequacies and provide recommendations for problem resolution. Propose approaches to effectively protect

the underrated equipment. Present technical evaluation with discussion of logical compromises for best coordination.

J. Completed data sheets for setting of overcurrent protective devices.

K. Provide software file of completed study with closeout submittal.

3.5 ARC FLASH STUDY

A. Perform arc flash calculations for Arc Flash Incident Energy (AFIE) levels and flash protection boundary distances. Utilize short circuit rating of equipment identified in fault current study – note infinite bus fault current alone is not acceptable.

B. Model worst-case arc flash conditions**,** including various operational configurations of the electrical system as described in Section 3.3.D.3.
   1. Equipment with PPE rating greater than 2 shall be investigated. Investigation shall include adjustment of upstream overcurrent device settings to determine if PPE rating can be reduced with minimal compromise to coordination with other overcurrent devices.
   2. Systems or portions thereof 240 V and less and on the secondary side of 112.5kVA or smaller transformer report calculated values from NFPA 70E equations.
   3. Study shall include investigation for “Maintenance Settings” scenario(s). Adjustable breakers shall be set to lowest instantaneous setting available
   4. Study shall include examination of DC arc-flash evaluation for [station-batteries.

C. Arc Flash Study Report: Provide study results in tabular form and include:
   1. Device or bus name
   2. Bolted fault and arcing fault current levels
   3. Arc Flash Incident Energy (AFIE) level at 455 mm expressed in cal/cm^2
   4. Flash protection boundary distances including:
      a. Limited shock approach boundary
      b. Restricted shock approach boundary
   5. Trip/Delay time
   6. Breaker opening time
   7. Working distance
   8. Equipment class and bus gap
   9. Personal protective equipment class (PPE)

D. Provide recommendation for reducing AFIE levels and enhancing worker safety.

3.6 FIELD QUALITY CONTROL

A. Inspect, set, test, and calibrate the protective relays, circuit breakers, fuses, and other applicable devices per requirements in Section 26 0812 – Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables.

B. Upon final approval of study, provide weatherproof vinyl or polyester arc flash label for all electrical equipment defined above. Label shall include calculated flash protection boundary, incident energy in cal/cm^2 at working distance (mm working distance based on equipment class, per IEEE 1584), required PPE level, limited approach, restricted approach, equipment name,

company name/logo who performed the study, available fault current, overcurrent device settings if applicable, and date label was produced.

1. Label to comply with ANSI Z535. Use “WARNING” (ANSI safety orange background with an orange exclamation point safety symbol) for all arc flash levels.
2. Per NFPA 70E 130.5(C), due to use of incident energy analysis method, PPE categories shall not be provided on labels unless site specific standard PPE categories differ from incident energy levels noted in NFPA 70E Table 130.7(C)(16).
3. Include verbiage on label noting study should be re-examined once every (5) years or upon modifications to electrical system.

3.7 ADJUSTING

A. Make modifications to equipment, as required, to accomplish conformance with equipment evaluation study.

B. Adjust relay and overcurrent protective device settings according to recommended settings table provided by overcurrent protective device coordination study.

C. Verify maintenance mode indicators illuminate upon being engaged.

D. Notify Owner/Engineer in writing of any required major modifications.

3.8 INSTALLATION

A. Install PPE labels on each piece of equipment prior to energizing equipment.

B. PPE labels shall be protected by clear plastic cover, weatherproof type material, or laminated and mounted on front of equipment. Taping of PPE label to front of equipment is unacceptable.

C. PPE label shall be clearly visible upon approach to equipment.

D. For large pieces of equipment, label shall be placed near main overcurrent device or incoming feeder to equipment. For equipment such as switchboards, UPS, or switchgear, with multiple vertical sections, provide (1) label per vertical section.

E. Contractor to provide one-line diagrams (meet IEEE/ANSI standard 141), mounted on 24”x36” (minimum) Styrofoam backboard. These one-line diagrams shall be mounted in each electrical room.

F. Label shall be mounted at a minimum of 42 to bottom and maximum 66” to top above finished floor.

END OF SECTION

SECTION 26 0593

ELECTRICAL SYSTEMS FIRESTOPPING

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0533 – Raceways and Boxes for Electrical Systems

B. See Architectural Specification sections for additional firestopping requirements.

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 - General Requirements.

1.3 DESCRIPTION

A. Section includes through-penetration firestop systems for penetrations through fire-resistance-rated constructions (walls, partitions, floors, and ceilings) including both empty openings and openings containing electrical penetrating items, including but not limited to raceways, cables, cable trays, busways, and wireways.

1.4 REFERENCE STANDARDS

A. ASTM E-814 – Standard Test Method for Fire Tests of Through-Penetration Firestops

B. UL 1479 - Fire Tests of Through-Penetration Firestops

C. UL 2079 - Tests For Fire Resistance of Building Joint Systems

1.5 PERFORMANCE REQUIREMENTS

A. Provide firestop system to resist spread of fire, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated.

B. Firestop systems shall be UL Classified for the application and correspond to those indicated by reference to designations listed by UL Fire Resistance Directory.

C. Conform to applicable Code requirements of Authority Having Jurisdiction.

D. For through-penetration firestop systems exposed to view, traffic, moisture, and physical damage, provide products that, after curing, do not deteriorate when exposed to these conditions.

1.6 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For each through-penetration firestop system, show each type of construction condition penetrated, relationships to adjoining construction and type of penetrating item. Include

firestop design designation of qualified testing and inspecting agency that evidences compliance with requirements for each condition indicated.

1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop system configuration for construction and penetration items, including documentation of UL certification for firestop systems.

C. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

D. Material Safety Data Sheets provided with product delivered to job site.

E. Certification of compliance with Building Codes of Project location.

F. Inspection reports

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A firm experienced in installing through-penetration firestop systems similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance.

B. Firestopping tests shall be performed by a qualified testing and inspecting agency, or another agency performing testing and follow-up inspection services for firestop systems acceptable to Authorities Having Jurisdiction.

C. Manufacturer's representative shall be on-site during initial installation of firestop systems to train appropriate Contractor personnel in proper selection and installation procedures.

1.8 DELIVERY, STORAGE AND HANDLING

A. Deliver through-penetration firestop system products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product, type and manufacturer, and UL Label where applicable.

B. Store and handle materials for through-penetration firestop systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

C. Handle in accordance with recommended procedures, precautions, or remedies described in material safety data sheets as applicable.

1.9 PROJECT CONDITIONS

A. Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop systems' manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Ventilate through-penetration firestop systems per manufacturers' written instructions by natural means or, where this is inadequate, forced-air circulation.

1.10 COORDINATION

A. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.

C. Notify Owner's inspecting agency at least 7 days in advance of through-penetration firestop system installations; confirm dates and times on days preceding each series of installations.

D. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until each installation has been examined by building inspector, if required by Authorities Having Jurisdiction.

1.11 SEQUENCING

A. Sequence work to avoid interferences with building finishes and installation of other products.

1.12 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. 3M (Fire Protection Products Division), Hilti Inc, Tremco (Sealant/Weatherproofing Division), Nelson Firestop Products, Specified Technologies Inc, RectorSeal Corporation, approved equal.

B. Pyrophobic Systems, Ltd - Intumescent Technologies FireBlok fire suppression gasket for use in 4" X 4" X 2-1/8" boxes.

2.2 MATERIALS

A. Firestop Products: UL 1479, ASTM E-814 tested for specific fire-rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements and fire-rating involved for each separate instance; materials shall not contain flammable solvents.

B. Firestop Systems: Produced by the same manufacturer.

C. Fire Suppression Gaskets: Single piece gasket for use in 4" X 4" X 2-1/8" or smaller recessed electrical boxes in walls rated up to 2 hr.

D. Accessories: Components for each through-penetration firestop system that are needed to install fill materials and to comply with Part 1 "Performance Requirements" Article. Accessories include the following items:
   1. Permanent forming/damming/backing materials
   2. Temporary forming materials
   3. Substrate primers
   4. Collars
   5. Steel sleeves

E. Fill Materials: Including the following:
   1. Firestop putty, caulk sealant, intumescent wrap strips, intumescent firestop collars, firestop mortars, pillows/bags, or a combination of these products to provide a UL-listed system for each application required for this Project; mineral wool backing where specified in manufacturer's application detail.

F. Mixing
   1. For those products requiring mixing before application, comply with through-penetration firestop system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions for compliance with requirements for opening configurations, penetrating items and other conditions affecting performance of firestopping.

B. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean out openings immediately prior to installing through-penetration firestop system to comply with firestop system manufacturer's written instructions.

B. Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.

C. Comply with manufacturer's recommendations for temperature and humidity conditions before, during and after installation of firestopping.

D. Install fire suppression gaskets inside electrical boxes before conductors are pulled. Install per manufacturer's requirements.

3.3 INSTALLATION

A. Comply with "System Performance Requirements" Article in Part 1 and with firestop system manufacturer's written installation instructions and drawings for products and applications indicated.

B. Install forming/damming/backing materials and other accessories of types required to support fill materials during application as required. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.

C. Avoid multiple penetrations of common fire barrier opening. Seal each penetration in accordance with manufacturer's UL installation details. When multiple penetrations are unavoidable, seal openings with appropriate UL Classified firestopping systems.

D. Adhere fire suppression gaskets to inside, rear of electrical box with attached adhesive strips.

3.4 IDENTIFICATION

A. Identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include the following information on labels:
   1. The words: “Warning—Through-Penetration Firestop System—Do Not Disturb. Notify Building Management of Any Damage.”
   2. Contractor’s name, address, and phone number
   3. Through-penetration firestop system designation of applicable testing and inspecting agency
   4. Date of installation
   5. Through-penetration firestop system manufacturer’s name
   6. Installer’s name

3.5 FIELD QUALITY CONTROL

A. Inspecting Agency: Owner will engage a qualified independent inspecting agency to inspect through-penetration firestop systems and to prepare test reports.
   1. Inspecting agency will state in each report whether inspected through-penetration firestop systems comply with or deviate from requirements.

B. Provide certification by Installer that all through-penetration firestop systems have been firestopped in accordance with applicable Building Codes of Project location.

C. Proceed with enclosing through-penetration firestop systems with other construction only after inspection reports are issued and firestop installations comply with requirements.

D. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with specifications.

3.6 CLEANING

A. Clean surfaces adjacent to sealed holes and joints to be free of excess firestop materials and soiling as work progresses.

END OF SECTION

SECTION 26 0812

POWER DISTRIBUTION ACCEPTANCE TESTS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0513.16 – Medium-Voltage, Single- and Multi-Conductor Cables

B. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

C. Section 26 0526 – Grounding and Bonding for Electrical Systems

D. Section 26 0813 – Power Distribution Acceptance Test Tables

E. Section 26 2200 – Low-Voltage Transformers

F. Section 26 2300 – Low-Voltage Switchgear

G. Section 26 2313 – Paralleling Low-Voltage Switchgear

H. Section 26 2413 – Switchboards

I. Section 26 2500 – Enclosed Bus Assemblies

J. Section 26 2550 – Generator Docking Station

K. Section 26 2713 – Electrical Metering

L. Section 26 2816 – Enclosed Switches and Circuit Breakers

M. Section 26 2913 – Enclosed Controllers

N. Section 26 3213 – Diesel Engine Generators

O. Section 26 3623 – Automatic Transfer Switches

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes acceptance testing requirements for assessing the suitability for service and reliability of the power distribution system.

B. It is the purpose of this specification to assure all tested electrical equipment, both contractor and Owner supplied, is operational and within industry and manufacturer's tolerances and is installed in accordance with design specifications.

C. Tests and inspections shall be performed after installation.

D. Tests and inspections shall determine suitability for energization.

E. Electrical systems shall pass tests prior to substantial completion or Owner occupancy.

F. This specification requires contractor to engage services of NETA certified testing agency.

G. All tests tables referenced in this specification provided in Section 26 0813 – Power Distribution Acceptance Test Tables.

H. Items to be tested and inspected as follows:
1. 600-volt conductors and cables
2. Medium-Voltage conductors and cables
3. Medium Voltage Fusible Interrupter Switchgear
4. Electrical metering
5. Engine generator
6. Dry type transformers
7. Generator Paralleling Switchgear
8. Low-voltage switchgear
9. Switchboard
10. Low-voltage insulated-case/molded-case circuit breakers
11. Low-voltage disconnect switches
12. Automatic transfer switches
13. Motor control and motor control center
14. Metal-enclosed busways
15. Ground fault protection systems
16. Grounding systems
17. Thermographic survey

1.5 SUBMITTALS

A. Test Reports: Include the following:
   1. Summary of project
   2. Description of equipment tested
   3. Equipment used to conduct the test
   4. Description of test
   5. Test results, as compared to manufacturers' or industry accepted standards and tolerances
   6. Conclusions and recommendations

7. Signature of responsible test organization authority

B. List of equipment used to perform tests. Identify the following:
1. Type
2. Manufacturer
3. Model number
4. Serial number
5. Date of last calibration
6. Documentation of calibration leading to NIST standards

1.6 QUALITY ASSURANCE

A. Qualifications of Testing Agency:
1. Testing firm shall be a corporately and financially independent testing organization that can function as an unbiased testing authority, professionally independent of the manufacturer, supplier, and installers of equipment or system evaluated by the testing firm.
2. Testing firm shall be regularly engaged in testing of electrical equipment, devices, installations and systems.
3. Testing firm shall meet Federal Occupational Safety and Health Administration (OSHA) requirements for accreditation of independent testing laboratories.
4. On-site technical person shall be currently certified by the InterNational Electrical Testing Association in electrical power distribution system testing.
5. Testing firm shall use technicians who are regularly employed by the firm for testing services.
6. Testing firm shall submit proof of above qualifications with bid documents when requested.

PART 2 - PRODUCTS

2.1 Not applicable to this Section.

PART 3 - EXECUTION

3.1 PREPARATION

A. Documentation: Deliver the following to testing firm, minimum two weeks prior to commencement of testing:
1. Complete set of electrical plans and specifications, with available short circuit indicated on power riser diagrams.
2. Approved submittals and shop drawings of equipment being tested.
3. Pertinent change orders.
4. Evaluation, overcurrent protective device coordination and arc flash studies provided by Engineer.

B. Schedule: Notify Owner and Engineer 10 working days prior to performance of any tests.

C. Coordination: Coordinate with Construction Manager/Owner/Engineer the testing schedule and availability of equipment ready for testing.

D. Test Power: Provide test power (including specialized) for equipment testing before and after service energizing.

3.2 FIELD QUALITY CONTROL

A. Inspection and Test Procedures: Comply with NETA.

1. 600 V Conductors and Cables:

a. Visual and Mechanical Inspection:

1) Compare cable data with drawing and specifications.

2) Inspect exposed sections of cables for physical damage.

3) Verify tightness of accessible bolted electrical connections by calibrated torque wrench in accordance with manufacturer's published data or Table 12.

4) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

5) Inspect compression-applied connectors for correct cable match and indentation.

6) Verify visible cable bends meet or exceed ICEA and manufacturer's minimum allowable bending radius.

7) For cables are terminated through window-type current transformers, provide an inspection to verify neutral and ground conductors are correctly placed for operation of protective devices.

8) Inspect for correct identification and arrangements.

9) Inspect jacket and insulation condition.

b. Electrical Tests:

1) Perform insulation-resistance test using megohm meter. Applied potential to be 1000 VDC. Individually test each conductor with other conductors grounded. Test duration shall be one minute.

2) Perform continuity tests to insure correct cable connection.

c. Test Values:

1) Insulation-resistance values should not be less than 50 megohms.

2. Medium-Voltage Cables:

a. Visual and Mechanical Inspection:

1) Compare cable date with drawings and specifications.

2) Inspect exposed sections of cables for physical damage.

3) Verify tightness of accessible bolted connections by calibrated torque wrench in accordance with manufacturer's published data or Table 12.

4) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

5) Inspect compression-applied connectors for correct cable match and indentation.

6) Inspection for shield grounding, cable support, and termination.

7) Verify visible cable bends meet or exceed ICEA and manufacturer's minimum allowable bending radius.

8) Inspect for adequate fireproofing in common cable areas, if specified.

9) For cables are terminated through window-type current transformers, provide an inspection to verify neutral and ground conductors are correctly placed and shields are correctly terminated for operation of protective devices.
10) Inspect jacket and insulation condition.
11) Inspect for correct identification and arrangements.

b. Electrical Tests:
1) Perform shield-continuity test on each power cable by ohmmeter method and record value.
2) Perform insulation-resistance test using megohm meter with voltage output of at least 2500 V. Individually test each conductor with other conductors and shields grounded. Test duration shall be 1 minute.
3) Perform DC high-potential test on cables, including terminations and joints after cable system installation and before placing cable in service. Adhere to precautions and limits as specified in applicable NEMA/ICEA Standards for the specific cable. Perform tests in accordance with ANSI/IEEE Standard 400. Test voltages shall not exceed 80% of cable manufacturer's factory test value or maximum test voltage in Table 6.
a) Ensure input voltage to test set is regulated.
b) Current-sensing circuits in test equipment shall measure only leakage current associated with cable under test and shall not include internal leakage of test equipment.
c) Record wet- and dry-bulb temperatures or relative humidity and temperature.
d) Test each section of cable individually.
e) Individually test each conductor with other conductors grounded. Ground shields.
f) Terminations shall be adequately corona-suppressed by guard ring, field reduction sphere, or other suitable method as necessary.
g) Ensure maximum test voltage does not exceed limits for terminators specified in ANSI/IEEE Standard 48 or manufacturer's specifications.
h) Apply DC high-potential test in at least 5 equal increments until maximum test voltage is reached. No increment shall exceed voltage rating of the cable. Record DC leakage current at each step after constant stabilization time consistent with system charging current.
i) Raise conductor to specified maximum test voltage and hold for 15 minutes on shielded cable and 5 minutes on non-shielded cable. Record readings of leakage current at 30 seconds and one minute and at one-minute intervals thereafter.
j) Reduce conductor test potential to zero and measure residual voltage at discrete intervals.
k) Apply grounds for time period adequate to drain insulation stored charge.
l) When new cables are spliced into existing cables, DC high-potential test shall be performed on new cable prior to splicing in accordance with this section. After test results are approved for new cable and splice is complete, perform insulation-resistance test and shield-continuity test on the length of new and existing cable including the splice. After satisfactory insulation-resistance test, DC high-potential test shall be performed on cable using test voltage acceptable to Owner and not exceeding 60% of factory test value.

c. Test Values:
   1) Shielding must exhibit continuity. Investigate resistance values in excess of 10 ohms per 1000 ft of cable.
   2) Graphic plots may be made of leakage current versus step voltage at each increment and leakage current versus time at final test voltages.
      a) Step voltage slope should be reasonably linear.
      b) Capacitive and absorption current should decrease continually until steady state leakage is approached.

3. Electrical Metering:
   a. Visual and Mechanical Inspection:
      1) Compare equipment nameplate data with drawings and specifications.
      2) Inspect physical and mechanical condition.
      3) Verify tightness of electrical connections.
      4) Inspect cover gasket, cover glass, condition of spiral spring, disc clearance, contacts, and case-shorting contacts, as applicable.
      5) Verify freedom of movement, correct travel and alignment, and tightness of mounting hardware.
   b. Electrical Tests:
      1) Check calibration of meters at cardinal points.
      2) Calibrate watt-hour meters according to manufacturer's published data.
      3) Verify instrument multipliers.
      4) Electrically confirm current transformer and voltage transformer secondary circuits are intact.

4. Engine Generator:
   a. Visual and Mechanical Inspection:
      1) Compare equipment nameplate data with drawings and specifications.
      2) Inspect physical and mechanical condition.
      3) Inspect correct anchorage and grounding.
      4) Inspect air baffles, filter media, and cooling fans.
      5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
      6) Confirm correct application of manufacturer's recommended lubricants.
   b. Electrical and Mechanical Tests:
      1) Perform insulation-resistance test on generator winding with respect to ground in accordance with ANSI/IEEE Standard 43. Calculate polarization index.
      2) Test protective relay devices in accordance with paragraph "Protective Relays."
      3) Perform phase-rotation test to determine compatibility with load requirements.
      4) Functionally test engine shutdown for low oil pressure, overtemperature, overspeed, and other protection features as applicable.
      5) Perform vibration baseline test. Plot amplitude versus frequency for each main bearing cap.
      6) Conduct performance test in accordance with NFPA Standard 110, Section 7-13 (Installation Acceptance).

7) Verify correct functioning of governor and regulator.
8) Verify function and temperature regulation for battery and engine heaters.

c. Test Values:
1) Polarization index values shall be in accordance with ANSI/IEEE Standard 43.
2) Vibration levels shall be in accordance with manufacturer's published data.
3) Performance tests shall conform to manufacturer's published data and NFPA 110.
4) Vibration amplitudes shall not exceed values shown in Table 10.
5) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

5. Dry Type Transformers:
a. Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment, and grounding.
4) Verify that resilient mounts are free and that any shipping brackets have been removed.
5) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
6) Perform thermographic survey of bolted electrical connections, in accordance with paragraph "Thermographic Survey."
7) Verify that as-lift tap connections are as specified.

b. Electrical Tests:
1) Perform insulation-resistance tests winding-to-winding and each winding-to-ground with test voltage in accordance with Table 5. Calculate dielectric absorption ratio or polarization index.

c. Test Values:
1) Bolt-torque levels should be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Insulation-resistance test values at one minute should be in accordance with Table 5.
3) The dielectric absorption or polarization index shall be greater than 1.0 and shall be recorded for future reference.

6. Low-Voltage Switchgear and Switchboard Assemblies:
a. Visual and Mechanical Inspection:
1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Verify appropriate anchorage, required area clearances, grounding and correct alignment.
5) Inspect doors, panels, and sections for paint, dents, scratches, fit, and missing hardware.

6) Verify fuse and/or circuit breaker sizes and types correspond to drawings and coordination study as well as to circuit breaker's address for microprocessor-communication packages.

7) Verify that current and potential transformer ratios correspond to drawings.

8) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench. Refer to manufacturer's published data or Table 12 for proper torque values.

9) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey."

10) Confirm correct operation and sequencing of electrical and mechanical interlock systems.

a) Attempt closure on locked-open devices. Attempt to open locked-closed devices.

b) Make key exchange with devices operated in off-normal positions.

11) Inspect insulators for evidence of physical damage or contaminated surfaces.

12) Verify correct barrier and shutter installation and operation.

13) Exercise active components.

14) Inspect mechanical indicating devices for correct operation.

15) Verify filters are in place and/or vents are clear.

16) Perform visual and mechanical inspection of instrument transformers, in accordance with paragraph "Instrument Transformers."

17) Inspect control power transformers.

a) Inspect physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.

b) Verify that primary and secondary fuse ratings or circuit breakers match drawings.

c) Verify correct functioning of draw-out disconnecting and grounding contacts and interlocks.

b. Electrical Tests:

1) Perform tests on all instrument transformers in accordance with paragraph "Instrument Transformers."

2) Perform resistance tests through bus joints with low-resistance ohmmeter. Joints that cannot be directly measured due to permanently installed insulation wrap shall be indirectly measured from closest accessible connection.

3) Perform insulation-resistance tests in each bus section, phase-to-phase and phase-to-ground for one minute in accordance with Table 1.

4) Perform over-potential test on each bus section, each phase-to-ground with phases not under test grounded, in accordance with manufacturer's published data. In the absence of any published data, Table 2 shall apply. Test voltage shall be applied for one minute.

5) Perform insulation-resistance tests at 1000 VDC on control wiring. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer's recommendation.

6) Perform current injection tests on the entire current circuit in each section of switchgear.

a) Perform current tests by primary injection, where possible, with magnitudes such that minimum of 1.0 amp flows in secondary circuit.
b) Where primary injection is impractical, utilize secondary injection with minimum current of 1.0 amp.
c) Test current at each device.

7) Determine accuracy of meters and calibrate watt-hour meters in accordance with paragraph “Electrical Metering.” Verify multipliers.
8) Perform phasing check on double-ended switchboard/switchgear to insure correct bus phasing from each source.
9) Perform the following tests on control power transformers:

a) Perform insulation-resistance tests. Perform measurements from winding-to-winding and each winding-to-ground. Test voltages shall be in accordance with Table 1 unless otherwise specified by manufacturer.
b) Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to correct secondary voltage. Confirm potential at all devices.
c) Verify correct secondary voltage by energizing primary winding with system voltage. Measure secondary voltage with secondary wiring disconnected.
d) Verify correct function of control transfer relays located in switchboard/switchgear with multiple control power sources.

10) Potential Transformer Circuits:

a) Perform insulation-resistance tests. Perform measurements from winding-to-winding and each winding-to-ground. Test voltages shall be in accordance with Table 1, unless otherwise specified by manufacturer.
b) Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to correct secondary voltage.
c) Verify secondary voltage by energizing primary winding with system voltage. Measure secondary voltage with secondary wiring disconnected.

11) Verify operation of switchgear/switchboard space heaters.

c. Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare bus connection resistances to values of similar connections.
3) Insulation-resistance values for bus, control wiring, and control power transformers shall be in accordance with manufacturer’s published data. In the absence of manufacturer’s published data, use Table 1. Values of insulation resistance less than this table or manufacturer’s minimum should be investigated. Over-potential tests should not proceed until insulation-resistance levels are raised above minimum values.
4) Bus insulation shall withstand the over-potential test voltage applied.
5) Contact resistance values shall not exceed high limit of normal range as indicated in manufacturer’s published data. If manufacturer’s data is not available, investigate values that deviate from similar bus by more than 50% of lowest value.

7. Low-Voltage Insulated-Case/Molded-Case Circuit Breakers, 225A and Larger:

a. Visual and Mechanical Inspection:

1) Compare nameplate date with drawings and specifications.
2) Inspect circuit breaker for correct mounting.
3) Check cell fit, element alignment and racking mechanism for draw-out breakers.
4) Operate circuit breaker to insure smooth operation.
5) Inspect case for cracks or other defects.
6) Verify tightness of accessible bolted electrical connections and/or cable connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
7) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests:
1) Perform a contact-resistance test.
2) Perform insulation-resistance test at 1000 VDC from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase. Test duration shall be one minute. Use a minimum test voltage in accordance with Table 1 or manufacturer's published data.
3) Perform insulation-resistance test at 1000 VDC on all control wiring. Test duration shall be one minute. Do not perform the test on wiring connected to solid-state components. Follow manufacturer's recommendation.
4) Perform adjustments for final trip settings in accordance with overcurrent protective device coordination study.
5) Perform long-time delay time-current characteristic tests by passing 300% rated current through each pole separately, unless series testing is required to defeat ground fault functions.
6) Determine short-time pickup and delay by primary current injection.
7) Determine ground-fault pickup and time delay by primary current injection.
8) Determine instantaneous pickup current by primary injection using run-up or pulse method.
9) Verify correct operation of auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.
10) Verify trip unit calibrations by secondary injection.
11) Determine minimum operation voltage on shunt trip and close coils in accordance with Table 20.
12) Check charging mechanism.

c. Test Values:
1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
2) Compare microhm or millivolt drop values to adjacent poles or similar breakers. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.
3) Circuit breaker insulation-resistance shall be in accordance with Table 1.
4) Control wiring insulation-resistance shall comply with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation resistance less than this table or manufacturer's minimum shall be investigated.

5) Trip characteristic of breakers shall fall within manufacturer's published time-current characteristic tolerance band, including adjustment factors. If manufacturer's curves are not available, trip times shall not exceed the value shown in Table 7. Circuit breakers exceeding specified trip time at 300% of pickup shall be tagged defective.

6) For molded-case circuit breakers, instantaneous pickup values shall be within manufacturer's published data or tolerances shown in Table 8.

7) Minimum operation voltages on shunt trip and close coils shall be in accordance with manufacturer's published data. In the absence of manufacturer's data, refer to Table 20.

8. Low-Voltage Disconnect Switches:

a. Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.

2) Inspect physical and mechanical condition.

3) Inspect anchorage, alignment, grounding, and required clearances.

4) Verify correct blade alignment, blade penetration, travel stops, and mechanical operation.

5) Verify that fuse sizes and types are in accordance with drawings, short-circuit and overcurrent protective device coordination studies.

6) Verify that each fuse has adequate mechanical support and contact integrity.

7) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.

8) Perform thermographic survey of accessible bolted electrical connection in accordance with paragraph "Thermographic Survey."

9) Verify operation and sequencing of interlocking systems.

10) Verify correct phase barrier installation.

11) Verify correct operation of all indicating and control devices.

12) Confirm correct application of manufacturer's recommended lubricants.

b. Electrical Tests:

1) Measure contact resistance across each switchblade and fuseholder.

2) Perform insulation-resistance test at 1000 VDC from pole-to-pole and from each pole-to-ground. Test duration shall be one minute. Use a minimum test voltage in accordance with Table 1 or manufacturer's published data.

3) Measure fuse resistance.

4) Perform ground fault test, if applicable.

c. Test Values:

1) Compare bolted connection resistances to values of similar connections.

2) Bolt-torque levels should be in accordance with Table 12, unless otherwise specified by the manufacturer.

3) Compare microhm or millivolt drop values to adjacent poles or similar switches. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.

4) Minimum insulation-resistance shall be in accordance with manufacturer's published data or Table 1.

5) Investigate fuse-resistance values that deviate from each other by more than 15%.

9. Automatic Transfer Switches:

a. Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.
2) Inspect physical and mechanical condition.
3) Confirm correct application of manufacturer's recommended lubricants.
4) Verify manual transfer warnings are attached and visible.
5) Verify tightness of control connections.
6) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
7) Perform thermographic survey of accessible bolted electrical connections in accordance with paragraph "Thermographic Survey."
8) Perform manual transfer operation.
9) Verify positive mechanical interlocking between normal and alternative sources.
10) Inspect anchorage, alignment, grounding and required clearances.

b. Electrical Tests:

1) Measure contact resistance.
2) Perform insulation-resistance tests, phase-to-phase and phase-to-ground, with switch in both source positions. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data. For control devices that cannot tolerate test voltage, follow manufacturer's recommendation.
3) Verify settings and operation of control devices.
4) Calibrate and set relays and timers in accordance with paragraph "Protective Relays."
5) Verify phase rotation, phasing and synchronized operation as required by the application.
6) Perform automatic transfer tests:
   a) Simulate loss of normal power.
   b) Return to normal power.
   c) Simulate loss of emergency power.
   d) Simulate all forms of single-phase conditions.
7) Verify correct operation and timing of following functions:
   a) Normal source voltage-sensing relays.
   b) Engine start sequence.
   c) Time delay upon transfer.
   d) Alternate source voltage-sensing relays.
   e) Automatic transfer operation.
   f) Interlocks and limit switch function.
   g) Time delay and retransfer upon normal power restoration.
   h) Engine cool down and shutdown feature.

c. Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

2) Insulation-resistance test voltage and minimum values shall be in accordance with Table 1.

3) Compare microhm values to adjacent poles or similar switches. Investigate deviations of more than 50% of lowest value. Investigate any value exceeding manufacturer's recommendations.

10. Motor Control and Motor Control Center:

a. Visual and Mechanical Inspection:

1) Compare equipment nameplate data with drawings and specifications.

2) Inspect physical and mechanical condition.

3) Inspect anchorage, alignment and grounding.

4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.

5) Verify controller mechanical operations. Inspect gap, wipe, alignment, and pressure are in accordance with manufacturer's published data.

6) Verify motor running protection installed and properly sized.

7) Confirm correct application of manufacturer's recommended lubricants.

b. Electrical Tests:

1) Perform resistance tests through all bus joints with low-resistance ohmmeter. Any joints that cannot be directly measured due to permanently installed insulation wrap shall be indirectly measured from closest accessible connection.

2) Perform insulation-resistance tests on each bus section, phase-to-phase and phase-to-ground with controller closed and across each open pole. Test duration shall be one minute. Use a test voltage in accordance with Table 1 or manufacturer's published data. For control devices that cannot tolerate test voltage, follow manufacturer's recommendations.

3) Perform insulation-resistance tests at 1000 VDC on control wiring. Test duration shall be one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer's recommendations.

4) Test motor protection devices in accordance with manufacturer's published data. In the absence of manufacturer's data, use paragraph "Protective Relays."

5) Test circuit breakers in accordance with paragraph "Low-Voltage Insulated-Case/Molded-Case Circuit Breakers."

6) Perform operational tests by initiating control devices.

c. Test Values:

1) Bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

2) Compare bus connection resistances to values of similar connections.

3) Insulation-resistance values for bus, control wiring, and control power transformers shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 1. Values of insulation-

resistance less than this table or manufacturer's minimum should be investigated.

4) Motor protection parameters shall be in accordance with manufacturer's published data.

11. Metal Enclosed Busways:
    a. Visual and Mechanical Inspection:
        1) Compare equipment nameplate data with drawings and specifications.
        2) Inspect busway for physical damage and correct connection in accordance with single-line diagram.
        3) Inspect for appropriate bracing, suspension, alignment, and enclosure ground.
        4) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
        5) Perform thermographic survey of bolted electrical connections in accordance with paragraph "Thermographic Survey".
        6) Confirm physical orientation in accordance with manufacturer's labels to insure adequate cooling.
        7) Examine outdoor busway for removal of "weep-hole" plugs, if applicable, and correct installation of joint shield.
    b. Electrical Tests:
        1) Measure insulation resistance of each busway, phase-to-phase and phase-to-ground for one minute, in accordance with Table 1.
        2) Perform over-potential test on each busway, phase-to-ground with phases not under test grounded, in accordance with manufacturer's published data. Test voltage shall be applied for one minute. If manufacturer has recommendation for this test, it shall be in accordance with Table 17.
        3) Perform contact-resistance test on each connection point of non-insulated busway. On insulated busway, measure resistance of assembled busway section and compare values to adjacent phase.
        4) Perform phasing test on each busway tie section energized by separate sources. Tests must be performed from their permanent sources.
        5) Verify operation of busway space heaters.
    c. Test Values:
        1) Bus bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.
        2) Insulation-resistance test voltages and resistance values shall be in accordance with manufacturer's specifications or Table 1. Minimum resistance values are for nominal megohms for 1000 ft. For busway runs over 1000 ft, convert the measured resistance value to the 1000 ft nominal value:
            a) R / 1000 ft = Measured Resistance x Length of Run/1000 ft
        3) Values of insulation-resistance less than Table 1 or manufacturer's minimum should be investigated. Over-potential tests should not proceed until insulation-resistance levels are raised above minimum values.
        4) Over-potential test voltages shall be applied in accordance with manufacturer's recommendations. Insulation shall withstand over-potential test voltage applied.
12. Ground Fault Protection Systems:

a. Visual and Mechanical Inspection:
   1) Compare equipment nameplate data with drawings and specifications.
   2) Visually inspect components for damage and errors in polarity or conductor routing:
      a) Verify ground connection is made ahead of neutral disconnect link and on line side of any ground fault sensor.
      b) Verify neutral sensors are connected with correct polarity on both primary and secondary.
      c) Verify all phase conductors and neutral pass through sensor in same direction for zero sequence systems.
      d) Verify grounding conductors do not pass through zero sequence sensors.
      e) Verify grounded conductor is solidly grounded.
   3) Verify tightness of accessible bolted electrical connections, including control circuits, by calibrated torque-wrench method in accordance with manufacturer's published data or Table 12.
   4) Verify correct operation of self-test panel.
   5) Set pickup and time-delay settings in accordance with settings provided on drawings and in specifications. Record operation and test sequences as required by NFPA 70.
   6) Verify the control power transformer has adequate capacity for the system.

b. Electrical Tests:
   1) Measure system neutral-to-ground insulation resistance with neutral disconnect link temporarily removed. Replace neutral disconnect link after testing.
   2) Perform insulation-resistance test of control wiring at 1000 VDC for one minute. Do not perform this test on wiring connected to solid-state components. Follow manufacturer's recommendations.
   3) Perform the following pickup tests using primary injection:
      a) Verify relay does not operate at 90% of pickup setting.
      b) Verify pickup is less than 125% of setting or 1200 amp, whichever is smaller.
   4) For summation type systems using phase-neutral current transformers, verify correct polarities by applying current to each phase-neutral current transformer pair. This test also applies to molded-case breakers using external neutral current transformer.
      a) Relay should operate when current direction is the same relative to polarity marks in the two current transformers.
      b) Relay should not operate when current direction is opposite relative to polarity marks in the two current transformers.
   5) Measure time delay of the relay at 150% or greater of pickup.
   6) Verify reduced voltage tripping capability: 55% for AC systems and 80% for DC systems.

c. Test Values:
   1) System neutral-to-ground insulation shall be minimum of one megohm.
   2) Insulation resistance values shall be in accordance with Table 1.
   3) Relay timing shall be in accordance with manufacturer's specifications but must also be no longer than one second at 3000 amp.

4) Bus bolt-torque levels shall be in accordance with Table 12, unless otherwise specified by manufacturer.

13. Grounding Systems:
    a. Visual and Mechanical Inspection:
        1) Verify ground system is in compliance with drawings, specifications, and NFPA 70.
        2) Inspect physical and mechanical condition.
        3) Inspect anchorage.
    b. Electrical Tests:
        1) Perform fall-of-potential or alternative test in accordance with ANSI/IEEE 81 on the main grounding electrode or system.
        2) Perform point-to-point tests to determine the resistance between the main grounding system and all major electrical equipment frames, system neutral, and/or derived neutral points.
        3) Make resistance measurements in dry weather not earlier than 48 hours after rainfall.
    c. Test Values:
        1) The resistance between the main grounding electrode and ground should be no greater than five ohms. (Reference ANSI/IEEE 142.) Investigate any values above five ohms and notify Engineer immediately for further instructions.
        2) Investigate point-to-point resistance values that exceed 0.5 ohm.
14. Thermographic Survey:
    a. Visual and Mechanical Inspection:
        1) Inspect physical, electrical, and mechanical conditions.
        2) Remove all necessary covers prior to thermographic inspection.
        3) Equipment to be inspected shall include all current-carrying devices. Provide report including the following:
            a) Discrepancies.
            b) Temperature difference between area of concern and reference area.
            c) Cause of temperature difference.
            d) Areas inspected. Identify inaccessible and unobservable areas and equipment.
            e) Identify load conditions at time of inspection.
            f) Provide photographs and thermogram of deficient area.
    b. Test Parameters:
        1) Inspect distribution systems with imaging equipment capable of detecting minimum temperature difference of 1°C at 30°C.
        2) Equipment shall detect emitted radiation and convert detected radiation to visual signal.
        3) Thermographic surveys should be performed during periods of maximum possible loading but not less than 40% of rated load of the electrical equipment being inspected. Refer to NFPA 70B, Section 20.17 (Infrared Inspection).
    c. Test Results:

1) Temperature differences of 1°C to 3°C indicate possible deficiency and warrant investigation.
2) Temperature differences of 4°C to 15°C indicate deficiency; repair as time permits.
3) Temperature differences of 16°C and above indicate major deficiency; repair immediately.
4) Suggested actions based on temperature rise can be found in Table 18.

B. Test Reports:
1. Testing firm shall do the following:
a. Prepare test report, including description of equipment tested, description of test, test results, conclusions and recommendations, retesting results, list of test equipment used and calibration date.
b. Show test results in comparison to industry and manufacturer's values and tolerances.
c. Interpret test results in writing and give recommendations for acceptance or rejection upon consultation with Engineer and prior to energizing equipment.
d. Assure electrical equipment is operational and within industry and manufacturer's tolerances, and is installed in accordance with contract documents.
e. Assure suitability of energization.
f. Report to the Owner and Engineer any system, material, or workmanship that is found defective on the basis of acceptance tests.
g. Retest equipment when required.
h. Maintain written record of tests.
i. Utilize safety practices during the tests in accordance with:
1) Acceptable state and local safety operating procedures
2) Owner's safety practices
3) OSHA
4) NFPA 70E
j. Perform tests with apparatus de-energized and grounded, except where otherwise specifically required ungrounded by test procedures.
k. Assemble and certify final test report.
l. Provide 4 copies of complete test report.
m. Attach label to all tested equipment with indication of date tested and testing firm name.
2. Contractor shall do the following:
a. Investigate, replace, or repair any fault in material or in any part of the installation revealed by the tests.
b. Deliver one copy of each test report directly to Engineer within 30 days after completion of testing, unless directed otherwise. Insert a copy of each test report in the equipment operation and maintenance manuals.

C. Test Equipment:
1. Test Instrument Calibration:
a. Testing firm shall have calibration program that assures test instruments are maintained with rated accuracy.

b. Instruments shall be calibrated in accordance with the following frequency schedule:
    1) Field instruments: Analog, 6 months maximum; Digital, 12 months maximum
    2) Laboratory instruments: 12 months
    3) Leased specialty equipment: 12 months where accuracy is guaranteed by lessor
c. Dated calibration labels shall be visible on test equipment.
d. Records, which show date and results of instruments calibrated or tested, must be kept up-to-date.
e. Up-to-date instrument calibration instructions and procedures shall be maintained for test instrument.
f. Equipment used for field testing shall be more accurate than instrument being tested.
g. Calibrating standard applied to testing equipment shall be of higher accuracy than instrument tested.

SECTION 26 0813

POWER DISTRIBUTION ACCEPTANCE TEST TABLES

TABLE 1
Insulation Resistance Test Values
Electrical Apparatus And Systems

Voltage Rating	Minimum DC Test Voltage	Recommended Minimum Insulation Resistance In Megohms
250	500	25
600	1,000	100
1,000	1,000	100
2,500	1,000	500
5,000	2,500	1,000
8,000	2,500	2,000
15,000	2,500	5,000
25,000	5,000	20,000
34,500 and above	15,000	100,000

See Table 14 for temperature correction factors.

TABLE 2
Switchgear Low-Frequency Withstand Test Voltages

Type of Switchgear	Rated kV	Maximum Test Voltage kV AC	DC
Low-Voltage Power Circuit Breaker Switchgear	.254	1.6	2.3
	.508	1.6	2.3
	.635	1.6	2.3
MC (Metal-Clad Switchgear)	4.76	14.0	20.0
	8.25	27.0	37.0
	15.0	27.0	37.0
	27.0	45.0	+
	38.0	60.0	+
SC (Station-Type Cubicle Switchgear)	15.5	37.0	+
	38.0	60.0	+
	72.5	*120*.0	+
MEI (Metal-Enclosed Interrupter Switchgear)	4.76	14.0	20.0
	8.25	19.0	27.0
	15.0	27.0	37.0
	15.5	37.0	52.0
	25.8	45.0	+
	38.0	60.0	+

Derived from ANSI/IEEE C37.20.2-1993, Paragraph 5.5, *Metal-Clad and Station-Type Cubicle Switchgear* and C37.20.3-1993, Paragraph 5.5, *Metal-Enclosed Interrupter Switchgear*, and includes 0.75 multiplier with fraction rounded down.

The column headed “DC, Maximum Test Voltage kV” is given as a reference only for those using DC tests to verify the integrity of connected cable installations without disconnecting the cables from the switchgear. It represents values believed to be appropriate and approximately equivalent to the corresponding power frequency withstand test values specified for voltage rating of switchgear. The presence of this column in no way implies any requirement for a DC withstand test on AC equipment or that a DC withstand test represents an acceptable alternative to the low-frequency withstand tests specified in this specification, either for design tests, production tests, conformance tests, or field tests. When making DC tests, the voltage should be raised to the test value in discrete steps and held for a period of one minute.

Because of the variable voltage distribution encountered when making DC withstand tests, the manufacturer should be contacted for recommendations before applying DC withstand tests to the switchgear. Voltage transformers above 34.5kV should be disconnected when testing with DC. Refer to ANSI/IEEE C57-13-1993 (*IEEE Standard Requirements for Instrument Transformers*) paragraph 8.8.2.

ANSI/IEEE C57.121-1998, *IEEE Guide for Acceptance and Maintenance of Less-Flammable Hydrocarbon Fluid in Transformers,* Table 3.

The test limits shown in this table apply to less-flammable hydrocarbon fluids as a class. Specific typical values for each brand of fluid should be obtained from each fluid manufacturer.

a. If the purpose of the HMWH installation is to comply with the NFPA 70 *National Electrical Code*, this value is the minimum for compliance with NEC Article 450.23.

TABLE 5

Transformer Insulation-Resistance
Acceptance Test Voltage and Minimum Results

Transformer Coil Rating Type in Volts	Minimum DC Test Voltage	Recommended Minimum Insulation Resistance in Megohms	
		Liquid Filled	Dry
0 - 600	1000	100	500
601 - 5000	2500	1000	5000
5001 - 15000	5000	5000	25000

See Table 14 for Temperature Correction Factors.
NOTE: Since insulation resistance depends on insulation rating (kV) and winding capacity (kVA), values obtained should be compared to manufacturer's test data.

Molded-Case Circuit Breakers
Values for Inverse Time Trip Test

(At 300% of Rated Continuous Current of Circuit Breaker)

Range of Rated Continuous Current Amperes	Maximum Trip Time in Seconds For Each Maximum Frame Rating[1]	
	250V	251 - 600V
0-30	50	70
31-50	80	100
51-100	140	160
101-150	200	250
151-225	230	275
226-400	300	350
401-600	----------	450
601-800	----------	500
801-1000	----------	600
1001-1200	----------	700
1201-1600	----------	775
1601-2000	----------	800
2001-2500	----------	850
2501-5000	----------	900

Reproduction of Table 5-3 from NEMA Standard AB4-1996.

[1] For integrally-fused circuit breakers, trip times may be substantially longer if tested with the fuses replaced by solid links (shorting bars).

TABLE 8
Instantaneous Trip Setting Tolerances for Field Testing of Marked Adjustable Trip Circuit Breakers

	Tolerances of High and Low Settings	
Ampere Rating	**High**	**Low**
Adjustable	+40%	-30%
Non-adjustable	+25%	-25%

Reproduction of Table 5-4 from NEMA publication AB4-1996.

For circuit breakers with nonadjustable instantaneous trips, tolerances apply to the manufacturer's published trip range, i.e., +40% on high side, -30% on low side.

TABLE 9
Instrument Transformer Dielectric Tests
Field Acceptance

Nominal System (kV)	BIL (kV)	Applied Potential Tests Field Test Voltage (kV)	
		AC	DC[1]
0.6	10	3	4
1.2	30	7.5	10
2.4	45	11.25	15
5.0	60	14.25	19
8.7	75	19.5	26
15	95	25.5	34
15	110	25.5	34
25	125	30	40
25	150	37.5	50
34.5	150	37.5	50
34.5	200	52.5	70

Derived from Paragraph 8.8.2 and Tables 2 and 7 of ANSI/IEEE C57.13-1993 (Standard Requirements for Instrument Transformers).

[1] DC potential tests are not recommended for transformers rated higher than 200 kV BIL. DC tests may prove beneficial as a reference for future testing. In such cases the test direct voltage should not exceed the original factory test RMS alternating voltages.

TABLE 10
Maximum Allowable Vibration Amplitude

RPM @ 60 Hz	Velocity in/s peak	Velocity mm/s	RPM @ 60 Hz	Velocity in/s peak	Velocity mm/s
3600	0.15	3.8	3000	0.15	3.8
1800	0.15	3.8	1500	0.15	3.8
1200	0.15	3.8	1000	0.13	3.3
900	0.12	3.0	750	0.10	2.5
720	0.09	2.3	600	0.08	2.0
600	0.08	2.0	500	0.07	1.7

Derived from NEMA publication MG 1-1998, Section 7.8.1, Table 7-1. Table is unfiltered vibration limits for resiliently mounted machines. For machines with rigid mounting, multiply the limiting values by 0.8.

TABLE 11
Overpotential Test Voltages for Electrical Apparatus Other than Inductive Equipment

Nominal System (Line) Voltage[1] (kV)	Insulation Class	AC Factory Test (kV)	Maximum Field Applied AC Test (kV)	Maximum Field Applied DC Test (kV)
1.2	1.2	10	6.0	8.5

24.9 (1 ∅)	27.0	125	60	78
34.5 (3 ∅)	38.0	150	70	103

Derived from ANSI/IEEE C37.63-1984(R1990) Table 2 (*Standard Requirements for Overhead, Pad-Mounted, Dry-Vault, and Submersible Automatic Line Sectionalizers of AC Systems*).

NOTE: Values of AC voltage given are dry test one-minute factory test values**.**

TABLE 17
Dielectric Withstand Test Voltages
Metal-Enclosed Bus

Type of Bus	Rated kV	Maximum Test Voltage, kV	
		AC	DC
Isolated Phase for Generator Leads	24.5	37.0	52.0
	29.5	45.0	--
	34.5	60.0	--
Isolated Phase for Other than Generator Leads	15.5	37.0	52.0
	25.8	45.0	--
	38.0	60.0	--
Nonsegregated Phase	0.635	1.6	2.3
	4.76	14.2	20.0
	15.0	27.0	37.0
	25.8	45.0	63.0
	38.0	60.0	--
Segregated Phase	15.5	37.0	52.0
	25.8	45.0	63.0
	38.0	60.0	--
DC Bus Duct	0.3	1.6	2.3
	0.8	2.7	3.9
	1.2	3.4	4.8
	1.6	4.0	5.7
	3.2	6.6	9.3

Derived from ANSI/IEEE C37.23-1987, Tables 3A, 3B, 3C, 3D, and paragraph 6.4.2. The table includes a 0.75 multiplier with fractions rounded down.

NOTE:

The presence of the column headed “DC” does not imply any requirement for a DC withstand test on AC equipment. This column is given as a reference only for those using DC tests and represents values believed to be appropriate and approximately equivalent to the corresponding power frequency withstand test values specified for each class of bus.

Direct current withstand tests are recommended for flexible bus to avoid the loss of insulation life that may result from the dielectric heating that occurs with rated frequency withstand testing.

Because of the variable voltage distribution encountered when making DC withstand tests and variances in leakage currents associated with various insulation systems, the manufacturer should be consulted for recommendations before applying DC withstand tests to this equipment.

TABLE 18
Thermographic Survey
Suggested Actions Based on Temperature Rise

Temperature difference (TD) based on comparisons between similar components under similar loading	Temperature difference (TD) based upon comparisons between component and ambient air temperatures	Recommended action
1°C to 3°C	1°C to 10°C	Possible deficiency; warrants investigation
4°C to 15°C	11°C to 20°C	Indicates probably deficiency; repair as time permits
-- -- --	21°C to 40°C	Monitor until corrective measures can be accomplished
>15°C	>40°C	Major discrepancy; repair immediately

Temperature specifications vary depending on the exact type of equipment. Even in the same class of equipment (i.e., cables) there are various temperature ratings. Heating is generally related to the square of the current; therefore, the load current will have a major impact on)T. In the absence of consensus standards for TD, the values in this table will provide reasonable guidelines.

An alternative method of evaluation is the standards-based temperature rating system as discussed in Chapter 8.9.2, Conducting an IR Thermographic Inspection, *Electrical Power Systems Maintenance and Testing*, by Paul Gill, PE, 1998.

It is a necessary and valid requirement that the person performing the electrical inspection be thoroughly trained and experienced concerning the apparatus and systems being evaluated as well as knowledgeable of thermographic methodology.

TABLE 19
Overpotential Test Voltages
Electrical Apparatus Other than Inductive Equipment

Nominal System (Line) Voltage[a] (kV)	Insulation Class	AC Factory Test (kV)	Maximum Field Applied AC Test (kV)	Maximum Field Applied DC Test (kV)
1.2	1.2	10	6.0	8.5
2.4	2.5	15	9.0	12.7
4.8	5.0	19	11.4	16.1
8.3	8.7	26	15.6	22.1
14.4	15.0	34	20.4	28.8
18.0	18.0	40	24.0	33.9
25.0	25.0	50	30.0	42.4
34.5	35.0	70	42.0	59.4

a. Intermediate voltage ratings are placed in the next higher insulation class.

TABLE 20
Rated Control Voltages and their Ranges
for Circuit Breakers

The maximum voltage is measured at the point of user connection to the circuit breaker [see Notes (9) (10)] with no operating current flowing, and the minimum voltage is measured with maximum operating current flowing.

Rated Control Voltages and their Ranges for Circuit Breakers					
RATED CONTROL VOLTAGE (8)	**Direct Current Voltage Ranges (1)(2) Volts, DC**		**OPENING FUNCTIONS ALL TYPES**	**RATED CONTROL VOLTAGE (60 Hz)**	**ALTERNATING CURRENT (1)(2)(3)(5) CLOSING, TRIPPING, AND AUXILIARY FUNCTIONS**
	CLOSING AND AUXILIARY FUNCTIONS				
	INDOOR CIRCUIT BREAKERS	**OUTDOOR CIRCUIT BREAKERS**		**SINGLE PHASE**	**SINGLE PHASE**
24	---	---	14-28	120	104-127 (4)
48	38-56	36-56	28-56	240	208-254 (4)
125	100-140	90-140	70-140	Polyphase	Polyphase

---	---	---	---	208Y/120	220Y/127
---	---	---	---	240	208-254

Derived from Table 8, ANSI C37.06-2000, *AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis – Preferred Ratings and Related Required Capabilities.*

RATED CONTROL VOLTAGES AND THEIR RANGES FOR CIRCUIT BREAKERS Solenoid-Operated Devices	
RATED VOLTAGE	**Closing Voltage Ranges for Power Supply**
125 DC	90 – 115 or 105 – 130
250 DC	180 – 230 or 210 – 260
230 AC	190 – 230 or 210 - 260

Notes:

(1) Electrically operated motors, contactors, solenoids, valves, and the like need not carry a nameplate voltage rating that corresponds to the control voltage rating shown in the table as long as these components perform the intended duty cycle (usually intermittent) in the voltage range specified.

(2) Relays, motors, or other auxiliary equipment that function as a part of the control for a device shall be subject to the voltage limits imposed by this standard, whether mounted at the device or at a remote location.

(3) Includes supply for pump or compressor motors. Note that rated voltages for motors and their operating ranges are covered by ANSI/NEA MG-1-1978.

(4) Includes heater circuits.

(5) Voltage ranges apply to all closing and auxiliary devices when cold. Breakers using standard auxiliary relays for control functions may not comply at lower extremes of voltage ranges when relay coils are hot, as after repeated or continuous operation.

(6) Direct current control voltage sources, such as those derived from rectified alternating current, may contain sufficient inherent ripple to modify the operation of control devices to the extent that they may not function over the entire specified voltage ranges.

(7) This table also applies for circuit breakers in gas-insulation substation installations.

(8) In cases where other operational ratings are a function of the specific control voltage applied, tests in C37.09 may refer to the “Rated Control Voltage.” In these cases, tests shall be performed at the levels in this column.

(9) For an outdoor circuit breaker, the point of user connection to the circuit breaker is the secondary terminal block point at which the wires from the circuit breaker operating mechanism components are connected to the user’s control circuit wiring.

(10) For an indoor circuit breaker, the point of user connection to the circuit breaker is either the secondary disconnecting contact (where the control power is connected from the stationary housing to the removable circuit breaker), or the terminal block point in the housing nearest to the secondary disconnecting contact.

(11) Some solenoid operating mechanisms are not capable of satisfactory performance over the range of voltage specified in the standard; moreover, two ranges of voltage may be required for such mechanisms to achieve an acceptable standard of performance.

(12) The preferred method of obtaining the double range of closing voltage is by use of tapped coils. Otherwise, it will be necessary to designate one of the two closing voltage ranges listed above as representing the condition existing at the device location due to battery or lead voltage drop or control power transformer regulation. Also, caution should be exercised to ensure that the maximum voltage of the range used is not exceeded.

SECTION 26 1116

SECONDARY UNIT SUBSTATIONS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0000 - General Electrical Requirements

B. Section 26 0553 - Electrical System Identification

C. Section 26 0573 - Power System Studies

D. Section 26 0812 - Power Distribution Acceptance Tests

E. Section 26 0813 - Power Distribution Acceptance Test Tables

F. Section 26 0913 - Electrical Power Monitoring and Control

G. Section 26 1216 - Dry-Type, Medium-Voltage Transformers

H. Section 26 1316 - Medium-Voltage Fusible Interrupter Switchgear

I. Section 26 2300 - Low-Voltage Switchgear

J. Section 26 2413 - Switchboards

K. Section 26 2713 - Electrical Metering

L. Section 26 4300 - Surge Protective Devices

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION OF SYSTEM

A. Specification covers 3 phase secondary unit substations for operations at primary voltages of 601 V through 38 kV, and secondary voltages of 600 V or less.

B. This includes devices such as medium-voltage switchgear, transformers, low-voltage switchgear and metering compartments.

1.4 REFERENCE STANDARDS

A. NECA 1 - 2000 - Standard Practices for Good Workmanship in Electrical Contracting

B. NECA 400 - 1998 - Recommended Practice For Installing and Maintaining Switchboards

C. ANSI C37.121 - Switchgear - Unit Substations

D. UL 1062 - Unit Substations

1.5 SUBMITTALS

A. Submit shop Drawings for equipment provided under this Section.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers:
   1. Schneider Electric; Square D
   2. ABB-GE Industrial Solutions
   3. Siemens

2.2 UNIT SUBSTATIONS

A. Unit substation shall be:
   1. Completely metal-enclosed assembly
   2. Constructed and assembled to permit lifting or rolling as single unit
   3. Arranged as indicated on drawings

B. Dimensions indicated on contract documents are maximum allowed.

C. Common bases and frame structure shall be 1-piece welded, structural steel.

D. Compartments shall be totally enclosed, stretcher leveled steel, not less than **2.657 mm(12 ga)**, bolted to base, with side, front and rear panels of 1-piece welded construction.

E. Compartments shall have ventilation louvers in top and bottom sections of front and rear panels.

F. Isolate cable compartments from bus compartments and leave ample space for cables or busways from above or below.

G. Phase bus material shall be copper.

H. Neutral bus material shall be copper.

I. Provide copper ground bus arranged for ground continuity between grounding bus, base, framework, and enclosing panels.

J. Neutral bus shall be same ampere capacity as phase buses.

2.3 PRIMARY INCOMING SECTION

A. Incoming section shall be medium voltage fusible switch in accordance with specification Section 26 1316 - Medium-Voltage Fusible Interrupter Switchgear.

2.4 TRANSFORMER SECTION

A. Transformer section shall be VPI dry type in accordance with specification Section 26 1216 - Dry-Type, Medium-Voltage Transformers.

2.5 LOW VOLTAGE SWITCHGEAR SECTION

A. Low voltage switchgear section shall be in accordance with specification Section 26 2300 - Low-Voltage Switchgear.

2.6 MULTIPLE SECTIONS

A. Section Assembly
   1. Sections shall be assembled at factory and tested by manufacturer.
   2. Sections and parts shall be match-mark to facilitate erection in field.

B. Cable and Bus Bar Connections
   1. Fusible Switchgear Section to Transformer Section
      a. Provide 15kV cable from load side of incoming section to transformer primary side.
         1). Cable size shall be 500kCMIL.
   2. Transformer Section to Low-Voltage Section
      a. Provide bus bar connection between transformer secondary side and Low Voltage Section.
         1). Bus bar shall be sized by manufacturer and is to be rated to meet the ampacity of 133% of transformer base rating for 40C ambient.

2.7 LABELING

A. Doors, hinged bolted panels, and screen doors giving access to high-voltage components or bus work shall be provided with "Danger - High Voltage" sign.

2.8 NAMEPLATE

A. Provide nameplates in accordance with Section 26 0553 - Electrical Systems Identification.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate final locations of equipment with General Contractor, and review final locations with Architect/Engineer prior to setting equipment.

B. Protect equipment during installation to prevent twisting or deformations, exposure to potentially damaging environments, and work of other trades. Maintain protection until completion of construction.

3.2 ACCEPTANCE TESTING

A. Testing by Testing Agency

B. Testing shall be performed in accordance with Section 26 0812 – Power Distribution Acceptance Tests.

3.3 ADJUSTMENTS AND CLEANING

A. Immediately prior to final inspection, make final adjustments and thoroughly clean equipment. Refinish damaged enclosures to original quality.

END OF SECTION

SECTION 26 1216

DRY-TYPE, MEDIUM-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0000 - General Electrical Requirements

B. Section 26 0553 - Electrical Systems Identification

C. Section 26 0812 - Power Distribution Acceptance Tests

D. Section 26 0813 - Power Distribution Acceptance Test Tables

E. Section 26 1116 - Secondary Unit Substations

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Specification covers dry type transformers, with primary voltage above 600 V, for unit sub station use. For use indoors.

1.4 REFERENCE STANDARDS

A. ANSI C57.12.50 - Requirements for Dry-Type Distribution Transformers, 1-500 kVA 1-phase and 15-500 kVA 3-phase, with high voltage 601 - 34,500 V, low voltage 120-1000 V

B. ANSI C57.12.51 - Dry-Type Power Transformers 501 kVA and Larger, 3-Phase with High-Voltage 601 to 34 500 V, Low-Voltage 208Y/120 to 4160 V, Requirements for Ventilated

C. ANSI C57.12.55 - Dry-Type Transformers in Unit Installations, Including Unit Substations - Conformance Standard

D. ANSI C57.12.70 - Terminal Markings and Connections for Distribution and Power Transformers

E. IEEE C57.12.01 - General Requirements for Dry-Type Distribution and Power Transformers Including Those with Solid Cast and/or Resin Encapsulated Windings

F. NEMA 5T20 - Dry Type Transformers for General Applications

G. UL 1561 - Dry Type General Purpose and Power Transformers

1.5 SUBMITTALS

A. Submit Shop Drawings for equipment provided under this Section.

B. Acoustical Sound and Vibration Test Data

1. Acoustical sound and vibration test data on manufactured unit.
   a. Test data sheets shall be submitted for review and approval by Owner and Architect/Engineer prior to shipment to job site.
   b. "Standard Test" data for like transformer design is not acceptable.
   c. Manufacturer shall provide 1 week advance notification of testing to Owner for opportunity for witnessing of testing.

C. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers:
   1. Square D -Schneider Electric
   2. ABB - General Electric
   3. Siemens
   4. Olsun Electrics
   5. Virginia Transformer

2.2 RATINGS

A. Ratings of transformer shall be as shown on drawings:
   1. Temperature Rise: 80C above ambient
   2. Primary: 12,470V – 95kV BIL
   3. Secondary: 480Y/277V – 30kV BIL
   4. Impedance: 5.75%

2.3 CONSTRUCTION

A. Transformer shall be cooled by natural air and forced air convection (AA/FA).
   1. Units shall include fans to increase kVA rating by 33%.
   2. Fan motors shall be 120 V with individual fusing.
   3. Dial type temperature gauge.
   4. Temperature monitor and fan control unit.
      a. Temperature monitor and fan control shall include:
         1). Digital readout.
         2). GREEN - power on, YELLOW - fan on, RED - high temperature indicating lights
         3). Audible high temperature alarm with alarm silence pushbutton
         4). Maximum temperature memory with read and reset switch
         5). Auto/manual fan control switch
         6). System test switch
         7). Auxiliary alarm contact for remote control and temperature monitoring

5. Temperature sensing in each coil.
6. Sequence of Operation
    a. Transformer operating below natural air convection cooling (AA) rating.
    b. GREEN light is activated
    c. Temperature rises to above natural air convection cooling (AA) rating
    d. Relay is energized, fans and YELLOW light activate.
    e. Temperature rises to higher set point, relay energizes and audible alarm, RED light, and circuit for remote alarms activates.
7. Control power shall be provided from internal control power transformer.

2.4 INSULATION TYPE VPI

A. Electrical Insulation
    1. Insulation system shall be rated 220°C.
    2. Temperature rise based on a 40°C ambient.
    3. Insulation shall be inorganic materials such as porcelain, glass fiber, electrical grade glass polyester, or Nomex.
    4. Coil assembly shall be Vacuum Pressure Impregnated (VPI) polyester.
    5. Transformer shall be:
        a. Designed for temperature rise of 80°C and shall be capable of operating at 33 % above base nameplate kVA capacity continuously.
        b. Designed to meet sound level standards for dry-type transformers.

2.5 CORE AND COIL

A. Coil
    1. Windings shall be 98% conductivity copper.

B. Core
    1. Constructed of high grade, grain oriented, non-aging silicon steel.

2.6 TAPS

A. Taps:
    1. +/- 2-1/2% taps with external handle for de-energized operation.
    2. Rigidly support
    3. Mark for connections
    4. Accessible from front or back by panel removal

2.7 ENCLOSURES

A. Transformer enclosure shall:
    1. Be constructed of 12 ga sheet steel.
    2. Be equipped with removable panels for access to core and coils.
    3. Include front and rear panels with ventilated grills.
    4. Include rubber isolation pads to isolate core from case. There shall be no metal-to-metal contact.

B. Finish
   1. Transformer enclosure and rails shall match switchgear color.

2.8 NAMEPLATE

A. Nameplates shall be:
   1. Secured to transformer enclosure with screws.

B. Transformer:
   1. Transformer shall have nameplate with:
      a. Manufacturer's name and drawing number.
      b. Electrical connection diagram
      c. Primary and secondary voltage rating
      d. kVA rating
      e. Basic Impulse Level

C. Doors:
   1. External doors and hinged bolted panels shall be provided with "Caution - High Voltage - Keep Out" signs.

D. Submit identification to Owner/Architect/Engineer for approval.

2.9 ACCESSORIES

A. Transformer shall include:
   1. Provisions for lifting and jacking
   2. Removable panel for access for de-energized tap changing
   3. Two ground pads.
   4. Threaded grounding lug.

PART 3 - EXECUTION

3.1 INSPECTION

A. Visually inspect equipment and components at time of delivery. Submit report to Owner/Architect/Engineer with list of items to be corrected.

3.2 INSTALLATION

A. Install equipment per manufacturer's recommendations and as indicated.

B. Coordinate final locations of equipment with Owner, and review final locations with Architect/Engineer prior to setting equipment.

C. Install transformer on concrete base on vibration isolation pads. Coordinate vibration mitigation requirements with project Structural Engineer.

D. Install transformer level and plumb.

3.3 FACTORY TESTING

A. The following standard factory tests shall be performed on equipment provided.
   1. Resistance measurements of windings and at the tap extremes of 1 unit only of a given rating on this project
   2. Ratio tests on the rated voltage connection and on all tap connections
   3. Polarity and phase-rotation tests
   4. No-load loss at rated voltage
   5. Excitation current at rated voltage
   6. Impedance and load loss at rated current and on the tap extremes of one unit only of a given rating on this project
   7. Applied potential test
   8. Induced potential tests
   9. Sound test
   10. Manufacturer shall provide copies of factory test reports to Engineer.

3.4 ACCEPTANCE TESTING

A. Testing by Testing Agency

B. Acceptance testing to be performed in accordance with Section 26 0812 - Power Distribution Acceptance Tests and Section 26 0813 - Power Distribution Acceptance Test Tables.

C. Equipment shall have passed applicable acceptance tests before energization.

D. Manufacturer's Field Service:
   1. Engage factory-authorized service representative to inspect and adjust field assembled components and equipment installation, including connections.
   2. Measure primary and secondary voltages and make appropriate tap adjustments.
   3. Provide 3 copies of manufacturer's representative's certification.

3.5 CLEANING OF TRANSFORMER

A. Clean transformer prior to initial testing and energization of unit, and again prior to final punch list.

B. Cleaning procedures shall be as follows:
   1. Vacuum surfaces of enclosure and transformer.
   2. Blow out components with dry compressed air.
   3. Use small paintbrush to dust small, hard to reach crevices.

END OF SECTION

SECTION 26 1316

MEDIUM-VOLTAGE FUSIBLE INTERRUPTER SWITCHGEAR

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0000 – General Electrical Requirements

B. Section 26 0513.16 – Medium-Voltage, Single-and-Multi-Conductor Cables

C. Section 26 0553 – Electrical Systems Identification

D. Section 26 1116 – Secondary Unit Substations

1.2 REFERENCE

A. Work under this section is subject to requirements of the Contract Documents including the General Conditions of the Contract, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Provide medium voltage load interrupter switchgear consisting of 3 pole, 1 throw, dead front, metal enclosed, load interrupter switches, fuses and necessary accessory components, factory assembled and operationally checked.

1.4 REFERENCE STANDARDS

A. ANSI/IEEE C37.20.3 - Metal-Enclosed Interrupter Switchgear

B. ANSI/IEEE C37.20.4 - Indoor AC Medium-Voltage Switches used in Metal-Enclosed Switchgear

C. ANSI C37.57 - Metal-Enclosed Interrupter Switchgear Assemblies - Conformance Testing

D. ANSI/IEEE C62.11 (1999) - Metal Oxide Surge Arresters for AC Power Circuits (>1 kV)

E. NEMA SG5 - Power Switchgear Assemblies

F. NEMA SG6 - Power Switching Equipment

1.5 SUBMITTALS

A. Shop Drawings:
   1. Submit shop drawings for equipment provided under this Section.

B. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

1.6 QUALITY ASSURANCE

A. Obtain switchgear from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver switchgear individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.8 WARRANTY

A. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.9 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.
   1. Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Acceptable Manufacturers:
   1. S&C
   2. Cutler-Hammer
   3. Square D – Schneider Electric
   4. Siemens

2.2 RATINGS (12,470V System)

A. Nominal System Voltage: 15 kV 3-phase, 3wire, grounded, 60 Hz

B. Maximum Design Voltage: 15 kV

C. Basic Impulse Level: 95kV

D. Main Bus Ampacity: 600A, continuous

E. Short Circuit Current Rating: 40kA, rms asym

F. Short-Time Current (Two Second): 25 kA, rms sym

G. Momentary Current: (10 Cycles): 40kA, rms asym

2.3 CONSTRUCTION

A. Enclosure
1. Provide NEMA 1 enclosure consisting of self-supporting floor-mounted equipment bays.
2. Each equipment bay shall be separately constructed cubicle.
3. Integrated switchgear assembly shall safely withstand effects of closing, carrying and interrupting currents up to maximum short circuit rating.
4. Enclosure, covers, doors shall be minimum 12 ga steel.
5. Provide a removable top cover and removable rear cover for each vertical section.
6. Provide a single full length, flanged front door equipped with 2 rotary latch type pad lockable handles for each vertical section.
7. Viewing window shall be installed to enable visual inspection of the disconnect blades through the closed door.

B. Bus
1. Phase buses shall be silver plated copper, rated 600 amperes.
2. Provide continuous silver plated copper ground bus through switchgear assembly. Connect bus to steel frame of vertical section
3. Size ground bus for rated (2-second) current of switchgear.
4. Drill main bus and ground bus for future extensions.
5. Cutout areas with removable covers for future extension of busses.

C. Load Interrupter Switch
1. Load interrupter switch:
a. Fixed mounted, manual 3-pole gang operated
b. Quick-make, quick-break over-toggle-type mechanism with speed of operation independent of operator
c. Separate main and break contacts
d. Insulating barriers between phases and between phases and enclosure
e. OPEN and CLOSED switch position indicators
f. Provisions for pad locking switch in open or closed positions.

D. Switch Operators
1. Isolate spring operator assembly from high voltage and couple through direct drive shaft.
2. Switch operating handle:

a. Permanently attached to front of switchgear
b. Covered by full height solid door for outdoor applications

2.4 FUSES

A. Current-Limiting type fuses
1. Fuse ampacity: as shown on drawings
2. Provide fuses rated for corresponding voltage class

2.5 SURGE ARRESTERS

A. Provide surge arrestors on all switches.

B. Surge arresters shall be rated to match the corresponding L-N voltage for each voltage class.

C. Provide fully shielded, dead front, metal-oxide, elbow type surge arrester with resistance-graded gap suitable for plugging into inserts.

D. Connect primary surge arrestors using manufacturer’s jumper cables.

2.6 WIRING TERMINATIONS

A. Provide wiring, terminal blocks and fuse blocks within vertical section as required.

B. Label control wiring with wire markers.

C. Provide wire termination system such that no additional cable bracing, tying or lashing is required to maintain short circuit withstanding rating of assembly.

D. Equip each cubicle section that contains lugs for incoming and/or outgoing feeders with horizontal cable supports.

E. Provide loop feed bus connections where indicated on drawings.

2.7 NAMEPLATE

A. Nameplates:
1. Engraved with 2” high black lettering on laminated plastic white background.
2. Secured to switchgear enclosure with screws.

B. Switchgear Assembly:
1. Provide nameplate indicating:
a. Manufacturer's name and drawing number
b. Voltage ratings (kV nominal; kV maximum design; kV BIL)
c. Main bus continuous rating (amperes)
d. Short circuit ratings (amperes, rms symmetrical and Mva 3-phase symmetrical at rated nominal voltage)
e. Monetary and fault-closing ratings (amperes, rms asymmetrical)
2. Provide nameplate in each bay indicating:
a. Ratings of interrupter switch (amperes continuous and interrupting)

b. Maximum rating of power fuse in amperes
c. Catalog number of fuse units or refill units

3. Mark control components for identification corresponding to designation on manufacturer's drawings.

2.8 ACCESSORIES

A. Control Power Transformer
1. Single phase
2. Primary disconnect fuse
3. 240/120 VAC secondary
4. Sized 200% of control power load

B. Provide key interlock system for interlocking multiple incoming switches on common bus.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Visually inspect to confirm that all items and accessories are in accordance with specifications and drawings.

B. Verify field measurements are as shown on shop drawings.

3.2 INSTALLATION

A. Install equipment per manufacturer's recommendations and as indicated.

B. Coordinate final locations of equipment with Owner and review final locations with Architect/Engineer prior to setting equipment.

C. Protect equipment during installation to prevent twisting or deformations, exposure to potentially damaging environments, and work of other trades. Maintain protection until completion of construction.

D. Verify tightness of accessible bolted bus joints with torque wrench prior to energizing switchgear. Tightness shall be in accordance with manufacturer's recommended values.

E. Conductor Bending
1. Bending of high-voltage cables should be avoided or minimized.
2. Necessary bends should meet minimum radii specified by cable manufacturer.

3.3 ACCEPTANCE TESTING

A. Testing by Testing Agency

B. Acceptance testing shall be performed in accordance with Section 26 0812 – Power Distribution Acceptance Tests.

C. Manufacturer's Field Service:

1. Engage factory-authorized service representative to inspect and adjust field assembled components and equipment installation, including connections.
2. Prior to energization, factory representative shall visually inspect switchgear installation to insure that switches and motor operators are operable and bus connections are complete.
3. Switch operators shall be tested minimum of 1 time after energization.
4. Measure primary and secondary voltages and make appropriate tap adjustments.
5. Provide 3 copies of manufacturer's representative's certification.

3.4 CLEANING

A. Switchgear shall be cleaned during construction phase, prior to initial testing and energization of unit, and prior to final punch-list.

3.5 TRAINING

A. Provide services of factory-trained representative to instruct Owner on maintenance and operation for period of 4 hours.

END OF SECTION

SECTION 26 2200

LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 25 0533 – Raceway and Boxes for Electrical Systems

E. Section 26 0553 – Electrical Systems Identification

F. Section 26 0812 – Power Distribution Acceptance Tests

G. Section 26 0813 – Power Distribution Acceptance Test Tables

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes dry type distribution and buck-boost transformers rated 600V and less, with capacities up to 500 kVA.

1.4 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting

B. IEE C57.12.91 – Test Code for Dry Type Distribution and Power Transformers

C. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

D. NEMA ST 1 – Specialty Transformers (except General Purpose Type)

E. NEMA ST 20 – Dry-Type Transformers for General Applications

F. NFPA 70 – National Electrical Code

G. UL 506 – Specialty Transformers

H. UL 1561 – Dry-Type General Purpose and Power Transformers

I. 10 CFR 431.192 – DOE Efficiency Standard for Distribution Transformers

1.5 SUBMITTALS

A. Product Data:
   1. Include rated nameplate data, capacities, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.

B. Shop Drawings:
   1. For each transformer size and type:
      a. Physical dimensions, including bolting templates, weight, and center of gravity
      b. Winding and termination material
      c. Loads, method of field assembly, components, and location and size of each field connection
      d. Wiring Diagrams: Power, signal, and control wiring
      e. kVA rating
      f. Primary taps
      g. Insulation class and temperature rise
      h. Efficiency values measured at 0, 25, 50, 75, and 100% load
      i. Impedance value – X/R and %Z
      j. Sound level
      k. “K” factor listing, where applicable

C. Submit 1/4” scale electrical room floor plans with transformer locations.

D. Manufacturer’s Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

E. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

F. Output Settings Report: Record output voltages and tap settings.

G. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of transformers.
   2. Operation and Maintenance Data:
      a. Include manufacturer’s recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include spare parts data listing, source, and current prices of replacement parts and supplies.
      c. Include in emergency, operation and maintenance manuals.
      d. Include manufacturer’s Seismic Qualification Certification, Installation Seismic Qualification Certification, manufacturer’s Ultra Quiet Transformers Sound Level Certification, where applicable, and Output Settings Report.

1.6 QUALITY ASSURANCE

A. Obtain transformers from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.
   3. Comply with 10 CFR 431.192 for minimum efficiency standards.

C. Certifications:
   1. Furnish Engineer with manufacturer's Ultra Quiet Transformers Sound Level Certification, where applicable: Submit certification that ultra quiet transformers have sound level not exceeding 35 dB. Submit for each ultra quiet transformer. Include the following:
      a. Basis for Certification: Indicate whether certification is based on actual test of assembled components or on calculations.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D – Schneider Electric

B. ABB – General Electric

C. Siemens

2.2 DISTRIBUTION TRANSFORMERS

A. Fabrication:
   1. NEMA ST 20, UL 1561
   2. Factory assembled and tested

3. Air-cooled, for 60 Hz service
4. Two winding dry type
5. Coils:
   a. Continuous wound construction and impregnated with non-hydroscopic, thermosetting varnish.
   b. Conductors: Continuous windings without splices, except for taps, and encapsulated wire resin compound to seal out moisture and air.
   c. Winding Materials: Copper
   d. Separate primary and secondary
   e. Internal Connections: Braised or pressure type
6. Cores: High-grade silicon steel, non-aging, with high magnetic permeability, low eddy current losses and low hysteresis. Magnetic flux densities below saturation point. Core laminations clamped with steel members, one leg per phase.
7. Rubber vibration absorbing mounts to isolate base of enclosure from core and coil assembly.
8. Transformer neutral visibly grounded to enclosures with flexible grounding conductor.

B. Enclosure:
1. NEMA 250
2. Type 2, unless otherwise indicated to comply with environmental conditions at installed location.
3. Code-gauge steel panel over core and coil.
4. Ventilated (air-cooled).
5. Cooling and terminal chamber access with both sides and rear obstructed.
6. Manufacturer’s lifting eyes or brackets.
7. Finish: Manufacturer’s standard gray enamel over prime coat after being degreased, cleaned, and phosphatized.

C. Ratings:
1. KVA Rating: 500 kVA maximum
2. Primary Voltage: As indicated on drawings.
3. Secondary Voltage: As indicated on drawings.
4. Insulation Class and Winding Temperature Rise:
   a. Transformers 15kVA and smaller: Class 220°C with 150°C temperature rise above 40°C ambient temperature.
   b. Transformers 25kVA – 112.5kVA: Class 220°C, with 115°C temperature rise above 40°C ambient temperature.
   c. Transformers above 112.5kVA: Class 220°C, with 80°C temperature rise above 40°C ambient temperature.
5. Top of Enclosure Temperature: Maximum 35°C above 40°C ambient temperature at warmest point at full load.
6. K-Factor Rating: UL 1561, as indicated on drawings.

D. Primary Taps:
1. Transformers rated less than 3kVA: None.
2. Transformers rated 3kVA - 15kVA: One 5% above and one 5% below normal full capacity.

3. Transformers rated 15kVA and larger: Two 2.5% above and two 2.5% below normal full capacity, minimum of four taps.

E. Energy Efficiency:
   1. Transformers rated 15kVA and larger, except K-rated, quiet type and ultra quiet type:
      a. 10 CFR 431.196 (a) (2) compliant

F. Sound Levels:
   1. NEMA ST 20, maximum average sound levels as follows:
      a. 45 dB for general-purpose transformer sizes less than 51kVA.
      b. 50 dB for general-purpose transformer sizes 51-150kVA.
      c. 55 dB for general-purpose transformer sizes 151-500kVA.

2.3 LUGS

A. Manufacturer's primary and secondary bolted lugs: labeled for 75°C copper and aluminum conductors for ventilated enclosures.

B. Connections at sides near bottom, accessible from front of cabinet.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure and ambient temperature requirements for each transformer.

B. Examine areas and surface to receive transformers for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Verify space indicated for transformers' mounting meets code-required working clearances.

D. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

E. Verify that ground connections are in place and requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems have been met.

F. Purchase manufacturer's "touch-up" paint kit for repainting.

3.2 INSTALLATION

A. Install transformers in accordance with ANSI/NECA 1.

B. Install level and plumb within 1/2 degree, and at least 6" from the adjacent wall or structure to insure proper ventilation, in accordance with manufacturer's written instruction, and in compliance with recognized industry practices.

C. Transformer mounting:
   1. Mount transformers as indicated on plans.
   2. Floor mounting:

a. Secure to floor via isolation pads between floor brackets (fabricated by manufacturer) and transformer.
b. Mount on vibration dampening laminated rubber/cork pad.

3. Wall mounting:
   a. Secure to concrete-and-block wall via isolation pads between wall brackets (fabricated by manufacturer) and transformer.
   b. Secure to gypsum walls with independent steel slotted channel supports, secured to floor via isolation pads between wall brackets (fabricated by manufacturer) and transformer.
   c. Mount on vibration dampening laminated rubber/cork pad.
4. Suspended mounting:
   a. Suspend transformer enclosures designed for floor mounting, where suspended from structural ceiling, via trapeze constructed of steel slotted channel support system hung via 1/2" minimum steel threaded hanger rods attached to structural members or inserts in structural slab. Each rod to contain spring isolator ceiling hanger. Use locking type nuts in assembly.
   b. Anchor and fasten transformers and their supports to building structural elements by the methods described in Section 26 0529 – Hangers and Supports for Electrical Systems.

D. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplate to transformer using small, corrosion-resistant metal screws or rivets with methods and location not to violate the rating of the enclosure. Do not use contact adhesive.
   1. Indicate kVA rating, voltage/phase rating for primary and secondary.
   2. Identify source and load.

E. Connect each transformer to rigid conduit system with maximum 36" of flexible liquid-tight metal conduit. Install conduit per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

F. Install transformer in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

3.3 CONNECTIONS

A. Ground transformers according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.4 FIELD QUALITY CONTROL

A. Inspect transformers for physical damage, proper alignment, anchorage, grounding, connections, and installation.

B. Test transformers per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Output Settings Report: Prepare a written report recording output voltages and tap settings and submit to Engineer.

3.5 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.6 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 h of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10% and not being lower than nameplate voltage minus 3% at maximum load conditions.

3.7 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 26 2300
LOW-VOLTAGE SWITCHGEAR

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0553 – Electrical Systems Identification

E. Section 26 0812 – Power Distribution Acceptance Tests

F. Section 26 0813 – Power Distribution Acceptance Test Tables

G. Section 26 2713 – Electrical Metering

H. Section 26 2813 – Fuses

I. Section 26 4300 – Surge Protective Devices

1.2 DESCRIPTION

A. Section includes free-standing, dead-front type, metal-enclosed, low-voltage distribution switchgear.

1.3 REFERENCE STANDARDS

A. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures

B. IEEE C37.20.1 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

C. IEEE C37.90 – Relay and Relay Systems Associated with Electric Power Apparatus

D. IEEE C62.41.1 Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits

E. IEEE C62.41.2 Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits

F. NFPA 70 – National Electrical Code

G. NEMA 2250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

H. UL 486A-486B – Wire Connectors

I. UL 869A – Reference Standard for Service Equipment

J. UL 1066 – Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures

K. UL 1558 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

1.4 SUBMITTALS

A. Product Data: For switchgear, components and accessories indicated:
   1. Include data on features and components and complete description; submit catalog cut sheets showing voltage, size, rating and size of surge protective devices, switching and overcurrent protective devices.
   2. Features, characteristics, factory settings and time-current curves of individual protective devices, auxiliary components and ground fault relaying.

B. Shop Drawings:
   1. For switchgear specified in this Section:
      a. General Arrangement:
         1) Indicate front, plan, and side views of switchgear; access requirements; overall dimensions and components list; shipping splits and weights.
         2) Front elevation indicating location of devices and instruments.
         3) Sections through switchgear showing space available for conduits.
      b. Conduit entrance locations and requirements
      c. Nameplate legends
      d. Configuration, size and number of bus bars for each phase and current rating of buses
      e. Ground bus
      f. Neutral bus
      g. Short circuit ratings of switchgear and overcurrent protective devices, and bus withstand rating
      h. Instrument details; enclosure types and details
      i. Wiring diagrams: power, signal and control wiring
      j. Utility company's metering provisions with indication of approval by utility company
      k. Mimic-bus diagram; samples: representative portion of mimic bus with specified finish, for color selection
   2. Submit 1/4" scale floor plans with switchgear location and required clearances and service space around equipment.

C. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Complete review of this specification noting for each paragraph whether proposed equipment complies with project specifications or deviates. Justification must be given for each deviation.

F. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations, configurations, and ratings of switchgear and major components on single-line diagrams and plan layouts.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.
      c. Include spare parts data listing, source, and current prices of replacement parts and supplies.
      d. Include time-current curves, including selectable ranges for each type of overcurrent protective device.

1.5 QUALITY ASSURANCE

A. Obtain switchgear from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver switchgear in 36" maximum width shipping splits, individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.7 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.8 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.
   1. Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.
   2. Control-Power Fuses: Equal to 10% of amount installed for each size and type, but no fewer than 2 of each size and type.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D – Schneider Electric

B. ABB – General Electric

C. Siemens

2.2 RATINGS

A. Nominal system voltage: 480Y/277V.

B. Main bus continuous amperes: As indicated on the drawings.

C. Short circuit current rating: As indicated on drawings.

D. Brace switchgear components to withstand mechanical forces for symmetrical fault current shown.

2.3 CONSTRUCTION

A. IEEE C37.20.1, UL 1558.

B. Free-standing, dead-front type; metal-enclosed; side, front and rear panels of one-piece welded or bolted construction; compartments with ventilation louvers in top and bottom sections of front and rear panels; supporting frame: steel channels rigidly fastened together, with same outside dimensions as the enclosure.

C. Adequate strength and rigidity necessary to resist conditions of use to which it may be subjected and to support equipment, devices and appurtenances contained therein.

D. Incoming lug locations: bottom, as applicable per drawings.

E. Connection to the supply source by conduit and wiring. UL service entrance label.

F. Environmental Limitations:
   1. Ambient temperatures: not exceeding 40°C
   2. Altitude: Not exceeding 600 ft.

3. Temperature rise: Not to exceed 65°C over a 40°C ambient environment, with no derating required.

G. Device Mounting and Type:
1. Front and rear accessible switchgear: Front and rear aligned.
a. Main device and feeder devices: Drawout and compartmented power circuit breakers.

H. Bus:
1. Material: Copper with tin plating; copper: 98% conductivity.
2. Connections: Accessible from rear only for maintenance.
a. Bolted:
1) Not fewer than 4 bolts for each 4″ x 4″ contact
2) Not fewer than 2 bolts for each 2″ x 2″ contact
3) Grade 5 bolts and conical spring-type washers
3. Sizing: Standard size, based on 65°C over 40°C; full capacity of the breaker frame size, not the trip setting; fully rated vertical and horizontal bus sections.
4. Main Phase Buses: Three phase, 4 wire; uniform capacity for entire length of switchgear; ampacity as indicated on drawings; rated for the main protective device frame size or main incoming conductors.
5. Bus Arrangement: A-B-C (left to right, top to bottom, front to rear).

I. Ground Bus: Extend length of switchgear.
1. 800 amp, hard-drawn copper of 98% conductivity, equipped with pressure connectors for feeder ground conductors.

J. Neutral Bus: 100% of the ampacity of phase buses, equipped with pressure connectors for outgoing circuit neutral cables. Bus extensions for busway feeder neutral bus are braced.

K. Hinged Front Doors: Allow access to metering, accessory, and blank compartments, with latch and padlocking provisions.

L. Removable, Hinged Rear Doors and Compartment Covers: Secured by standard bolts, for access to rear interior of switchgear, with latch and padlocking provisions.

M. Circuit breaker compartment: Equipped to house drawout type circuit breakers, fitted with hinged outer doors, and segregated from adjacent compartments by steel barriers; equipped with drawout rails, levering out mechanism, primary and secondary contacts; The following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.

N. Section barriers between main circuit breakers compartments: Extended to rear of section; rear compartment barrier between the cable compartment and the main bus; glass polyester barrier between adjacent vertical structures in the cable compartment.

O. Bus isolation barriers: Arranged to isolate line bus from load bus at each main circuit breaker; separate barriered compartment for current and potential transformers; main and riser buses fully isolated from breaker instrument and auxiliary compartments.

P. Bus bars connect: Between vertical sections and between compartments. Cable connections are not permitted.

Q. Safety shutter: To automatically cover line and load stubs to protect against accidental contact.

R. Provide a 4" diameter polymer lens infrared (IR) scanning window for each set of circuit breaker terminations, mounted on cable compartment door.

S. Metering Compartment: Fabricated compartment barriered from the rest of the section, with a hinged lockable front cover and removable bus links, complying with utility company's requirements. If separate vertical section is required for utility metering, match and align with basic switchgear. Metering equipment: Provisions for mounting current transformers and potential transformers; meter base(s), metering conductors and miscellaneous appurtenances required by serving utility.

T. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchgear.
   1. Pull Section: Size as indicated on drawings, depth and height to match switchgear.

U. Pull Box on Top of Switchgear:
   1. Adequate ventilation to maintain temperature in pull box within same limits as switchgear.
   2. Removable top, front, and sides, same construction as switchgear.
   3. Insulating, fire-resistive bottom with separate holes for cable drops into switchgear.
   4. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.

V. Spare circuit breakers and spaces for future circuit breakers: Allowance in vertical section bus size.

W. Future Provisions: Fully equip spaces for future devices with bussing, bus connections, rails, mounting brackets, supports, and appurtenances, insulated and braced for short circuit currents, with continuous current rating of 800A. Extension of phase, neutral, and ground buses from both ends by means of predrilled bolt-holes and connecting links.

X. Adequate lifting means.

Y. Dimensions: 90" maximum height, excluding floor sills, lifting members and pull boxes; 84" depth; Length as required.

Z. Line and Load Terminations: Compression type, labeled for 75°C copper and aluminum conductors; suitable for number, sizes and trip ratings; feeder load terminals: tin-plated copper bus extensions equipped with pressure connectors for incoming and outgoing circuit conductors.

AA. Bus-Bar Insulation: Individual bus bars wrapped with factory-applied, flame-retardant tape or spray-applied, flame-retardant insulation, or fluidized epoxy coating. No live connections shall be accessible from the rear, except the breaker load side terminals.

1. Sprayed Insulation Thickness: 3 mils, minimum.
2. Bolted Bus Joints: Insulate with secure joint covers that can easily be removed and reinstalled.
3. Breaker run-back customer cable terminations: Provide two-part, removable insulated boots to cover exposed buswork and cable lugs.

BB. Relays: IEEE C37.90; types and settings as indicated; with test blocks and plugs.

CC. Enclosure: Steel, NEMA 250, Type 1:

1. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
2. Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer's standard color, undersurfaces treated with corrosion-resistant undercoating.

DD. Mimic Bus: Continuously integrated mimic bus factory applied to front of switchgear. Arrange in single-line diagram format showing bussing, connections and devices, using symbols and letter designations consistent with final mimic-bus diagram. Use black color plastic strips fastened flat against panel face with corrosion-resistant screws and rivets. Coordinate mimic-bus segments with devices in switchgear sections to which they are applied. Produce a concise visual presentation of principal switchgear components and connections. For double-ended switchgear provide blue mimic bus for the left side and red for the right side.

2.4 SERVICE ENTRANCE

A. UL 869A

B. Switchgear labeled as suitable for use as service entrance equipment, where applicable, with incoming line isolation barriers, and a removable neutral bond to switchgear ground for solidly grounded wye systems.

C. Bond Neutral bus to ground bus with removable jumper sized in accordance with NEC 250.66. Label jumper "Neutral-Ground Bonding Jumper - Do Not Remove Without Engineering Approval".

D. Surge arrestors on all phases per requirements in Section 26 4300 – Surge Protective Devices.

2.5 SHORT CIRCUIT CURRENT RATING

A. Switchgear with minimum short circuit current rating as indicated on drawings.

B. Switchgear: Marked with their maximum short circuit current rating at supply voltage.

C. Switchgear: Fully rated

2.6 SURGE PROTECTIVE DEVICES (SPD)

A. IEEE C62.41.1; integrally mounted, plug-in style, solid-state, parallel-connected, sine-wave tracking suppression and filtering modules.

B. Per requirements in Section 26 4300 – Surge Protective Devices.

2.7 OVERCURRENT PROTECTIVE DEVICES

A. Insulated Case Circuit Breaker and Accessories: ANSI C37.13, UL 1066:

1. Ratings: As indicated for continuous, interrupting, and short-time current ratings for each circuit breaker; voltage and frequency ratings same as switchgear.
2. Operating Mechanism: Mechanically and electrically trip-free, stored-energy operating mechanism with the following features:
   a. Normal Closing Speed: Independent of both control and operator.
   b. Slow Closing Speed: Optional with operator for inspection and adjustment.
   c. Store-Energy Mechanism: Manually charged.
   d. Means for manual opening and closing.
   e. Operation counter.
3. Trip Devices: Electronic (solid-state, microprocessor-based), overcurrent trip-device system consisting of one or two current transformers or sensors per phase, a release mechanism, and the following features:
   a. Functions: Long-time pickup and delay, short-time pickup and delay, ground-fault pickup and delay and instantaneous-trip functions, independent of each other in both action and adjustment.
   b. Temperature Compensation: Ensures accuracy and calibration stability from 23°F to 104°F.
   c. Field-adjustable time-current characteristics.
   d. Current Adjustability: Dial settings and ratings plugs on trip units or sensors on circuit breakers, or a combination of these methods.
   e. Three bands, minimum, for long-time- and short-time-delay functions; marked "minimum," "intermediate," and "maximum."
   f. Pickup Points: Five minimum, for long-time- and short-time-trip functions. Equip short-time-trip function for switchable I^2t operation.
   g. Pickup Points: Five minimum, for instantaneous-trip functions.
   h. Trip Indication: Labeled, battery-powered lights or mechanical targets on trip device to indicate type of fault.
   i. Power measurement trip module with BACnet and Modbus communications protocol connection with the following features:
      1) True RMS sensing
      2) LCD Backlit display
      3) Display and communicate over Modbus and BACnet
         a) Power (Real and Apparent)
         b) Voltage (P-P, P-N)

c) Amperage per phase and neutral
d) Power factor

4. Auxiliary Contacts: For interlocking or remote indication of circuit breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit breaker operation. Each consists of two type "a" and two type "b" contacts wired through secondary disconnect devices to a terminal block in stationary housing; "a" contacts mimic circuit breaker contacts, "b" contacts operate in reverse of circuit breaker contacts.

~~4.~~a. *Provide interface with BAS system to enable remote viewing of Main and Tie breakers for each Switchgear lineup.*

5. Drawout Features: Circuit breaker mounting assembly equipped with a racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:
   a. Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.
   b. Circuit Breaker Positioning: An open circuit breaker may be racked to or from connected, test, and disconnected positions only with the associated compartment door closed unless live parts are covered by a full dead-front shield. An open circuit breaker may be manually withdrawn to a position for removal from the structure with the door open. Status for connection devices for different positions includes the following:
      1) Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.
      2) Disconnected Position: Primary and secondary devices and ground contact disengaged.
6. Arc Chutes: Readily removable from associated circuit breaker when it is in disconnected position and arranged to permit inspection of contacts without removing circuit breaker from switchgear.
7. Padlocking Provisions: For installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.
8. Operating Handle: One for each circuit breaker capable of manual operation.
9. Electric Close Button: One for each electrically operated circuit breaker.
10. Mechanical Interlocking of Circuit Breakers: Uses a mechanical tripping lever or equivalent design and electrical interlocks.
11. Key Interlocks: Arranged so keys are attached at devices indicated. Mountings and hardware are included where future installation of key interlock devices is indicated.
12. Shunt-Trip Devices: Where indicated.
13. Indicating Lights: To indicate circuit breaker is open or closed, for main and bus tie circuit breakers interlocked wither with each other or with exterior devices.
14. Communication Capability: Integral communication module with functions and features compatible with power monitoring requirements.
15. Zone-Selective Interlocking: Where Indicated: Integral with electronic trip unit; for interlocking ground fault protection function, and/or short time function.

16. Control Voltage: 120VDC.
17. Listed for 100% of breaker's continuous ampere rating.

B. Ground Fault protection equipment on breakers, where indicated: Integrally mounted relay and trip unit, push-to-test feature and ground fault indicator:
   1. Ground-fault protection with at least three adjustable short-time-delay settings and three trip-time-delay bands; adjustable current pickup with maximum setting of 1200 A. Arrange to provide protection for the following:
      a. Four-wire circuit or system
   2. Trip units shall be capable of the following types of ground-fault protection: source ground return. Ground-fault sensing systems shall be field adjustable and replaceable.
   3. Neutral current transformers shall be provided for 4-wire system.
   4. Ground-fault settings for circuit breaker sensor sizes 1200 A or below shall be in nine bands from 0.2 to 1.0 times In. The ground-fault settings for circuit breakers above 1200 A shall be in minimum three bands up to 1200 A.
   5. Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and 3-phase current transformer/sensor.

C. Arc Energy Reduction
   1. Where the highest continuous current trip setting for which the actual overcurrent device is rated or can be adjusted is 1200A or higher, an energy-reducing maintenance switch with local status indicator shall be provided.

2.8 ATO, CONTROL POWER, COMPONENTS IDENTIFICATION, AND CONTROL WIRING

A. Control Circuits: 120V, supplied through secondary disconnecting devices from control-power transformer: Dry-type transformers in separate compartments for units larger than 3 KVA, including primary and secondary fuses. Provide dual control power supplies for double-ended switchboards. Control power connections to the bus are to be on the line side of the main disconnecting device for each incoming source.
   1. Provide AC-DC rectifier, DC Best Battery Selector and DC-DC converter as indicated in ATO Detail Diagram.

B. Electrically Interlocked Main and Tie Circuit Breakers: Two control-power transformers in separate compartments, with interlocking relays, connected to the primary side of each control-power transformer at the line side of the associated main circuit breaker. 120 V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.

C. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

D. Control components mounted within assembly, such as relays, pushbuttons, switches etc.: Suitably marked for identification, corresponding to appropriate designations on manufacturer's wiring diagrams.

E. Control Wiring: Factory installed, with bundling, lacing, and protection included; flexible conductors for #8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units; insulated locking spade terminals for control connections, except where saddle type terminals, integral to a device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving switchgear, with wire markers at each end of control wiring.

F. Control power to supply individual circuit breaker trip unit. Coordinate supply voltage and current requirements with trip unit. No more than four (4) trip units are to be daisy chained together from the same source wiring and each vertical section is to have its own dedicated wiring back to control power source. For double ended systems, provide a minimum of two control power sources to supply the left and right halves of the switchboard. The tie breaker trip unit is to be connected to both power supplies.

G. Communications Gateway: Provide network switch and gateway to collect individual trip unit and meter network connections to allow for a single network connection to customer's LAN and/or BAS system. Coordinate requirements with LAN system administrator and BAS system provider. Gateway is to be powered from switchboard control power source. Gateways in double-ended switchboards are to be powered from both incoming source control power supplies.

H. Automatic-Throw-Over (ATO) Controller (where indicated on single-line diagram):
   1. Microprocessor-based, or PLC-based controller for monitoring and controlling main and tie breakers. HMI is to be provided to allow operator to monitor system position, utility availability, set parameters, and control circuit breakers manually.
   2. ATO controller to electrically interlock and electrically operate main and tie breakers.
   3. ATO controller to monitor line and load side of main breakers.
   4. ATO controller to monitor both bus sides of tie breaker.
   5. ATO controller to monitor position of main and tie breakers.
   6. ATO controller is to have programmable pick-up and drop-out settings for voltage and frequency and programmable transition delay settings.
   7. ATO to receive control power from control power transformers in switchgear (originating from both sides to allow for single source outage).
   8. Provide all necessary relays for bus synchronization check and system protection.
   9. Sequence of Operations:
      a. Normal condition is with main breakers closed and tie breaker open.
      b. The tie breaker is allowed to be closed by the ATO controller manually if the controller detects the two sources to be synchronized. The user is to indicate which main breaker is to be opened prior to the tie breaker being closed. The ATO controller is to automatically close the tie breaker before opening the selected main breaker (closed transition).
      c. If the two sources are not synchronized, the closed transition function is to be prohibited by the ATO controller.
      d. A normal power failure on one or both sources is detected by ATO controller. If both sources are lost, system remains in last set position.

e. If a single source is lost, that source breaker is opened, and the tie breaker is closed. The HMI screen is to indicate the source status (available, unavailable) and circuit breaker positions at all times.

f. After a return of both sources, the status screen HMI indicates both sources are available.

g. The ATO controller and/or synch check relay checks synchronization of the two sources.

h. If the two sources are synchronized, the open source breaker can be allowed to close before the tie breaker is opened (closed transition).

i. If the two sources are not synchronized, the ATO controller prohibits the open source breaker from being closed until the tie breaker is opened (open transition).

j. A return to normal condition is initiated after a programmed delay period. If one or both sources are lost during the delay period, the delay clock starts over.

k. Upon detection of loss of control power from station battery, ATO controller is alarm from internal super-capacitor source for 30 min and close a form-c contact for remote monitoring.

l. Refer to drawings for additional requirements.

I. 125V DC Battery Plant

1. Provide sufficient lead-calcium batteries to support ATO and protection relays in a standby mode for a period of 8 hours.
2. Provide charger to support battery plant with voltage and charge current meter. Charger is to be sized to charge plant from a discharged state to fully charged state in 8 hours.
3. Provide normally open and normally closed contacts that function when the plant voltage drops below 15% of fully charged state and charger is not functioning.
4. Provide epoxy-coated, steel rack for batteries.

2.9 ACCESSORY COMPONENTS AND FEATURES

A. Furnish portable test set to test functions of circuit breakers and solid-state trip devices without removal from switchgear. Include relay and meter test plugs suitable for testing switchgear meters and switchgear class relays.

B. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

C. Furnish one portable, floor-supported, roller-based, elevating carriage arranged for movement of circuit breakers in and out of compartments for present and future circuit breakers.

D. Furnish overhead circuit-breaker lifting devices, mounted at top front of switchgear, with hoist and lifting yokes matching each drawout circuit breaker.

E. Furnish set of tools for manually charging circuit breaker stored energy device.

F. Furnish racking handle to manually move circuit breaker between connected and disconnected positions.

G. Lockout Devices: Circuit breakers with integral, lockout/tagout devices.

2.10 METERING

A. Per requirements in Section 26 2713 – Electrical Metering.

PART 3 - EXECUTION

3.1 COORDINATION

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:
   1. Concrete: Per requirements in Division 03 – Concrete.
   2. Dimensions: Per requirements in Section 26 0529 – Hangers and Supports for Electrical Systems.

C. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

D. Coordinate utility company metering equipment requirements.

E. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.2 EXAMINATION

A. Examine areas and surface to receive switchgear for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for switchgear mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install switchgear in accordance with applicable portions of ANSI/NECA 400.

B. Switchgear mounting
   1. Bolt switchgear to concrete housekeeping pads, using anchor bolts in accordance with Section 26 0529 – Hangers and Supports for Electrical Systems. Cast anchor bolt inserts into pads.

C. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification for switchgear, every instrument, overcurrent protective device and disconnect device. Attach nameplate to exterior of switchgear using small corrosion-resistant metal screws and rivets. Do not use contact adhesive. Indicate switchgear manufacturer's name and drawing number, name, amperage, voltage, phase, number of wires, short circuit current rating (amp, RMS symmetrical and MVA 3-phase symmetrical) and momentary and fault-closing ratings (amp, RMS asymmetrical). For each overcurrent protective device and disconnect device, include circuit, load and area served, voltage/phase rating, and fuse size and type, when applicable.

D. Provide framed, printed operating instructions for switchgear, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of switchgear.

E. Install switchgear in dedicated electrical space per NFPA 70, and as indicated on drawings.

F. Tighten electrical connectors and terminal according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

G. Install control power fuses at job site per requirements in Section 26 2813 – Fuses.

H. Connect surge protective devices to switchgear bus per requirements in Section 26 4300 – Surge Protective Devices.

I. Install utility company metering equipment, devices and wiring in conformance with serving utility requirements.

J. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

K. Apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.4 CONNECTIONS

A. Ground switchgear according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 FIELD QUALITY CONTROL

A. Inspect switchgear for physical damage, proper alignment, connections, anchorage, and grounding.

B. Test continuity of each circuit.

C. Test switchgear per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

3.6 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.7 ADJUSTING

A. Set field-adjustable circuit breakers trip settings, to values indicated on drawings or recommended by the overcurrent protective device coordination study per Section 26 0573 – Overcurrent Protective Device Coordination Study.

B. Field adjustments of trip setting and adjustment or replacement of equipment to comply with Section 26 0573 – Overcurrent Protective Device Coordination Study; no additional cost to Owner.

3.8 CLEANING

A. Clean switchgear during construction phase, prior to initial testing and energization, and prior to final punch list, after other trades have departed. Cleaning procedures shall be as follows:

1. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.
2. Rack out circuit breakers and remove arc chutes.
3. Wipe down surfaces, including arc chutes and circuit breakers with Endust or equivalent.
4. Use paintbrush to dust small, hard-to-reach crevices.

3.9 DEMONSTRATION

A. Provide training session by manufacturer for one workday at a job location, to train the Owner's personnel in the operation and maintenance of switchgear.

END OF SECTION

SECTION 26 2313

PARALLELING LOW-VOLTAGE SWITCHGEAR

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 260519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 260526 – Grounding and Bonding for Electrical Systems

C. Section 260529 – Hangers and Supports for Electrical Systems

D. Section 260553 – Electrical Systems Identification

E. Section 260573 – Power System Studies

F. Section 260812 – Power Distribution Acceptance Tests

G. Section 260813 – Power Distribution Acceptance Test Tables

H. Section 262813 – Fuses

I. Section 263213 – Engine Generators

J. Section 263623 – Automatic Transfer Switches

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes free-standing, dead-front type, metal-enclosed, low-voltage distribution switchgear and associated monitoring and control systems, for paralleling 4 generators on an isolated bus, and distributing generator power.

1.4 REFERENCE STANDARDS

A. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures

B. IEEE C37.20.1 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

C. IEEE C37.90 – Relay and Relay Systems Associated with Electric Power Apparatus

D. IEEE C62.41.1 Guide on the Surges Environment in Low-Voltage (1000 V and Less) AC Power Circuits

E. IEEE C62.41.2 Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits

F. NFPA 70 – National Electrical Code

G. NEMA 2250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

H. UL 486A-486B – Wire Connectors

I. UL 869A – Reference Standard for Service Equipment

J. UL 1066 – Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures

K. UL 1558 – Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

1.5 SUBMITTALS

A. Product Data: For switchgear, components and accessories indicated:
   1. Include data on features and components and complete description; submit catalog cut sheets showing voltage, size, rating and size, switching and overcurrent protective devices.
   2. Features, characteristics, factory settings and time-current curves of individual protective devices, auxiliary components and ground fault relaying.
   3. Description of sequence of operation for paralleling controls.

B. Shop Drawings:
   1. For switchgear specified in this Section:
      a. General Arrangement:
         1). Indicate front, plan, and side views of switchgear; access requirements; overall dimensions and components list; shipping splits and weights.
         2). Front elevation indicating location of devices and instruments.
         3). Sections through switchgear showing space available for conduits.
      b. Conduit entrance locations and requirements.
      c. Nameplate legends
      d. Configuration, size and number of bus bars for each phase and current rating of buses.
      e. Ground bus
      f. Neutral bus
      g. Short circuit ratings of switchgear and overcurrent protective devices, and bus withstand rating
      h. Instrument details; enclosure types and details
      i. Wiring diagrams: power, signal and control wiring
      j. Wiring diagrams showing connections of component devices and equipment
      k. Schematic control diagrams
      a. Diagrams of current and future circuits showing device terminal numbers and internal diagrams
      b. Schematic diagrams showing connections to remote devices
      c. Mimic-bus diagram; samples: representative portion of mimic bus with specified finish, for color selection
   2. Submit 1/4” scale floor plans with switchgear location and required clearances and service space around equipment.

C. Manufacturer’s Installation Instructions:

1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports:
   1. Provide factory test report
   2. Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Complete review of this specification noting for each paragraph whether proposed equipment complies with project specifications or deviates. Justification must be given for each deviation.

F. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations, configurations, and ratings of switchgear and major components on single-line diagrams and plan layouts.
      b. Updated mimic bus diagram reflecting field changes after final switchgear load connections have been made, for record.
   2. Operation and Maintenance Data:
      a. Include manufacturer's written instructions for sequence of operation.
      b. Include manufacturer's sample system checklists and log sheets.
      c. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      d. Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.
      e. Include spare parts data listing, source, and current prices of replacement parts and supplies.
      f. Include time-current curves, including selectable ranges for each type of overcurrent protective device.

1.6 QUALITY ASSURANCE

A. Obtain switchgear from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NEC for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Factory Test
   1. Test paralleling system in accordance at the factory in accordance with Section 260812 - Power Distribution Acceptance Tests and Demonstration of Switchgear Functions.
   2. Provide factory test report

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver switchgear in 48” maximum width shipping splits individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.8 WARRANTY

A. Refer to Division 01 and Section 260000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 2 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.9 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.
   1. Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.
   2. Control-Power Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Russelectric

2.2 RATINGS

A. As Scheduled

2.3 CONSTRUCTION

A. IEEE C37.20.1, UL 1558

B. Free-standing, dead-front type; metal-enclosed; side, front and rear panels of one-piece welded or bolted construction; compartments with ventilation louvers in top and bottom sections of front and rear panels; supporting frame: steel channels rigidly fastened together, with same outside dimensions as enclosure.

C. Adequate strength and rigidity necessary to resist conditions of use to which it may be subjected and to support equipment, devices and appurtenances contained therein.

D. Barriers shall be placed such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

E. Environmental Limitations:
   1. Ambient temperatures: not exceeding 40°C

2. Altitude: Not exceeding 2000m.
3. Temperature rise: Not to exceed 65°C over a 40°C ambient environment, with no derating required.

F. Device Mounting and Type:
1. Front and rear accessible switchgear
a. Generator and feeder devices: Drawout and compartmented power circuit breakers.

G. Bus:
1. Material: Copper with silver plating; copper: 98% conductivity.
2. Connections: Accessible from rear only for maintenance.
a. Bolted:
1). Not fewer than 4 bolts for each 4” x 4” contact.
2). Not fewer than 2 bolts for each 2” x 2” contact.
3). Grade 5 bolts and conical spring-type washers
3. Sizing: Standard size, based on 65°C over 40°C; full capacity of the breaker frame size, not the trip setting; fully rated vertical and horizontal bus sections.
4. Main Phase Buses: 3 phase, **4** wire; uniform capacity for entire length of switchgear; ampacity as indicated on drawings; rated for paralleled engine capacity.
5. Bus Arrangement: A-B-C (left to right, top to bottom, front to rear).

H. Ground Bus: extend length of switchgear.
1. 1600 A, hard-drawn copper of 98% conductivity, equipped with pressure connectors for feeder ground conductors.

I. Hinged Front Doors: Allow access to metering, accessory, and blank compartments, with latch and padlocking provisions.

J. Removable, Hinged Rear Doors and Compartment Covers: Secured by captive thumb screws, for access to rear interior of switchgear, with latch and padlocking provisions.

K. Circuit breaker compartment: Equipped to house drawout type circuit breakers, fitted with hinged outer doors, and segregated from adjacent compartments by steel barriers; equipped with drawout rails, levering out mechanism, primary and secondary contacts; The following functions may be performed without need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.

L. Section barriers between generator and master control compartment: Extended to rear of section; rear compartment barrier between cable compartment and main bus; glass polyester barrier between adjacent vertical structures in cable compartment.

M. Bus isolation barriers: Arranged to isolate line bus from load bus at each generator circuit breaker; separate barriered compartment for current and potential transformers; main and riser buses fully isolated from breaker instrument and auxiliary compartments.

N. Bus bars connect: Between vertical sections and between compartments. Cable connections are not permitted.

O. Safety shutter: To automatically cover line and load stubs to protect against accidental contact.

P. Provide a 4” diameter polymer lens infrared (IR) scanning window for each set of circuit breaker terminations, mounted on cable compartment door.

Q. Spare circuit breakers and spaces for future circuit breakers: Allowance in vertical section bus size.

R. Adequate lifting means.

S. Line and Load Terminations: Compression type, labeled for 75°C copper and aluminum conductors; suitable for number, sizes and trip ratings; feeder load terminals: silver-plated copper bus extensions equipped with pressure connectors for outgoing circuit conductors.

T. Bus-Bar Insulation: Individual bus bars wrapped with factory-applied, flame-retardant tape or spray-applied, flame-retardant insulation, or fluidized epoxy coating. No live connections shall be accessible from the rear, except breaker load side terminals.
   1. Sprayed Insulation Thickness: 3 mils, minimum.
   2. Bolted Bus Joints: Insulate with secure joint covers that can easily be removed and reinstalled.

U. Relays: IEEE C37.90; types and settings as indicated; with test blocks and plugs.

V. Enclosure: Steel, NEMA 250, Type 1
   1. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer’s standard gray finish over rust-inhibiting primer on treated metal surface.
   2. Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer’s standard color, undersurfaces treated with corrosion-resistant undercoating.

2.4 GENERATOR PARALLELING MONITOR AND CONTROL SYSTEM

A. Paralleling control reliability. Redundant distributed processing or redundant master control to prevent loss of paralleling control.

B. Individual Generator Control and Monitoring: Provide each generator with control and monitoring components to view status and control operation of respective generator.
   1. Mount components and devices in a section of the switchgear lineup dedicated for each generator. Dual generator sections are not acceptable. Each section shall have the following features and characteristics:
   2. Generator Metering: 1% accuracy class or better.
      a. Ammeter, Voltmeter, Frequency Meter, Wattmeter, Kilowatt-Hour Meter, and Power Factor Meter:
         1). For 3-phase and 4-wire systems, indicate line-to-line and line-to-neutral conditions on voltmeter.
         2). Provide analog devices for voltmeter and frequency meters.
         3). Provide switches or other provisions to allow reading of both generator and bus voltages and frequencies from this metering set.
      b. Synchroscope and “Generator Set Synchronized” Indication
         1). Provide lamp or LED indication of synchronization.
         2). Provide 360-degree analog movement synchroscope.
      c. Engine run-time meter, start counter, rpm meter, and battery voltage meter.

d. Engine oil temperature gage and engine coolant temperature gage.

3. Generator Protective and Control Switches: Provide oil tight, industrial-grade switches.
   a. Mode Selector Switch (Run/Off/Auto):
      1). "Run" mode to start and accelerate unit to rated speed and voltage, but not close paralleling circuit breaker.
      2). "Off" mode to prevent generator from starting or to immediately shutdown generator if running.
      3). "Auto" mode to start generator on receipt of remote start signal.
   b. Circuit-Breaker Trip/Close Switch: Interlocked with system control so that circuit-breaker closure is impossible unless the following occurs:
      1). Mode selector switch is in "Run" position.
      2). Generator set is synchronized with system bus.
   c. Control/reset push button with flashing lamp to indicate generator is locked out due to fault condition.
   d. Lamp test push button to simultaneously test all lamps on panel.
   e. Control Panel Illumination: DC lamps to illuminate panel when lighting from surrounding environment is not available.
   f. Emergency Stop Push Button: Red mushroom-head switch maintaining its position until manually reset.
   g. Voltage and Frequency Raise/Lower Switches:
      1). Allow ±5% adjustment when generator set is operating but not paralleled. The following paragraphs are optional but recommended for outdoor applications.
4. Generator Protective and Control Devices: Solid-state industrial relays, integrated microprocessor-based control devices, and other accessories and devices located either in generator control and monitoring panel or in switchgear control section to provide the following features and functions:
   a. Kilowatt Load Sharing Control:
      1). Operates engine governors during synchronizing and provides isochronous load sharing when paralleled.
      2). Allows generator set to ramp up to kilowatt load level signaled by system master controller.
   b. Load-Demand Governing Control:
      1). Causes generator set to ramp down to zero load when signaled to shut down in load-demand mode.
      2). Causes generator set to ramp up to a proportional share of total bus load.
   c. Kilovolt Ampere Rating Load Sharing Control
      1). Operates alternator excitation system while generator set is paralleled.
      2). Causes sharing of reactive load among all generator sets to within 1% of equal levels without voltage drop.
   d. Sync-Check and Paralleling Monitor and Control:
      1). Monitors and verifies that generator set has reached 90% of nominal voltage and frequency before closing to bus.
      2). Prevents out-of-phase paralleling if two or more generator sets reach operating conditions simultaneously, by sending "inhibit" signal to sets not designated by system as "first to close to bus."

3). Recognizes failure of “first-to-close” generator set and signals system paralleling to continue.

4). Prevents out-of-phase closure to bus due to errant manual or automatic operation of synchronizer.

e. Synchronizer Control:

1). Adjusts engine governor to match voltage, frequency, and phase angle of paralleling bus.

2). Maintains generator-set voltage within 1% of bus voltage, and phase angle within 20 electrical degrees of paralleling bus for 0.5 seconds before circuit-breaker closing.

3). Provides “fail-to-synchronize time delay” adjustable from 10 to 120 seconds; with field selectivity to either initiate alarm or shut down generator set on failure condition.

f. Reverse Power Monitor and Control:

1). Verifies generator set and paralleling bus phase rotation match prior to closing paralleling circuit breaker.

g. Phase Rotation Monitor and Control:

1). Verifies generator set and paralleling bus phase rotation match prior to closing paralleling circuit breaker.

h. Electronic Alternator Overcurrent Alarm and Shutdown Control:

1). Monitors current flow at generator-set output terminals.

2). Initiates alarm when load current on generator set is more than 110% of rated current for more than 60 seconds.

3). Provides overcurrent shutdown function matched to thermal damage curve of alternator. Provide without instantaneous-trip function.

i. Electronic Alternator Short-Circuit Protection:

1). Provides shutdown when load current is more than 175% of rated current and combined time/current approaches thermal damage curve of alternator. Provide without instantaneous-trip function.

j. Loss of Excitation Monitor:

1). Initiates alarm when sensing loss of excitation to alternator while paralleled to system bus.

k. Generator-Set Start Contacts: Redundant system, 10 A at 32 VDC.

l. Cool-Down Time-Delay Control: Adjustable, 0 to 600 seconds.

m. Start Time-Delay Control: Adjustable, 0 to 300 seconds.

n. Paralleling Circuit-Breaker Monitor and Control:

1). Monitors circuit-breaker auxiliary contacts.

2). Initiates fault signal if circuit breaker fails to close within adjustable time-delay period (0.5 to 15 seconds).

3). Trips open and locks out paralleling circuit breaker upon paralleling circuit breaker failure to close, until manually reset.

5. Engine Protection and Local Annunciation:

a. Provide annunciation and shutdown control modules for alarms indicated.

b. Provide visual alarm status indicator and alarm horn with silence/acknowledge push button on generator control and monitoring panel.

c. Annunciate the following conditions:
   1). Status, Light Only (Nonlatching):
      a). Generator engine control switch not in auto (red)
      b). Generator engine control switch in auto (green)
      c). Emergency mode (red)
      d). Generator circuit breaker closed (red)
      e). Generator circuit breaker open (green)
      f). Engine stopped (green).
      g). Engine running (red)
      h). Engine cool-down (amber)
   2). Pre-Alarm, Light and Horn (Non-latching):
      a). Pre-high coolant temperature (amber)
      b). Pre-low oil pressure (amber)
      c). Low coolant temperature (amber)
      d). Engine low battery (amber)
      e). Engine low fuel (amber)
      f). Generator fails to synchronize (amber)
   3). Shutdown Alarm, Light and Horn (Latching):
      a). Engine overcrank (red)
      b). Engine overspeed (red)
      c). Engine low oil pressure (red)
      d). Engine high coolant temperature (red)
      e). Engine low coolant level (red)
      f). Engine remote emergency shutdown (red)
      g). Generator circuit breaker tripped (red)
      h). Generator loss of field (red)
      i). Generator reverse power (red)
      j). Generator undervoltage (red)
      k). Generator overvoltage (red)
      l). Generator underfrequency (red)
      m). Generator overfrequency (red)

C. Master Control System and Monitoring Equipment: Provide paralleling and monitoring equipment components, and accessories for multiple generators with the following features and characteristics:
   1. Mount components and devices in a dedicated switchgear control section of the switchgear lineup.
   2. Paralleled System Metering: 1% accuracy class or better to monitor total output of generator bus.
      a. Ammeter, voltmeter, frequency meter, wattmeter, kilowatt-hour meter, power factor meter, kilovolt ampere rating, and kilowatt demand meters.
         1). For 3-phase/4-wire systems, indicate line-to-line and line-to-neutral conditions on voltmeter.

2). Display functions on the human machine interface device.

3. Full-Color Human Machine Interface (HMI) Device
   a. Provide three (HMI) devices:
      1). Located at the paralleling gear
      2). Located at Level 0 ATS Room
      3). Located at Level 8 ATS Room
   b. Provide means to monitor and control the complete system of paralleled generator sets.
   c. Screens shall include the following:
      1). Main Menu: Include date, time and system status messages with screen push buttons to access one-line diagram, system controls, load controls, alarms, bus metering, and individual generator-set data.
      2). One-Line Diagram Screen: Depict system configuration and system status by screen animation, screen colors, text messages, or pop-up indicators. Indicate the following minimum system conditions:
         a). Generator sets, buses, and paralleling circuit breakers energized/de-energized.
         b). Generator set mode (run/off/auto).
         c). Generator set status (normal/warning/shutdown/load-demand stop).
         d). Paralleling circuit-breaker status (open/closed/tripped).
         e). Bus conditions (energized/de-energized).
         f). Provide access to other screens.
      3). AC Metering Screen: Display the following minimum meter data for the paralleling bus:
         a). Phase volts and amperes, Kilowatts, Kilovolt Amperes, Kilovolt Ampere Rating, power factor, frequency, Kilowatt/hr, Kilowatt demand.
         b). Real-time trend chart for system Kilowatt and Volts updated on not less than one-second intervals.
         c). Minimum of one historical trend chart for total system loads with intervals no shorter than five minutes and a minimum duration of four hours.
      4). Generator-Set Control Screen: Provide control over individual generator sets from master system control panel. Include the following minimum functions:
         a). Generator manual start/stop control (functional only when generator-set mounted control switch is in “Auto” position).
         b). Generator-set alarm reset.
         c). Manual paralleling and circuit-breaker controls.
      5). Generator-Set Data Display Screen: Provide the following minimum parameters:
         a). Engine speed, oil pressure and temperature, coolant temperature, and engine operating hours.
         b). Three-phase voltage and current, kW, PF, and kW/hr.
         c). Generator control switch position and paralleling circuit-breaker position.
         d). Generator-set alarms.
      6). System Control Screen: Password protected and with the following minimum functions:
         a). System Test Modes: Test with load/test without load/normal/retransfer time-delay override.

b). Test with Load: Starts and synchronizes generator sets on paralleling bus but does not transfer loads to bus.

c). Time adjustments for retransfer time delay, transfer time delay, system time delay on stopping, and system time delay on starting.

7). Load-Demand Control Screen: Monitor total load on system bus and control number of generator sets running to match capacity with load demand. Provide the following:

a). Load-Demand Control: On/off.

b). Load-Demand Pickup set Point: Adjustable from 90 to 40% in 5% increments.

c). Load-Demand Dropout Set Point: Adjustable from 20 to 70% in 5% increments.

8). Manual Load Control Screen: Provide screen to manually add or delete generator sets from paralleled system in response to system load parameters. Provide the following:

a). Indicate available system in kW and amp.

b). Control functions to allow manual addition/removal of generator sets on system, and to activate load-shed/load-restore functions.

9). Load-Add/Load-Shed Sequence Screen: Password protected and with the following minimum functions:

a). "Load-add sequence priority" assignment to each load control relay with designation for relay operation after a set number of generator sets are online.

b). "Load-shed sequence priority" assignment to each load control relay with designation for relay operation depending on number of generator sets online.

10). Alarm Summary and Run Report Screen:

a). Lists most recent alarm conditions and status changes.

b). Lists a minimum of the most recent 32 alarm conditions by name and time/date; acknowledges alarm conditions with time/date.

c). For each start signal, lists start time and date, stop time and date, maximum kW and ampere load on system during run time, and start and stop times of individual generator sets.

11). *ATS Monitoring and Control Screen – Central Utility Plant and Hospital ATS's*

a). Show each ATS with its unique identification arranged by priority

b). Show position of each ATS

c). Show load in KW and Voltage of each ATS

d). Be able to change position of ATS if both sources are accepted

e). Be able to initiate ATS test

12). *Fuel System Monitoring Screen:*

a). Monitor fuel management system and display:

a General Alarms

b Day tank levels in %

c Day tank pumps running/off

d Bulk tank level in %

e Bulk tank level in gallons

~~c).~~

4. Solid-State System Status Panel:

a. Provides visual alarm status indicator and alarm horn with silence/acknowledge push button.
b. Annunciates the following conditions:
1). Status, Light Only:
a). Running Status: Display generator set number and “green” running-status light
b). Load demand mode (green)
c). Priority Load Status: display load number and “green” on-status light
d). System test (green)
e). Remote system start (red)
f). Normal source available (green)
g). Connected to normal (green)
h). Generator source available (green)
i). Connected to generator source (green)
2). Status, Light and Alarm:
a). Load-Shed Level Status: Displays load number and red load-shed status light
b). Generator Alarm Status: Displays generator number and red “Check Generator” status light
c). Controller malfunction (red)
d). Check station battery (red)
e). Bus overload (red)
f). System not in auto (red)

5. *Communications with Transfer Switches*
a. *Paralleling system receives hard-wired engine start contact closure from each ATS (Central Utility Plant and Hospital)*
b. *Paralleling system sends hard-wired load shed/add signals to transfer switches*
c. *Provide Fiber RTU for remote transfer switch communications to monitor ATS metering and status information*
6. *Communications with BAS System*
a. *Provide BACNET communication to BAS system to allow monitoring of all paralleling gear functions.*
b. *Mimic paralleling gear HMI interface screen to show status of all systems, but BAS system is not to allow control of paralleling gear.*
~~f).~~

D. Description of System Operation:
1. Loss of Normal Power:
a. System receives “start” signal from any ATS; all generator sets start and achieve rated voltage and frequency.
b. System closes the first generator set achieving 90% of rated voltage to paralleling bus.
c. “Priority load add” controls prevent overloading of system. System to provide minimum of 32 independent load add levels to control each transfer switch individually.
d. Remaining generator sets switched to synchronizers that control and allow closure of generator sets to paralleling bus.

e. On closure to paralleling bus, each generator set assumes its proportional share of total load.
f. Tie breaker closes once all generators are connected to the paralleling bus. Tie breaker remains closed after a loss of one or more generators from the bus.

2. Failure of a Generator Set to Start or Synchronize:
   a. After expiration of overcrank time delay, generator set shuts down and alarm is initiated.
   b. Priority controller prevents overload of system bus.
   c. Manual override of priority controller at HMI allows addition of low-priority load to bus.
   d. Bus overload monitor protects bus from manual overloading.
3. Bus Overload:
   a. On bus overload, load-shed controls initiates load shedding.
   b. If bus does not return to normal frequency within adjustable time period, additional load continues to be shed until bus returns to normal frequency.
   c. Loads shed can be reconnected to bus only by manual reset at HMI.
4. Load-Demand Mode:
   a. With “load-demand” function activated, controller continuously monitors total bus load.
   b. If bus load is below preset limits for 15 minutes, demand controller shuts down generator sets in predetermined order until minimum number of sets are operating.
   c. On sensing available bus capacity diminished to set point, controller starts and closes generator sets to bus to accommodate load.
5. Return to Normal Power:
   a. Process starts on removal of start signals from system.
   b. When no load remains on paralleling bus, all generator breakers open, go through cool-down period, and shut down.
   c. If start signal is received during cool-down period, one generator set is reconnected to bus, and system operation follows that of “loss of normal power.”
   d. Tie breaker remains closed until all generators have been removed from the bus.
6. Failure of a Generator Controller or Master Controller:
   a. Redundant processors allow engines to perform all 5 modes of operation.

2.5 JOINT COMMISSION REPORTING SYSTEM

A. Integrated Server for Producing Joint Commission Reports
   1. Automated reporting system triggered by ATS engine start signal causing system to begin emergency mode
   2. Report captures the following parameters for each emergency mode event:
      a. ID of ATS initiating system emergency mode
      b. Date and Time of day of initiating event
      c. Each ATS ID included in event transmitting engine start signal
      d. Average KW load measured on each ATS during event
      e. Number of minutes each ATS connected to emergency source
      f. Generator ID required to run and connect to bus during event
      g. Each generator average and peak KW during event
      h. Generator exhaust stack temperature for each generator running during test

i. Total generator run time in minutes for each gen connected during event
j. Date and Time of Day of when event is cleared and system returned to normal

3. Server stores all reports and allows retrieval of reports locally at HMI or remotely via network connection. Reports are accessible via standard software package not requiring subscription or license.

2.6 OVERCURRENT PROTECTIVE DEVICES

A. Power Circuit Breaker and Accessories: ANSI/IEEE C37.13; UL 1066; metal frame; field interchangeable electrical accessories, including shunt trip, spring release, electrical operator, auxiliary contacts and trip unit.

1. Ratings: As indicated for continuous, interrupting, and short-time current ratings for each circuit breaker; voltage and frequency ratings same as switchgear.
2. Operating Mechanism: Mechanically and electrically trip-free, stored-energy operating mechanism with the following features:
   a. Normal Closing Speed: Independent of both control and operator.
   b. Slow Closing Speed: Optional with operator for inspection and adjustment.
   c. Store-Energy Mechanism: Electrically charged, with optional manual charging.
   d. Means for manual opening and closing
   e. Operation counter
3. Trip Devices: Electronic (solid-state, microprocessor-based), overcurrent trip-device system consisting of one or two current transformers or sensors per phase, a release mechanism, and features per Subparagraph 2.6 B in this Section.
4. Drawout Features: Circuit breaker mounting assembly equipped with a racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:
   a. Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.
   b. Circuit Breaker Positioning: An open circuit breaker may be racked to or from connected, test, and disconnected positions only with the associated compartment door closed unless live parts are covered by a full dead-front shield. An open circuit breaker may be manually withdrawn to a position for removal from structure with door open. Status for connection devices for different positions includes the following:
      1). Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.
      2). Disconnected Position: Primary and secondary devices and ground contact disengaged.
5. Auxiliary Contacts: For interlocking or remote indication of circuit breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit breaker operation. Each consists of two type “a” and two type “b” contacts wired through secondary disconnect devices to a terminal block in stationary housing; “a” contacts mimic circuit breaker contacts, “b” contacts operate in reverse of circuit breaker contacts.
6. Arc Chutes: Readily removable from associated circuit breaker when it is in disconnected position and arranged to permit inspection of contacts without removing circuit breaker from switchgear.
7. Padlocking Provisions: For installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.

8. Electric Close Button: One for each electrically operated circuit breaker.
9. Mechanical Interlocking of Circuit Breakers: Uses a mechanical tripping lever or equivalent design and electrical interlocks.
10. Key Interlocks: Arranged so keys are attached at devices indicated. Mountings and hardware are included where future installation of key interlock devices is indicated.
11. Shunt-Trip Devices: Where indicated.
12. Indicating Lights: To indicate circuit breaker is open or closed, interlocked circuit breakers.
13. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 260913 – Electrical Power Monitoring and Control.
14. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function, and/or short time function.
15. Control Voltage: 120 VDC.
16. Trip Voltage: 24 VDC, close and charge.
17. Listed for 100% of breaker's continuous ampere rating.

B. Circuit Breaker Electronic Trip Unit general characteristics:
1. Circuit breakers, with solid-state microprocessor based trip units:
   a. Unit shall consist of current sensors, solid-state trip device, and solid-state adjustable time/current curve shaping elements.
   b. Trip units shall be removable to allow for field upgrades.
   c. Trip units shall incorporate "True RMS Sensing."
2. Solid-state elements shall provide functions as indicated above.
3. Adjustments shall be made using non-removable, discrete steps.
4. Sealable transparent cover shall be provided over adjustments.
5. Adjustable long-time pickup (Ir) and delay shall be available in an adjustable rating plug that is UL listed as field-replaceable. Adjustable rating plug shall allow for 5 minimum long-time pickup settings from 0.4 to 1.0 times the sensor plug (In). Other adjustable rating plugs shall be available for more precise settings to match the application. Long-time delay settings shall be at least 3 bands.
6. Short-time pickup shall allow for 5 minimum settings from 1.5 to 10 times Ir. Short-time delay shall be at least 3 bands with I^2t ON and OFF.
7. Instantaneous settings on the trip units shall be available in 5 minimum bands from 2 to 15 times In. The instantaneous settings shall also have an OFF setting when short-time pickup is provided.
8. Trip units shall have the capacity to electronically adjust the settings locally and remotely to fine increments below the switch settings. Fine increments for pickup adjustments are to be 1 amp. Fine increments for delay adjustments are to be 1 second.
9. Trip unit shall Indicate:
   a. Long-time fault
   b. Short-time fault
   c. Instantaneous fault
   d. Ground fault, where provided
10. Trip unit shall provide local trip indication and capability to indicate local and remote reason for trip, i.e., overload, short circuit or ground fault.

11. Trip unit shall contain means to conduct circuit breaker tests, or via separate test kit.
12. Breaker shall be equipped with externally accessible test points to be used for field testing.
13. Trip units shall be available to provide real time metering. Metering functions include current, voltage, power and frequency.
14. Trip units shall be provided with the following standard features:
    a. True RMS sensing
    b. LI
    c. LSI
    d. LSIG/Ground-fault trip where indicated
    e. Ground Fault Alarm (no trip), with external relay, where indicated
    f. Adjustable rating plugs
    g. LCD or LED – Long-time pickup
    h. LCD or LED – Trip indication
    i. Communications for power monitoring capabilities
    j. Ammeter
    k. LCD dot matrix display
    l. Advanced user interface
    m. Protective relay functions
    n. Neutral protection
    o. Incremental fine tuning of settings
    p. Selectable long-time delay bands
    q. Power measurement
    r. Maximum peak demand (measure of average power over a 15-minute period) continuously recorded over a one-year period

C. Ground Fault protection equipment on breakers, where indicated: Integrally mounted relay and trip unit, push-to-test feature and ground fault indicator:
    1. Ground-fault protection with at least three adjustable short-time-delay settings and three trip-time-delay bands; adjustable current pickup with maximum setting of 1200 A. Arrange to provide protection for the following:
        a. 3-wire circuit or system
        b. 4-wire circuit or system
        c. 4-wire, double-ended substation
    2. Provide trip units capable of the following types of ground-fault protection: source ground return, residual, zero sequence. Ground-fault sensing systems shall be changed in the field.
    3. Neutral current transformers shall be provided for 4-wire system.
    4. Provide ground-fault settings for circuit breaker sensor sizes 1200 amp or below with 9 bands from 0.2 to 1.0 times In. Provide ground-fault settings for circuit breakers above 1200 A with minimum 3 bands up to 1200 A.
    5. Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and 3-phase current transformer/sensor.

D. Arc Energy Reduction

1. Where the highest continuous current trip setting for which the actual overcurrent device is rated or can be adjusted is 1200A or higher, an energy-reducing maintenance switch with local status indicator shall be provided.

2.7 CONTROL POWER, COMPONENTS IDENTIFICATION, AND CONTROL WIRING

A. Control Circuits: 120 VDC, supplied through secondary disconnecting devices from control-power DC battery plant. Provide VRLA battery plant capable of supplying standby control power for 8 hours with the ability to cycle each circuit breaker twice at that end of the 8 hour standby period.

B. Provide best battery automatic source selector to allow control system to be powered from control power source or DC battery plant.

C. Electrically Interlocked Circuit Breakers: Two control-power transformers in separate compartments, with interlocking relays, connected to the primary side of each control-power transformer at the line side of the associated primary circuit breaker. 120V secondaries connected through automatic transfer relays to ensure a fail-safe automatic transfer scheme.

D. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

E. Control components mounted within assembly, such as relays, pushbuttons, switches etc.: Suitably marked for identification, corresponding to appropriate designations on manufacturer's wiring diagrams.

F. Control Wiring: Factory installed, with bundling, lacing, and protection included; flexible conductors for #8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units; insulated locking spade terminals for all control connections, except where saddle type terminals, integral to a device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving switchgear, with wire markers at each end of control wiring.

G. *125V DC Battery Plant*

1. *Provide sufficient lead-calcium batteries to support ATO and protection relays in a standby mode for a period of 8 hours.*
2. *Provide charger to support battery plant with voltage and charge current meter. Charger is to be sized to charge plant from a discharged state to fully charged state in 8 hours.*
3. *Provide normally open and normally closed contacts that function when the plant voltage drops below 15% of fully charged state and charger is not functioning.*
4. *Provide epoxy-coated, steel rack for batteries.*

2.8 ACCESSORY COMPONENTS AND FEATURES

A. Furnish portable test set to test functions of circuit breakers and solid-state trip devices without removal from switchgear. Include relay and meter test plugs suitable for testing switchgear meters and switchgear class relays.

B. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

C. Furnish 1 portable, floor-supported, roller-based, elevating carriage arranged for movement of circuit breakers in and out of compartments for present and future circuit breakers.

D. Furnish overhead circuit-breaker lifting devices, mounted at top front of switchgear, with hoist and lifting yokes matching each drawout circuit breaker.

E. Furnish set of tools for manually charging circuit breaker stored energy device.

F. Furnish racking handle to manually move circuit breaker between connected and disconnected positions.

G. Lockout Devices: Circuit breakers with integral, lockout/tagout devices.

PART 3 - EXECUTION

3.1 COORDINATION

A. Instruct manufacturer about location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:
   1. Concrete: Per requirements in Division 03 – Concrete.
   2. Dimensions: Per requirements in Section 260529 – Hangers and Supports for Electrical Systems.

C. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

D. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.2 EXAMINATION

A. Examine areas and surface to receive switchgear for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for switchgear mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install switchgear in accordance with applicable portions of ANSI/NECA 400.

B. Install engraved plastic nameplates under provisions of Section 260553 – Electrical Systems Identification for switchgear, every instrument, overcurrent protective device and disconnect device. Attach nameplate to exterior of switchgear using small corrosion-resistant metal screws and rivets. Do not use contact adhesive. Indicate switchgear manufacturer’s name and drawing number, name, amperage, voltage, phase, number of wires, short circuit current rating (amperes, RMS symmetrical and MVA three-phase symmetrical) and momentary and fault-closing ratings (amperes, RMS asymmetrical). For each overcurrent protective device and disconnect device,

include circuit, load and area served, voltage/phase rating, and fuse size and type, when applicable.

C. Provide framed, printed operating instructions for switchgear, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of switchgear.

D. Install switchgear in dedicated electrical space per NFPA 70, and as indicated on drawings.

E. Tighten electrical connectors and terminal according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

F. Install fuses in fusible switch at job site per requirements in Section 262813 – Fuses.

G. Install surge arrestors in cable termination compartments and connect to each phase of circuit, per requirements in Section 264300 – Surge Protective Devices.

H. Connect surge protective devices to switchgear bus per requirements in Section 264300 – Surge Protective Devices.

I. Install utility company metering equipment, devices and wiring in conformance with serving utility requirements.

J. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

K. Apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.4 CONNECTIONS

A. Ground switchgear according to Section 260526 – Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 260519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 ACCEPTANCE TESTING

A. Testing by Electrical Contractor

B. Perform acceptance testing – Section 260812 – Power Distribution Acceptance Tests and Section 260813 – Power Distribution Acceptance Test Tables. Interpret test results in writing and submit to Engineer.

C. Manufacturer's Field Service:

1. Engage factory-authorized service representative to inspect, and adjust field assembled components and equipment installation, including connections.

D. Adjust or replace equipment as needed to comply with manufacturer's specifications and submit new test reports.

3.6 FIELD QUALITY CONTROL

A. Inspect switchgear for physical damage, proper alignment, connections, anchorage, and grounding.

B. Test continuity of each circuit.

3.7 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.8 ADJUSTING

A. Set field-adjustable circuit breakers trip settings, to values indicated on drawings or recommended by the overcurrent protective device coordination study per Section 260573 – Power System Studies.

B. Field adjustments of trip setting and adjustment or replacement of equipment to comply with Section 260573 – Power System Studies; no additional cost to Owner.

3.9 CLEANING

A. Clean switchgear during construction phase, prior to initial testing and energization, and prior to final punch list, after other trades have departed. Cleaning procedures shall be as follows:
   1. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.
   2. Rack out circuit breakers and remove arc chutes.
   3. Wipe down surfaces, including arc chutes and circuit breakers with Endust or equivalent.
   4. Use paintbrush to dust small, hard-to-reach crevices.

3.10 DEMONSTRATION

A. Provide training session by manufacturer for one workday at a job location, to train the Owner’s personnel in the operation and maintenance of switchgear.

END OF SECTION 262313

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 2413

SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0553 – Electrical Systems Identification

E. Section 26 0812 – Power Distribution Acceptance Tests

F. Section 26 0813 – Power Distribution Acceptance Test Tables

G. Section 26 2713 – Electrical Metering

H. Section 26 2813 – Fuses

I. Section 26 4300 – Surge Protective Devices

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes free-standing, dead-front type low-voltage distribution switchboards.

1.4 REFERENCE STANDARDS

A. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures

B. ANSI/NECA 400 – Recommended Practice for Installing and Maintaining Switchboards

C. IEEE C62.11 – Metal-Oxide Surge Arresters for Alternating Current Power Circuits

D. IEEE C62.41 – Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits

E. NFPA 70 – National Electrical Code

F. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

G. NEMA AB 3 – Molded-Case Circuit Breakers and Their Applications

H. NEMA FU 1 – Low-Voltage Cartridge Fuses

I. NEMA KS 1 – Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

J. NEMA LA 1 – Surge Arresters

K. NEMA PB 2 – Dead-Front Distribution Switchboards

L. NEMA PB 2.1 – General Instructions for Proper Handling, Installation and Maintenance of Dead-Front Distribution Switchboards Rated 600 Volts or Less

M. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)

N. UL 98 – Enclosed and Dead-Front Switches

O. UL 486A-486B – Wire Connectors

P. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures

Q. UL 869A – Reference Standard for Service Equipment

R. UL 891 – Dead-Front Switchboards

S. UL 1053 – Ground-Fault Sensing and Relaying Equipment

T. UL 1066 – Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures

1.5 SUBMITTALS

A. Product Data: For each switchboard, components and accessories indicated:
   1. Include data on features and components and complete description; submit catalog cut sheets showing voltage, size, rating and size of surge protective devices, switching and overcurrent protective devices.
   2. Features, characteristics, factory settings and time-current curves of individual protective devices, auxiliary components and ground fault relaying.

B. Shop Drawings:
   1. For each switchboard specified in this Section:
      a. General Arrangement:
         1) Indicate front, plan, and side views of switchboards; access requirements (front, side, rear); overall dimensions and components list; shipping splits and weights.
         2) Front elevation indicating location of devices and instruments.
         3) Sections through switchboard showing space available for conduits.
      b. Conduit entrance locations and requirements.
      c. Nameplate legends.
      d. Configuration, size and number of bus bars for each phase and current rating of buses.
      e. Ground bus.
      f. Neutral bus.
      g. Short circuit ratings of switchboards and overcurrent protective devices, and bus withstand rating.

h. Instrument details; enclosure types and details.
i. Wiring diagrams: power, signal and control wiring.
j. Descriptive documentation of optional barriers specified for electrical insulation and isolation.

2. Contractor to submit 1/4" scale floor plans with switchboard locations and required clearances and service space around equipment.

C. Manufacturer's Installation Instructions:
1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Complete review of this specification noting for each paragraph whether proposed equipment complies with project specifications or deviates. Justification must be given for each deviation.

F. Closeout Submittals:
1. Project Record Documents:
a. Record actual locations, configurations, and ratings of switchboard and major components on single-line diagrams and plan layouts.
2. Operation and Maintenance Data:
a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
b. Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.
c. Include spare parts data listing, source, and current prices of replacement parts and supplies.
d. Include time-current curves, including selectable ranges for each type of overcurrent protective device.

1.6 QUALITY ASSURANCE

A. Obtain switchboards from one source and by single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70 for components and installation.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchboards as required to prevent condensation.

B. Deliver switchboards in shipping splits of length that can be moved in delivery path to final location in project, individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes,

and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Handle switchboards in accordance with NEMA PB 2.1 and ANSI/NECA 400. Use factory-installed lifting provisions. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.9 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Fuses for Fused Switches and for Fused Circuit Breakers: Equal to 10% of amount installed for each size and type, but no fewer than 3 of each size and type

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D – Schneider Electric

B. ABB - General Electric

C. Siemens

2.2 RATINGS

A. Nominal system voltage: As indicated on the drawings or scheduled.

B. Main bus continuous amp: As indicated on the drawings or scheduled.

C. Short circuit current rating: As indicated on drawings.

D. Brace switchboard components to withstand mechanical forces for symmetrical fault current shown.

2.3 CONSTRUCTION

A. NEMA PB 2, UL 891

B. Free-standing, dead-front type; vertical sections bolted together; sides and rear covered with removable bolt-on covers; adequate ventilation within enclosure; supporting frame: steel channels rigidly fastened together, with same outside dimensions as the enclosure.

C. Adequate strength and rigidity necessary to resist conditions of use to which it may be subjected and to support equipment, devices and appurtenances contained therein.

D. Incoming lug locations: as applicable per drawings.

E. Connection to the supply source by conduit and wiring.

F. Environmental Limitations:
   1. Ambient temperatures: Not exceeding 40°C.
   2. Altitude: Not exceeding 6600 ft
   3. Temperature rise: Not to exceed 65°C over a 40°C ambient environment, with no derating required.

G. Device Mounting and Type:
   1. Front accessible switchboard: Front and rear aligned for free standing installation have rear and side access or front and side access only for placement against the wall, as indicated by drawings:
      a. Main device: Fixed (individually) mounted insulated-case circuit breaker or fusible switch as indicated on drawings.

H. Bus:
   1. Material: Copper with silver plating; copper: 98% conductivity. The bus bars shall have sufficient cross-sectional area to meet UL 891 temperature rise requirements through actual tests. The bus bars shall be standard density rated for 1000 amperes per square inch copper.
   2. Connections:
      a. Bolted:
         1) Not fewer than 4 bolts for each 4” x 4” contact.
         2) Not fewer than 2 bolts for each 2” x 2” contact.
         3) Grade 5 bolts and conical spring-type washers.
         4) Clamp joints are not allowed.

   3. Sizing: Standard size, based on 65°C rise over 40°C ambient.
   4. Main Phase Buses: Three phase, 3 or 4 wire as indicated on drawings; fully rated; uniform capacity for entire length of switchboard; ampacity as indicated on drawings; rated for the main protective device frame size or main incoming conductors.
   5. All feeder device line and load connection detail: Rated to carry current rating of device frame (not trip rating).
   6. Support for Buses: Mounted on high-impact, non-tracking insulated supports; joints in the vertical bus are not permitted.
   7. Bus arrangement: A-B-C (left to right, top to bottom, front to rear).

I. Ground Bus: extend length of switchboard.
   1. 1/4” x 2” minimum-size, hard-drawn copper of 98 percent conductivity, equipped with pressure connectors for feeder ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection.

J. Neutral Bus: 100% of the ampacity of phase buses, equipped with pressure connectors for outgoing circuit neutral cables. Bus extensions for busway feeder neutral bus are braced.

K. Hinged Front Doors: Allow access to metering and accessory compartments; concealed hinges; fastened by head bolts.

L. Device Barriers

1. Individually Mounted Devices: Between adjacent devices; between vertical sections
2. Group Mounted Devices: Between adjacent vertical sections.

M. Hinged Front Doors:
1. Over individually mounted device compartments, with concealed hinges and fastened by hex head bolts.
2. Over cable termination compartments of group mounted devices.

N. Hinged Rear Doors and Compartment Covers: With concealed hinges and fastened by hex head bolts.

O. Bus Connections: Extend from load side of individually mounted devices into cable compartment for connections to outgoing cables.

P. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
1. Pull Section: Width, depth and height to match switchboard.

Q. Pull Box on Top of Switchboard:
1. Adequate ventilation to maintain temperature in pull box within same limits as switchboard.
2. Removable top, front, and sides, same construction as switchboard.
3. Insulating, fire-resistive bottom with separate holes for cable drops into switchboard.
4. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.
5. Set front to accommodate lifting devices for drawout circuit breakers.

R. Future Provisions: Fully equip spaces for future devices with bussing, mounting brackets, supports, and appurtenances. Spaces for individually mounted devices are to include all line and load bus detail.

S. Rail mounted trolley with lifting hoist for draw-out breakers. Trolley is to travel across top of all sections with draw-out breakers.

T. Line and Load Terminations: Allow for bolted connection of two-bolt, long barrel compression lugs. Provide holes and lug space for quantity of cables shown on drawings.

U. Provide a 4” diameter polymer lens infrared (IR) scanning window for each set of circuit breaker terminations, mounted on cable compartment panel.

V. Enclosure: Steel, NEMA 250, Type 1 for indoor installation:
1. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer’s standard gray finish over a rust-inhibiting primer on treated metal surface.

W. Mimic Bus: Black plastic 3/8” X 1/16” thick attached with rivets or stainless steel screws showing all overcurrent protection devices, current transformers, buswork, and connections. For double-ended switchboards, mimic bus is to be blue for the left feed and red for the right feed.

2.4 SERVICE ENTRANCE

A. UL 869A

B. Switchboards labeled as suitable for use as service entrance equipment, where applicable, with incoming line isolation barriers, and a removable neutral bond to switchboard ground for solidly grounded wye systems.

C. Bond Neutral bus to ground bus with removable jumper sized in accordance with NEC 250.66. Label jumper “Neutral-Ground Bonding Jumper Do Not Remove Without Engineering Approval”.

D. Provide surge protection device per requirements in Section 26 4300 – Surge Protective Devices.

2.5 SHORT CIRCUIT CURRENT RATING

A. Each switchboard with minimum short circuit current rating as indicated on drawings.

B. Switchboards: Marked with their maximum short circuit current rating at supply voltage.

C. Switchboards are to be fully rated.

2.6 SURGE PROTECTIVE DEVICES (SPD)

A. Provided by installing electrician.

B. Externally mounted in NEMA-1 enclosure.

C. Per requirements in Section 26 4300 – Surge Protective Devices

2.7 OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker: NEMA AB 1, NEMA AB 3, UL 489; lockable handle; interrupting capacity to meet available fault current.
   1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Fixed trip values for circuit breaker frame sizes 225 A and below.
   2. Electronic (solid-state microprocessor based) trip unit circuit breakers: digital true RMS sensing trip units; interchangeable in the field within the frame size (field-replaceable rating plug to determine the breaker trip rating), field-adjustable settings and the following trip functions for circuit breaker frame sizes 250 A - 1200 A:
      a. Instantaneous trip
      b. Long- and short-time pickup levels
      c. Long- and short-time time delay adjustments with I^2t response
      d. Ground-fault pickup level, time delay, and I^2t response
      e. Metering (where indicated on drawing)
   3. Current-Limiting Circuit Breakers: No fusible element, frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
   4. 80% long time current rated

B. Molded-Case Circuit Breaker Options and Accessories: Standard frame sizes, trip ratings, and number of poles.
   1. Communication Capability: Trip unit mounted circuit breaker communication module with functions and features compatible with power monitoring system, specified in Section 26 2713 – Electrical Metering.

2. Undervoltage Trip: 120 V, set to operate at less than 75% of rated voltage with field-adjustable 0.1- to 0.6-second time delay.
3. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit breaker contacts, "b" contacts operate in reverse of circuit breaker contacts.
4. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function and/or short time function.

C. Enclosed, Insulated-Case Circuit Breaker and Accessories: NEMA AB 1, UL 489; fully rated circuit breaker with interrupting capacity rating to meet available fault current.
1. Fixed (individually) circuit breaker mounting for branch breakers
2. Drawout design: Circuit breaker to be withdrawn from an engaged position, to a test position, and to a disengaged position for main circuit breaker.
3. Two-step, stored-energy closing; manually operated.
4. A charging handle, closed pushbutton, open pushbutton and Off/On/Charge indicator located on the breaker escutcheon and visible with the breaker compartment closed.
5. Electronic (solid-state microprocessor-based) trip units with interchangeable rating plug, trip indicators, field-adjustable settings and the following trip functions:
   a. Instantaneous trip.
   b. Long- and short-time pickup levels.
   c. Long- and short-time time delay adjustments with I^2t response.
   d. Ground-fault pickup level, time delay, and I^2t response.
   e. Metering (where indicated on drawing)
6. Shunt Trip: 120 V trip coil energized from separate circuit.
7. Undervoltage Trip: 120 V, set to operate at 75% of rated voltage with field-adjustable 0.1- to 0.6-second time delay.
8. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit breaker contacts, "b" contacts operate in reverse of circuit breaker contacts.
9. Communication Capability: Trip unit mounted circuit breaker communication module with functions and features compatible with power monitoring system, specified in Section 26 2713 – Electrical Metering.
10. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground fault protection function and/or short time function.
11. Listed for 100% of breaker’s continuous long time ampere rating.

D. Circuit Breaker Electronic Trip Units general characteristics:
1. Circuit breakers, with solid-state microprocessor based trip units:
   a. Unit shall consist of current sensors, solid-state trip device, and solid-state adjustable time/current curve shaping elements.
   b. Trip units shall be removable to allow for field upgrades.
   c. Trip units shall incorporate “True RMS Sensing.”
2. Solid-state elements shall provide functions as indicated above.
3. Adjustments shall be made using non-removable, discrete steps.
4. Sealable transparent cover shall be provided over adjustments.
5. Adjustable long-time pickup (Ir) and delay shall be available in an adjustable rating plug that is UL listed as field-replaceable. Adjustable rating plug shall allow for five minimum long-time

pickup settings from 0.4 to 1.0 times the sensor plug (In). Other adjustable rating plugs shall be available for more precise settings to match the application. Long-time delay settings shall be at least three bands.

6. Short-time pickup shall allow for five minimum settings from 1.5 to 10 times Ir. Short-time delay shall be at least three bands with I^2t ON and OFF.
7. Instantaneous settings on the trip units shall be available in five minimum bands from 2 to 15 times In. The instantaneous settings shall also have an OFF setting when short-time pickup is provided.
8. Trip units shall have the capability to electronically adjust the settings locally and remotely to fine increments below the switch settings. Fine increments for pickup adjustments are to be one ampere. Fine increments for delay adjustments are to be one millisecond.
9. Trip unit shall indicate:
    a. Long-time fault
    b. Short-time fault
    c. Instantaneous fault
    d. Ground fault, where provided
    e. Metering (where indicated on drawing)
10. Trip unit shall provide local trip indication and capability to indicate local and remote reason for trip, i.e., overload, short circuit or ground fault.
11. Trip unit shall contain means to conduct circuit breaker test, or via separate test kit.
12. Breaker shall be equipped with externally accessible test points to be used for field testing.
13. Trip units shall be available to provide real time metering. Metering functions include current, voltage, power and frequency.
14. Trip units shall be provided with the following standard features:
    a. Power Trip Unit
    b. True RMS sensing
    c. LSI – Long-Time Pickup, Long-Time Delay, Short-Time Pickup, Short-Time Delay, Instantaneous
    d. LSIG/Ground-fault trip (where ground fault is required)
    e. Ground Fault Alarm (no trip), with external relay, where required
    f. Adjustable rating plugs
    g. LCD or LED – Long-time pickup
    h. LCD or LED – Trip indication
    i. Communications interface via ModBus TCP/IP
    j. LCD backlit display showing:
        1) Amperage per phase
        2) Voltage per phase
        3) Real Power Demand
        4) Apparent Power Demand
        5) Maximum peak power demand (measure of average power over a 15-minute period) continuously recorded over a one-year period
        6) Power Factor
    k. Contact wear indication

l. Incremental fine tuning of settings
m. Selectable long-time delay bands

E. Ground Fault protection equipment on breakers or relay for opening bolted pressure switches, where indicated: relay and trip unit, push-to-test feature and ground fault indicator:
1. Ground-fault protection with ten adjustable pick-up settings adjustable delay settings from 0 to.4 seconds. Arrange to provide protection for the following:
a. Three-wire or four wire or system
2. Trip units shall be capable of the following types of ground-fault protection: zero sequence.
3. Neutral current transformers shall be provided for 4-wire system.
4. Ground-fault settings for circuit breaker sensor sizes 1200 A or below shall be in nine bands from 0.2 to 1.0 times In. The ground-fault settings for circuit breakers above 1200 A shall be in minimum three bands up to 1200 A.
5. Time delay is to have I^2T on and off functions.
6. Ground-Fault Relay: UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and 3-phase current transformer/sensor.
7. Zone selective interlocking connections where main and branch devices in same switchboard require ground fault protection.

F. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.
1. Provision for Class L fuses
2. Fuses per requirements in Section 26 2813 – Fuses
3. Ground Fault Relay controlled releasing unit where required

G. Fused Switch: NEMA KS 1, UL 98; enclosed knife switch heavy duty type, external lockable operable handle, clips or pads to accommodate specified fuses:
1. Rejection clips for Class R fuses
2. Provision for Class J or RK1 fuses, as applicable
3. Fuses per requirements in Section 26 2813 – Fuses

2.8 CONTROL POWER, COMPONENTS IDENTIFICATION, AND CONTROL WIRING

A. Control Circuits: 120 V, supplied through secondary disconnecting devices from control-power transformer. Provide dual control power supplies for double-ended switchboards. Control power connections to the bus are to be on the line side of the main disconnecting device for each incoming source.

B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

C. Control components mounted within assembly, such as relays, pushbuttons, switches, etc.: Suitably marked for identification, corresponding to appropriate designations on manufacturer's wiring diagrams.

D. Control Wiring: Factory installed, with bundling, lacing, and protection included for conductors across hinges, and for conductors for interconnections between shipping units; insulated locking spade terminals for all control connections, except where saddle type terminals, integral to a

device; current transformer secondary leads, connected to short circuit terminal blocks; terminal blocks with suitable numbering strips for group of control wires leaving switchboard, with wire markers at each end of control wiring.

E. Control power to supply individual circuit breaker trip unit. Coordinate supply voltage and current requirements with trip unit. No more than four (4) trip units are to be daisy chained together from the same source wiring and each vertical section is to have its own dedicated wiring back to control power source. For double ended systems, provide a minimum of two control power sources to supply the left and right halves of the switchboard. The tie breaker trip unit is to be connected to both power supplies.

F. Communications Gateway: Provide network switch and gateway to collect individual trip unit and meter network connections to allow for a single network connection to customer's LAN and/or BAS system. Coordinate requirements with LAN system administrator and BAS system provider. Gateway is to be powered from switchboard control power source. Gateways in double-ended switchboards are to be powered from both incoming source control power supplies.

2.9 ACCESSORY COMPONENTS AND FEATURES

A. Furnish portable test set to test functions of solid-state trip devices without removal from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

B. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

C. Furnish set of tools for manually charging circuit breaker stored energy device.

2.10 CUSTOMER METERING

A. Per requirements in Section 26 2713 – Electrical Metering.

PART 3 - EXECUTION

3.1 COORDINATION

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:

1. Dimensions: Per requirements in Section 26 0529 – Hangers and Supports for Electrical Systems.

C. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

D. Verify with manufacturer that "touch-up" paint kit is available for repainting.

3.2 EXAMINATION

A. Examine areas and surface to receive switchboards for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for switchboard mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install switchboard in accordance with NEMA PB 2.1 and ANSI/NECA 400.

B. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification for each switchboard, every instrument, overcurrent protective device and disconnect device. Attach nameplate to exterior of each switchboard using self adhesive backing.

C. Provide metal manufacturer's nameplate indicating switchboard manufacturer's name and drawing number, amperage, voltage, phase, number of wires, short circuit current rating (amp, RMS symmetrical and MVA 3-phase symmetrical) and momentary and fault-closing ratings (amp, RMS asymmetrical) and UL mark with applicable standard number. Permanently affix nameplate to switchboard main and tie sections with stainless steel rivets.

D. Provide framed, printed operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of switchboards.

E. Install switchboards in dedicated electrical space per NFPA 70, and as indicated on drawings.

F. Tighten electrical connectors and terminal according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

G. Install fuses in fusible switch at job site per requirements in Section 26 2813 – Fuses.

H. Connect surge protective devices to switchboard bus per requirements in Section 26 4300 – Surge Protective Devices.

I. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

J. Apply temporary heat to prevent condensation according to manufacturer's written instructions.

3.4 CONNECTIONS

A. Ground switchboards according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 FIELD QUALITY CONTROL

A. Inspect switchboards for physical damage, proper alignment, connections, anchorage, and grounding.

B. Test continuity of each circuit.

C. Test switchboards per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

E. Test switch operators after energizing.

3.6 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.7 ADJUSTING

A. Set field-adjustable circuit breakers trip settings or change the trip settings to values indicated on drawings or Overcurrent Protective Device Coordination Study.

3.8 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

3.9 DEMONSTRATION

A. Provide training session by manufacturer for one workday at a job location, to train the Owner's personnel in the operation and maintenance of switchboards.

END OF SECTION

SECTION 26 2416.13

LIGHTING AND APPLIANCE PANELBOARDS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0533 – Raceway and Boxes for Electrical Systems

E. Section 26 0553 – Electrical Systems Identification

F. Section 26 0812 – Power Distribution Acceptance Tests

G. Section 26 0813 – Power Distribution Acceptance Test Tables

H. Section 26 2713 – Electrical Metering

I. Section 26 2813 – Fuses

J. Section 26 4300 – Surge Protective Devices

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes circuit breaker type lighting and appliance branch circuit panelboards as shown on drawings and as scheduled.

1.4 REFERENCE STANDARDS

A. NECA 407 - Recommended Practice for Installing and Maintaining Panelboards

B. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)

C. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

D. NEMA FU1 - Low-Voltage Cartridge Fuses

E. NEMA PB 1 - Panelboards

F. NEMA PB 1.1 - General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less

G. NFPA 70 - National Electrical Code

H. UL 50 - Enclosures for Electrical Equipment

I. UL 67 - Panelboards

J. UL 98 - Enclosed and Dead-Front Switches

K. UL 248 - Low-Voltage Fuses

L. UL 486A-486B - Wire Connectors

M. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

N. UL 869A - Reference Standard for Service Equipment

1.5 SUBMITTALS

A. Product Data:
   1. Submit catalog data showing specified features of standard products. Eliminate extraneous catalog data.

B. Shop Drawings:
   1. Submit for review prior to manufacture. Include complete description, front view, dimensions, voltage, main bus ampacity, circuit breaker arrangement and sizes, short circuit current rating, and factory settings of individual protective devices.
   2. Submit 1/4” scale electrical room floor plans with panelboard locations.

C. Partial Submittals:
   1. Panelboards shall be submitted for review together. Partial submittals of panelboards are not acceptable and will be rejected.

D. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

E. Manufacturer’s Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

F. Test Reports:
   1. Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

G. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of panelboards and record actual circuiting arrangements.
   2. Operation and Maintenance Data:

a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
b. Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.
c. Include time-current curves and selectable ranges for each type of overcurrent protective device.
d. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain panelboards, overcurrent protective devices, components, and accessories from one source and by single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with NEMA PB 1.1 and manufacturer's written instructions.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.9 MAINTENANCE

A. Extra Materials:
1. Furnish Owner with two keys per panelboard.
2. Furnish 10% or minimum of three fuses of each rating and type of fuse installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D

B. ABB - General Electric

C. Siemens

D. Cooper Bussman (Fusible and Elevator Panels Only)

E. Mersen (Fusible and Elevator Panels Only)

F. Littlefuse (Fusible Panels Only)

2.2 LIGHTING AND APPLIANCE BRANCH CIRCUIT PANELBOARDS

A. NEMA PB 1, UL 67

B. Fabrication:
1. Factory assembled.
2. With door-in-door construction.
3. Incoming feeder lugs: copper conductors.
4. Multiple lugs to match number of conductors per phase.
5. Sub-feed (double) lugs, or feed-through lugs where indicated.
6. Filler plates.
7. Wiring terminals for field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

C. Panelboard Buses:
1. Copper
2. Ampere rating as scheduled
3. Ground bus: uninsulated, bonded to panelboard cabinet
4. Insulated neutral bus: 100% of phase bus rating

D. Molded-Case Circuit Breakers:
1. NEMA AB 1, UL 489
2. Bolt-on type, labeled for 75°C copper and aluminum conductors
3. Quick-make, quick-break, with thermal-magnetic trip.
4. Common internal trip on multi-pole breakers. Handle-ties are not permitted.
5. Ampere rating as scheduled
6. Listed as Type SWD for lighting circuits
7. Listed as Type HACR for air conditioning equipment circuits
8. Bussing, device mounting hardware, and steel knockouts in dead front where “space” is indicated
9. Tandem circuit breakers are not acceptable
10. Locks on trip handles where indicated
11. Main Circuit Breaker on all panelboards unless otherwise indicated on drawings.
12. Main breakers with shunt trip in branch circuit panels, where indicated
13. Ground fault equipment protection (GFEP), rated 30 mA trip, to provide equipment protection for branch circuits feeding electrical heat tracing, where indicated
14. Ground fault circuit interrupter (GFCI), rated at 4-6 mA trip for protection of personnel, where indicated

E. Branch Fused Disconnects

1. Visible circuit ON/OFF indication with colored and international symbol markings.
2. Open fuse indication via permanently installed neon indicating light or permanent open fuse indication.
3. UL and cUL listed 600Vac/200kA or 125Vdc/100kA voltage/short-circuit current rating, load-break disconnect with amp ratings and number of poles as indicated on the panelboard schedule.
4. Finger-safe component with trim installed.
5. Mechanical interlock fuse and disconnect to prevent fuse removal while fuse terminals are energized.
6. No special tools required for fuse removal.
7. Bolt-on style bus connectors.
8. Clearly mark device housing with device amperage.
9. Provide permanently installed lockout means on the device for lockout tagout procedures. Provide permanently installed means for locking device in the ON position.
10. Provide fuse amp rating rejection at the following ampacities to ensure continued circuit protection at the specified circuit rating: 15A, 20A, 30A, 40A, 50A, 60A, 70A, 90A, 100A.

F. Main and Branch Fusible Overcurrent Protection
1. Overcurrent protective devices: minimum UL listed interrupting rating of 300kA and CSA Certified interrupting rating of 200kA.
2. Branch circuit overcurrent protection: 600Vac UL listed class CF minimum 300kA IR and CSA certified minimum 200kA IR finger-safe fuse.
3. Main overcurrent protective devices: 600Vac UL listed class CF or class J minimum 300kA IR and CSA certified minimum 200kA IR.
4. Panelboard main fuses: where installed, fused panelboard branch circuits shall selectively coordinate with upstream fuses for all overcurrents up to 200kA.

G. Cabinet
1. NEMA 250, UL 50
2. NEMA Type 1 enclosure.
3. Front (trim) surface mounted with door in front with concealed self-adjusting trim clamps, and complete with cylinder-type lock and catch.
4. Same height matching trim, where two cabinets are mounted adjacent to one another in finished areas.
5. All sections of panelboards have the same size, where oversize cabinets are required for one section of multi-section panelboard.
6. Boxes and fronts made of code-gauge galvanized steel.
7. Manufacturer’s standard gray enamel finish over prime coat.

2.3 METERS

A. Provide separate metering compartments with digital meter in accordance with Section 26 2713 - Electrical Metering.

2.4 SERVICE ENTRANCE

A. UL 869A

B. Panelboards labeled as suitable for use as service entrance equipment where applicable and must include connection for bonding and grounding of neutral conductor.

2.5 SHORT CIRCUIT CURRENT RATING

A. Each panelboard with minimum short circuit current rating as indicated on drawings.

B. Panelboards marked with their maximum short circuit current rating at supply voltage.

C. Panelboards: Fully rated. Series-rated panelboards are not acceptable.

2.6 SURGE PROTECTIVE DEVICES (SPD)

A. As indicated on drawings and as scheduled.

B. Per requirements in Section 26 4300 – Surge Protective Devices.

2.7 SPARE CONDUITS

A. Spare conduits per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

PART 3 - EXECUTION

3.1 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of additional wiring gutter space when required (i.e., top, bottom, right, left, or combination).

B. Instruct manufacturer about the location of main lugs or main circuit breaker (i.e., top or bottom feed based on incoming feeder entrance location).

C. Instruct manufacturer to provide multiple lugs where conductors in parallel or sub-feed (double) lugs or feed-through lugs are indicated.

D. Instruct manufacturer on the size of cross-connection cables for panelboards fed via sub-feed (double) lugs or feed-through lugs. Make cable size with ampacity equal to incoming feeder.

E. Verify that “touch-up” paint kit is available for repainting.

3.2 EXAMINATION

A. Verify that space indicated for panelboard mounting meets code-required working clearances and dedicated equipment space.

B. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install panelboards in accordance with NECA 407 and NEMA PB 1.1.

B. Install panelboards plumb and rigid without distortion of box, in accordance with manufacturer's written instructions, and in compliance with recognized industry practices.

C. Panelboard mounting:
   1. Fasten panelboards firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.
   2. Anchor and fasten panelboards and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 0529 – Hangers and Supports for Electrical Systems.
   3. Install two rows of steel slotted channel, with a minimum of 4 attachment points, for each panelboard section.
   4. When not located directly on wall, provide support frame of steel slotted channel anchored to floor and ceiling structure.

D. Install top breaker handle a maximum of 6’-6” above finished floor or working platform with handle in its highest position.

E. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A – 486B.

F. Install as-built typewritten circuit directory in directory frame (to indicate installed circuit loads) mounted inside each panelboard door. Include description of connected loads, room number, room name, area, or item served for each branch circuit. Indicate motor names and horsepower as applicable. Cover circuit directory with colorless plastic. Coordinator with Owner and Architect to ensure that room numbers used in panel directory are final numbers assigned by Owner.

G. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplate to exterior of each panelboard using small metal screws or rivets. Do not use contact adhesive.
   1. Include panelboard name, amperage, voltage, phase, and number of wires.

H. Label spare circuits as SPARE. Leave spare breakers in OFF position.

I. Room numbers used shall be those used by Owner except as otherwise directed by Architect.

J. Install panelboard in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

K. Install filler plates in unused spaces.

L. Install three 3/4” spare conduits stubbed into accessible ceiling space or space designated to be ceiling space in the future for all flush-mounted panelboards. Install conduits in accordance with requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

3.4 CONNECTIONS

A. Ground panelboards according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment, anchorage, and grounding.

B. Maintain proper phasing for multi-wire circuits.

C. Test main circuit breakers in accordance with requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

E. Check phase-to-phase and phase-to-ground insulation resistance levels prior to energization of panelboards.

F. Check panelboards for electrical continuity of circuits and for short-circuits prior to energization.

3.6 REPAINTING

A. Remove paint splatters or other marks from surface of panelboards.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.7 ADJUSTING

A. Adjust fronts, covers, hinges, and locks.

3.8 CLEANING

A. Clean panelboard interiors and exteriors prior to final inspection. Remove paint splatters and other spots, dirt and debris.

END OF SECTION

SECTION 26 2416.16

DISTRIBUTION PANELBOARDS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0553 – Electrical Systems Identification

E. Section 26 0812 – Power Distribution Acceptance Tests

F. Section 26 0813 – Power Distribution Acceptance Test Tables

G. Section 26 2713 - Electrical Metering

H. Section 26 2813 – Fuses

I. Section 26 4300 – Surge Protective Devices

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes circuit breaker type and fusible switch type power distribution panelboards as shown on drawings and as scheduled.

1.4 REFERENCE STANDARDS

A. NECA 407 - Recommended Practice for Installing and Maintaining Panelboards

B. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum)

C. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

D. NEMA FU 1 - Low-Voltage Cartridge Fuses

E. NEMA KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

F. NEMA PB 1 - Panelboards

G. NEMA PB 1.1 - General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less

H. NFPA 70 - National Electrical Code

I. UL 50 - Enclosures for Electrical Equipment

J. UL 67 - Panelboards

K. UL 486A – 486B - Wire Connectors

L. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

M. UL 4248 - Fuseholders

N. UL 869A - Reference Standard for Service Equipment

1.5 SUBMITTALS

A. Product Data:
   1. Submit catalog data showing specified features of standard products. Eliminate extraneous catalog data.

B. Shop Drawings:
   1. Submit for review prior to manufacture. Include complete description, front view, dimensions, voltage, main bus ampacity, circuit breaker or fusible switch arrangement and sizes, short circuit current rating, and factory settings of individual protective devices.
   2. Submit 1/4” scale electrical room floor plans with panelboard locations.
   3. Submit features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
   4. Panelboards shall be submitted for review together. Partial submittals of panelboards are not acceptable and will be rejected.

C. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

D. Manufacturer’s Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

E. Test Report:
   1. Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

F. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of panelboards and record actual circuiting arrangements.
   2. Operation and Maintenance Data:

a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
b. Include manufacturer's written instructions for testing and adjusting overcurrent protective devices.
c. Include time-current curves and selectable ranges for each type of overcurrent protective device.
d. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain panelboards, overcurrent protective devices, components, and accessories from one source and by a single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with NEMA PB 1.1 and manufacturer's written instructions.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.9 MAINTENANCE

A. Extra Materials:
1. Furnish Owner with two keys per panelboard.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D – Schneider Electric

B. ABB - General Electric

C. Siemens

2.2 POWER DISTRIBUTION PANELBOARDS

A. NEMA PB 1, UL 67.

B. Fabrication:
   1. Factory assembled
   2. Individualized breaker or fusible switch dead-front cover door-in-door construction
   3. Incoming feeder lugs: copper conductors
   4. Multiple lugs to match number of conductors per phase
   5. Sub-feed (double) lugs, or feed-through lugs where indicated
   6. Filler plates
   7. Wiring terminals for field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

C. Panelboard Buses:
   1. Copper
   2. Ampere rating as scheduled
   3. Ground bus: uninsulated, bonded to panelboard cabinet
   4. Insulated neutral bus where applicable: 100% of phase bus rating

D. Molded-Case Circuit Breakers:
   1. NEMA AB 1, UL 489
   2. Bolt-on or I-line type, labeled for 75°C copper and aluminum conductors
   3. Quick-make, quick-break, with thermal-magnetic trip and electronic (solid-state microprocessor-based) trip.
   4. Equipped with individually insulated, braced, and protected connectors
   5. Common internal trip on multi-pole breakers. Handle-ties are not permitted.
   6. Ampere rating as scheduled
   7. Front face flush with each other
   8. Large, permanent, individual circuit numbers affixed to each breaker in uniform position
   9. Tripped indication clearly shown by breaker handle taking position between “ON” and “OFF.”
   10. Listed as Type HACR for air conditioning equipment circuits
   11. Bussing, device mounting hardware, and steel knockouts in dead front where “space” is indicated
   12. For 225A frame size and below: thermal-magnetic trip
   13. For 250A frame size and above: electronic trip units interchangeable in the field within the frame size and field-adjustable long time pick-up, long time delay, short time pick-up, short time delay, and instantaneous current settings. Each adjustment shall have discrete settings and shall be independent of all other adjustments.
   14. Locks on trip handles where indicated

E. Fusible Switches:
   1. NEMA KS1, NEMA FU1, UL 512
   2. Labeled for 75°C conductors

3. Quick-make quick-break with visible blades, externally operable handle and dual horsepower ratings.
4. Handles to physically indicate “ON” and “OFF” position.
5. Lockable only in “OFF” position and accept three industrial type heavy-duty padlocks.
6. Covers and handles be interlocked to prevent opening in “ON” position, with means to permit release of interlock.
7. Large permanent individual circuit numbers affixed to each fusible switch in uniform position.
8. Rejection clips for Class R fuses specified.
9. Provisions for Class J or Class L fuses, as applicable.
10. Fuses: Per requirements in Section 26 2813 – Fuses.

F. Cabinet
1. NEMA 250, UL 50
2. NEMA Type 1 enclosure.
3. Four-piece front (trim) surface mounted with door over the front, with concealed self-adjusting trim clamps, and complete with cylinder-type lock and catch except omit door in fusible switch panelboard.
4. Same height matching trim, where two cabinets are mounted adjacent to one another in finished areas.
5. All sections of panelboards have the same size, where oversize cabinets are required for one section of multi-section panelboard.
6. Boxes and fronts made of code-gauge galvanized steel
7. Manufacturer’s standard gray enamel finish over prime coat

2.3 METERS

A. Provide separate metering compartments with digital meter in accordance with Section 26 2713 - Electrical Metering.

2.4 SERVICE ENTRANCE

A. UL 869A

B. Panelboards labeled as suitable for use as service entrance equipment where applicable and must include connection for bonding and grounding of neutral conductor.

2.5 SHORT CIRCUIT CURRENT RATING

A. Each panelboard with minimum short circuit current rating as indicated on drawings.

B. Panelboards marked with their maximum short circuit current rating at supply voltage.

C. Panelboards: Fully rated. Series-rated panelboards are not acceptable.

2.6 SURGE PROTECTIVE DEVICES (SPD)]

A. As indicated on drawings and as scheduled.

B. Per requirements in Section 26 4300 – Surge Protective Devices.

PART 3 - EXECUTION

3.1 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of additional wiring gutter space when required, i.e. top, bottom, right, left, or combination.

B. Instruct manufacturer about the location of main lugs or main circuit breaker (i.e., top or bottom feed based on incoming feeder entrance location).

C. Instruct manufacturer to provide multiple lugs where conductors in parallel or sub-feed (double) lugs or feed-through lugs are indicated.

D. Instruct manufacturer on the size of cross-connection cables for panelboards fed via sub-feed (double) lugs or feed-through lugs. Make cable size with ampacity equal to incoming feeder.

E. Verify that “touch-up” paint kit is available for repainting.

3.2 EXAMINATION

A. Verify that space indicated for panelboard mounting meets code-required working clearances and dedicated equipment space.

B. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install panelboards in accordance with NECA 407 and NEMA PB 1.1.

B. Install panelboards plumb and rigid without distortion of box, in accordance with manufacturer's written instructions, and in compliance with recognized industry practices.

C. Panelboard mounting:
   1. Fasten panelboards firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.
   2. Anchor and fasten panelboards and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 0529 – Hangers and Supports for Electrical Systems.
   3. Install two rows of steel slotted channel, with a minimum of four attachment points, for each panelboard section.
   4. When not located directly on wall, provide support frame of steel slotted channel anchored to floor and ceiling structure.

D. Install top breaker handle a maximum of 6’-6” above finished floor or working platform, with handle in its highest position.

E. Tighten electrical connectors and terminals according to equipment manufacturer's published torque tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A –486B.

F. Install as-built typewritten circuit directory in directory frame (to indicate installed circuit loads before completing load balancing) mounted inside each panelboard door. Include description of

connected loads, room number, room name, area, or item served for each branch circuit. Indicate motor names and horsepower as applicable. Cover circuit directory with colorless plastic. Coordinate with Owner and Architect to ensure that room numbers used in panel directory are final numbers assigned by Owner.

G. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplate to exterior of each panelboard using small, corrosion-resistant metal screws or rivets. Do not use contact adhesive.
   1. Indicate panelboard name, amperage, voltage, phase, and number of wires.

H. Label spare circuits as SPARE. Leave spare breakers in OFF position.

I. Room numbers used shall be those used by Owner except as otherwise directed by Architect.

J. Install panelboard in dedicated electrical space per NFPA 70 and as shown on drawings. Coordinate with miscellaneous trades for equipment foreign to the electrical installation to be outside of dedicated electrical space.

K. Install filler plates in unused spaces.

L. Install fuses in fusible switches, per requirements in Section 26 2813 – Fuses.

3.4 CONNECTIONS

A. Ground panelboards according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment, anchorage, and grounding.

B. Test circuit breakers per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Check phase-to-phase and phase-to-ground insulation resistance levels prior to energizing panelboards.

E. Check panelboards for electrical continuity of circuits and for short-circuits prior to energizing.

3.6 REPAINTING

A. Remove paint splatters or other marks from surface of panelboards.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint to Owner.

3.7 ADJUSTING

A. Adjust fronts, covers, hinges, and locks.

B. Circuit Breakers: Set field-adjustable trip settings or change the trip settings, as provided by engineer.

3.8 CLEANING

A. Clean panelboard interiors and exteriors prior to final inspection. Remove paint splatters and other spots, dirt and debris.

END OF SECTION

SECTION 26 2500

ENCLOSED BUS ASSEMBLIES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0533 – Raceway and Boxes for Electrical Systems

E. Section 26 0553 – Electrical Systems Identification

F. Section 26 0593 – Electrical Systems Firestopping

G. Section 26 0812 – Power Distribution Acceptance Tests

H. Section 26 0813 – Power Distribution Acceptance Test Tables

I. Section 26 2813 – Fuses

J. Section 26 2816 – Enclosed Switches and Circuit Breakers

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes feeder and plug-in busways, 600 V or less, including accessories, plug-in units and components.

1.4 REFERENCE STANDARDS

A. NEMA BU 1 – Busways

B. NEMA BU 1.1 – General Instructions for Handling, Installation, Operation and Maintenance of Busways Rated 600V or Less

C. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

D. NEMA KS 1 – Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

E. UL 98 – Enclosed and Dead-Front Switches

F. UL 489 – Molded Case Circuit Breakers, Molded Case Switches, and Circuit Breakers Enclosures

G. NFPA 70 – National Electrical Code

1.5 SUBMITTALS

A. Product Data:
   1. Submit catalog cuts for components, accessories, and plug-in units.

B. Shop Drawings:
   1. Submit for review for each type of busway and plug-in unit.
   2. Indicate ratings, dimensions, layout diagram, and finishes.
   3. Show fabrication and installation details.
   4. Indicate location of supports and fittings.
   5. Indicate listed firestops and weatherseals at penetrations; show fittings, materials, fabrication, and installation methods.
   6. Include details of wall and floor penetrations.
   7. Indicate required clearances, method of field assembly, and location and size of each field connection.
   8. Indicate short circuit current rating.

C. Coordination Drawings: Floor plans and section (where needed), drawn to scale. Include completely dimensioned and scaled busway layouts and relationships between components and adjacent structural, mechanical, and electrical elements. Show the following:
   1. Vertical and horizontal enclosed busway runs, offsets, and transitions.
   2. Clearances for access above and to the side of enclosed busways.
   3. Vertical elevation of enclosed busways above the floor or bottom of structure.
   4. Support locations, type of support, and weight on each support.

D. Location of adjacent construction elements, including light fixtures, HVAC and plumbing equipment, fire sprinklers and piping, signal and control devices, and other equipment.

E. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

F. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

G. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of busway routing and location of plug-in units.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.

b. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain busways, fittings, accessories and plug-in units from one source and by single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70 for components and installation.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with NEMA BU 1.1 and manufacturer's written instructions.

1.8 SEQUENCING

A. Sequence work to avoid interferences with building finishes and installation of other products.

1.9 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.10 MAINTENANCE

A. Extra Materials:
1. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Feeder and plug-in busways and plug-in units:
1. Square D – Schneider Electric
2. ABB - General Electric
3. Siemens

B. Busway shall be of the same manufacture as the electrical equipment busway terminates in or originates from, except for automatic transfer switches as noted below.

1. Busway system manufacturer shall furnish termination fittings to manufacturer of automatic transfer switches for factory installation.

2.2 FEEDER AND PLUG-IN BUSWAYS

A. Description: NEMA BU 1, low-impedance busway in non-ventilated housing:
   1. Voltage and ampere ratings as indicated.
   2. 100% neutral capacity.
   3. Ground bus: **50% capacity integral with housing.**
   4. Temperature Rise: 55°C above 40°C ambient maximum for continuous rated current.
   5. Bus Materials: Current-carrying copper conductors, fully insulated with Class 130C insulation, except at joints.
   6. Joints: Single bolt type, with silver-plated contact surface for bus and split plate, testing of tightness and inspection without de-energizing, removal of any one section without disturbing adjacent pieces.
   7. Standard 10 ft sections.
   8. Feeder busway enclosure: Weatherproof, galvanized steel or aluminum with manufacturer's standard finish, sealed seams, drains, and removable closures.
   9. Plug-in busway enclosure: Steel, with manufacturer's standard finish, plug-in openings 24" o.c., and hinged covers over unused openings
   10. Fittings and Accessories: Manufacturer's standard.
   11. Mounting: Arranged flat, edgewise, or vertically without derating.

2.3 **PLUG-IN UNITS**

A. Description: Switching and overcurrent protection in enclosure with hinged door and externally operable handle for (hookstick) (chain) operation:
   1. Types and ratings as indicated.
   2. Mechanically interlocked with bus housing to prevent installation or removal while in ON position; means to defeat interlock.
   3. Ground connection to housing before stabs make contact with busbars.
   4. Provisions for 10 plug-in openings, per 10 ft section, 5 to a side and usable simultaneously.
   5. Suitable support at each plug-in opening for protection of bus in event of stresses due to fault.
   6. Full isolation of stabs of any plug-in device installed on busway.
   7. Molded-Case Circuit Breakers: NEMA AB 1 and UL 489; quick-make, quick-break, with [thermal-magnetic trip] [electronic (solid-state microprocessor-based) trip]; lockable with two padlocks, and interlocked with cover in closed position:
      a. For 225A frame size and below: thermal-magnetic trip.
      b. For 250A frame size and above: electronic trip units interchangeable in the field within the frame size and field-adjustable [long time pick-up], [long time delay], [short time pick-up], [short time delay], and [instantaneous] current settings. Each adjustment shall have discrete settings and shall be independent of all other adjustments.
   8. Fusible Switches: NEMA KS 1 and UL 98; enclosed knife switch, heavy-duty type, externally operable handle, lockable with two padlocks, and interlocked with cover in closed position; clips or pads to accommodate specified fuses:
      a. Rejection clips for Class R fuses.

b. Provisions for Class J or Class L fuses, as applicable.
c. Fuses: Per requirements in Section 26 2813 - Fuses.

2.4 SHORT CIRCUIT CURRENT RATING

A. Busways and plug-in units with minimum short circuit current rating as indicated on drawings.

PART 3 - EXECUTION

3.1 FIELD COORDINATION

A. Coordinate busways routing to clear work of other trades:
1. Coordinate with installation of adjacent construction elements, including light fixtures, HVAC and plumbing equipment, fire sprinklers and piping, signal and control devices, and other equipment.
2. Coordinate relationship between busways and adjacent structural, mechanical, and electrical elements.
3. Coordinate size and location of concrete curbs around openings for vertical bus. Concrete, reinforcement and formwork shall conform to requirements in Division 03. Refer to details shown on drawings.

B. Coordinate factory installation of termination fittings furnished by busway system manufacturer with the manufacturer of electrical equipment.

C. Coordinate busway terminations to equipment enclosures to ensure proper phasing, connections, and closure.

D. Verify field measurements prior to fabrication.

E. Coordinate the precise length of vertical busways so that joints and other components requiring access occur in accessible areas (ceiling space above finished area or equipment rooms). Access panels in finished walls are not acceptable, except where indicated.

F. Coordinate floor penetrations.

G. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

H. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.2 INSTALLATION

A. Install in accordance with NEMA BU 1.1, parallel to walls, floors, and ceilings.

B. Tighten buses’ joints using torque wrench, to manufacturer’s specified values.

C. Install busway length with expansion fitting at each location where busway run crosses building expansion joint. Install expansion fittings per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

D. Mount horizontal busway runs in edgewise to allow access to tap locations on both sides.

E. Busway supports:
   1. Support busway to prevent twisting from eccentric loading.
   2. Support busways at maximum as recommended by manufacturer or at 10’ intervals. Do not block access to busway joint with supports or hardware.
   3. Support busway by steel slotted channel with 3/8” minimum steel threaded hanger rods. Install side bracing to prevent swaying or movement of busway, for unbalanced weight of busway with plug-in units plus weight of a 250 lb man on a ladder at the height of the busway installation.
   4. Support vertical risers at each floor level by adjustable vertical spring hangers as indicated on drawings.
   5. Fasten supports securely to building structure according to Section 26 0529 – Hangers and Supports for Electrical Systems.

F. Install busway with integral firestops located where busway penetrates fire-rated walls, ceilings, and floors. Seal around opening to maintain fire rating equal to wall, ceiling, or floor rating. Refer to requirements in Section 26 0593 – Electrical Systems Firestopping.

G. Install concrete curb at least 4” high around interior floor penetrations.

H. Install busway with integral weatherseal fittings and flanges located where busway penetrates exterior wall or roof. Seal around opening to maintain weathertight installation.

I. Install fuses in fusible switches at job site per requirements in Section 26 2813 – Fuses.

J. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplates to busway using small, corrosion-resistant metal screws or rivets. Do not use contact adhesive.
   1. Indicate busway name, amperage, voltage, phase, number of wires and short circuit rating.

K. Do not block plug-in openings by hangers.

L. Install plug-in units. Support connecting conduit independent of plug-in unit.

M. Install flexible liquid-tight metal conduit connection to plug-in units to permit removal. Provide conduit per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

3.3 CONNECTIONS

A. Ground equipment according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.4 FIELD QUALITY CONTROL

A. Inspect busways for physical damage, proper alignment, supports, and seismic restraints.

B. Inspect busway components, wiring, connections, and grounding.

C. Test busways per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

D. Remove and replace plug-in units that do not pass tests and inspections and retest.

E. Interpret test results in writing and submit to Engineer.

F. Meggar test busways immediately prior to energizing, interpret test results in writing and submit to Engineer.

G. Scan entire busway with infra-red thermography camera with bus energized and loaded to at least 50% rated ampacity. Provide load bank to supplement load if required. Provide test results to Engineer. Make corrections to busway joints and components that show abnormal heating and retest.

3.5 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.6 ADJUSTING

A. Set field adjustable circuit breaker trip settings or change the trip settings, as indicated on drawings.

3.7 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

3.8 PROTECTION

A. Provide final protection to ensure that moisture does not enter busways.

END OF SECTION

SECTION 26 2550

GENERATOR DOCKING STATION

PART 1 GENERAL

1.1 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

GUARANTEE/WARRANTY

A. Refer to Section 01 77 19 – Contract Closeout and Section 26 00 00 – General Electrical Requirements for general warranty requirements.

B. The equipment installed under this contract shall be left in proper working order.

C. New materials and equipment shall be guaranteed against defects in composition, design or workmanship. Guarantee certificates shall be furnished.

COMMISSIONING

A. An independent third-party Commissioning Agent will document completion of the Fire Suppression, Mechanical, Plumbing, HVAC, Electrical and Electronic Safety and Security Systems for the project. The Construction Manager and Division Subcontractors are members of the Commissioning Team and will facilitate completion of the Commissioning process. Refer to section 01 91 13 “Building Systems Commissioning” for the project Commissioning requirements and roles and responsibilities of each member of the Commissioning Team

OPERATION AND MAINTENANCE MANUAL

A. Refer to Division 01 Section 01 78 23 for requirements
   1. O&M manuals
   2. Training log and Training hours required for each piece of equipment

CONTRACT CLOSE OUT

A. Refer to Division 01 Section 01 77 19 for requirements
   3. Spare parts
   4. As- Built
   5. Warranty

PART 2 PRODUCTS

2.1 GENERATOR DOCKING STATION

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   6. Trystar
   7. Gus Berthold Electric
   8. ESL Power Systems

2.2 GENERAL REQUIREMENTS

A. Docking station shall include 16 Series Camlok Panel Mounts for use as connection to Portable Load Bank.

B. Entire package must be listed to ETL or UL 1008 Standards. UL listing of individual components is not acceptable.

C. Enclosures:
   1. NEMA 3R 12ga Steel or Aluminum enclosure

a. Pad-lockable front door shall include a hinged access plate at the bottom for entry of cables from portable generator or portable load bank. NEMA 3R integrity shall be maintained with access plate open for cable entry.
b. Front and side through a front access panel shall be accessible for maintenance.
c. Top, side, and bottom through a front access panel shall be accessible for permanent cabling.

2. Finishes:
a. Paint after fabrication.

D. Phase, Neutral, and Ground Buses:
1. Material: Silver-plated Copper
2. Equipment Ground Bus: bonded to box.
3. Isolated Ground Bus: insulated from box.
4. Ground Bus: 50% of phase size.

E. Temporary load bank connectors shall be Camlok style mounted on gland plate.
1. Camlok shall be color coded according to system voltage
a. A phase –Brown
b. B phase –Orange
c. C phase –Yellow
d. G Ground – Green

F. Temporary connectors shall include protective flip lids to prevent accidental contact.

G. Permanent connectors shall be compression lug.

H. Voltage presence indicator mounted to front door.

I. Short Circuit & Withstand Rating
1. Shall be minimum 100KAIC unless otherwise indicated on drawings.

J. Voltage & Amperage:
1. 480V, 3-Phase, 4W, 3000A

K. Phase Rotation Monitor Device:
1. Phase monitoring relay to be Siemens 3U4512-1AR20 or equal.

L. Additional accessories shall be included in submittal drawings as follows:
1. Two Wire Auto Start

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive Generator Docking Station for compliance with installation tolerances and other conditions affecting performance of the Work.

3.2 INSTALLATION

A. Surface, Flush or Base Mounted: Determined by Application
1. Install anchor bolts to elevations required for proper attachment to Generator Docking Station.

3.3 FIELD QUALITY CONTROL

A. Third Party Tests and Inspections to include the following:
1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

B. Prepare test and inspection reports, including a certified report that identifies Generator Docking Station and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 26 25 50

SECTION 26 2713

ELECTRICAL METERING

PART 1 - GENERAL

1.1 RELATED WORK

A. [Section 23 0901 – Control Systems Integration

B. Section 23 0905 – Instrument Point List

C. Section 23 0993 – Control Sequences]

D. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

E. Section 26 0526 – Grounding and Bonding for Electrical Systems

F. Section 26 0529 – Hangers and Supports for Electrical Systems

G. Section 26 0548 – Vibration and Seismic Controls for Electrical Systems

H. Section 26 0553 – Electrical Systems Identification

I. Section 26 0812 – Power Distribution Acceptance Tests

J. Section 26 0813 – Power Distribution Acceptance Test Tables

K. Section 26 0913 – Electrical Power Monitoring and Control

L. Section 26 1113 – Primary Unit Substations

M. Section 26 1316 – Medium-Voltage Fusible Interrupter Switchgear

N. Section 26 2300 – Low-Voltage Switchgear

O. Section 26 2313 – Paralleling Low-Voltage Switchgear

P. Section 26 2413 – Switchboards

Q. Section 26 2416.13 – Lighting and Appliance Panelboards

R. Section 26 2416.16 - Distribution Panelboards

S. Section 26 2813 – Fuses

T. Section 26 4300 – Surge Protective Devices

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes equipment for energy and demand metering by Owner. It also includes options that provide for monitoring or automatic control of demand at a remote location.

1.4 REFERENCE STANDARDS

A. ANSI C12.1 – Code for Electricity Metering

B. ANSI C12.7 – Requirements For Watthour Meter Sockets

C. ANSI C12.9 – Test Switches For Transformer-Rated Meters

D. ANSI C12.10 – Watthour Meters

E. ANSI C12.11 – Instrument Transformers for Revenue Metering, 10 kV BIL Through 350 kV BIL (0.6 kV NSV Through 69 kV NSV)

F. ANSI C12.18 – Protocol Specification For ANSI Type 2 Optical Port

G. ANSI C12.19 – Utility Industry End Device Data Tables

H. ANSI C12.20 – Electricity Meters-0.2 and 0.5 Accuracy Classes

I. ANSI C39.1 – Requirements, Electrical Analog Indicating Instruments

N. IEEE C62.41.2 – Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits

O. IEEE C62.45 – Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000 V and Less) AC Power Circuits

P. NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting

Q. NECA 400 – Recommended Practice for Installing and Maintaining Switchboards

R. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

S. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

T. NEMA AB 3 – Molded-Case Circuit Breakers and Their Applications

U. NEMA EI 21.1 – Instrument Transformers for Revenue Metering (110KV BIL and Less)

V. NEMA KS 1 – Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

W. NEMA LA 1 – Surge Arresters

X. NEMA PB 2 – Dead-Front Distribution Switchboard

Y. NFPA 70 – National Electrical Code

Z. UL 50 – Standard for Enclosures for Electrical Equipment (1995)

AA. UL 98 – Enclosed and Dead-Front Switches

BB. UL 414 – Standard for Meter Sockets (1999)

CC. UL 467 – Grounding and Bonding Equipment

DD. UL 486A-486B – Wire Connectors

EE. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

FF. UL 891 – Dead-Front Switchboards

GG. ASTM D1535 – Standard Practice for Specifying Color by the Munsell System

1.5 SUBMITTALS

A. Product Data: For metering equipment, components and accessories indicated:
   1. Include data on features, components, and complete description; submit catalog cut sheets showing electrical characteristics and ratings.
   2. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes. Describe operating sequences, both automatic and manual.

B. Shop Drawings:
   1. Dimensioned plans and sections or elevation layouts.
   2. Wiring Diagrams: Power, signal, and control wiring. Identify terminals and wiring designations and color codes to facilitate installation, operation, and maintenance. Indicate recommended types, wire sizes, and circuiting arrangements for field installed wiring, and show circuit protection features.

C. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations and ratings of metering equipment on single-line diagrams and plan layouts.
   2. Operation and Maintenance Data:

a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
b. Include manufacturer's written instructions for testing.
c. Include spare parts data listing, source, and current prices of replacement parts and supplies.
d. Include manufacturer's Seismic Qualification Certification and Installation Seismic Qualification Certification.

1.6 QUALITY ASSURANCE

A. Obtain metering equipment from one source and by single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70 for components and installation.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.
3. Products being used as part of a utility or revenue metering system must meet the requirements of the electrical utility.

1.7 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.8 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.
1. Potential Transformer Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.
2. Control-Power Fuses: Equal to 10% of amount installed for each size and type, minimum of 2 of each size and type.
3. Fuses for Fused Switches: Equal to 10% of amount installed for each size and type, minimum of 3 of each size and type.

PART 2 - PRODUCTS

2.1 EQUIPMENT FOR ELECTRICAL METERING BY OWNER

A. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
1. Manufacturers – Models:
a. Panelboard/Switchboard/Switchgear:
1) Schneider Electric PowerLogic METSEPM5563RD
2) Eaton PXM2260MA65145

b. LEED Multi-Circuit Meter
    1) Schneider Electric PowerLogic HDPM6000

2. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
    a. Phase Currents, Each Phase: +/-0.5%
    b. Phase-to-Phase Voltages, Three Phase: +/-1%
    c. Phase-to-Neutral Voltages, Three Phase: +/-1%
    d. Kilowatts: +/-2%
    e. Kilovars: +/-2%
    f. Power Factor: +/-2%
    g. Frequency: +/-0.5%
    h. Megawatt Demand: +/-2%; demand interval programmable from 5 to 60 minutes
    i. Accumulated Energy, Megawatt Hours: +/-2%. Accumulated values unaffected by power outages up to 72 hours
    j. Maximum demand (measure of average power demand over a 15-minute period) continuously recorded over a one-year period.
    k. Total Harmonic Current Distortion, Percentage
    l. Total Harmonic Voltage Distortion, Percentage
    m. Individual Current Harmonics through the 63rd
    n. Integral Communications Port
3. Mounting: Display and control unit flush or semiflush, mounted in instrument compartment door.

B. Instrumentation:
1. Instrument Transformers: NEMA EI 21.1, IEEE C57.13, and the following:
    a. Potential Transformers: Secondary voltage rating of 120 V and NEMA accuracy class of 0.3 with burdens of W, X, and Y.
        1) 600 V and below: external PTs not required; fused potential connection.
    b. Current Transformers: Window type; ratios shall be as indicated with accuracy class and burden suitable for connected relays, meters, and instruments; shorting test blocks: 10 poles – 4 potential and 6 current, mounted with meter or in accessible location.
    c. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
    d. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondaries to ground overcurrent relays to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit breaker ground-fault protection.

C. Data Communications:
1. Means to transmit data to central control and/or monitoring system.
    a. Two RS 485 communication ports.
    b. Output communication of the meter through a serial RJ-45 connection.
    c. Provide meter gateway for connecting two or more meters within the same piece of equipment.
    d. Digital communication port connection in BACnet compatible communication protocol to communicate with Building Automation System (BAS) via Ethernet.

e. Keypad and scrollable display for local reading of measured values.

D. Kilowatt-Hour Meters:
1. Manufacturers:
a. Schneider Electric PowerLogic METSEPM5563RD
b. Eaton PXM2260MA65145
2. Kilowatt-Hour/Demand Meter: Electronic single and/or three-phase meters, measuring electricity use and demand.
a. Voltage and Phase Configuration: Designed for use on circuits with voltage rating and phase configuration indicated for its application.
b. Display: Digital liquid crystal, indicating accumulative kilowatt hours, current time and date, current demand, historic peak demand, and time and date of historic peak demand.
c. Demand Signal Communication Interface: Match signal to building automation system or campus standard input and arrange to convey the instantaneous, integrated, demand level measured by meter to provide data for processing and possible programmed demand control action by destination system.
d. Programmable Contact Module: Unit shall have push-button switches and a display for setting the demand level at which an integral set of Form C contacts shall be operated to initiate indicated action.
e. Enclosure: NEMA 250, Type 1 minimum, with hasp for padlocking or sealing.
f. Identification: Comply with Section 26 0553 – Electrical Systems Identification.
g. Memory Backup: Self-contained to maintain memory throughout power outages of 72 hours, minimum.
h. Sensors: Current-sensing type, with current or voltage output, selected for optimum range and accuracy for ratings of circuits indicated for this application.
1) Type: Split core.
i. Meter Accuracy: Nationally recognized testing laboratory certified to comply with ANSI C12.1.
j. Current-Transformer Cabinet: Listed or recommended by metering equipment manufacturer for use with sensors indicated.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate adjustment and programming of metering equipment with manufacturer.

B. Instruct manufacturer about the location of incoming lugs (i.e., top or bottom feed based on incoming feeder entrance location).

C. Coordinate installation of housekeeping concrete pad based on actual equipment supplied:
1. Concrete: Per requirements in Division 03 – Concrete.
2. Dimensions: Per requirements in Section 26 0529 – Hangers and Supports for Electrical Systems.

D. Coordinate with miscellaneous trades for equipment foreign to electrical installation to be outside of dedicated electrical space.

E. Verify with manufacturer that “touch-up” paint kit is available for repainting.

F. Coordinate utility company metering equipment requirements.

G. Coordinate meter data transmission with campus Tridium Building Automation System (BAS) and campus power monitoring system (CPMS) to integrate metering components with system architecture.
   1. Each meter shall transmit data independently, daisy chaining of meters for communication to Tridium Building Automation System (BAS) is not acceptable.

H. Coordinate meter data transmission with Tridium Building Automation System (BAS) to integrate electrical system metering data with campus power monitoring system (CPMS) and Tridium Building Automation System (BAS) GUI and LEED reporting requirements.

3.2 EXAMINATION

A. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Comply with installation requirements in NECA 1.

B. Tighten electrical connectors and terminal according to equipment manufacturer’s published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A-486B.

C. Install fuses in fusible switch at job site per requirements in Section 26 2813 – Fuses.

D. Install surge arrestors in cable termination compartments and connect to each phase of circuit, per requirements in Section 26 4300 – Surge Protective Devices.

E. Mount meters in the locations indicated on the drawings. Mounting height: 5’-6” or less from finished floor.

3.4 FIELD WIRING

A. Install field wiring to complete the electricity metering installation.
   1. Transformer-rated meter:
      a. Current transformer wiring shall be #12 AWG minimum size. Where distance to meter exceeds 22 ft, increase wire size to #10 AWG to reduce the burden on the metering circuit.
      b. Potential wiring shall be #14 AWG.
      c. Color coding: Same for current and potential wiring. A phase – black; B phase – red; C phase – blue; Neutral – white; Ground – green. Identify all wiring with plastic sleeve wire markers. Cloth markers are not acceptable.
      d. Neatly train and lace wiring for metering installation within pad-mounted transformer compartment and meter socket enclosure using nylon cable ties.
   2. Self-contained meter:
      a. Field wiring for building automation system (BAS) connection to solid-state electricity meter:

1) Conduit: Install a 3/4” conduit routed underground from meter compartment to BAS panel in the building; terminate conduit within 12” of BAS panel.
2) Communications Wiring: In the 3/4” conduit, install a 3-conductor communications cable as recommended by meter manufacturer. Connect one end to cable lead from meter KYZ pulse initiator module. Leave 4 ft excess cable coiled at opposite end for connection to BAS panel.

3.5 CONNECTIONS

A. Ground metering equipment according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect power and control wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.6 FIELD QUALITY CONTROL

A. Test continuity of each circuit.

B. Test metering equipment per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

C. Interpret test results in writing and submit to Engineer.

D. Test Owner’s electricity-metering installation for proper operation, accuracy, and usability of output data.
   1. Connect a load of known kilowatt rating, 2kW minimum, to a circuit supplied by metered feeder.
   2. Turn off circuits supplied by metered feeder and secure them in off condition.
   3. Run test load continuously for 8 h, minimum, or longer to obtain a measurable meter indication. Use test load placement and setting that ensures continuous, safe operation.
   4. Check and record meter reading at end of test period and compare with actual electricity used based on test load rating, duration of test, and sample measurements of supply voltage at test load connection. Record test results.
   5. Repair or replace deficient or malfunctioning metering equipment, or correct test setup; then retest. Repeat for each meter in installation until proper operation of entire system is verified.

E. Inspect modular meter center for physical damage, proper alignment, connections, anchorage, and grounding.

F. Verify that correct multiplier is indicated on face of meter.

G. Verify that current transformer secondary circuits are intact.

H. Inspect indicating devices for proper operation.

3.7 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.8 ADJUSTING

A. Adjustment and programming of metering equipment: By factory-authorized representative.

B. Compare meter display readings with readings taken with clamp on ammeter and hand held voltmeter.

C. Make adjustments as necessary.

3.9 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

3.10 DEMONSTRATION

A. Provide training session by manufacturer for up to 4 h at a job location, to train the Owner's personnel in the operation and maintenance of metering equipment.

END OF SECTION

SECTION 26 2726

WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0526 - Grounding and Bonding for Electrical Systems

B. Section 26 0553 - Electrical Systems Identification

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes receptacles, hazardous (classified) location receptacles and device cover plates.

1.4 REFERENCE STANDARDS

A. ASHRAE 90.1 – Energy Standard for Buildings Except Low-Rise Residential Buildings

B. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits

C. IEEE C62.45 – Surge Testing for Equipment Connected to Low-Voltage (1000V and less) AC Power Circuits

D. NECA 1 – Good Workmanship in Electrical Contracting

E. NFPA 70 – National Electrical Code

F. ~~[~~NFPA 99 –Health Care Facilities~~]~~

G. NEMA WD-1 – General Color Requirements for Wiring Devices

H. NEMA WD-6 – Wiring Devices - Dimensional Requirements

I. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum)

J. UL 498 – Attachment Plugs and Receptacles

K. UL 943 – Ground-Fault Circuit-Interrupters

L. UL 1310 – Class II Power Units

M. UL 1436 – Outlet Circuit Testers and Similar Indicating Devices

N. ~~[~~UL 1449 – ~~Transient Voltage Surge Suppressors~~Surge Protective Devices~~]~~

O. [UL 1699A – Arc Fault Circuit Interrupters]

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

D. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

E. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations and ratings of wiring devices.
   2. Operation and Maintenance Data:
      a. Include in manufacturers' packing label warnings and instruction manuals with labeling conditions.
      b. Include source and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain wiring devices from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory unopened packaging until ready for installation.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Cooper Wiring Devices; a division of Cooper Industries, Inc.

B. Hubbell Incorporated; Wiring Device-Kellems

C. Leviton Manufacturing Company, Inc.

D. Pass & Seymour/Legrand; Wiring Devices & Accessories

2.2 RECEPTACLES

A. Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

B. Receptacles: 125 V, 20A, ~~[heavy-duty (specification grade)]~~ ~~[~~hospital grade~~]~~; back and side wired; flush or surface mounted; straight blade; 2 pole, 3 wire grounding; thermoplastic body; duplex configuration unless otherwise noted. *All receptacles in project shall be Tamper Resistant (TR) type.*

1. Ground Fault Circuit Interrupter (GFCI):
   a. Additional compliance with UL 943 Class A.
   b. Leakage current trip level: 4 to 6 mA.
   c. Trip time: .025 seconds nominal.
   d. Feed-through type
   e. Reverse line-load function to prevent GFCI from functioning if wired incorrectly.
   f. Indicator Light: Lighted when device is tripped.
2. Isolated Ground (IG):
   a. Ground strap isolated from mounting strap.
   b. Ground screw connected directly to ground contacts.
3. ~~[~~USB Charging:
   a. UL-498 and UL-1310 listed
   b. Two USB 2.1 Amp or 3.0 Amp, 5VDC charging ports in addition to two 120V, 20A NEMA 5-20R outlets in one single gang device.
      1) One USB Type-A port
      2) One USB Type-C port
   c. LED indicator for notification of USB port connection.
   d. Auto-grounding connection type.~~]~~
4. ~~[~~Arc Fault Interrupter (AFCI):
   a. Additional compliance with UL 1699A
   b. Face-mounted test and reset actuation.
   c. Face-mounted LED indicating unit is powered and functioning.
   d. Tamper resistant (TR).~~]~~
5. ~~[Transient Voltage Surge Suppression~~Surge Protective Device (~~TVS~~SPD):
   a. Additional compliance with UL 1449, with integral ~~TVSS~~ SPD in line to ground, line to neutral, and neutral to ground.
   b. ~~TVSS~~ SPD Components: Multiple metal-oxide varistors; with a nominal clamp-level rating of 400 volts and minimum single transient pulse energy dissipation of 240 J, according to IEEE C62.41.2 and IEEE C62.45.
   c. Active ~~TVSS~~ SPD Indication: Visual and audible, with light visible in face of device to indicate devise is “active” or “no longer in service.”~~]~~

6. Tamper Resistant (TR):
   a. Requires insertion of object in both left and right contacts to energize.
   b. 2- or 3-prong plug.
7. Twist-locking:
   a. NEMA WD 6 configuration as indicated on drawings.
8. Switched: Upper half switched and lower half not switched.
9. Dedicated: Labeled “Dedicated.”
10. Special Purpose Receptacles: Specification grade, rated for voltage, amperage and NEMA configuration as noted on drawings.

2.3 DEVICE COVER PLATES

A. Single and combination types to match corresponding wiring devices:
   1. Attachment: Metal screws with head color to match plate finish.
   2. Material for Finished Spaces:
      a. Satin-finished stainless steel.
   3. Material for Unfinished Spaces: Galvanized steel.
   4. Material for Damp Locations: Cast aluminum with while-in-use hinged cover, and listed and labeled for use in “wet locations.”

B. Weatherproof Cover Plates (Indoor Flush):
   1. Vertical Receptacles: Hubbell HBL5221 or approved equal.
   2. Horizontal Receptacles: Hubbell HBL5206WO or approved equal.

C. Weatherproof Cover Plates (Outdoor): NEMA 250, complying with type 3R weather-resistant, die-cast aluminum with weatherproof while-in-use hinged cover with tab for locking with padlock.

D. Tamper Resistant (TR):
   1. Slide cover over receptacle.

2.4 FINISHES

A. Color:
   1. Receptacle faceplates, and device cover plates: ~~insert color~~WHITE, except as follows:
      a. Receptacle faceplates connected to Essential Power System: Red.
      b. ~~[~~TVSS SPD Receptacles: Blue~~]~~
      ~~c. [Isolated-Ground Receptacles: As specified above, with orange triangle on face.]~~
      ~~d. [UPS Receptacles: Gray]~~

PART 3 - EXECUTION

3.1 COORDINATION

A. Special Purpose Receptacles: Coordinate final selections of NEMA configuration (locking, straight, blade, etc.) with configuration of plug on utilization equipment.

B. Receptacles for Owner-furnished equipment and equipment furnished under other divisions of specifications: Match plug configurations.

C. Coordination with Other Trades:
   1. Take steps to insure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers guided by riding against outside of the boxes.
   2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
   3. Install device boxes in brick or block walls so that the device cover plate does not cross a joint
   4. Install wiring devices after all wall preparation, excluding painting, is complete. Install device cover plates after painting is complete.

3.2 EXAMINATION

A. Verify location of wiring devices with architectural interior elevation drawings, prior to rough-in.

B. Verify outlet boxes are installed at proper height.

C. Verify wall openings are neatly cut and completely covered by wall plates.

D. Verify branch circuit wiring installation is completed, tested, and ready for connection to wiring devices.

3.3 PREPARATION

A. Clean debris from outlet boxes.

3.4 INSTALLATION

A. Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise scheduled or indicated on drawings. Indicated dimensions are to center of device.

B. Conductors:
   1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.
   2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
   3. Length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
   4. Do not place bare stranded conductors directly under device screws. Use crimp on fork terminals for device terminations.

C. Device Installation:
   1. Replace all devices that have been in temporary use during construction or show signs of installation prior to completion of building finishing operations.
   2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
   3. Do not remove surface protection, such as plastic film and smudge covers, until last possible moment.

4. Connect devices to branch circuits using pigtails that are not less than 6” in length.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by the manufacturer.
7. When conductors larger than #10 AWG are installed on 20A circuits, splice #12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.
10. Install devices plumb, level with finished surfaces and free from blemishes.
11. Install devices above counters, 2” to the bottom of device above countertop or backsplash. Install all devices at same height above any one counter or fixed cabinet.
12. Install special purpose receptacles according to shop and rough-in drawings furnished by trade(s) producing such equipment. Verify locations prior to rough-in.
13. Install weatherproof GFCI receptacles:
    a. Within 25’-0” of roof-mounted mechanical equipment
    b. Outdoors
    c. As indicated on drawings
14. Connect wiring device grounding terminal to outlet box with bonding jumper and branch circuit equipment grounding conductor. Ground per requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems.

D. Installation Orientations:
1. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the left.
2. Unless otherwise indicated or where space problem occurs, mount devices flush, with long dimension vertical.

E. Device Cover Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

3.5 IDENTIFICATION

A. Comply with Section 26 0553 – Electrical Systems Identification.
1. Receptacles (20A, 120V): Use hot, stamped or engraved machine printing with black-filled lettering on white background on face of cover plate, and durable wire markers or tags inside outlet boxes. Indicate source panel identification and circuit number. Indicate “NORMAL” on side of receptacle opposite of panel/circuit.
2. Receptacles (other than 20A,120V): Use hot, stamped or engraved machine printing with black-filled lettering on white background on face of cover plate, and durable wire markers or tags inside outlet boxes. Indicate source panel identification, circuit number, voltage, phase, and amperage.
3. [Essential Power Receptacles: In addition to above, identify coverplates with engraved “EMERGENCY” or “CRITICAL” depending on classification of system.]
4. Engrave cover plates on all Owner-furnished equipment and equipment furnished under other divisions of these specifications with source panel identification, circuit number (where applicable) as specified in this section. [This includes headwalls, gas columns and booms,

patient consoles, medical rail systems, custom casework with electrical devices, etc. Include "Emergency", "Critical" or "Standby" as required depending on classification of system.]

3.6 FIELD QUALITY CONTROL

A. Inspect wiring devices for defects.

B. Verify receptacle device is energized.

C. Perform tests and prepare test reports:

1. Test receptacle devices for proper polarity:
   a. Test every receptacle with receptacle circuit tester. Tester shall test for open ground, reverse polarity, open hot, open neutral, hot and ground reversed, hot or neutral and hot open. Rewire receptacles with faults and retest.
2. Test each GFCI receptacle device for proper operation:
   a. Perform testing using an instrument specifically designed and manufactured for testing ground-fault circuit interrupters. Apply the test to the receptacle. "TEST" button operation will not be acceptable as a substitute for this test. Replace receptacles that do not shut off power with 5/1000 A within 1/40 second and retest.
3. [Test each AFCI device for proper operation:
   a. Perform testing using an instrument specifically designed and manufactured for testing arc-fault circuit interrupters. Apply the test to the receptacle. "TEST" button operation will not be acceptable as a substitute for this test. Replace receptacles that do not shut off power within the limits stated in UL-1699A and retest.]
4. [In healthcare facilities, prepare reports that comply with recommendations in NFPA 99.]
5. Test Instruments: Use instruments that comply with UL 1436.
6. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

D. Tests for Convenience Receptacles:

1. Line Voltage: Acceptable range is 105 V to 132 V.
2. [USB Voltage: Acceptable range is 4.8VDC to 5.5VDC.]
3. Percent Voltage Drop under 15A Load: A value of 5% or higher is not acceptable.
4. Ground Impedance: Values of up to 2 ohms are acceptable.
5. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
6. [AFCI Trip: Test for tripping values specified in UL 1699A.]
7. Using the test plug, verify that the device and its outlet box are securely mounted.
8. The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

E. Test straight blade [convenience outlets in patient-care areas] [hospital-grade convenience outlets] for the retention force of the grounding blade according to NFPA 99. Retention force shall be not less than 4 oz.

F. Operational Tests: Demonstrate the operation of each switch with the systems fully energized and operating. Each switch shall be demonstrated three times.

G. Interpret test results in writing and submit to Engineer.

3.7 ADJUSTING

A. Adjust devices and wall plates to be flush and level.

3.8 CLEANING

A. Remove excess plaster from interior of outlet boxes.

B. Clean devices and cover plates after painting is complete. Replace stained or improperly painted devices and cover plates.

END OF SECTION

SECTION 26 2813

FUSES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 2413 – Switchboards

B. Section 26 2416.16 - Distribution Panelboards

C. Section 26 2419 - Motor Control Centers

D. Section 26 2816 - Enclosed Switches and Circuit Breakers

E. Section 26 2913 - Enclosed Controllers

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and section under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes nonrenewable cartridge fuses, rated 600V and less, for use in low-voltage power distribution system and spare fuse cabinet.

1.4 REFERENCE STANDARDS

A. NEMA FU 1 - Low Voltage Cartridge Fuses

B. UL 248-1 - Low Voltage Fuses - Part 1: General Requirements

C. UL 248-4 - Low-Voltage Fuses - Part 4: Class CC Fuses

D. UL 248-5 - Low-Voltage Fuses - Part 5: Class G Fuses

E. UL 248-8 - Low-Voltage Fuses - Part 8: Class J Fuses

F. UL 248-10 - Low-Voltage Fuses - Part 10: Class L Fuses

G. UL 248-12 - Low-Voltage Fuses - Part 12: Class R Fuses

H. UL 248-15 - Low-Voltage Fuses - Part 15: Class T Fuses

I. UL 248-17 – Low-Voltage Fuses – Part 17: Class CF Fuses

J. UL 4248 - Fuseholders

1.5 SUBMITTALS

A. Product Data:

1. Submit the following for each fuse type and size indicated:
   a. Manufacturer's technical data on features, performance, electrical characteristics, ratings, and dimensions.
   b. Time-current curves, selective coordination charts and tables, and related data.
   c. Let-through current curves for fuses with current-limiting characteristics.
   d. Fuse size for each elevator disconnect switch.

B. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual class, size, and location of fuses.

1.6 QUALITY ASSURANCE

A. Obtain fuses from one source and by single manufacturer.

B. Comply with NFPA 70 for components and installation.

1.7 MAINTENANCE

A. Extra Materials:
   1. Furnish to the Owner a quantity of spare fuses equal to 10% of the total quantity of each fuse class and size installed, minimum of 3 of each fuse class and size.
   2. Furnish 2 fuse pullers for each size fuse.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Eaton Cooper Bussmann

B. Mersen

C. Littelfuse

2.2 CARTRIDGE FUSES

A. NEMA FU 1, UL 248-1.

B. Characteristics: nonrenewable current-limiting cartridge fuse; current rating and class, as specified or indicated, and voltage rating consistent with circuit voltage.

C. Miscellaneous data:

UL Standard	Class	Volts	Amperage	Interrupting Rating (Amp RMS Sym.)
248-4	CC	600	0-30	200,000
248-5	G	600	0-20	100,000
248-5	G	480	25-60	100,000

UL Standard	Class	Volts	Amperage	Interrupting Rating (Amp RMS Sym.)
248-8	J	600	0-600	200,000
248-10	L	600	601-6000	200,000
248-11	Plug	125	15-30	10,000
248-12	RK1	250 or 600	0-600	200,000
248-12	RK5	250 or 600	0-600	200,000
248-15	T	300	0-1200	200,000
248-15	T	600	0-800	200,000
248-17	CF	600	1-100	200,000

2.3 FUSEBLOCKS

A. UL 4248

B. Thermoplastic base with UL flammability 94VO

C. Clip reinforcing springs – 100A and above

D. 200,000 A RMS Sym short-circuit current rating

E. Copper or aluminum connections

2.4 FINGER SAFE FUSEHOLDERS

A. UL 4248

B. Thermoplastic base with UL flammability 94VO

C. Cover over fuses

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

3.2 INSTALLATION

A. Verify proper fuse locations, sizes, and characteristics.

B. Install fuses in fusible devices specified in other sections at job site.

C. Arrange fuses so manufacturer, class, and size are readable without removing fuse.

D. Install typewritten labels on inside door of each fused device, indicating fuse replacement information.

3.3 APPLICATION

A. Main Service: Class L

B. Main Feeders: Class L, Class J, or Class RK1 as indicated by Engineer

C. Motor Branch Circuits: Class J or Class RK1, dual element time delay

D. Transformer Primary Protection: Class J or Class RK1 dual element time delay

E. Other Branch Circuits: Class J or Class RK1, fast acting, current limiting or as indicated by Engineer

F. Lighting and Appliance Panelboard 208/120V, 1A-100A branch circuits: Class CF, Class CC or Plug

G. Lighting and Appliance Panelboard 480/277V, 1A-100A branch circuits: Class CF or Class CC

3.4 CLEANING

A. Clean fuses and tighten connections prior to energizing of equipment.

END OF SECTION

SECTION 26 2816

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0553 – Electrical Systems Identification

E. Section 26 0812 – Power Distribution Acceptance Tests

F. Section 26 0813 – Power Distribution Acceptance Test Tables

G. Section 26 2813 – Fuses

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes fusible and non-fusible disconnect switches and circuit breakers in individual enclosures.

1.4 REFERENCE STANDARDS

A. ANSI//NECA 1 - Standard Practices for Good Workmanship in Electrical Contracting

B. NEMA AB 1 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures

C. NEMA KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

D. NFPA 70 - National Electrical Code

E. UL 98 - Enclosed and Dead Front Switches

F. UL 486A - 468B - Wire Connectors

G. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures

H. UL 869A - Reference Standard for Service Equipment

1.5 SUBMITTALS

A. Product Data:
   1. Submit catalog cut sheet indicating voltage, amperage, HP ratings, enclosure type, and dimension, fuse clip features, terminal lugs and all accessories including interlock devices, short circuit current ampere rating and factory settings of individual protective devices.

B. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

C. Test Reports:
   1. Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

D. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations of disconnect switches and ratings of installed fuses.
      b. Record actual locations and continuous current ratings of enclosed circuit breakers.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.6 QUALITY ASSURANCE

A. Obtain disconnect switches and enclosed circuit breakers from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect from dirt, water, construction debris, and traffic.

B. Comply with manufacturer's written instructions.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D

B. General Electric

C. Siemens

2.2 DISCONNECT SWITCHES

A. NEMA KS 1, UL 98

B. Load interrupter enclosed knife switch, heavy-duty type.

C. Fusible or non-fusible type as indicated.

D. Switch Interiors:
1. Switch blades that are visible in "OFF" position when switch door is open.
2. Plated current carrying parts.
3. Removable arc suppressors to permit easy access to line side lugs.

E. Switch Mechanism:
1. Quick-make, quick-break, with visible blades and externally operable handle.
2. Lockable only in “OFF” position and accept three industrial type, heavy-duty padlocks.
3. Dual cover interlock to prevent unauthorized opening of switch door when handle is in "ON" position, and to prevent closing of switch mechanism with door open.
4. Defeater mechanism to bypass interlock.
5. Operating handle integral part of enclosure.
6. Handle to physically indicate "ON" and "OFF" position.

F. Ratings:
1. Ampacity as indicated on drawings.
2. Minimum 10kA withstand rating for non-fusible switches
3. Minimum 100kA withstand rating for fusible switches
4. Horsepower rated.

G. Fusible Switches:
1. Rejection clips for Class R fuses specified.
2. Provisions for Class J or Class L fuses, as applicable.
3. Fuses: Per requirements in Section 26 2813 – Fuses.

2.3 ENCLOSED CIRCUIT BREAKERS

A. NEMA AB 1, UL 489.

B. Enclosed molded-case circuit breakers:
1. Tripped indication clearly shown on breaker handle taking position between “ON” and “OFF”.

2. 225A frame size and below: thermal-magnetic trip.
3. 250A frame size and above: electronic (solid-state microprocessor-based) trip units interchangeable in the field within the frame size and field-adjustable long time pick-up, long time delay, short time pick-up, short time delay, and instantaneous current settings. Each adjustment shall have discrete settings and shall be independent of other adjustments.
4. Locking tabs on cover to allow breaker handle to be locked in the open or closed position. When locked cover is not allowed to be removed.

C. Breaker Mechanism:
1. Quick-make, quick-break.

D. Ratings:
1. Ampacity as indicated on drawings.
2. Listed as Type HACR for air conditioning equipment circuits.
3. Listed as Type SWD for lighting circuits.
4. Interrupting rating as indicated on drawings. Minimum ratings unless otherwise noted:
a. 208/120V: 22kA
b. 480/277V: 65kA

2.4 LUGS

A. Front removable lugs.

B. Labeled for 75°C copper and aluminum conductors.

C. Multiple lugs to match number of conductors per phase.

D. Termination of field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

2.5 ACCESSORIES:

A. Solid neutral assembly, where required.

B. Equipment ground kit.

C. One set of normally open (NO) auxiliary contacts, where disconnect switch is installed at a remote motor served by any type of motor controller including full and reduced voltage starters, solid state soft starters and variable frequency drives.

2.6 ENCLOSURES

A. NEMA KS 1, NEMA AB 1, UL 98, UL 489, as applicable.

B. NEMA Type 1 (dry indoor locations)
1. Code-gauge galvanized steel
2. Manufacturer’s standard gray enamel finish over prime coat

C. NEMA Type 3R (intermittently wet indoor or outdoor locations)
1. Code-gauge galvanized steel

2. Manufacturer's standard gray enamel finish over prime coat

D. NEMA Type 4X (continuously wet or corrosive locations to include cooling towers)
1. Code-gauge Type 316 stainless steel

E. Surface-mounted

2.7 SERVICE ENTRANCE

A. UL 869A

B. Switches and circuit breakers identified for use as service entrance equipment are to be labeled for this application, provided with solid neutral assembly and equipment ground bar, and must include connection for bonding and grounding of neutral conductor.

2.8 SHORT CIRCUIT CURRENT RATING

A. Each circuit breaker shall have minimum short circuit current rating as indicated on drawings.

PART 3 - EXECUTION

3.1 COORDINATION WITH MANUFACTURER

A. Instruct manufacturer about the location of incoming lugs, i.e., top or bottom feed based on incoming feeder entrance location.

B. Verify that "touch-up" paint kit is available for repainting.

C. Provide watertight bolt-on hubs for top entry NEMA-3R and NEMA-4X enclosures.

3.2 EXAMINATION

A. Examine areas and surface to receive disconnect switches and enclosed circuit breakers for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for disconnect switches and enclosed circuit breakers mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data and shop drawings.

3.3 INSTALLATION

A. Install disconnect switches and/or enclosed circuit breakers in accordance with ANSI/NECA 1.

B. Install disconnect switches and/or enclosed circuit breakers level and plumb, in accordance with manufacturer's written instruction.

C. Disconnect switches and enclosed circuit breakers mounting**:**
1. Fasten disconnect switches and enclosed circuit breakers firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.

2. Anchor and fasten disconnect switches and enclosed circuit breakers and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 0529 – Hangers and Supports for Electrical Systems.
3. Install two rows of steel slotted channel, with a minimum of four attachment points, for each disconnect switch and enclosed circuit breaker.
4. When not located directly on wall, install support frame of steel slotted channel anchored to floor and ceiling structure.

D. Do not support disconnect switches and/or enclosed circuit breakers by raceway.

E. Install top disconnect switch and/or enclosed circuit breaker handle a maximum of 6'-6" above finished floor.

F. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A - 486B.

G. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplate to exterior of each switch and/or enclosed circuit breaker using small corrosion-resistant metal screws or rivets. Do not use contact adhesive.
1. Include switch and/or enclosed circuit breaker name, amperage, voltage, phase, and number of wires.

H. Install fuses in fusible switches at job site per requirements in Section 26 2813 – Fuses.

3.4 CONNECTIONS

A. Ground equipment according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

3.5 FIELD QUALITY CONTROL

A. Inspect for physical damage, proper alignment connections, anchorage, and grounding.

B. Correct malfunctioning units on-site and retest to demonstrate compliance. Remove and replace with new units and retest.

C. Test disconnect switches and/or enclosed circuit breakers per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

D. Interpret test results in writing and submit to Engineer.

3.6 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches, or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.7 ADJUSTING

A. Circuit Breakers: Set field-adjustable trip settings or change the trip settings, as provided by Engineer.

3.8 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 26 2913
ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

B. Section 26 0526 – Grounding and Bonding for Electrical Systems

C. Section 26 0529 – Hangers and Supports for Electrical Systems

D. Section 26 0533 – Raceway and Boxes for Electrical Systems

E. Section 26 0553 – Electrical Systems Identification

F. Section 26 0812 – Power Distribution Acceptance Tests

G. Section 26 0813 – Power Distribution Acceptance Test Tables

H. Section 26 2813 – Fuses

1.2 DESCRIPTION

A. Section includes enclosed manual and magnetic motor controllers and enclosed contactors.

B. Motors shown on the drawings or specified in other Divisions of these specifications shall be provided with motorized equipment and connected under this section. Provide motor controllers and power circuit disconnect devices for all motors, unless shown or specified to be furnished with motorized equipment under other Divisions of these specifications, and/or by others, for installation by this contract.

C. Variable-frequency controllers furnished by Division 20 for installation by Division 26.

D. Motor Voltage Information:

1. Voltages available are: 120V single phase and 460 V, 3-phase. Circuits are designed for motors with voltage ratings as follows:
    a. Smaller than 1/2 hp motors: 115 V, single phase.
    b. 1/2 hp motors and larger: 460 V, 3-phase.

1.3 REFERENCE STANDARDS

A. ANSI/NECA 1 – Standard Practices for Good Workmanship in Electrical Contracting

B. NEMA AB 1 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures

C. NEMA 250 – Enclosures for Electrical Equipment (1000 V Maximum)

D. NEMA ICS 2 – Industrial Control and Systems: Controllers, Contactors and Overload Relays, Rated Not More Than 2000 VAC or 750 VDC

E. NEMA ICS 4 – Industrial Control and Systems: Terminal Blocks

F. NEMA ICS 5 – Industrial Control and Systems: Control Circuit and Pilot Devices

G. NEMA ICS 6 – Industrial Control and Systems: Enclosures

H. NEMA KS 1 – Enclosed and Miscellaneous Distribution Equipment Switches (600 V Maximum)

I. NEMA MG 1 – Motors and Generators

J. NFPA 70 – National Electrical Code

K. UL 98 – Enclosed and Dead Front Switches

L. UL 486A-486B – Wire Connectors

M. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breakers Enclosures

N. UL 508 – Industrial Control Equipment

1.4 SUBMITTALS

A. Product Data:
   1. Motor controllers: Submit catalog cut sheets showing voltage, size, rating and size of switching and overcurrent protective devices, dimensions, and enclosure details.
   2. Contactors: Submit catalog cut sheets showing voltage, size, current rating, dimensions, and enclosure details.
   3. Factory settings and time-current curves of individual protective devices.
   4. Confirm motor sizes and voltages with submittals of other Divisions of specifications, and/or by others, prior to Section submittals.

B. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and/or starting of product.

C. Test Reports: Indicate field test and inspection procedures and interpret test results and corrective action taken for compliance with specification requirements.

D. Closeout Submittals:
   1. Project Record Documents:
      a. Record actual locations and ratings of enclosed motor controllers and enclosed contactors and each overload type and size.
   2. Operation and Maintenance Data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventive maintenance instructions.
      b. Include spare parts data listing, source, and current prices of replacement parts and supplies.

1.5 QUALITY ASSURANCE

A. Obtain motor controllers, and contactors from one source and by single manufacturer.

B. Regulatory Requirements:
   1. Comply with NFPA 70 for components and installation.
   2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.

1.7 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.

1.8 MAINTENANCE

A. Extra Materials: Furnish extra materials described below that match product installed, are packaged with protective covering for storage, and are identified with labels describing contents.
   1. Spare pilot lights: Furnish 1 spare lamp for every 5 installed units, but not less than 1 set of 3 of each kind.
   2. Spare Fuses: Furnish 6 spare fuses for each size installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Square D – Schneider Electric

B. ABB - General Electric

C. Siemens

D. Allen Bradley

2.2 MANUAL MOTOR CONTROLLERS

A. Description: NEMA ICS 2, AC general-purpose, Class A, manually operated, full-voltage controller for small motors, with bimetal type overload relay and pushbutton operator.

2.3 FULL-VOLTAGE NON-REVERSING MAGNETIC MOTOR CONTROLLERS

A. Equal to Square D Class 8536

B. Description: NEMA ICS 2, AC general-purpose, Class A, magnetic controller for induction motors rated in horsepower, three-phase and single-phase, as scheduled, except where single-phase motors scheduled to be provided with built-in overload elements:
   1. Size 1 minimum
   2. Control Voltage: **[120 VAC] [24VAC]**, 60 Hz
   3. Overload Relays: NEMA ICS 2, solid-state:
      a. Solid-state type:
         1) Class 10, 20 selectable inverse-time tripping characteristics.
         2) Non-volatile operating memory.
         3) 3:1 current adjustment range.
         4) Phase loss/phase unbalance protection.
         5) Ambient temperature insensitive.
         6) Self-powered.
         7) Manual reset. Automatic reset not acceptable.
         8) Manual trip.
         9) Visible trip indication.
   4. Features:
      a. Auxiliary Contacts: NEMA ICS 2, 3 each field-convertible contacts in addition to seal-in contact, capable of a total of 4 external interlocks.
      b. Red mushroom type E-Stop button
      c. Pilot Lights NEMA ICS 5: push-to-test LED incandescent or LED type. Red for running, green for off.
      d. Hand-Off-Auto (H-O-A) Selector Switches: Rotary type.
      e. Micro switch wired into control circuit to deenergize starter before disconnect opens.
      f. Control Power Transformers: 120V secondary, adequate capacity to operate connected pilot, indicating and control devices, plus 100% spare capacity in each motor controller, but not less than 150VA. Fused primary and secondary, and unfused leg of secondary bonded to enclosure.
      g. Terminals: NEMA ICS 4.
      h. Other accessories detailed or required by drawings.

2.4 COMBINATION CONTROLLERS

A. Equal to Square D Co., Class 8638 or 8539.

B. Factory-assembled motor controllers with externally operable disconnect, fusible switch type, in common enclosure; means for locking disconnect handle and means for defeating cover interlock.
   1. Fusible Switch: NEMA KS 1 and UL 98; enclosed knife switch, heavy-duty type, external operable handle, clips or pads to accommodate specified fuses:
      a. Rejection clips for Class R fuses.
      b. Provisions for Class J type fuses.

2.5 MOTOR CONTROLLER ACCESSORIES

A. Factory installed devices in controller enclosure, unless otherwise indicated, as follows:
   1. **[120 V] [24 V]** control circuits and pilot light, unless noted otherwise.

2. Red pilot light to indicate motor operation.
3. Green pilot light to indicate motor stopped.
4. Minimum wire size for control circuits: #14 AWG.
5. Stop and Lockout Pushbutton Station: Momentary-break pushbutton station with a factory-applied hasp arranged so a padlock can be used to lock pushbutton in depressed position with control circuit open, where indicated.

B. Control services: As scheduled on motor schedule or indicated.

2.6 LUGS

A. Labeled for 75°C copper and aluminum conductors.

B. Multiple lugs to match number of conductors per phase.

C. Termination of field installed conductors: Pressure wire connectors, except wire-binding screws for #10 AWG or smaller conductors.

D. For equipment specified in this section and for equipment furnished under other Divisions of this specification and/or by others.

2.7 MOTOR CONTROLLERS AND CONTACTOR ENCLOSURES

A. NEMA 250, NEMA 1CS 6.

B. NEMA Type 1, Type 3R (outdoor locations) enclosure.

C. NEMA-4X for corrosive environments including cooling towers.

D. Code-gauge galvanized steel.

E. NEMA-4X enclosure is to be Type 316 Stainless Steel.

F. Manufacturer’s standard gray enamel finish over prime coat.

G. Surface-mounted.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate motor control wiring with Division 23 of these specifications.

B. Coordinate motor sizes and voltages with submittals of other Divisions of these specifications and/or by others.

C. Verify with manufacturer that “touch-up” paint kit is available for repainting.

3.2 EXAMINATION

A. Examine areas and surface to receive motor controllers and contactors for compliance with requirements, installation tolerances, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that space indicated for motor controllers and contactors mounting meets code-required working clearances.

C. Notify Architect/Engineer of any discrepancies prior to submittal of product data.

3.3 INSTALLATION

A. Install motor controllers and contactors in accordance with ANSI/NECA 1.

B. Install level and plumb, in accordance with manufacturer's written instruction.

C. Motor controllers and contactors mounting:
   1. Fasten motor controllers and contractors firmly to walls and structural surfaces, ensuring they are permanently and mechanically anchored.
   2. Anchor and fasten motor controllers and contactors and their supports to building structural elements (wood, concrete, masonry, hollow walls and nonstructural building surfaces) by the methods described in Section 26 0529 – Hangers and Supports for Electrical Systems.
   3. Install two rows of steel slotted channel, with minimum of four attachment points, for each motor controller and contactor.
   4. When not located directly on wall, install support frame of steel slotted channel anchored to floor and ceiling structure.
   5. Do not support motor controllers and contactors only by raceway.

D. Tighten electrical connectors and terminals according to equipment manufacturer's published torque-tightening valves. Where manufacturer's torque valves are not indicated, use those specified in UL 486A-486B.

E. Install engraved plastic nameplates under provisions of Section 26 0553 – Electrical Systems Identification. Attach nameplate to exterior of each motor controller and contactor, using small corrosion resistant metal screws or rivets. Do not use contact adhesive:
   1. Indicate motor served, nameplate horsepower, full load amperes, code letter, service factor, voltage/phase rating, overload size, and fuse size and type, when applicable.

F. Connect each motor terminal box to rigid conduit system with maximum 18" of flexible liquid-tight metal conduit. Install conduit per requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

G. Check for proper rotation and phase relationship of each motor.

H. Install fuses in fusible switch at job site pre requirements in Section 26 2813 – Fuses.

I. Control Wiring Installation:
   1. Install wiring between motor control devices according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.
   2. Install motor control wiring in accordance with control wiring diagrams and in raceways where indicated or required by contract drawings.
   3. Bundle, train, and support wiring in enclosures.
   4. Connect hand-off-automatic switch and other automatic-control devices where applicable.
      a. Connect selector switches to bypass only manual- and automatic-control devices that have no safety functions when switch is in hand position.

b. Connect selector switches with motor-control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.4 APPLICATION

A. Select features of each motor controller to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; duty cycle of motor, and configuration of pilot device and control circuit affecting controller functions.

3.5 CONNECTIONS

A. Provide green wire ground through flexible conduit to interconnect motor frame and rigid conduit system.

B. Ground and bond motor controller and contactor enclosures according to Section 26 0526 – Grounding and Bonding for Electrical Systems.

C. Connect power and control wiring according to Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables.

D. Connect control wiring for operation, control and supervision of motorized equipment as shown on drawings and/or specified in this and other Divisions of these specifications.

3.6 FIELD QUALITY CONTROL

A. Inspect motor controllers and contactors for physical damage, proper alignment, connections, anchorage, and grounding.

B. Correct malfunctioning motor controllers and contactors on-site and retest to demonstrate compliance. Remove and replace with new units and retest.

C. Test continuity of each circuit.

D. Test motor controllers per requirements in Sections 26 0812 – Power Distribution Acceptance Tests and 26 0813 – Power Distribution Acceptance Test Tables.

E. Interpret test results in writing and submit to Engineer.

3.7 REPAINTING

A. Remove paint splatters and other marks from surface of equipment.

B. Touch-up chips, scratches or marred finishes to match original finish, using manufacturer-supplied paint kit. Leave remaining paint with Owner.

3.8 ADJUSTING

A. Set field-adjustable circuit breakers trip settings or change the trip settings as indicated on drawings.

B. Adjust motor circuit protectors.

3.9 CLEANING

A. Vacuum dirt and construction debris from interior and exterior of equipment; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 26 3213

DIESEL ENGINE GENERATORS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 20 1300 – Pipe, Pipe Fittings and Pipe Support

B. Section 20 2200 –Insulation - Mechanical

C. Section 22 0400 – Fuel Oil Storage and Distribution System

D. Section 23 1213 – Facility Fuel – Oil Pumps

E. Section 23 1200 – Sheet Metal and Flexible Ducts

F. Section 26 0000 – General Electrical Requirements

G. Section 26 0519 – Low-Voltage Electrical Power Conductors and Cables

H. Section 26 0526 – Grounding and Bonding for Electrical Systems

I. Section 26 0529 – Hangers and Supports for Electrical Systems

J. Section 26 0812 – Power Distribution Acceptance Tests

K. Section 26 0813 – Power Distribution Acceptance Test Tables

L. Section 26 2313 – Paralleling Low-Voltage Switchgear

M. Section 26 2816 – Enclosed Switches and Circuit Breakers

N. Section 26 3623 – Automatic Transfer Switches

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION OF SYSTEM

A. Section describes complete package generator set, unit-mounted radiator cooling system, exhaust silencer, microprocessor based control and monitoring panel, battery and charger, Building Management System (BMS) communications module, remote annunciator**.**

B. Package generator set rated for emergency/standby duty as defined by ISO8528-1.

C. Engine fuel system:

1. Remote bulk fuel tank with local day tank and transfer pump assembly provided by others.

1.4 REFERENCE STANDARDS

A. ASTM-A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

B. EPA 40 CFR Part 60 – Environmental Protection Agency Code of Federal Regulation New Source Protection Standards for Stationary Sources

C. IEC8528 Part 4 – Control Systems for Generator Sets

D. IEEE446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications

E. ISO 8528-1 2005 - Reciprocating Internal Combustion Engine Driven Alternating Current Generating Sets

F. NEMA MG-1 – Motors and Generators

G. NETA 2007 – InterNational Electrical Testing Association

H. NFPA 37 - Standard for Installation and Use of Stationary Combustion Engines and Gas Turbines

I. NFPA 70 – National Electric Code (NEC)

J. NFPA 99 – Essential Electrical System for Health Care Facilities

K. NFPA 110 – Standard for Emergency and Standby Power Systems

L. NFPA 780 – Standard for the Installation of Lightning Protection Systems

M. SSPC-SP1 – The Society for Protective Coatings; Solvent Cleaning

N. UL 2200 – Stationary Engine Generator Assemblies

O. UL 142 – Steel Aboveground Tanks for Flammable and Combustible Liquids

P. UL 2085 – Protected Aboveground Tanks for Flammable and Combustible Liquids

1.5 SUBMITTALS

A. Shop Drawings
   1. Submit for engineering review and approval prior to production release. Include the following for engine-generator:
      a. Power output rating for emergency/standby, prime and/or continuous operation for specified ambient temperature and elevation.
      b. Outline drawings of equipment showing weights and center of gravity location for skid-mounted and enclosed units with sub-base tanks attached.
      c. Overall dimensions including bolting template **.**
      d. Right hand, left hand, end, and top views of proposed assembly
      e. Battery, battery rack, battery charger, and wiring diagrams
      f. Vibration isolation bases, mounts, and hangers
      g. Exhaust silencer and flexible fittings

h. Fuel connection locations including remote filter rack if required
i. Power and control wiring entrance locations including conduit stub window dimensions
j. Circuit breaker sizes, locations, and required clearances
k. Lug sizes and locations
l. Engine-generator control panel drawings showing devices to be provided, with each device referenced to material list with complete description for device.
m. Weather protective enclosure installation drawings, color chip options, lighting fixture catalog cut, conduit, and wiring requirements.
n. Sound level data
o. Enclosure sound performance data as applicable
p. Exhaust silencer characteristics
q. Factory certified prototype test report indicating fuel efficiency and emission levels

2. Information on engine characteristics:
   a. Make, type, and number of cylinders
   b. Brake horsepower (bhp) available
   c. Jacket water heat rejection
   d. Cooling pump characteristics
   e. Exhaust flow rate and temperature at 25, 50, 75, and 100% rated load
   f. Ventilation requirements
   g. Combustion air requirements
   h. Fuel consumption rates at 25, 50, 75, and 100% rated load
   i. Liquid refill capacities
   j. Exhaust backpressure limitation
   k. Type and manufacturer of governor
   l. Alternator size to limit voltage dip to 10% at rated kVA block load
3. Information on generator characteristics:
   a. Make and type
   b. Voltage, phase, poles, full load amps
   c. Type of construction
   d. Temperature rise
   e. Regulation characteristics
   f. Ventilation requirements
   g. Type and rating of winding insulation
   h. KW/KVA, power factor
   i. Type of exciter and voltage regulator
   j. Subtransient reactance
   k. SKVA @ 10%, 15%, and 20% voltage drop
   l. Maximum fault current contribution
4. Output Circuit Breaker Manufacturers Data
   a. Complete manufacturer’s data sheet for circuit breaker
   b. LSI adjustment parameters
   c. Trip curves

d. Auxiliary contact provisions and wiring diagrams

B. Interconnection detail drawing showing control and power connections in complete standby system. Control connections between components are to be labeled with identical nomenclature. Coordinate with generator manufacturer.

C. Accessories including fuel lines, flexible exhaust couplings, exhaust flange, and other exhaust system components.

D. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

E. Complete test specification detailing testing procedure to be used to verify performance of equipment provided.

F. Recommended spare parts lists.

G. Test Reports:
1. Submit certified factory tests report on engine-generator delivery. Alarms, sensors, and meters must be tested and certified.
2. Submit, upon completion of installation and testing of engine-generator sets, certified test reports from load tests for each engine-generator.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Handle equipment in accordance with manufacturer's written instructions. One copy of instructions are to be included with equipment at time of shipment. Maintain factory bracing, packaging, and wrapping.

1.7 OPERATION AND MAINTENANCE MANUALS

A. Refer to Section 01 7700 - Closeout Procedures and herein below.

B. Submit Operation and Maintenance (O&M) manuals to Engineer for review 60 days prior to acceptance of unit.

C. Installation, maintenance, and operating instruction manuals shall include, but not limited to, the following:
1. 100% accurate system "as-installed" drawings, interconnect diagrams, schematic diagrams, wiring diagrams, individual sub-system component manuals, operation procedures, system description with theory of operation, maintenance schedules and procedures, original programmed settings and parameters, and other information necessary for the Owner to maintain, operate, test, and troubleshoot system.
2. The O&M manual shall contain step-by-step instructions for startup and shutdown. The first page shall contain name, address, and phone number of local representative to be called for service or parts. Follow with complete parts lists by actual ordering catalog numbers. O&M manual also shall contain four copies each of test record forms and service record forms for Owner use. Forms shall show proper interval for testing, servicing, and replacing of components, lubrication, filters, antifreeze, etc., including recommended specifications and fluid levels for lubricants.

3. Recommended spare parts list (with pricing) for 2 yrs of operation.

D. O&M manuals shall not solely rely on sub-component manuals. Thorough consolidation of operating and maintenance information shall be available in system overview guide. Include major components of system in overview.

E. Turn final reviewed manuals over to Owner prior to conducting training of Owner personnel.

F. Seal single copy of service record forms, recommended operation and service practices for unit in plastic and wall mount in weather-protective enclosure.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide one year written warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion.
   1. Optional two-year and five-year warranties shall be available upon request.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Acceptable Manufacturers:
   1. Engine Generator Set – Caterpillar
   2. Battery charger – Same as above

2.2 RATINGS AND PERFORMANCE

A. Engine Generator Set
   1. Generator kW Output: 1500 kW
   2. Altitude 3300 ft above sea level in ambient temperature of 104°F
   3. Stable frequency regulation
   4. 1875 kVA, .8 Power Factor
   5. 480/277V, 3 Ph, 60 Hz, 4 Wire Y
   6. Stable voltage regulation 0-full load less than or equal to ± .5%.

B. Generator Set Transient Performance
   1. Engine
      a. Start and load in 10 seconds per NFPA 110
      b. Accept 100% block load per NFPA 110
   2. Frequency regulation ±5% no load to full load. ± .25% steady state speed droop shall be adjustable from 0 to 10%, from no load to full load, and share within 5% when paralleled with similarly equipped engines.
   3. Alternator
      a. 15% Voltage dip at rated locked rotor kVA

b. AC waveform output contains <5% total harmonic distortion (THD) at full linear load when measured from line to neutral with <3% in any single harmonic, and no third-order harmonics or their multiples.
c. Telephone influence factor < 50
d. Telephone harmonic factor < 3
e. 6 X FLA Fault current capability

C. Factory Prototype Test Certified
1. Harmonic Distortion Levels
a. Demonstrate
2. Unit tested with factory enclosure when specified with enclosure
a. UL 2200 listed
3. 30 Degree Water Spray Unit Rain Test
a. Demonstrate no water leakage into electrical boxes
4. Fuel consumption at 25%, 50%, 75% and 100% load in gallons/hour.
5. Exhaust emissions at 25%, 50%, 75% and 100% load.

D. Factory Production Test Certified
1. Alternator Impedance to Ground
2. Dielectric Testing
a. At 1000 V and 2 times rated voltage
3. Maximum kW Rating
4. Engine Response Time
5. Alternator Construction Testing
a. Impedance Balance Tested
6. Alternator Insulation Testing
a. Surge Tested
7. Output Circuit Breaker Testing (If equipped with unit-mounted circuit breaker)
a. Circuit breaker(s) to be tested according to Section 26 0812 – Power Distribution Acceptance Tests to meet NETA 2007 and circuit breaker manufacturer’s specifications.
b. Circuit breaker manufacturer’s factory test report for each circuit breaker complying with above is acceptable if available.
8. Load Test
a. Tests to include minimum of 4 starts of engine-generator set, minimum 2 hour maintained operation under conditions of applied loads at 10 to 100% of rated capacity.
b. Provide certified results of testing, including frequency and voltage regulation at 25, 50, 75, and 100% of rated load.
c. Engine-generator set test results are to be certified to comply with specification parameters or necessary corrective actions implemented and tests repeated until compliance is certified.

2.3 FABRICATION AND MANUFACTURER

A. Engine:

1. Cylinder arrangement: Inline or V
2. Four-stroke, diesel compression cycle
3. 1800 rpm
4. Cast iron block and cylinder heads with removable cylinder liners
5. Pressurized oil lubricated
6. Water cooled
7. Fuel Type: No. 2 domestic diesel fuel oil
8. Engine accessories:
    a. Fuel filters (primary, secondary, water separator)
    b. Lube oil filters
    c. Intake air filter(s)
        1) Dry-type replaceable.
    d. Lube oil cooler
        1) Suitable for operation of generator set at full rated load in ambient temperature specified.
    e. Fuel transfer pump
        1) Capable of lifting fuel six feet
    f. Fuel priming pump
        1) Engine driven positive displacement, mechanical, full pressure
    g. Gear driven water pump
    h. Electronic direct fuel injection or have suitable emission control equipment
    i. Electric speed sensing governor capable of isochronous regulations.
9. EPA Certified
    a. Provide for engine type, horsepower, generator set duty rating, and location of installation to meet current federal and local regulations.
10. Stainless Steel Data Plate indicating:
    a. Manufacturer
    b. Date of Manufacture
    c. Location of Final Assembly
    d. Horsepower
    e. Fuel Type
    f. Quantity of Cylinders
    g. Cylinder Bore Diameter
    h. Cylinder Stroke Length
    i. RPM
    j. EPA Certification

B. Cooling System:
1. Engine skid mounted, engine-driven fan cooled radiator with prop type fan, sized to maintain safe operation at 122°F ambient temperature.
2. Provide radiator with:
    a. Engine-driven fan

b. Core guard
c. Fan guard
d. Mounting hardware
e. Direct adapter flange. Ductwork with flexible connection between radiator and exhaust plenum to be provided by Division 23 for indoor applications. Coordinate with Division 23.
f. Flexible pipe connections at engine and radiator
g. User accessible, pressure regulating fill cap with overflow surge container

3. Block Heater
   a. Water Jacket Heater: Circulating type with inlet and outlet valves and removable connections to allow for replacement.
   b. Sized to maintain engine jacket water to 70°F in ambient temperature of 0°F
   c. Heater to be equipped with thermostatic switch
   d. Single phase 208 V
4. Fill engine cooling system with solution of water/ethylene glycol at initial fill meeting -40F.
5. Ductwork with flexible connection between radiator and exhaust dampers to be provided by others. Refer to Section 23 3114 – Ductwork.

C. Exhaust System:
1. Furnish engine exhaust critical grade silencer:
   a. Sized according to engine manufacturer's recommendations for backpressure
   b. Meeting sound attenuation requirements of installation site
   c. Mount so weight is not supported by engine
   d. Flexible exhaust fitting
   e. Diesel Oxidation Catalyst Filter included (Combination Critical Grade Silencer/Catalyst)
      1) 304 stainless steel housing with removable catalyst
   f. 4” thick removable insulation blanket.
   g. Installation: Indoors by Mechanical Contractor
   h. Refer to Section 23 2118 – Pipe and Pipe Fittings
2. Condensate Traps
   a. Drain plug at low point of muffler
3. Thermal Expansion
   a. Stainless steel exhaust flex to accommodate thermal growth and vibration isolation
4. Thimble
   a. Pipe and wall of compatible construction
5. Exhaust clearing area

D. Starting System
1. Comply with NFPA 110, Level 1
2. Provide DC electric starting system with positive engagement drive. Provide DC voltage recommended by manufacturer.
3. Provide fully automatic start-stop controls.
4. Provide cycle cranking to open and lock out start circuit after 3 attempts to start failed engine start.

5. Batteries
   a. Provide valve regulated lead-acid storage battery set:
      1) Heavy duty diesel starting type
      2) Voltage compatible with starting system voltage
      3) Capacity to provide for 75 seconds total cranking time at 0°F without recharging in accordance with NFPA 110, Level 1.
   b. Provide vinyl or epoxy coated steel battery rack.
   c. Battery cables and clamps
6. Battery Charger
   a. Dual Rate Battery Charger
      1) Constant current, and float equalized
   b. Charger Accessories:
      1) Overload protection
      2) ±1% line and load regulation
      3) Electronic current limit output 105%
      4) DC ammeter and voltmeter digital meter with ±2% volt accuracy, ±5% amp accuracy.
      5) UL 1236 listed and meets NFPA 110 requirements
      6) Output protection
      7) Temperature compensation
      8) Enclosed in NEMA 1 aluminum or stainless steel enclosure
      9) Form C contacts for the following alarms
         a) AC fail
         b) Low battery volts
         c) High battery volts
         d) Charger fail
         e) Battery fault
7. AC input voltage: 120 V
8. When installed on the engine generator set, mount on vibration isolators.

E. Speed Control
   1. Mechanical: 1% droop
   2. Electronic: Isochronous

F. Alternator:
   1. Maximum temperature rise 105°C at 40°C ambient
   2. Copper windings
   3. Synchronous type
   4. Self ventilated
   5. Drip-proof construction
   6. Directly connected to engine flywheel housing with a flex coupling
   7. Capable of sustaining 300% overcurrent for 10 seconds under a 3-phase symmetrical short circuit
   8. Subtransient Reactance limited to 15% maximum

9. Insulation
    a. Complies with NEMA (MG1-33.4, MG1-22.40, and MG-1-16.40)
    b. Class H Insulation Systems
        1) UL 1449 recognized
        2) Vacuum impregnated with epoxy varnish
        3) Fungus resistant
10. Permanent magnet brushless excitation (PMG).
    a. PMG shall derive excitation current from pilot exciter mounted on the rotor shaft. It is to be able to sustain 300% of rated current for ten seconds during a fault condition.
    b. Self-excited system to be brushless and consist of a 3-phase armature and a 3-phase full wave bridge rectifier mounted on the rotor shaft. Include surge suppressors to protect the diodes from voltage spikes.
11. Rotor
    a. 4 pole
    b. Winding
        1) Form Wound
    c. Varnish process
        1) Epoxy based material applied to each layer of magnet wire
    d. Coil supports
        1) Driven through flexible coupling to ensure permanent alignment.
    e. End winding spacing
    f. Amortisseur windings
    g. Bearings
        1) Sealed
12. Stator
    a. 3-phase copper winding
    b. Laminations
    c. Cooling air passages and fan
    d. Welded laminations to prevent cutting of wires
    e. Skewed stack to minimize slot ripple on output voltage and produce smooth voltage waveform.
    f. Pitch – Skewed design to optimize efficiency and minimize total harmonic distortion.
    g. Varnish process
        1) 2 dips and bakes using Class A impregnating varnish
13. Alternator Components
    a. Strip Heater: 120V
    b. Solid state design digital voltage regulator:
        1) Performance
            a) Microprocessor based.
            b) Programmable
            c) Regulation: ± .5% at any constant load for any load from 0% to 100% of pf rating.
            d) 3-phase, true RMS sensing

e) PMG input, engine unloading
f) Design insensitive to severe, load induced wave shape distortion from SCR or thyrister circuits such as those used in battery charging, UPS, and motor speed control equipment loads.
g) Controls to limit build-up of AC generator voltage to provide a linear rise and limit overshoot.
h) Digital adjustments for output voltage adjustment gain, damping and frequency rate–off, and reactive droop adjustment to allow paralleling.
i) System setup controls and fault alarms.

2) Protection
a) Overcurrent based on damage curve
b) Over-excitation protection
c) Electronic voltage buildup protection
d) Loss of sensing protection
e) Temperature compensation
f) Limitation of voltage overshoot on startup
g) Ground fault alarm: protection relay to provide alarm for ground fault adjustable from 10A to 1200A with delay settings up to 1 second. Manufacturer's standard ground fault protection to meet warranty requirements are to be maintained.

3) Features
a) Parallel support
b) VAR/PF control

4) Environmentally sealed
5) UL 508A listing

c. Unit-Mounted Output Circuit Breaker(s)
1) 100% rated circuit breaker(s) with adjustable trip meeting the requirements for circuit breakers in Section 26 2816 - Enclosed Switches and Circuit Breakers
2) Adjustable long time, long time delay, short time, and short time delay curve shaping elements
3) Shunt Trip for integration with load bank controls and closed transition transfer switches.
4) Position indicating contacts to alarm when breaker is in the open position
5) Load side connections suitable for compression cable lugs
6) NEC required access in front of breaker

d. Stainless Steel Data Plate Indicating:
1) Manufacturer
2) Date of Manufacture
3) Location of Final Assembly
4) KVA/KW/PF
5) Voltage/Phase
6) Full Load Amps
7) Poles
8) Temperature Rise

9) Insulation Class/Temp

G. Instrument Panel
1. Dual range voltmeter 3 1/2-inch, +/- 2% accuracy.
2. Dual range ammeter 3 1/2-inch, +/- 2% accuracy.
3. Voltmeter-ammeter phase selector switch.
4. Lights to indicate high or low meter scale.
5. Direct reading pointer-type frequency meter 3 1/2-inch, 0.5% accuracy, 45 to 65 Hz scale.
6. Panel illuminating lights.
7. Battery charging voltmeter.
8. Coolant temperature gauge.
9. Oil pressure gauge
10. Running time meter
11. Voltage adjust rheostat.

H. Controls:
1. Meets NFPA 110 requirements
2. Micro-processor based solid state controls to automatically start, protect and monitor engine-generator set with panel illuminating lighting and digital display.
3. Control panel includes:
   a. Solid state trip main circuit breaker
   b. Motor starting switch
   c. Electrically operated fuel control
   d. Relay to disconnect battery charger during cranking
   e. Switching lamps and meters to be oil tight and dust tight. All active components to be installed within a NEMA 3R enclosure. There shall be no exposed components with door open operating 750 V.
   f. Protective relays to open main circuit breaker and shut down and lockout engine on abnormal conditions including:
      1) Overcrank
      2) Overspeed
      3) Low lube oil pressure
      4) High Engine Temp
      5) Operation of Remote Stop
   g. Monitoring items shall include but is not limited to the following items and control:
      1) Coolant temperature
      2) Oil pressure
      3) Battery voltage
      4) RPM
      5) Voltmeter, digital or analog type having 0.5% accuracy with selector switch for L-L, L-N
      6) Ammeter, digital or analog type having 0.5% accuracy with selector switch for phases A, B, C, N.

7) Frequency meter, 55-65 Hz ±0.125 Hz.
8) Running Time Meter (hours and 1/10 hours), non-resettable
9) AC power metering to be 0.5% accuracy and include frequency, phase, selector switch with real time power metering including, kW, kVA, kVAR, kWh, PF, % of rated load.

h. Control Items:
1) Comply with NFPA 110, Level 1
2) Voltage and Frequency adjustment
3) Overspeed level adjustment
4) Overvoltage level adjustment
5) Undervoltage level adjustment
6) Overfrequency level adjustment
7) Underfrequency level adjustment
8) Four position key function switch marked AUTO, MANUAL RUN, OFF/RESET and STOP
9) 4 NO and 4 NC dry contacts for local and remote alarms, wired to terminal strips.
10) Emergency off mushroom button
11) Automatic remote start capability. Engine cranking system to permit minimum 3 cranking attempts of 15 seconds duration with rest of periods of 15 seconds.
a) Overcrank lockout shall occur after 3 cranking attempts.

i. In accordance with NFPA 110, Level 1, control panel shall furnish battery-powered individual visual alarm indicator functions at battery voltage and visual and audible pre-alarm, with terminals provided for each signal:
1) Overcrank (red)
2) Low water temperature
3) High engine temperature pre-alarm (yellow)
4) High engine temperature (red)
5) Low lube oil pressure pre-alarm (yellow)
6) Low lube oil pressure (red)
7) Air damper (red)
8) Overspeed (red)
9) Low fuel main tank (red)
10) Low coolant level
11) EPS supplying load
12) Control switch not in automatic position (flashing red)
13) High battery voltage
14) Low cranking voltage
15) Low voltage in battery (red)
16) Auxiliary Prealarm (yellow)
17) Auxiliary Fault (red)
18) Battery charger ac failure (red)
19) System Ready (green)

20) Lamp test
21) Contacts for local and remote common alarm
22) Spare

j. Engine shut down, with audible alarm:
1) Low oil pressure
2) High engine temperature
3) Overcrank
4) Overspeed
5) Remote Emergency Stop
6) Overcurrent (circuit breaker trap and lockout)
7) Reverse power
8) Low-coolant level
9) Fail to synchronize

k. Status report to building Fire Alarm Panel:
1) Engine running
2) Circuit breaker open
3) Circuit breaker closed
4) Generator Fault (Common Alarm)

4. Visual alarm resettable only after fault condition has been corrected.
5. Audible alarm shall include silencing circuit, which, after activation, will permit annunciation of subsequent failures.
6. Control Panel mounting:
a. Mounted on engine generator set in NEMA 1 enclosure on shock isolators
7. Provide remote annunciator panel(s) as indicated on drawings
a. Compliant with NFPA 110 Level 1 requirements
b. Powered from engine starting batteries
c. Hardwired from generator to annunciator

I. Isolate engine generator set from building structure and from connecting services.
1. Separately derived grounding system. Connect generator ground as shown on drawings to grounding electrode system.
2. Bond generator neutral to ground bonding strap to solid grounding location.

J. Termination Bars and Connections:
1. Silver or tin-plated copper bus bars for terminating cables.
2. Standard NEMA standard bolt hole spacing, for 3-phase and neutral, within generator connection box with gasketed bolt on cover. Use two-hole, long barrel compression cable lugs only.
3. Engine-generator set control interfaces to other system components to be made on a permanently labeled terminal block assembly. Provide labels describing connection points.
4. Connections to engine-generator set: Flexible or isolation type connections. Include electrical, fuel, exhaust, and ventilation connections.

K. Equipment Bases:

1. Mount complete unit on a structural steel sub-base, rectangular in shape, with sufficient rigidity to maintain alignment of generator set. Provide perimeter beams with minimum depth equal to 1/10 of longest dimension of base, except beam depth need not exceed 14" provided that deflection and misalignment are kept within acceptable limits as determined by manufacturer. Engine-generator set to be statically and dynamically balanced at factory. Peak-to-peak amplitude of vibration velocity in horizontal, vertical, and axial direction shall not exceed 0.65" per second at main structural components.
2. Engine-generator set weight distribution is to be considered to provide uniform deflections.
3. Bases shall provide equipment alignment and assure uniform weight distribution.

L. Vibration Isolators:
1. Provide spring isolators with shipping locks to be removed at time of installation. Isolators shall have a minimum of 3/4" deflection at rated load.
2. Prevent equipment vibrations from being transmitted to enclosure for outdoor units.
3. Required between the structural steel sub-base and concrete housekeeping pad for indoor and outdoor units.
4. Steel or cast iron top and bottom housings incorporating 1 or more steel springs with built-in leveling bolts and built-in resilient chocks to control oscillation and withstand lateral forces in all directions.

M. Fuel System
1. Day Tank
a. Mechanical Contractor to provide day tank system. Refer to Section 23 1214 - Liquid Fuel Systems.
2. Remote Fuel Tank
a. Fuel tank provided by Mechanical Contractor. Refer to Section 23 1214 – Liquid Fuel Systems.

2.4 INTERFACE WITH BUILDING MANAGEMENT SYSTEM (BMS)

A. Interface shall be as follows:
1. Control panel shall incorporate communication module with digital communication port connection to building control system (BMS) via BACnet communication.
2. Communications shall be for the following:

TYPE	CONDITION/DESCRIPTION	RANGE/UNITS
LDI 1	Low lube oil pressure prealarm	
LDI 2	Low water temperature	
LDI 3	High engine temperature prealarm	
LDI 4	Battery charger AC failure	
LDI 5	Spare	
LDI 6	Control switch not in automatic position	
LDI 7	High battery voltage	
LDI 8	Low coolant level	
LDI 9	Low cranking voltage	
LDI 10	Low voltage in battery	

TYPE	CONDITION/DESCRIPTION	RANGE/UNITS
LDI 11	EPS supplying loads	
LDI 12	Generator circuit breaker ground fault	
LDI 13	Low lube oil pressure	
LDI 14	High engine temperature	
LDI 15	Overcrank	
LDI 16	Overspeed	
LDI 17	Remote emergency manual stop switch	
LDI 18	Overcurrent (circuit breaker trip and lockout)	
LDI 19	Reverse power relay trip	
LDI 20	Failure to synchronize	
LDI 21	Engine running	
LDI 22	Generator running	
LDI 23	Generator circuit breaker open	
LDI 24	Generator circuit breaker closed	
LDI 25	Generator circuit breaker failed to close	
LDI 26	Spare	
LDI 27	Control voltage failure	
LDI 28	Auto start	
LDI 29	Battery charger failure	
LDI 30	Spare	
LDI 31	Spare	
LDI 32	Spare

LDO 5	Load adding and load shedding	

Notes:

LDI - LAN: Digital Input from control panel communication module to BMS via Ethernet communication.

LAI - LAN: Analog Input from control panel communication module to BMS via Ethernet communication.

LDO - LAN: Digital Output from BMS to communication module via Ethernet communication.

LAN – Local Area Network

3. Provide all additional information as required for a complete and operable system.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install engine-generator set and associated equipment as indicated. Coordinate final location of equipment with General Contractor. Final location of equipment to be reviewed with Engineer prior to installation.

B. Install equipment in accordance with manufacturer's recommendations. Provide equipment protection during and subsequent to installation.

C. Mount generator on concrete equipment pad according to manufacturer’s instructions and meeting requirements stated in Section 26 0529 – Hangers and Supports for Electrical Systems.

D. Mount generator level and square with equipment pad. Remove spring isolator transport locks and adjust spring isolators to allow free movement.

E. Connect battery charger to engine starting system. Do not connect charger output directly to starting batteries.

F. Fuel connections for remote fuel tank and day tank to be provided by Mechanical Contractor as applicable.

G. Exhaust connections for indoor applications are to be provided by Mechanical contractor.

H. Provide communications connections for BAS system to generator communications modem.

I. Provide connection and mounting of remote annunciator(s) as shown on drawings.

J. Provide connection of start/stop controls from transfer switches and/or paralleling switchgear as applicable.

K. Provide connection to building fire alarm system as indicated on drawings.

L. Provide connection from fuel tank leak detection sensor to remote leak detection panel and BAS system as applicable.

M. Provide connection of circuit breaker position indicating contacts to generator status alarm input and paralleling switchgear as applicable.

N. Provide power connections to circuit breaker terminals or alternator connection bus using compression lugs or lugs as provided by circuit breaker manufacturer. Torque lugs to manufacturer's specifications.

O. Bond generator neutral bonding strap to generator ground bonding location. Ground generator to power conduit grounding bushings and local ground rod or counterpoise stub location and as indicated in Section 26 0526 – Grounding and Bonding for Electrical Systems. Ground fuel tanks to building grounding system in accordance with NFPA 780.

P. Terminate enclosure lighting, block heater battery heater and other enclosure accessories to incoming power connections as indicated on drawings and as applicable.

Q. Adjust generator frequency output to 60.1Hz to allow transfer switch in-phase monitor and closed transfer switches to function in a reasonable time period.

3.2 ACCEPTANCE TESTS

A. Testing by Testing Agency

B. Perform Acceptance Testing in accordance with Section 26 0812 - Power Distribution Acceptance Tests and Section 26 0813 – Power Distribution Acceptance Test Tables.

3.3 ACCEPTANCE LOAD TEST (ON-SITE)

A. Conduct load testing of engine-generator set, under direct supervision of factory-authorized representatives of manufacturers of engine-generator set and auto-transfer switch.

B. Tests to include minimum of 10 starts of engine-generator set, minimum of 10 operations of auto-transfer switch, 6 hour maintained operation under conditions of applied loads at 10 to 100% of rated capacity.

1. Loading shall be by use of load banks and connections provided by installing contractor.
2. Fuel for testing is to be furnished by installing contractor.

C. Tests to comply with latest NFPA 110 and local AHJ requirements in addition to testing required in this and other specification sections referenced in this section

D. Provide certified results of testing, including frequency and voltage regulation at 25, 50, 75, and 100% of rated load at actual measured values for pickup and drop out relays for ATS, measured values for time delay relays.

E. Engine-generator set test results are to be certified to comply with specification parameters or necessary corrective actions implemented and tests repeated until compliance is certified.

F. At conclusion of testing, service engine-generator set including replacing air, oil and fuel filters, changing lubrication oil, checking and refilling batteries, adjusting fan belts for proper tightness, and refilling of cooling system as required. Refill fuel tank. Set is to be cleaned and placed into service in a condition satisfactory to the Owner.

END OF SECTION

SECTION 26 3623

AUTOMATIC TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0000 – General Electrical Requirements

B. Section 26 0529 – Hangers and Supports for Electrical Systems

C. Section 26 0533 – Electrical Systems Identification

D. Section 26 2713 - Electrical Metering

E. Section 26 2313 – Paralleling Low Voltage Switchgear

F. Section 26 3213 – Diesel Engine Generators

1.2 REFERENCE

A. Work under this section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION OF SYSTEM

A. Provide automatic transfer switch(es), 3 phase, 60 Hz, 3 and 4 pole. Units with 4-poles are to have overlapping neutral for voltage and current as indicated on drawings.

B. Provide Bypass Isolation Transfer Switches with removable switch mechanism as indicated on drawings.

1.4 REFERENCE STANDARDS

A. ANSI Z535.4-2011 – Product Safety Signs and Labels

B. ICS 10 Industrial Control and Systems Part 1: Electromechanical AC Transfer Switch Equipment

C. UL1008 Automatic Transfer Switches

D. NFPA 70 National Electric Code

E. NFPA 110 Standard for Emergency and Standby Power Systems

1.5 SUBMITTALS

A. Submit shop Drawings for equipment provided under this Section.

B. Shop Drawings are to include at a minimum:
   1. Enclosure Withstand Rating
   2. Switch Close-On Rating

3. Cabinet dimensions and working clearance requirements
4. Side and rear access requirements if applicable
5. Shipping split dimensions and weights
6. Switch maximum continuous current, operating voltage, number of poles
7. Adjustable relay parameters (min/max/default)
8. Options selected
9. Internal wiring diagram
10. Line/Load conductor lug provisions and location
11. Communications provisions and number/type of ports
12. Metering provisions
13. Alarms/User interface diagrams

C. Complete review of this specification, noting for each paragraph whether or not proposed equipment complies with project specifications, or deviates in some fashion. Justification must be provided for each deviation.

1.6 QUALITY ASSURANCE

A. Obtain automatic transfer switches from one source and by single manufacturer.

B. Regulatory Requirements:
1. Comply with NFPA 70 for components and installation.
2. Furnish products listed and classified by Underwriters Laboratories, Inc., as suitable for purpose specified and indicated.

C. Factory Prototype Test
1. Test system in accordance at the factory in accordance with Section 26 0812 - Power Distribution Acceptance Tests and Demonstration of Transfer Functions.
2. Provide factory test report.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, fumes, water, corrosive substances, construction debris, and traffic. Provide temporary heaters in switchgear as required to prevent condensation.

B. Deliver individually wrapped for protection, and mounted on shipping skids. Mark crates, boxes, and cartons clearly to identify equipment. Show crate, box, or carton identification number on shipping invoices.

C. Use factory-installed lifting provisions. Handle carefully to avoid damage to internal components, enclosure, and finish.

1.8 WARRANTY

A. Refer to Division 01 and Section 26 0000 – General Electrical Requirements for general warranty requirements.

B. Manufacturer shall provide standard 1 yr warranty against defects in materials and workmanship for products specified in this Section. Warranty period shall begin on date of substantial completion or as stated in contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Acceptable Manufacturers:
   1. Russelectric

B. Acceptable Fire Pump ATS manufacturers:
   1. Firetrol
   2. Joslyn Clark
   3. Metron

2.2 AUTO-TRANSFER SWITCH

A. Auto-transfer switch:
   1. Mechanically held, electrically operated type.
   2. Open transition switches are to be interlocked to ensure one of only two possible positions, normal and emergency.
   3. Delayed transition transfer switches are to have 3 possible positions: normal, neutral-hold (center-off), and emergency.
   4. Closed transitions transfer switches are to have two possible simultaneous positions, normal and emergency.
   5. Rated for continuous duty in unventilated sheet metal enclosure.
   6. Suitable for all classes of loads at maximum rated voltages.
   7. Withstand rating that meets or exceeds withstand rating of transfer switch feeder breakers.

B. Provide main contacts with silver alloy wiping action type protected by arcing contacts.

C. Provide switch components accessible from front of enclosure.

D. Provide 3 cycle short circuit rating to guarantee contact opening and no damage when transfer switch is served by circuit breakers.

E. Provide transfer switches with the following items:
   1. Adjustable 1 to 3 second time delay to override momentary voltage dips and outages.
   2. Time delay on transfer to emergency. Adjustable from 1 to 300 seconds (factory set at 3 seconds).
   3. Time delay on retransfer to normal. Adjustable from 2 seconds to 30 minutes.
   4. Full phase protection consisting of 2 phase relays and one close differential relay. Phase relays shall be set to 70% drop out, 90% pick up, and differential relays set for 92 to 95% pick-up and 83 to 85% drop-out.
   5. Pushbutton reset to normal.
   6. Pushbutton to bypass time delay on retransfer to normal.
   7. Pilot light (green) to indicate normal source accepted.

8. Pilot light (green) to indicate switch in normal position.
9. Pilot light (red) to indicate emergency source accepted.
10. Pilot light (red) to indicate switch in emergency position.
11. Pilot light (yellow) to indicate alarm silenced.
12. Auxiliary contact to close when normal power fails.
13. Auxiliary contact to open when normal power fails.
14. Auxiliary contact on same shaft as main contacts (closed on normal).
15. Auxiliary contact on same shaft as main contacts (closed on emergency).
16. Four position selector switch to provide "Test," "Auto," "OFF", and "Engine Start."
17. Contacts to start engine-generator when normal power fails.
18. Time delay engine start, adjustable from 0 to 5 seconds.
19. Adjustable time delay on retransfer to normal source with 5 minute unloaded running time of standby plant:
    a. Minimum delay 2 minutes
    b. Maximum delay 25 minutes
    c. Built in circuitry to nullify time delay if emergency source fails and power is available at normal source.
20. Relay to prevent transfer to emergency until voltage and frequency of generating plant have reached 90% of rated value.
21. Provide bi-direction in-phase monitor adjustable to +/- 10° phase angle differential.
22. Digital RMS meter connected to transfer switch load contacts indicating at a minimum:
    a. Voltage per phase L-L, L-N
    b. RMS Current per phase
    c. RMS Peak current measured with reset
    d. KW/KVA/KVAR/PF
23. Auxiliary External Power Supply to supply control power to ATS controllers for switches that select between two normally unavailable sources such as two generators.
24. Load control relays
    a. Load add/shed active
    b. Load shed Enable/Disable
    c. Block transfer
25. Provide delayed transition switch(es) as indicated on drawings with dual motor operator with programmed neutral to allow voltage decay in motor and transformer circuits. Provide adjustable neutral-hold time delay.
26. Provide open, closed, delayed transition switch(es) as indicated on drawings with dual motor operator for make-before-break paralleled connection of both sources. Provide in-phase monitor and protective reverse power relays and other protective controls as required by the utility. Provide shunt trip control relay to open generator breaker in case of extended paralleling situation.

F. Bypass/Isolation switch:
   1. Dual-source enclosed.
   2. Isolate transfer switch and de-energize for maintenance, testing or repair.

3. Dual-source operation - bypass either to normal or emergency source directly to load at discretion of operator.
4. Break-before-make operation of contacts.
5. Operation - fully mechanical, designed to provide quick-make-quick-break of contacts and only allow switch to be fully closed or fully open with no mid position possible.
6. Operation - possible regardless of the position or condition of the automatic transfer switch.

2.3 FIRE PUMP AUTOMATIC TRANSFER SWITCH:

A. Fire pump ATS is upstream of a fire pump controller/ATS. Interconnect fire pump ATS with the fire pump controller lock-out circuit. Coordinate wiring requirements with fire pump controller provider.

B. Shall be completely assembled, wired, and tested by control manufacturer before shipment from factory.

C. Shall be listed for NFPA20 & NFPA 1008 compliance.

D. Shall be combined manual and automatic.

E. Heavy gauge formed steel, NEMA Type 3R enclosure with top drip hood.

F. Provide complete with following:
1. Isolating Switch: Externally operable, quick-break type
2. Pilot light to show circuit breaker closed and power available
3. Ammeter and voltmeter displays on front of panel
4. Alarm relay to energize audible or visible alarm
5. With Automatic Transfer Switch
6. Voltage surge protection

2.4 ELEVATOR CONTROL INTERFACE

A. Provide auxiliary contacts to provide emergency system status to elevator controller.

B. Contacts required are:
1. Emergency power signal
2. Pre-transfer warning signal

C. Pre-transfer warning signal relay to change state prior to operation of transfer switch in either direction.

D. These contacts are in addition to other required contacts.

2.5 PARALLELING SWITCHGEAR INTERFACE

A. Engine Start/Stop
1. Coordinate the paralleling switchgear and genset requirements.
2. Start/Stop signal is to be hardwired from ATS to paralleling gear inputs in dedicated metallic raceway.

B. Load Shed/Add

1. Coordinate requirements with paralleling gear requirements.
2. Load shed/add communication is to be hardwired from switch to paralleling gear inputs in dedicated metallic raceway. LAN or other network communications for load shed/add signals as a primary means is not allowed.
3. Display on ATS is to indicate when ATS is under a shed condition.

C. Status Communications
1. Transfer switch is to communicate status, alarms and meter data to paralleling switchgear and Tridium BAS by means of Ethernet open protocol BACNET.
2. Bypass switches are to annunciate to paralleling switchgear and BAS when switch is placed in the bypass position.

2.6 ATS ETHERNET COMMUNICATIONS

A. Ethernet Communications Interface – The controller shall be capable of interfacing, through an Ethernet over TCP/IP module, with a network of transfer switches, locally (up to 100m) or remotely through a LAN. Standard software specific to transfer switch applications shall be available by the ATS manufacturer. The software shall allow for monitoring, control, and setup of parameters.

2.7 ATS MONITORING AND CONTROL SYSTEM

A. Provide Critical Power Monitoring system for monitoring and control of transfer switches, ATS metering and status gateway. The CPMS system shall conform to the requirements of BSMI, CE, FCC and UL.

B. The CPMS shall include a Windows 7 based touch panel PC with the following hardware specifications.
1. 15” Touch Panel LCD display
2. Flash Memory 16GB
3. Hard Drive Memory – None
4. USB Ports (2)
5. 1000 Mbps Ethernet Port
6. Network Modbus Protocol (Only)
7. Interface with BMS System
8. Server

C. The CPMS software shall allow for Web Browsing from clients on the same LAN. The following security measures shall be provided.
1. Login Security
2. Three Levels of Security Access
3. 128 bit AES Encryption
4. Auto log out
5. Firewall on server

D. The CPMS Overview Screen default graphical representation shall display all automatic transfer switches, transfer switch metering and generator set. The graphical representation shall be “drag and drop”, allowing to arrange automatically detected devices. User shall be able to click on graphical representation to view transfer switch or generator set screens.

E. Transfer Switch Screen shall be a color graphical representation displaying real time information on the transfer switch status, voltage, frequency, and load. The graphical representation shall include bypass isolation status. The transfer switches shall have the ability to be controlled through “Transfer” “Re-Transfer” and “Bypass time delay” switch operations. Transfer switch settings and event log shall be viewable from the CPMS.

F. Transfer switch and generator set power metering functions shall be displayed including instantaneous watt demand, maximum watt demand and demand size window in minutes.

G. System shall be capable of system alarm notification via Email. The user shall have the ability to configure alarm settings; activate alarms, acknowledge alarms and add multiple email recipients.

H. CPMS shall maintain a database of alarming and trending history.

I. The CPM shall generate a diagnostic log report identifying for use by factory certified technicians.

J. A real-time mimic graphic of the transfer switch controller display screen will display the status of each individual transfer switch.

K. Transfer switch monitoring system shall be capable of displaying the following:
   1. System KW, KVA, KVAR, PF
   2. Phase KW, KVA, KVAR, PF
   3. System average current
   4. Phase current
   5. Current unbalance percentage
   6. Line to neutral voltage
   7. Average line to line voltage
   8. Average line to neutral voltage
   9. Line to line voltage unbalance percentage
   10. Line to neutral voltage unbalance percentage
   11. kWh import on normal and emergency
   12. kWh export on normal and emergency
   13. kWh net on normal and emergency
   14. kVARh lag on normal and emergency
   15. kVARh lead on normal and emergency
   16. kVARh net on normal and emergency
   17. kVAh net on normal and emergency
   18. Instantaneous watt demand in kW
   19. Maximum watt demand in kW
   20. Demand window size in minutes

L. Transfer switches equipped with a power metering and status gateway (85S) a trending function will be available to generate trend lines for kilowatts, Current, Voltage or Frequency over intervals of 1 minute, 15 minutes, 30 minutes or an 1 hour. Phase kW, total kW, and phase current, average current, line to line voltage, average line to neutral voltage and frequency real-time values shall be displayed within the trend line legend for the respective value.

M. Include page that will display current alarm on transfer switch as well as historic alarms. The screen will provide details including device name, alarm name, date and time of alarm, status, acknowledge date, deactivation date and the user's predefined level of severity for that alarm type. The ability to acknowledge selected alarms or alarms will be available on that page.

N. Include page that will display events on transfer switch. If a transfer switch is equipped with a power metering and status gateway (85S) the ability to display events on the devices separately or together.

2.8 ATS Remote Annunciator

A. Provide remote annunciator(s) in the fire command center to provide remote visual status reporting of all automatic transfer switches.

B. The recessed panel(s) shall contain the following:

a. LED indicators shall indicate the position of each transfer switch.

b. Source availability.

c. Lamp test button.

d. Power ON light.

C. Each indicator shall be labeled using the name of the transfer switch depicted on the one-line diagrams

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install equipment in accordance with manufacturer's recommendations and complying with Section 26 0529 – Hangers and Supports for Electrical Systems.

B. Provide side and rear access as required by manufacturer.

C. Provide equipment protection during and subsequent to installation.

D. Floor-mounted switches are to be placed on concrete housekeeping pads meeting requirements in Section 26 0529 – Hangers and Supports for Electrical Systems.

E. Provide wiring between transfer switch and elevator controller. Final connections at elevator controller by Elevator Contractor.

F. Provide wiring between transfer switch and generator controller for start/stop control.

G. Provide shunt trip wiring between transfer switch and generator breaker for closed transition transfer switches.

H. Connect transfer switches that are part of fire pump controllers.

I. Use only compression lugs unless prohibited by the switch manufacturer. Torque lugs to manufacturer's specifications.

J. Make adjustments to relay settings provided by Engineer.

K. Provide LAN and communications connections to building LAN and/or BAS as needed. Obtain IP addresses from Owner/BAS contractor.

L. Provide load add/shed and communications cabling from ATS to paralleling switchgear.

M. Provide wiring between transfer switches and remote annunciators.

3.2 IDENTIFICATION

A. Provide equipment identification complying with Section 26 0533 – Electrical Systems Identification

B. Minimum equipment identification is to include:
1. Unique Equipment Identification
2. Voltage
3. Amperage
4. Poles
5. Normal Source Name
6. Emergency Source Name
7. Load Name
8. System Type (Life Safety, Legally Required, Critical, Equipment, Standby)
9. Priority (when controlled by paralleling switchgear)

C. Provide Warning Labels Meeting ANSI, OSHA and NFPA 70E Requirements to Include:
1. “Equipment Fed From Multiple Sources”
2. “Emergency Equipment – May Start at Any Time”
3. “Emergency Life Safety System – Do Not Leave in the ‘OFF’ Position”
4. Arcflash warning labels per NFPA 70 ART 110.16
5. All labels are to meet specification guidelines found in ANSI Z535.4-2011

3.3 OPERATION

A. Parallel "start engine-generator" contacts of automatic transfer switches, such that failure of normal source at any switch shall start engine.

B. Transfer of one switch from normal to emergency shall not preclude any other switch from transferring.

C. Engine generator cool down cycle shall not start until all transfer switches have timed out back to normal source.

3.4 ACCEPTANCE TESTING

A. Testing by Testing Agency

B. Perform acceptance testing in accordance with Section 26 0812 – Power Distribution Acceptance Tests.

C. Adjust or replace equipment as needed to comply with manufacturer's specifications and resubmit corrected test reports.

END OF SECTION

SECTION 26 4113

LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0526 – Grounding and Bonding for Electrical Systems

B. Section 26 0533 – Raceway and Boxes for Electrical Systems

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Section includes lightning protection systems consisting of air terminals, roof conductors, bonding conductors, down conductors, fastener connections, and grounding.

1.4 REFERENCE STANDARDS

A. ANSI/NEMA GR1 - Grounding Rod Electrodes and Ground Rod Electrode Couplings

B. NFPA 70 - National Electrical Code

C. NFPA 780 - Standard for the Installation of Lightning Protection Systems

D. UL 96 - Lightning Protection Components

E. UL 96A - Installation Requirements for Lightning Protection Systems

1.5 SUBMITTALS

A. Product Data:
   1. Submit manufacturer’s descriptive and technical literature and catalog cuts.

B. Shop Drawings:
   1. Submit installation shop drawings for the overall lightning protection system. Include physical layout of the equipment, mounting details, and relationship to other parts of the work.
   2. Submit detail drawings for each major component.
   3. Submit location, size, and material of grounding electrodes, and connection type.
   4. Submit roof adhesive data for air terminals mounted on single-ply roofing.

C. Certification, signed by Contractor, that roof adhesive for air terminals is approved by manufacturers of both the terminal assembly and the single-ply roofing material.

D. Copy of Owner’s UL Master Label Certificate.

E. Test Reports:
   1. Submit test reports of resistance to earth for each grounding electrode.
   2. Include in each test report date of test, soil moisture content, soil temperature, test operator, instrument or other test equipment used, electrode designation or location matching that on shop drawings and ground impedance in ohms.

F. Manufacturer's Installation Instructions:
   1. Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation.

G. Closeout Submittals:
   1. Project record documents:
      a. Record active location of lighting protection system components.
   2. Operation and maintenance data:
      a. Include manufacturer's recommended operating instructions, maintenance procedures and intervals, and preventative maintenance instructions.

1.6 QUALITY ASSURANCE

A. Qualifications:
   1. Lightning protection system materials:
      a. Consists of standard products by a manufacturer regularly engaged in production of lightning protection systems.
      b. UL Listed
   2. Lightning protection system installer: UL Listed.

B. Regulatory Requirements:
   1. Lightning protection system: Comply with NFPA 780, UL 96, and UL 96A.

C. Certifications:
   1. Furnish Owner with UL Master Label Certificate upon completion of installation providing proof that the lightning protection system is in compliance with UL 96 and UL 96A standards.

1.7 SEQUENCING

A. Coordinate installation of lightning protection with installation of other building systems and components, including supporting structures and building materials, metal bodies requiring bonding to lightning protection components, exterior and interior building finishes, and building roofing.

B. Approval is to be granted from roofing system provider for all attachment and penetration methods being used by lightning protection installer to prevent violation of roofing system warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Thompson Lightning Protection Company

B. Harger Lightning Protection, Inc.

C. Erico International Corporation

D. Approved Equal

2.2 LIGHTNING PROTECTION SYSTEM COMPONENTS

A. NFPA 780, UL 96.

B. Materials: Air terminals, main and cross-run roof conductors, bonding and down conductors, conductor fasteners, and connections:
   1. Class I for portions of buildings 75’ and less above ground.
   2. Class II for portions of buildings higher than 75’ above ground.
   3. Air terminals: Solid type with a safety tip.

C. ANSI/NEMA GR1 Grounding Electrodes: 3/4” x 10 ft long copper-clad steel ground rod.

D. Concrete-Encased Electrodes: As shown on drawings.

E. Ground Ring Electrode: As shown on drawings.

F. Ground Connectors:
   1. Bronze of the clamp type and bronze clamp accessories.
   2. Provide in accordance with the requirements in Section 26 0526 – Grounding and Bonding for Electrical Systems.

G. Galvanic Compatibility of Materials:
   1. Air terminals, conductors, fasteners, and connectors shall be galvanically compatible with surfaces they are mounted to.
   2. Copper materials in all locations except where the use of aluminum materials is necessary for galvanic compatibility.
   3. Aluminum materials on copper roofs are not acceptable.
   4. Aluminum materials where mounted on aluminum roofing, siding, or other aluminum surfaces.
   5. Bimetallic fittings when joining metals that are not galvanically compatible.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install lighting protection to comply with UL 96A, NFPA 70, and NFPA 780. Conform to the most stringent requirement in NFPA 780.

B. Bond exterior metals including flashing, roof drains, vent stacks, fans, water pipes, metal raceways, enclosures, frames, and other non-current carrying metal parts of electrical and mechanical equipment on roof to lightning protection system.

C. Bond lower end of exhaust ducts, vent stacks, etc., passing through roof.

D. Run bonding jumpers continuously horizontally or down from point of bond to point of connection to main conductor.

E. Make down conductors electrically continuous, with direct paths from air terminals to ground connections. Avoid sharp bends and narrow loops. Protect down conductors, where necessary, to prevent physical damage or displacement to the conductor. Use PVC Schedule 40 conduits. Provide conduits in accordance with requirements in Section 26 0533 – Raceway and Boxes for Electrical Systems.

F. Conceal system conductors and interior conductors.

G. Notify Architect at least 48 h before concealing lightning protection system components.

H. Below-grade or concealed cable connections: Use approved exothermic-welded connections for all conductor splices and connections between conductors and other components.

I. Exposed cable connections: Use approved mechanical connections.

J. Air terminals mounted on single-ply roofing: Use adhesive recommended by manufacturer of air terminals and approved by manufacturer of roofing material. Comply with adhesive manufacturer's installation instructions.

K. Attach each down conductor to the grounding electrode by exothermic welding.

L. Provide grounding electrodes with top 12" below finished grade.

3.2 CORROSION PROTECTION

A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the present of moisture, unless moisture is permanently excluded from the junction of such materials.

B. Use conductors with suitable protective coatings where conditions would cause deterioration or corrosion of conductors.

3.3 FIELD QUALITY CONTROL

A. Apply for inspection by Underwriters Laboratories, Inc. (UL) to obtain UL Master Label Certificate.

B. Verify that lightning protection surge arrestor devices are installed on all incoming power and communications lines, in order to obtain UL Master label Certificate.

C. Test grounding system to ensure continuity prior to backfilling and paving: Check that resistance to earth does not exceed 25 ohms, measured by "Fall-of-Potential" method.

D. Make resistance measurements in dry weather not earlier than 48 h after rainfall.

E. Make visual inspection to verify that there are no loose connections that may result in high resistance joints, and conductors and system components are securely fastened to their mounting surfaces and are protected against accidental mechanical displacement.

END OF SECTION

SECTION 26 4300

SURGE PROTECTIVE DEVICES (SPD)

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 26 0000 - General Electrical Requirements

B. Section 26 0526 - Grounding and Bonding for Electrical Systems

1.2 REFERENCE

A. Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 01 General Requirements.

1.3 DESCRIPTION

A. Provide Type 1 or Type 2 Surge Protective Devices (SPD) for the protection of AC electrical circuits formerly known as Transient Voltage Surge Suppression (TVSS) System. Provide high energy surge current diversion and be suitable for application in Type 1 and Type 2 environments.

B. Modes of Protection:
   1. Line to Ground, Line to Neutral and Neutral to Ground for services with a neutral
   2. For Services without a neutral, Line to Line and Line to Ground

C. Provide common and normal modes of protection.

1.4 REFERENCE STANDARDS

A. ANSI C62.33 IEEE Standard Test Procedures for Varistor Surge-Protective Devices

B. ANSI C62.35 IEEE Standard Test Methods for Avalanche Junction Semiconductor Surge-Protection Device Components

C. ANSI C62.41 Recommended Practice for Surge Voltage in Low-Voltage AC Power Circuits

D. UL 1449 Surge Protective Devices Fourth Edition

E. IEEE 587

F. FIPS PUB 94

G. IEEE C62.45, IEEE Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000V and less) AC Power Circuits

H. National Electrical Code – Article 285

I. National Fire Protection Association – NFPA 20, 70, 75, and 78

1.5 SUBMITTALS

A. Submit Shop Drawings for equipment provided under this Section.

B. Submit shop drawings and product information for approval and final documentation in quantities listed according to Conditions of the Contract. Transmittals shall identify customer name, customer location, and customer order number.

C. Submittals shall include UL 1449 Listing documentation to verify the following:
   1. Short Circuit Current Rating (SCCR)
   2. Voltage Protection Ratings (VPRs) for all modes
   3. Maximum Continuous Operating Voltage rating (MCOV)
   4. I-nominal rating (I-n) of 20kA
   5. Type 1 or Type 2 device as required by location or indicated on drawings
   6. VPR, MCOV, I-n, and Type 1 and Type 2 information is posted at www.UL.com under Certifications or any Nationally Recognized Testing Laboratory. SCCRs are posted in manufacturer's published documentation.
   7. UL data and visual inspection takes precedence over manufacturer's published documentation.

D. Provide shop drawings including manufacturer installation instruction manual and line drawings detailing dimensions and weight of enclosure, internal wiring diagram illustrating all modes of protection in each type of SPD required, wiring diagram showing field connections, and manufacturer's recommended wire and breaker sizes (if required).

E. Upon request, an un-encapsulated SPD module shall be presented for visual inspection, proprietary technology included. MOV type and quantity shall reflect kA ratings on cutsheets, verification of diagnostic monitoring, thermal and overcurrent protection, etc.

F. Provide 3rd party testing for single and repetitive surge current for both devices for the MCOV listed. Test reports to indicate successful device operation to 3,500 sequential surges at rated surge current without failure.

PART 2 - PRODUCTS

2.1 MATERIAL

A. Acceptable manufacturers:
   1. Thomas and Betts Division of ABB, Current Technology
   2. Smiths Power, Transtector/LEA International
   3. Mersen Electrical Power

2.2 PERFORMANCE CHARACTERISTICS

A. Response time: < 5 nanoseconds for all modes of protection.

B. SPD shall bear the Mark of a Nationally Recognized Testing Laboratory and shall be Listed to Fourth Edition of UL 1449. "Manufactured in accordance with" is not equivalent to the Listing and does not meet intent of specification.

C. Post SPD and performance parameters at www.UL.com under Category Code: VZCA or any Nationally Recognized Testing Laboratory. Products or parameter without posting are not approved.

D. Minimum surge current capacity for Service Entrance units based on 8 x 20 microsecond current waveform:
   1. 200,000 A between each phase for line-to-line mode
   2. 200,000 A each phase for line-to-ground mode
   3. 200,000 A each phase for line-to-neutral mode
   4. 200,000 A for neutral-to-ground mode

E. Minimum surge current capacity for panelboard units based on 8 x 20 microsecond current waveform:
   1. 100,000 A between each phase for line-to-line mode
   2. 100,000 A each phase for line-to-ground mode
   3. 100,000 A each phase for line-to-neutral mode
   4. 100,000 A for neutral-to-ground mode

F. Sequential Surge Current Survivability:
   1. 3,500 sequential category surges without failure.

G. Current Rating:
   1. Rated for continuous current and AIC rating of equipment protected.

2.3 OPERATING CONDITIONS

A. Temperature range: -40°C to +50°C

B. Relative humidity range: 0 to 95%, non-condensing

C. Audible noise level: < 40 dBA at 5 ft

2.4 FABRICATION

A. SPD Modules:
   1. UL Labeled as Type 1, intended for use without need for external or supplemental overcurrent controls. Protect suppression component of every mode, including N-G, by internal overcurrent and thermal overtemperature controls. SPDs relying on external or supplementary installed safety disconnects do not meet intent of specification.
   2. UL Labeled with 20kA I-nominal (I-n) (verifiable at UL.com) for compliance to UL 96A Lightning Protection Mater label and NFPA 780.
   3. Suppression components: Heavy-duty MOVs, selenium cells, or combination of both.
   4. Provide surge current diversion paths for all modes of protection: L-N, L-G, N-G in WYE systems, and L-L, L-G in DELTA systems.
   5. Provide thermal overload protection of MOV circuit. Overcurrent fuse protection of MOV circuit is not acceptable.
   6. Provide service entrance SPD audible diagnostic monitoring by way of audible alarm.
   7. Provide service entrance SPD with 1 set of NO/NC dry contacts for alarm conditions.

8. Provide visual LED diagnostics including a minimum of 1 green LED indicator per phase, and 1 red service LED. Include an audible alarm with on/off silence function and diagnostic test function (excluding branch).
9. For service entrance applications, provide an integral UL Recognized disconnect switch.
10. Dedicated 60A breaker to serve as a means of disconnect for distribution SPDs.
11. SPD is to be mounted in its own NEMA-1 enclosure external to the equipment being protected. Leads are to be HPI SPD conductor, less than 5' and routed in metallic conduit.
12. Meet or exceed the following criteria:
    a. UL 1449 Listed Voltage Protection Ratings (VPRs) for 6kV 3000A testing as follows:

VOLTAGE	**L-N** **L-G** **N-G**	**L-L**
208Y/120V	650-800V	650-800V
480Y/277V	1100-1300V	1900-2100V

13. UL 1449 Listed Maximum Continuous Operating Voltage (MCOV) (verifiable at UL.com):

System Voltage	**Allowable System Voltage Fluctuation (%)**	**MCOV**
208Y/120	25%	150V
480Y/277	25%	320V

14. Provide warranty for a period of 10 yrs against workmanship and manufacturing defect.

B. Service Entrance:
1. Install 1 primary suppressor external to the service entrance in accordance with manufacturer instructions.
2. Install SPD on line or load side as shown on drawings.
3. Bond SPD ground to service entrance ground or panelboard ground.

C. Distribution Panelboards:
1. Install 1 suppressor external to each designated distribution panelboard.
2. Install surge suppression device in accordance with manufacturer instructions.

D. SPD High Performance Interconnect Cable (HPI):
1. Provide dual-shielded triple insulated multi-core power conductor cable specifically listed for SPD installations.
2. Low impedance approximately 25% of conventional pipe and wire for improved clamping voltage.
3. Conductor length is to be less than 5'.
4. Avoid 90 degree bends in conductors.

PART 3 - EXECUTION

3.1 APPLICATION OF SPD

A. Provide UL approved disconnect switch within the SPD as a means of service disconnect. A 100A breaker in the service entrance gear can be substituted for a direct connection only where the AHJ will not allow a direct feed from the bus to the SPD disconnect.

B. Provide independent means of servicing disconnect at Distribution, MCC, and Branch such that the protected panel remains energized. A 60A breaker (or larger) may serve this function. Provide breaker as recommended by Manufacturer for each application

3.2 INSTALLATION

A. Install per manufacturer's recommended practices.

B. Conductors are to be High Performance, Low Impedance (HPI) cable.

C. Provide short and straight conductors not exceeding 5 feet in length.

D. Input conductors twisted together to reduce inductance.

E. Avoid 90-degree bends in cable.

3.3 QUALITY ASSURANCE

A. Factory test system before shipment. Include quality control check, "Hi-Pot" tests at 2 times rated voltage plus 1,000 V, ground leakage tests, and calibration.

B. Manufacturer Qualifications: Engage a firm with at least 5 yrs experience in manufacturing surge protective devices.

C. Manufacturer of equipment shall have produced similar electrical equipment for a minimum period of 5 yrs. When requested by Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with requirement.

D. Provide SPD compliant with the Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC.

3.4 FIELD QUALITY CONTROL

A. Inspections before SPD startup:
   1. Visual Inspection:
      a. Verify installation per drawings.
      b. Verify phase, neutral, and ground conductors are properly sized and configured.
   2. Mechanical Inspection:
      a. Check connections for tightness.
      b. Check terminal screws, nuts and/or connectors for tightness.
   3. Electrical Inspection:
      a. Confirm input voltage.
      b. Confirm phase, neutral and ground connections are proper.

3.5 WARRANTY

A. Provide 10 yr manufacturer warranty.

END OF SECTION

SECTION 26 5100

LIGHTING SYSTEMS

PART 1 - GENERAL

1.1 RELATED WORK

A. Section 260000 - General Electrical Requirements

B. Section 260519 - Low-Voltage Electrical Power Conductors and Cables

C. Section 260526 - Grounding and Bonding for Electrical Systems

D. Section 260533 - Raceway and Boxes for Electrical Systems

E. Section 260923 - Lighting Control Devices

1.2 DESCRIPTION OF WORK

A. Provide complete and fully operational lighting system per Contract Drawings and Specifications.

B. Luminaires shall be provided complete with necessary accessories for proper installation.

C. Catalog numbers shown in luminaire schedule are basic luminaire types. Additional features, accessories and options specified, scheduled or necessary for proper installation shall be included.

D. Provide lamps (LED boards, modules, drivers) for luminaires as recommended by luminaire manufacturer, unless noted otherwise.

E. Specifications and drawings convey the features and functions of luminaires only and do not show every item or detail necessary for the work.

F. Work includes final aiming and focusing of luminaires under the direction of, and at a time designated by the Architect/Engineer/Lighting Designer.

1.3 REFERENCE STANDARDS

A. NECA/IESNA 500 - Standard for Installing Indoor Commercial Lighting Systems (ANSI)

B. NECA/IESNA 501 - Standard for Installing Exterior Lighting Systems (ANSI)

C. NECA/IESNA 502 - Standard for Installing Industrial Lighting Systems (ANSI)

D. NECA 503 – Standard for Installing Fiber Optic Lighting Systems

E. NEMA LE 4 - Recessed Luminaires, Ceiling Compatibility

F. UL 676 – Underwater Luminaires and Submersible Junction Boxes

G. UL 773 - Plug-in Photocontrols for use with area lighting

H. UL 924 - Emergency Lighting and Power Equipment

I. UL 1574 – Track Lighting

J. UL 1598 – Luminaires

K. UL 1838 – Low Voltage Landscape Lighting Systems

L. UL 2108 – Low Voltage Lighting Systems

M. UL 2388 – Flexible Lighting Products

N. UL 2562 – Pendant Cable

O. UL 8750 – LED Light Sources for use in Lighting Products

P. ANSI C78.377 – Chromaticity

Q. IESNA LM-79 – Approved Method: Electrical and Photometric Measurements of Solid-State Lighting Products

R. IESNA LM-80 - Approved Method: Testing Lumen Maintenance of LED Light Sources

S. IESNA TM21-11 - Projecting Long Term Lumen Maintenance of LED Light Sources including Addendum A

T. IES Lighting Handbook – 10th Edition

U. IES RP-29 Lighting for Hospitals and Healthcare Facilities

1.4 QUALITY ASSURANCE

A. Luminaire and accessory components shall be constructed of materials appropriate for their use.

B. Luminaires, drivers, lamps and other components shall meet the requirements of all applicable State and Municipal codes and energy codes.

C. Provide luminaires listed and labeled by UL or other testing lab acceptable to local jurisdiction for their indicated use and installation conditions.

D. Contractor shall coordinate installation of lighting systems with all trades.
   1. Manufacturers listed in the luminaire schedule shall be assumed capable of supplying listed luminaires. Any such exceptions shall immediately be brought to the attention of Architect, Engineer, or Lighting Designer.
   2. Multiple Name Specification:
      a. When multiple manufacturers are listed, Electrical Contractor shall choose which of the listed products are to be provided.
      b. Products of the same type shall be of same manufacturer.
   3. Single Name Specification:

a. When only one product is suitable for the application and/or no other known acceptable products exist, only one manufacturer/product is listed in the Luminaire Schedule. For such instances, Electrical Contractor shall provide the listed product or pre-approved alternate.

b. Specifier has secured accurate pricing for all single name products prior to bidding and has shared this information with Architect/Owner's Representative. Contractor shall supply contractor net unit pricing for all single name products specified. Unit price shall be for equipment only and not include installation or miscellaneous electrical costs.

4. Contractor shall coordinate and verify compatibility of luminaires with lighting control system

a. Control protocol indicated for luminaires matches protocol of lighting control system specified. Contractor shall coordinate and verify compatibility of all dimming luminaires with control system to ensure that dimming is flicker free, continuous dimming through the dimming range noted on the luminaire schedule.

E. Substitution requests:

1. Will be evaluated prior to Bid.
2. Shall follow procedures set forth in this Section under paragraph 1.7 and in Section 012500 - Substitution Procedures.
3. Shall be made not less than 10 days prior to bid date.
4. Shall include the following information indicating that the proposed substitution is of similar construction quality and assembly, lumen output and distribution, color temperature, color consistency, and controllability:

a. Specified and proposed manufacturer's product data sheet, noting options and features.

b. Provide dimensioned drawing of luminaire.

c. Provide photometric data in the form of an electronic IES file on USB or via email for use in a recognized computer lighting program.

5. Provide table-top working samples and/or mockup of specified luminaire and proposed alternate.
6. Samples shall:

a. Be fully operable, complete with specified lamp(s) and with functioning cord and plug ready for installation.

b. Remain available during construction.

c. Meet the requirements outlined in Section 1.8.

7. Electrical Contractor shall be responsible for all costs incurred by substitution request sample and/or mockup production and review.
8. Equipment delivery lead time shall not be held as a valid reason for requesting luminaire substitution unless luminaire lead time from specified manufacturer is in excess of 14 weeks. It shall be sole responsibility of Electrical Contractor to determine necessary equipment lead times, deliver submittals for review in a timely fashion, and place orders accordingly to ensure timely delivery.
9. When requesting a substitution, Electrical Contractor shall provide unit and extended pricing for specified luminaire, unit and extended pricing for proposed alternate, and unit and extended delta savings to owner to be realized by accepting proposed alternate. If requested, provide unit pricing for each luminaire type specified to provide a baseline comparison for substitution request.

10. Electrical Contractor shall guarantee pricing on all luminaire types for which a substitution request has been granted. This price guarantee shall be per unit and shall be maintained through the end of construction, regardless of quantity purchased.
11. For all luminaire types using an LED light source, provide independently tested, IESNA LM79 compliant photometry testing data and IESNA LM-80 Lumen Maintenance data.

1.5 WARRANTY

A. Exit Signs Utilizing LED lamp Technology: Provide manufacturer's warranty for a period of not less than five years from the date of substantial completion including parts and labor for full replacement of defective product.

B. LED Luminaires: Provide Manufacturer's warranty for a period of not less than five years from the date of substantial completion or the specified warranty period greater than five years for repair or replacement of defective electrical parts, including light source and driver

C. Luminaires without integral LED sources: Provide manufacturer's warranty for a period of not less than one year from the date of substantial completion including parts and labor for full replacement of defective product.

1.6 SUBMITTALS

A. Electronic submittal shall be limited to the greater of 500 pates or 30 MB to ensure that all pages load correctly. Bookmarks by luminaire type are required for ease of navigation. Submittals exceeding these limits should be broken in a logical fashion into multiple volumes for separate review. Measures to reduce file size should not compromise legibility or any other factors affecting ease of review.

B. Upon award of Contract, submit complete list of lighting products to be furnished, with manufacturer and catalog designations, including currently quoted lead times for product delivery. Should Electrical Contractor anticipate delivery schedule of any specified product may adversely impact construction schedule, they shall bring it to the attention of Owner/Architect/Lighting Designer at this time.

C. In addition to complying with requirements of Section 260000 - General Electrical Requirements, submittals shall include the following:
   1. Manufacturer's product data
   2. Installation instructions
   3. Maintenance data
   4. Parts list for each luminaire accessory
   5. Photometric Data: photometric data for luminaire, including optical performance as follows:
      a. Coefficients of utilization
      b. Luminance table
      c. Candela distribution data
      d. Zonal lumens
      e. Area and roadway luminaires shall include Isocandela Charts, IES Roadway Distribution Classification and IES BUG (Backlight – Uplight – Glare) ratings.
   6. Driver schedule indicating manufacturer, type, and catalog number for each luminaire

7. Driver cut sheet for each driver used, referencing luminaire type(s)
8. Lamp schedule indicating manufacturer, type, and catalog number for each luminaire
9. Lamp cut sheet for each lamp used, referencing luminaire type(s)
10. Documentation of LED and driver compatibility
11. Lighting Controls and LED Driver Compatibility Document
    a. Lighting control vendor must review and approve in writing each luminaire controlled by their system is compatible and will operate at full range of dimming. Lighting vendor responsible for providing lighting control vendor with LED driver technical specifications required to verify the lighting controls and LED driver compatibility. Contractor must submit a Lighting Controls and LED Driver Compatibility Document for Owner/Design Team review/approval.
12. Product color/finish
    a. Where specific finish or color is not specified and options exist, submit color or finish samples to Architect/Engineer/Lighting Designer for selection.

D. Shop Drawings for equipment provided under this Section shall include the following:
1. Overall submittal drawings indicating luminaire size, mounting (including ceiling type), light source, shielding, and voltage attributes, as well as manufacturer's product data, installation instructions, maintenance data, and parts list for each luminaire.
2. Catalog cutsheets lacking sufficient detail will not be accepted.
3. Detailed drawings of linear pendant mounted and suspended luminaires including dimensions, support spacing, suspension type, power feed type and locations, lamp combinations, driver locations, wiring and controls configuration, luminaire joint locations and end plates. Provide canopy details that indicate coordination with the ceiling system provided.
4. Detailed drawings for each cove and linear wall system configuration including dimensions, power feed locations, driver locations, luminaire joint locations, extension plates for end and corner sections and end plates.
    a. For LED strip luminaires mounted in architectural coves, provide dimensioned drawings and sections and include accessory cut sheets as specified. Within coves, all luminaires are to be mounted end to end with no more than 12” unlit split evenly between ends
5. Detailed drawings for LED systems including LED color, color consistency, rated life, warranty, and scale plans with luminaire layout, number, type and location for drivers, and a complete bill of materials.
6. Detailed drawings for continuous recessed or continuous surface mounted LED luminaires including dimensions, power feed locations, driver locations/quantity, luminaire joint locations, extension plates for end and corner sections and end plates as applicable.
7. Detailed drawings for custom LED handrail systems including dimensions, power feed locations, driver locations/quantity, luminaire joint locations as applicable.
8. For LED luminaires, submit documentation that indicates specified products have been tested, or will be tested, for compatibility with the lighting controls being procured and will perform as specified. Control devices or system shall be able to control luminaires with flicker free, continuous dimming, in range specified. Electrical Contractor, luminaire manufacturer and lighting control manufacturer shall be financially responsible for any incompatibilities.

9. Detailed drawings for nonstandard/custom luminaires indicating dimensions, weights, method of field assembly, components, features, and accessories. Details shall be scaled to a legible size.
10. Drawings for site lighting shall include pole data with wind loading, complete dimensions and finish, pertinent physical characteristics and accessories including mounting details, driver type and location and any specified control options.
11. Photometric Data: Where indicated on luminaire schedule and Contract Drawings, supply complete photometric data for luminaire, including optical performance rendered by independent testing laboratory developed according to methods of the Illuminating Engineering Society of North America as follows:
    a. Coefficients of utilization
    b. Luminance table with data presented numerically, showing maximum luminaire luminance at shielding angles. Readings should be taken both crosswise and lengthwise in case of luminaire with an asymmetric distribution.
    c. Candela distribution data, presented graphically and numerically, in 5° increments (5°, 10°, 15°, etc.). Data developed for up and down quadrants normal, parallel, and at 11-1/2°, 45°, 67-1/2° to lamps if light output is asymmetric.
    d. Zonal lumens stated numerically in 10° increments (5°, 15°, etc.) as above.
12. No variation from the general arrangement and details indicated on drawings shall be made on shop drawings unless required by actual conditions. All variations shall be marked on drawings submitted for approval.

E. Provide luminaires with factory or field finish as directed by Architect/Engineer/Lighting Designer. Verify final finish requirements before releasing luminaires for fabrication.

F. Where specific finish or color is not specified and options exist, submit color or finish samples to Architect for selection. Luminaires not having color or finish acceptable to Architect shall be replaced at no additional cost.

1.7 SAMPLES

A. Upon return of submittals, and prior to release for manufacturing, Contractor shall furnish one working sample of each luminaire for which sample requirement is noted in Luminaire Schedule.
    1. All requested samples shall be furnished as specified on luminaire schedule including but not limited to: light output, correlated color temperature, distribution, lens type and finish.

B. Shipping: Samples shall be complete with specified lamp(s) or LED module(s), cord and plug, ready for hanging, energizing, and examining, and shall be shipped, prepaid by Contractor, to Architect/Engineer/Lighting Designer or as otherwise advised.

C. Samples will not be returned, nor included in quantities listed for project.

D. Sample must be actual working unit.

E. All custom luminaires require a submission of material finish samples, component approval and a complete operating prototype luminaire. Prototype to be submitted prior to commencement of final luminaire fabrication and shall include specified lamps. Modifications may be required as a result of prototype review. These modifications and others that do not materially affect the cost of the luminaire shall be incorporated at no additional cost to Owner.

1.8 LUMINAIRE MOCK-UPS

A. Upon return of submittals, and prior to release for manufacturing, Contractor shall provide mock-up on site (or at another agreed upon location) in actual architectural conditions for review by Architect/Engineer/Lighting Designer and Owner.

B. Provide type and quantity of luminaires as requested by Architect/Engineer/Lighting Designer.

C. Mock-up shall include working luminaires and fastening devices.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Luminaires:
1. As shown on Luminaire Schedule

B. LED Drivers:
1. Shall be manufacturer recommended compatible driver.
2. All LED drivers shall be dimming type standard unless otherwise noted. Refer to construction documents for control per application.
3. Manufacturers must be compatible with lighting control system(s) provided and control luminaires from 100% to 1% light output or 100% to 10% light output per Luminaire Schedule and controls intent documents.

C. Emergency LED Drivers:
1. Bodine, Dual-Lite, Iota or as specified in the Luminaire Schedule

D. Low Voltage Transformers:
1. Q-Tran or as specified in the Luminaire Schedule

E. LED Modules:
1. Philips Lumileds, Xicato, Cree, GE, Nichia, Osram Sylvania, Bridgelux, Citizen or as specified in the Luminaire Schedule

2.2 FABRICATION AND MANUFACTURER

A. Luminaires:
1. Construction
a. Luminaires shall bear label indicating circuit voltage. Labels shall not be visible from normal viewing angles.
b. Luminaires shall be constructed with joints made by means of welded, brazed, screwed, or bolted construction methods.
c. Housings shall be so constructed that all electrical components are accessible and replaceable without removing luminaires from their mountings.
d. Surface temperatures of luminaires with integral drivers shall not exceed 90°C in 30°C ambient.

e. Luminaires recessed in ceilings utilized as air handling plenums shall be certified as suitable for the purpose and conform to NEC Article 300.

f. Miter cuts shall be accurate, joints shall be flush and without burrs.

g. LED troffers with doors shall have spring-loaded door cam latches.

h. Luminaires shall be free of light leaks and designed to provide sufficient ventilation of lamps to provide the photometric performance documented. Low voltage transformers and drivers shall be vented per manufacturer's specifications.

i. Provide inscription for exit and stairway signs to conform to applicable codes.

j. Verify types of ceiling construction with General Contractor prior to releasing luminaires for fabrication and delivery and provide luminaires adapted to ceiling construction used.

k. Coordinate recessed luminaire mounting appurtenances, flanges and trims with construction of ceiling in which luminaire is to be recessed. Provide correct luminaire mounting assembly.

l. Luminaire frames shall be manufactured of non-ferrous metal or be suitably rust proofed after fabrication.

2. LED Luminaires are considered a lighting system with dependent components that must be evaluated as a complete system. Each LED luminaire includes a light emitting source, provisions for heat transfer, electrical control, optical control, mechanical support and protection, as well as aesthetic design elements. All LED luminaires shall:

a. Be UL listed or equivalent. Where remote drivers are specified, all drivers shall also have UL listing or equivalent and comply with code requirements.

b. Be tested to IESNA LM-79-08 testing using absolute photometry criteria.

c. Be rated at > or = to 70% lumen maintenance at 50,000 hours of operation.

d. Be rapid cycle stress tested.

e. Have integral lamp modules with a minimum operating temperature of -20°C.

f. Have lamp modules that are capable of being easily replaced upon failure with a manufacturer provided replacement module without voiding the UL listing of the luminaire.

g. Have driver housings easily accessible for ease of maintenance.

h. Have a maximum operating temperature at LED junction to not exceed 90°C over the expected operating range of the luminaire.

i. Be RoHS compliant, lead and mercury free.

j. Have an LED operating frequency of + or – 120 Hz.

k. Must meet the appropriate Federal Communications Commission (FCC) requirements for FCC 47 CFR 15 (consumer use) and/or FCC 47 CFR Part 18 (industrial use)

l. Be Class A Sound rated.

m. Be supplied with power supply that complies with IEEE C. 62.41-1991.

n. Operate at 120 or 277 volts, ±10%.

o. Have reverse polarity protected at all hardwired connections and have high voltage protection in the event connections are reversed or shorted during the installation process.

3. Lenses, Reflectors and Diffusers

a. All lenses or louvers shall be removable, but held so that normal motion will not cause them to drop out.

b. All glass used in LED luminaires shall be made from thermal shock resistant borosilicate glass.

c. Optical lenses shall be free from spherical and chromatic aberrations.

d. Acrylic lenses shall be 100% virgin acrylic material.

e. Diffuser materials shall be UV stabilized in applications exposed to sunlight.

f. LED troffer lenses shall be 0.125” thick, unless otherwise noted.

g. Alzak reflectors and louvers shall be low iridescent equivalent to Coil Anodizers. All Alzak parabolic cones shall be guaranteed against discoloration for a minimum of ten years.

h. Reflector cones shall not have visible lamp flashing in the cone.

4. Optics and Adjustments

a. Lamp holders shall be suitable for the indicated lamps and shall be set such that lamps are positioned in optically correct relation to all luminaire components.

b. Adjustable Angle Luminaire: Luminaires with adjustment beam angle shall contain reliable angle locking devices.

5. Finishes

a. Provide luminaires with finish as shown in the luminaire schedule. Verify final finish requirements before releasing luminaires for fabrication.

b. Painted luminaires shall be painted after fabrication or "post painted".

c. Ferrous parts and supports shall be rust proofed after fabrication.

d. For weatherproof or vaportight installations, painted finishes of luminaires and accessories shall be weather resistant using proper primers or galvanized and bonderized epoxy, so that entire assembly is completely corrosion resistant for service intended and rated for an outdoor life expectancy of not less than 20 years.

6. Wiring

a. Luminaires shall be completely wired at the factory and as required by code.

b. Internal wiring shall contain no splices.

c. Connections shall be made with insulated "wire nut" type mechanical connectors except that driver connections shall comply with NEC Article 410.

d. Wire for connections to lamp sockets and lamp auxiliaries shall be minimum #16 AWG luminaire wire.

e. Luminaires shall be provided with flexible conduit, pigtails, and equipment for external connections.

f. Recessed luminaires installed in inaccessible ceilings shall be UL listed for through wiring with the junction box accessible from the luminaire opening.

g. Provide dual-level switching for luminaires as indicated on luminaire schedule and/or where shown on Contract Drawings. Typically first switch designation controls outboard lamps, and second switch designation controls inboard lamp(s), unless noted otherwise.

h. Cords shall be fitted with proper strain reliefs and watertight entries where required by application.

i. Provide lamps for all luminaires.

7. Ceiling Coordination

a. Verify type of ceiling construction prior to releasing luminaires for fabrication and delivery.

b. Provide mounting appurtenance, flanges, sloped ceiling adaptors where required.

c. Provide mounting assembly, clips or other mechanical mounting lugs as required for support of luminaires.

d. Coordinate light fixture trim paint color/finish to match the ceiling system. The same light fixture type may require multiple trim finishes due to installation in multiple ceiling systems and finishes.

8. Track-Lighting Systems:

a. A lighting track system is defined as a manufactured assembly designed to support and energize luminaires that are capable of being readily repositioned on the track. Its length may be altered by addition or subtraction of sections of track. Lighting track may be either flexible or rigid depending on the specific application.

b. Provide lighting track types as specified in Luminaire Schedule, in lengths as indicated on lighting plans.

c. All line voltage track lighting systems shall be provided with integral current limiters or be fed from supplementary overcurrent protection panels to limit power consumed by track.

d. Lighting track system includes current carrying conductors which may convey either line voltage (120V) or low voltages (12V or 24V). Characteristics of lighting track that conveys line voltages are different than a lighting track system that conveys low voltages and as such are governed by different requirements. Therefore, they are considered individually in these Specifications.

1). Line voltage (120V) Lighting Track systems:

a). Provide components, including track, fittings, and luminaires from the same manufacturer as recommended by manufacturer for the intended use. All components shall be UL Listed and comply with the National Electric Code Standards for Lighting Track.

b). Maintain continuity of conductors through feeds, splice fittings and boxes. Relative positions of live and neutral conductors must always be maintained along continuous run so that track fittings connect into the track in a consistent manner.

c). Support lighting track at intervals recommended by the track manufacturer.

d). One or two circuit Lighting Track shall be supplied with separate neutral busbars and have the ability to have each circuit separately dimmed as required when using standard voltage and low voltage luminaires with either magnetic or electronic transformers.

e). Lighting Track shall have the ability to be dimmed or switched in selected sections in addition to dimming or switching an entire track configuration or track run.

f). One and two circuit 120 volt Lighting Track shall be rated at 120/250 volt, 60 Hz, 2,400 watts maximum each circuit. Neutral busbar(s) shall be oversized and comparable to #10 AWG 30 amp wire to reduce the possibility of overheating due to non-linear loads and harmonics.

g). A separate grounding busbar shall be integral in all track lengths.

2). Low voltage (12V or 24V) Lighting Track systems:

a). Provide components, including track conductors, remote mounted transformers, fittings, and luminaires from the same manufacturer as

recommended by the manufacturer for the intended use. Components shall be UL Listed as applicable for low voltage use.

b). Maintain continuity of conductors through feeds, splice fittings and boxes. Relative positions of conductors must always be maintained along continuous run so that track fittings connect into track in a consistent manner.

c). Support lighting track at intervals recommended by track manufacturer.

d). One and two circuit low voltage Lighting Track shall be supplied with three conductors and have the ability to have each circuit separately switched with either magnetic or electronic transformers provided by the track manufacturer. Two circuit low voltage Lighting Track can only be dimmed if both circuits are fed from the same transformer and as a result, separate circuit dimming shall not be attempted or permitted.

e). All transformers shall be supplied with both primary and secondary voltage over-current protection devices that shall remain readily accessible for maintenance and testing purposes.

f). Lighting Track shall have the ability to be dimmed or switched in selected sections in addition to dimming or switching an entire track configuration or track run. Separate, single circuit transformers are required for each independently controlled circuit with the use of electrically isolated couplers.

g). Conductors used in low voltage Lighting Track shall be, at minimum, equivalent to #10 AWG 30 amp wire or heavier and be capable of carrying a 300 watt load (at 12 volts) up to 32 ft from transformer feed within range of luminaire voltage tolerance. At 24 volts, conductors shall be capable of supplying a 600 watt load up to 60 ft from transformer feed within range of luminaire voltage tolerance.

h). If taut strung cable conductors are used as low voltage Lighting Track system, they shall have a Kevlar core to prevent strain on outer current carrying conductors.

i). Only insulated type taunt strung cable conductors shall be used in order to comply with local electrical codes governing installation.

9. Outdoor Lighting Systems:
   a. Provide luminaires, mounting arms, brackets, poles, hand-hole covers, base components, and all other accessories for a complete assembly. Manufacturers shall be responsible for proper fitting of elements and structural integrity of unit
   b. Provide poles as shown on luminaire schedule.
      1). Poles shall have hand-holes.
      2). Fusing for each luminaire head shall be located in hand-hole near base of pole.
      3). Pole base anchor bolts shall be galvanized.
   c. Exterior Luminaires:
      1). Shall operate at a minimum ambient temperature of 0˚ F (-17˚C)
      2). Shall be fully gasketed, with UL wet location label.
      3). Shall have approved wire mesh screens for ventilation openings.
      4). Anodized aluminum reflectors shall have minimum of 0.00079” (0.02mm) anodizing thickness.
   d. Pole/luminaire combination shall have EPA rating that will withstand site wind conditions.

e. All castings and extrusions shall be given minimum one coat of baked-on clear lacquer, unless painted finish is specified.
f. Aluminum surfaces shall receive a duronodic or polyester powdercoat paint finish.
g. Cast-in luminaire housing installed directly in concrete shall be fabricated of hot dip galvanized steel or cast aluminum or composite.
h. Where cast aluminum housing are used, give two coats of asphaltum paint prior to installation.
i. Provide 1/8” thick x 2” diameter (3 mm thick x 50 mm diameter) solid neoprene grommets at each point light luminaire surfaces are mounted to concrete structure.

2.3 DRIVERS

A. Drivers for use in cold or freezer rooms, parking structures, loading docks, and outdoors shall be low temperature type.
1. Driver shall be lowest temperature rating available in standard manufacture for its type.

B. Drivers shall be located in luminaire they serve, unless otherwise noted.

C. LED Drivers and Power Supplies shall:
1. Operate system LEDs within the current limit specification of the LED manufacturer.
2. Be supplied with over-temperature protection circuitry.
3. Be programmable to allow for LED replacement modules to be “tuned” to match the output of remaining adjacent modules in the event that some time has passed and there has been lumen depreciation.
4. Be within a NEMA enclosure.
5. Be equipped with knockouts to accommodate standard conduit sizes
6. Have a Power Factor to be = or > than 0.9
7. Have a Lamp Current Crest Factor < 1.5
8. Dimmable LED drivers must be compatible with dimming system(s) provided and control luminaires per luminaire schedule and controls documentation.
9. ETL certified, CBM and UL Listed, high power factor, and meet or exceed NEMA and ANSI Standards.
10. Class A sound rated
11. Equipped with resetting thermal sensitive device.
12. For operation at 60 Hz and voltage as scheduled.
13. Meet or exceed all ANSI or NEMA standards
14. Capable of operating LEDs with less than 5% flicker
15. Be DMX compatible in Color changing LED luminaires.

D. LED Data Enablers shall be:
1. Compatible with DMX.
2. NEMA enclosure.
3. Equipped with knockouts to accommodate standard conduit sizes.
4. Convection cooled.
5. RoHS compliant.

E. Emergency LED Drivers shall:
1. Be UL 924 listed
2. Operate LED luminaire at 10W minimum output for 90 minutes with efficacy equal to or greater than the normal power efficacy.
3. Have high temperature nickel-cadmium battery.
4. Be installed inside/on top off luminaires
5. Have solid state charging
6. Battery to be recharged within 24 hours
7. Remote battery test switch.

2.4 LOW VOLTAGE TRANSFORMERS

A. Transformers shall be:
1. Sized to compensate for voltage drop over indicated distances
2. Locally fused

B. Transformers shall have line voltage switch within reach.

C. Provide adequate ventilation to meet code and manufacturers requirements.

2.5 LAMPS

A. Provide lamps as noted on Luminaire Schedule.

B. Provide lamps of same type from same manufacturer.

C. Where a specific lamp manufacturer has been indicated in the Luminaire Schedule, lamps shall be supplied from named manufacturer only.

D. White LED sources shall be:
1. Minimum CRI of 90 unless noted otherwise on Luminaire Schedule
2. Less than 5% flicker
3. Within 0.004 on the CIE 1976 diagram for color spatial uniformity
4. Within 0.007 on the CIE 1976 diagram for color maintenance over the rated lifetime of the source
5. Binned within a 3-step MacAdam ellipse minimum, or as indicated in Luminaire Schedule
6. Color temperature as noted on Luminaire Schedule
7. Have a published life rating based on the point at which LED sources reach L70 lumen maintenance and tested in accordance with IES LM80-08 Approved Method: Testing Lumen Maintenance of LED light sources and IES TM-21-11: Projecting Long Term Lumen Maintenance of LED Light Sources
8. L70 rated life shall be a minimum of 50,000 hours.
9. LED modules, unless noted otherwise, shall be provided by light fixtures manufacturer and integral to luminaire.
10. Screw-base LED replacement lamps, where required and listed on the luminaire schedule, shall meet dimming, output, CCT and CRI as specified. 25,000 hours is acceptable L70 rated life for these products.

E. Provide all other lamp types and special purpose lamps as noted on Luminaire Schedule.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Marking:
1. Voltage identification: Luminaires designed for voltages other than 110-125 volt circuits shall be clearly marked with rated voltage.
2. Markings must be clear and shall be located to be readily visible to service personnel but invisible from normal viewing angles when lamps are in place.

B. Installation of Luminaires:
1. Lamps, glassware, reflectors and refractors shall be clean and free of chips, cracks and scratches.
2. Install decorative luminaires, reflector cones, baffles, aperture plates, lenses, trims, and decorative elements of recessed luminaires after completion of ceiling tile, plastering, painting, and general cleanup is completed. Where luminaire location or construction does not permit sequential installation, all reflectors, lenses, flanges and other visible surfaces shall be carefully protected.
3. Light leaks between ceiling trim of recessed luminaires and ceiling are not allowed.
4. Locations
    a. Install luminaires at locations and heights as indicated.
    b. Do not scale electrical drawings for locations of luminaires.
    c. Architectural reflected ceiling plans show locations of luminaires.
    d. Where noted on the drawings, the exact location of luminaires shall be confirmed (in the field) with the Architect/Engineer prior to installation.
    e. Where luminaires are to be concealed, or surface mounted in highly visible public spaces, a small sampling of luminaires shall be installed, adjusted and aimed for Architect/Engineer's review approval, prior to installing remaining luminaire of same type.
    f. Mount all luminaires so as to maintain full range of motion.
    g. Install luminaires plumb, square, and level with ceilings and walls.
    h. Coordinate stem, rod, chain, or aircraft cable hanger lengths with job conditions. Provide extra length of adjustable supports where diffusers are mounted directly above light fixtures to facilitate air balancing efforts.
    i. Industrial type luminaires in unfinished areas, which are near obstructions such as ducts and pipes, shall be:
        1). Suspended so that bottom of luminaire is no higher than bottom of obstruction.
        2). Located at height of lowest luminaire
        3). Minimum height: 8’-0”
        4). Shall not be located until locations of obstructions are determined.
        5). Where a minimum height of 8’-0” is unachievable, wall mounted luminaires will be utilized.
5. Support

a. Support surface mount luminaires from building structure.
b. Metal decking shall not be pierced for luminaire support.
c. Provide luminaires and/or luminaire outlet boxes with hangers to support luminaire weight.
d. LED troffers shall be held in place by support clips.
e. Provide plaster frames for recessed luminaires in plaster ceilings.
f. Rigid metallic pipe stems shall be utilized for the support of pendant mounted luminaires, unless otherwise noted.
g. Stem hangers shall be equipped with aligner box covers or canopies so that stems hang vertically, irrespective of the angle of the surface they are mounted from.
h. Wherever a luminaire or its hanger canopy is attached to a surface mounted outlet box, a finishing ring shall conceal the outlet box.
i. Yokes, brackets and supplementary supporting members needed to mount luminaires to suitable ceiling members shall be furnished and installed by Contractor. Verify mounting hardware required prior to installation.
j. Recessed luminaires shall be supported with 12 ga wire hangers, 2 per luminaire, at diagonally opposite corners.
k. Recessed LED troffers and luminaires over 55 lbs, such as 4' x 4' shall be supported with 12 ga wire hangers, 4 per luminaire, 2 at 45 degree diagonals, and two perpendicular to structure. Wire hangers and attachment to structure shall be capable of supporting 4 times luminaires weight.
l. Surface luminaires installed in grid ceilings shall be supported by independent support clips and 12 ga wire.
m. Exit signs installed in grid ceilings shall be supported by electrical box hanger and additional 12 ga wire installed from box to structure.
n. Support surface mounted luminaires greater than 2 ft in length at a minimum of each additional 2 ft, or as recommended by manufacturer.
o. Brace suspended luminaires installed near ducts or other constructions with solid pendants or threaded rods.
p. Rigidly align continuous rows of luminaires.
q. Luminaire types with remote mounted driver shall have:
   1). Proper support for driver weight.
   2). Mounting distance from remote driver to luminaire per manufacturer's recommendations.

6. Mounting and Enclosures
   a. Install flush mounted luminaires to eliminate light leakage.
   b. For luminaires mounted adjacent to insulation, provide barrier to prevent insulation from coming in contact with luminaire, unless luminaire is approved for installation in contact with such insulation.
   c. Provide approved fire rated enclosures around luminaires in fire rated ceilings.
7. Conduit and Wiring
   a. Wire for connections to lamp sockets and auxiliaries shall be suitable for temperature, current, and voltage conditions.
   b. Recessed luminaires shall have final connections made with flexible metal conduit, not in excess of 72", with THHN conductors and green wire ground conductor.

c. Conduit shall be hidden from normal view in all possible cases. In public areas where surface mounted conduit must be used, contractor shall install conduit as unobtrusively as possible. Contractor shall obtain field approval by the architect for all exposed conduit runs prior to rough in.

8. In-Grade Luminaires:
   a. Where installed in tree grates, furnish burial light lens and louver to tree grate manufacturer for coordination of opening.
   b. Provide adequate drainage system per manufacturer's recommendations.

C. Installation of Outdoor Pole Bases
1. Contractor shall provide bases for luminaires.
2. Pole base details shall be provided by the project structural engineer.
3. Provide handhole for electrical connection within 4’-0” of pole base.
4. Contractor shall:
   a. Rough-in conduits
   b. Coordinate spacing, base dimensions, heights, orientation of bases, etc. as necessary.
5. Where square or rectangular poles or luminaire heads are used, Contractor shall verify orientation with Architect/Engineer/Lighting Designer.

D. Pole Installation:
1. Install luminaires, poles, hardware, etc., for complete system.
2. Use web fabric slings (not chain or cable) to raise and set poles.

E. Grounding:
1. Ground luminaires and metal poles according to Division 26 Section "Grounding and Bonding for Electrical Systems".
2. Poles:
   a. Install 10 ft driven ground rod at each pole.
3. Nonmetalic Poles:
   a. Ground metallic components of lighting unit and foundations. Connect luminaires to grounding system with #10 AWG conductor.

F. Spare Parts:
1. Provide spare globes and guards, 1 for every 100 of each type and rating installed. Furnish at least one of each luminaire family.
2. Provide spare louvers and reflector cones, 1 for every 100 of each luminaire family. Furnish at least one of each type.
3. Provide spare plastic diffusers and lenses, 1 for every 100 of each luminaire family and rating installed. Furnish at least one of each type.
4. Furnish one spare custom luminaire for each 10 supplied.
5. Provide 1% spare replaceable LED lamp modules for each primary fixture series type in Luminaire Schedule
   a. Spare LED lamp modules shall be delivered to Owner in new condition and in original packaging.

b. Manufacturer and model number shall match those installed in the project's luminaires.

6. Provide spare LED drivers, 1 for every 100 of each primary fixture series type and rating installed. Furnish at least one of each type.
   a. Manufacturer and model number shall match those installed in the project's luminaires.
7. Provide 1% spare LED luminaires with non-replaceable lamp modules consisting of entire LED luminaire assembly and driver(s).

3.2 SUBSTANTIAL COMPLETION

A. Quality Control:
1. At Date of Substantial Completion, replace lamps/LED modules/LED luminaires which are not operating properly.
2. Protection wrapping on lensed or louvered luminaires shall be removed before installation of furniture, but after finish work is complete.
3. Deliver spare equipment to Owner's representative.

B. Tests:
1. Give advance notice of dates and times for field tests.
2. Provide instruments to make and record test results.
3. Verify normal operation of each luminaire after luminaires have been installed and circuits have been energized.
4. Verify operation of luminaires with lighting control system and daylight harvesting systems. Any dimmed fixtures shall exhibit no signs of flickering.
5. Replace or repair malfunctioning luminaires and components, then retest. Repeat procedure until all units operate properly.
6. Report results of tests.

C. Adjusting and Cleaning:
1. Clean luminaires of handling marks, dust and dirt.
2. Cleaning and touch-up work shall be performed in accordance with luminaire manufacturer's recommendations.
3. Damaged luminaires or components shall be replaced with new.
4. Keep luminaires clean and protected for remainder of construction period.
5. Verify orientation of directional luminaires prior to installation.
   a. This includes wall washers, cove lighting, floodlights, exterior area lights and adjustable accent luminaires. Contractor shall provide electrician's services to aim, adjust, and focus luminaires, as required, at direction of Architect/Lighting Designer. These electricians shall be available at times designated by Architect/Lighting Designer and shall be provided at no extra charge to Owner over base bid. Contractor shall provide equipment for luminaires' focus including ladders and mechanical lifting systems.
6. Program preset dimming system lighting levels per direction from Owner/Architect/Engineer/Lighting Designer. Submittal process must include Contractor request for preset setting levels.

7. Program ambient light sensors integral to luminaires for appropriate illumination levels as indicated in control narrative or in lighting control specifications.
8. Program occupancy sensors integral luminaires for appropriate time delay as indicated in control narrative or in lighting control specifications.
9. Exterior poles, bollards, bases and other exterior luminaires shall be painted to match factory color where finish has been damaged.
10. No light leaks shall be permitted at ceiling line from any visible part or joint.

D. Training

1. Contractor shall provide Owner with 3 complete hard copies and 1 digital copy of Operations and Maintenance manuals
   a. All “Approved as Noted” comments shall be corrected/picked-up in this record manual set.
   b. Each manual shall contain specific information pertaining to the equipment installed. Each manual shall contain at a minimum:
      1). Detailed as built shop drawings for all lighting equipment installed.
      2). Manufacturer’s product cut sheets for all equipment installed keyed by type as to as built drawings.
      3). Manufacturer’s complete installation instructions for all equipment installed keyed by type to as built drawings.
      4). Equipment maintenance requirements and schedules.
      5). Equipment manufacturer contacts.
      6). Equipment manufacturer warranties.
         a). Luminaires
         b). Control gear/drivers
         c). Lamps/LED modules
2. Contractor shall provide qualified personnel onsite to provide a minimum of three days of training to Owner's representatives.
3. This training shall cover:
   a. Luminaire use and maintenance
   b. Architectural lighting system use and maintenance
   c. LED lighting systems that contain field replaceable components (LED boards, modules, drivers.
   d. LED lighting systems which are disposable technology where the entire fixture must be replaced, no field replaceable components.

END OF SECTION

SECTION 270501 - GENERAL PROVISIONS - COMMUNICATIONS

PART 1 - GENERAL

1.1 The Instructions to Bidders, General and Special Conditions, and all other contract documents shall apply to the Contractor's work as well as to each of his Sub Contractor's work. Each Contractor is directed to familiarize himself in detail with all documents pertinent to this Contract. In case of conflict between these General Provisions and the General and/or Special Conditions, the affected Contractor shall contact the Engineer for clarification and final determination.

1.2 Each Contractor shall be governed by any alternates, unit prices and Addenda or other contract documents insofar as they may affect his part of the work.

1.3 The work included in this division consists of the furnishing of all labor, equipment, transportation, supplies, material and appurtenances and performing all operations necessary for the satisfactory installation of complete and operating Electrical Systems indicated on the drawings and/or specified herein.

1.4 Any materials, labor, equipment or services not mentioned specifically herein which may be necessary to complete or perfect any part of the Electrical Systems in a substantial manner, in compliance with the requirements stated, implied, or intended in the drawings and specifications, shall be included as part of this Contract. The Contractor shall give written notice of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted a minimum of ten days prior to bid. In the absence of such written notice and by the act of submitting his bid, it shall be understood that the Contractor has included the cost of all required items in his bid, and that he will be responsible for the approved satisfactory functioning of the entire system without extra compensations.

1.5 It is not the intent of this section of the specifications (or the remainder of the contract documents) to make any specific Contractor, other than the Contractor holding the prime contract, responsible to the Owner, Architect and Engineer. All transactions such as submittal of shop drawings, claims for extra costs, requests for equipment or materials substitution, shall be done through the Contractor to the Architect (if applicable), then to the Engineer.

1.6 This section of the Specifications or the arrangement of the contract documents shall not be construed as an attempt to arbitrarily assign responsibility for work, material, equipment or services to a particular trade Contractor or Sub-Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be the responsibility of the Contractor holding the prime contract.

1.7 It is the intent of this Contract to deliver to the O a "like new" project once work is complete. Although plans and specifications are complete to the extent possible, it shall be responsibility of the Contractors involved to remove and/or relocate or re-attach any existing or new systems which interfere with new equipment or materials to be installed by other trades without additional cost to the Owner.

1.8 In general, and to the extent possible, all work shall be accomplished without interruption of the existing facilities' operations. Each Contractor shall advise the Architect, Owner and Engineer in writing at least one week prior to the deliberate interruption of any services. The Owners shall be advised of the exact time that interruption will occur and the length of time the interruption will occur. Failure to comply with this requirement may result in complete work stoppage by the Contractors

involved until a complete schedule of interruptions can be developed. Contractor will not be entitled to additional compensation due to work stoppage mandated by unscheduled interruption.

1.9 Whenever utilities are interrupted, either deliberately or accidentally, the Contractor shall work continuously to restore said service. The Contractor shall provide tools, materials, skilled journeymen of his own and other trades as necessary, premium time as needed and coordination with all applicable utilities, including payment of utility company charges (if any), all without requests for extra compensation to the Owner, except where otherwise provided for in the contract for the work. The contractor shall abide by the requirements on the Special Conditions and the University's outage request program.

1.10 Definitions:

1.10.1 Prime Contractor - The Contractor who has been engaged by the Owner in a contractual relationship to accomplish the work.

1.10.2 Electrical Contractor - Any Contractor whether bidding or working independently or under the supervision of a General Contractor, that is: the one holding the Prime Contract and who installs any type of Electrical work, such as: power, lighting, intercom, fire detection and alarm, security, video, etc.

1.10.3 Electrical Sub-Contractor - Each or any Contractor contracted to, or employed by, the Electrical Contractor for any work required by the Electrical Contractor.

1.10.4 Low Voltage Contractor - Any Contractor whether bidding or working independently or under the supervision of a General Contractor, that is: the one holding the Prime Contract and who installs any type of Electrical work, such as: television, telecommunications, data, fiber optic, intercom, fire detection and alarm, security, video, underground or overhead electrical, etc.

1.10.5 Engineer - The Consulting Mechanical-Electrical Engineers either consulting to the Owner, Architect, other Engineers, etc.

1.10.6 Architect - The Architect of Record for the project, if any.

1.10.7 Furnish - Deliver to the site in good condition.

1.10.8 Provide - Furnish and install in complete working order.

1.10.9 Install - Install equipment furnished by others in complete working order.

1.10.10 Contract Documents - All documents pertinent to the quality and quantity of all work to be performed on the project. Includes, but not limited to: Plans, Specifications, Addenda, Instructions to Bidders, (both General and Sub-Contractors), Unit Prices, Shop Drawings, Field Orders, Change Orders, Cost Breakdowns, Construction Manager's Assignments, Architect's Supplemental Instructions, Periodical Payment Requests, etc.

1.11 Note: Any reference within these specifications to a specific entity, i.e., "Electrical Contractor" is not to be construed as an attempt to limit or define the scope of work for that entity or assign work to a specific trade or contracting entity. Such assignments of responsibility are the responsibility of the Contractor or Construction Manager holding the prime contract, unless otherwise provided herein.

PART 2 - INTENT

2.1 It is the intent of these specifications and all associated drawings that the Contractor provide finished work, tested, and ready for operation. Wherever the word "provide" is used, it shall mean "furnish and install complete and ready for use."

2.2 Minor details not usually shown or specified, but necessary for the proper installation and operation, shall be included in the work, the same as if herein specified or shown.

PART 3 - DRAWINGS AND SPECIFICATIONS

3.1 The drawings are diagrammatic only and indicate the general arrangement of the systems and are to be followed insofar as possible. If deviations from the layouts are necessitated by field conditions, detailed layouts of the proposed departures shall be submitted in writing to the Engineer for approval before proceeding with the work. The Contract Drawings are not intended to show every vertical or horizontal offset which may be necessary to complete the systems. Contractors shall, however, anticipate that additional offsets may be required and submit their bid accordingly.

3.2 The drawings and specifications are intended to supplement each other. No Contractor or supplier shall take advantage of conflict between them, or between parts of either, but should this condition exist, the Contractor or supplier shall request a clarification of the condition at least ten days prior to the submission of bids so that the condition may be clarified by Addendum. In the event that such a condition arises after work is started, the interpretation of the Engineer shall be the determining factor. In all instances, unless modified in writing and agreed upon by all parties thereto, the Contract to accomplish the work shall be binding on the affected Contractor.

3.3 The drawings and specifications shall be considered to be cooperative and complimentary and anything appearing in the specifications which may not be indicated on the drawings or conversely, shall be considered as part of the Contract and must be executed the same as though indicated by both.

3.4 This Contractor shall make all his own measurements in the field and shall be responsible for correct fitting. He shall coordinate this work with all other branches of work in such a manner as to cause a minimum of conflict or delay.

3.5 The Engineer shall reserve the right to make minor adjustments in location of conduit, fixtures, outlets, switches, etc., where he considers such adjustments desirable in the interest of concealing work or presenting a better appearance.

3.6 Each Contractor shall evaluate ceiling heights called for on Architectural Plans. Where the location of Electrical equipment may interfere with ceiling heights, the Contractor shall call this to the attention of the Engineer in writing prior to making the installation. Any such changes shall be anticipated and requested sufficiently in advance so as to not cause extra work on the part of the Contractor or unduly delay the work.

3.7 Should overlap of work between the various trades become evident, this shall be called to the attention of the Engineer. In such event neither trade shall assume that he is to be relieved of the work which is specified under his branch until instructions in writing are received from the Engineer.

3.8 The drawings are intended to show the approximate location of equipment, materials, etc. Dimensions given in figures on the drawings shall take precedence over scaled dimensions and all dimensions whether given in figures or scaled shall be verified in the field. In case of conflict between small and large scale drawings, the larger scale drawings shall take precedence.

3.9 The Low Voltage Contractor and his Sub Contractors shall review all drawings in detail as they may relate to his work (structural, architectural, site survey, mechanical, electrical, etc.). Review all

drawings for general coordination of work, responsibilities, ceiling clearances, wall penetration points, chase access, elevations, etc. Make any pertinent coordination or apparent conflict comments to the Engineers at least ten days prior to bids, for issuance of clarification by written addendum.

3.10 Where on any of the drawings a portion of the work is drawn out and the remainder is indicated in outline, or not indicated at all, the parts drawn out shall apply to all other like portions of the work. Where ornament or other detail is indicated by starting only, such detail shall be continued throughout the courses or parts in which it occurs and shall also apply to all other similar parts of the work, unless otherwise indicated.

PART 4 - EXAMINATION OF SITE AND CONDITIONS

4.1 Each Contractor shall inform himself of all of the conditions under which the work is to be performed, the site of the work, the structure of the ground, the obstacles that may be encountered, the availability and location of necessary facilities and all relevant matters concerning the work. All Contractors shall carefully examine all Drawings and Specifications and inform themselves of the kind and type of materials to be used throughout the project and which may, in any way, affect the execution of his work.

4.2 Each Contractor shall fully acquaint himself with all existing conditions as to ingress and egress, distance of haul from supply points, routes for transportation of materials, facilities and services, availability of temporary or permanent utilities, etc. The Contractor shall include in his work all expenses or disbursements in connection with such matters and conditions. Each Contractor shall verify all work shown on the drawings and conditions at the site, and shall report in writing to the Engineer ten days prior to bid, any apparent omissions or discrepancies in order that clarifications may be issued by written addendum. No allowance is to be made for lack of knowledge concerning such conditions after bids are accepted.

4.3 The Low Voltage Contractor is required to provide coordination drawings, data and collaboration for all aspects of his work in accordance with the general and special conditions – Divisions 20, 22, 23, 26 and 28 the Construction Manager’s procedures.

PART 5 - EQUIPMENT AND MATERIALS SUBSTITUTIONS OR DEVIATIONS

5.1 When any Contractor requests review of substitute materials and/or equipment, and when under an approved formal alternate proposal, it shall be understood and agreed that such substitution, if approved, will be made without additional cost regardless of changes in connections, spacing, service, mounting, etc. In all cases where substitutions affect other trades, the Contractor offering such substitutions shall advise all such Contractors of the change and shall reimburse them for all necessary changes in their work. Any drawings, Specifications, Diagrams, etc., required to describe and coordinate such substitutions or deviations shall be professionally prepared at the responsible Contractor's expense. Special Note: Review of Shop Drawings by the Engineer does not absolve the Contractor of this responsibility.

5.2 References in the specifications to any article, device, product, material, fixture, form, or type of construction by name, make, or catalog number shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition. Each Contractor, in such cases, may, at his option, use any article, device, product, material, fixture, form, or type of construction which in the judgment of the Engineer is equivalent to that specified, provided the provisions of paragraph (A) immediately preceding are met. Substitutions shall be submitted to the Engineer a minimum of ten days prior to bid date for approval to bid in written form thru addenda or other method selected by the Engineer. If prevailing laws of cities, towns, states or countries are more stringent than these specifications regarding such substitutions, then those laws shall prevail over these requirements.

5.3 Wherever any equipment and material is specified exclusively only such items shall be used unless substitution is accepted in writing by the engineers.

5.4 Each Contractor shall furnish along with his proposal a list of specified equipment and materials which he proposes to provide. Where several makes are mentioned in the Specifications and the Contractor fails to state which he proposes to furnish, the Engineer shall have the right to choose any of the makes mentioned without change in price.

PART 6 - SUPERVISION OF WORK

6.1 Each Contractor and Sub-Contractors shall personally supervise the work or have a competent superintendent on the project site at all times during progress of the work, with full authority to act for him in matters related to the project.

PART 7 - CODES, RULES, PERMITS, FEES, REGULATIONS, ETC.

7.1 The Contractor shall give all necessary notices, obtain and pay for all permits, government sales taxes, fees, and other costs including utility connections or extensions, in connection with his work. As necessary, he shall file all required plans, utility easement requests and drawings, survey information on line locations, load calculations, etc., prepare all documents and obtain all necessary approvals of all utility and governmental departments having jurisdiction; obtain all required certificates of inspection for his work and deliver same to the Engineer before request for acceptance and final payment for the work.

7.2 Ignorance of Codes, Rules, regulations, utility company requirements, laws, etc., shall not diminish or absolve Contractor's responsibilities to provide and complete all work in compliance with such.

7.3 The Contractor shall include in the work, without extra cost, any labor, materials, services, apparatus or drawings required in order to comply with all applicable laws, ordinances rules and regulations, whether or not shown on drawings and/or specified.

7.4 All materials furnished and all work installed shall comply with the current edition of the National Electrical Codes, National Fire Codes of the National Fire Protection Association, the requirements of local utility companies, owners private utility standards and with the requirements of all governmental agencies or departments having jurisdiction.

7.5 All material and equipment for the low voltage systems shall bear the approval label, or shall be listed by the Underwriters' Laboratories, Incorporated. Listings by other testing agencies may be acceptable with written approval by the Engineer.

7.6 All low voltage work is to be constructed and installed in accordance with plans and specifications which have been approved in their entirety and/or reflect any changes requested by the University Fire Marshal, as applicable or required. Electrical work shall not commence until such plans are in the hands of the Electrical Contractor.

7.7 The Contractor shall insure that his work is accomplished in accord with OSHA Standards and any other applicable government requirements.

7.8 Where conflict arises between any code and the plans and/or specifications, the code shall apply except in the instance where the plans and specifications exceed the requirements of the code. Any changes required as a result of these conflicts shall be brought to the attention of the Engineer at least ten working days prior to bid date, otherwise the Contractor shall make the required changes at his own expense. The provisions of the codes constitute minimum standards for wiring

methods, materials, equipment and construction and compliance therewith will be required for all electrical work, except where the drawings and specifications require better materials, equipment, and construction than these minimum standards, in which case the drawings and specifications shall be the minimum standards.

PART 8 - COST BREAKDOWNS

8.1 Within thirty days after acceptance of the Contract, each Contractor is required to furnish to the Engineer one copy of a detailed cost breakdown on each respective area of work. These cost breakdowns shall be made on forms provided or approved by the Engineer or Architect. Payments will not be made until satisfactory cost breakdowns are submitted.

PART 9 - GUARANTEES AND WARRANTIES

9.1 Each Contractor shall unconditionally guarantee all equipment, apparatus, materials, and workmanship entering into this Contract to be the best of its respective kind and shall replace all parts at his own expense, which fail or are deemed defective within one year from final acceptance of the work by the Engineer. The effective date of completion of the work shall be the date each or any portion of the work is accepted by the Engineer as being substantially complete.

9.2 Items of equipment which have longer guarantees, as called for in these specifications or as otherwise offered by the manufacturer, such as generators, engines, batteries, transformers, etc., shall have warranties and guarantees completed in order, and shall be in effect at the time of final acceptance of the work by the Engineer. The Contractor shall present the Engineer with such warranties and guarantees at the time of final acceptance of the work. The Owner reserves the right to use equipment installed by the Contractor prior to date of final acceptance. Such use of equipment shall in no way invalidate the guarantee except that Owner shall be liable for any damage to equipment during this period due to negligence of his operator or other employee.

PART 10 - INSPECTION, APPROVALS AND TESTS

10.1 Before requesting a final review of the installation from the Architect and/or Engineer, the Contractor shall thoroughly inspect his installation to assure that the work is complete in every detail and that all requirements of the Contract Documents have been fulfilled. Failure to accomplish this may result in charges from the Architect and/or Engineers for unnecessary and undue work on their part.

10.2 The Contractor shall provide as a part of this contract electrical inspection by a competent Electrical Inspection Agency, licensed to provide such services. The name of this agency shall be included in the list of materials of the Form of Proposal by the Contractor. All costs incidental to the provision of electrical inspections shall be borne by the Electrical Contractor.

10.3 The Contractor shall advise each Inspection Agency in writing (with an information copy of the correspondence to the Architect and/or Engineer) when he anticipates commencing work. Failure of the Inspection Agency to inspect the work in the stage following and submit the related reports may result in the Contractor's having to expose concealed work not so inspected. Such exposure will be at the expense of the responsible Contractor.

10.4 Inspections shall be scheduled for rough as well as finished work. The rough inspections shall be divided into as many inspections as may be necessary to cover all roughing-in without fail. Report of each such inspection visit shall be submitted to the Architect, Engineer and the Contractor within three days of the inspection.

10.5 Approval by an Inspector does not relieve the Contractor from the responsibilities of furnishing equipment having a quality of performance equivalent to the requirements set forth in these plans and specifications. All work under this contract is subject to the review of the Architect and/or Engineer, whose decision is binding.

10.6 Before final acceptance, the Contractor shall furnish three copies of the certificates of final approval by the Electrical Inspector (as well as all other inspection certificates) to the Engineer with one copy of each to the appropriate government agencies, as applicable. Final payment for the work shall be contingent upon completion of this requirement.

10.7 The Contractor shall test all wiring and connections for continuity and grounds before equipment and fixtures are connected, and when indicated or required, demonstrate by Megger Test the insulation resistance of any circuit or group of circuits. Where such tests indicate the possibility of faulty insulation, locate the point of such fault, pull out the defective conductor, replacing same with new and demonstrate by further test the elimination of such defect.

PART 11 - CHANGES IN WORK

REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 12 - CLAIMS FOR EXTRA COST

REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 13 - SURVEYS, MEASUREMENTS AND GRADES

13.1 The Contractor shall lay out his work and be responsible for all necessary lines, levels, elevations and measurements. He must verify the figures shown on the drawings before laying out the work and will be held responsible for any error resulting from his failure to do so.

13.2 The Contractor shall base all measurements, both horizontal and vertical from established bench marks. All work shall agree with these established lines and levels. Verify all measurements at site and check the correctness of same as related to the work.

13.3 Should the Contractor discover any discrepancy between actual measurements and those indicated, which prevents following good practice or the intent of the drawings and specifications, he shall notify the Engineer thru normal channels of job communication and shall not proceed with his work until he has received instructions from the Engineer.

PART 14 - TEMPORARY USE OF EQUIPMENT

14.1 The permanent electrical equipment, when installed, may be used for temporary services, subject to and owner consent of the Engineer. Should the permanent systems be used for this purpose, each Contractor shall pay for all temporary connections required and any replacements required due to damage without cost, leaving the equipment and installation in "as new" condition. The Contractor may be required to bear utility costs, user fees, etc.

14.2 Permission to use the permanent equipment does not relieve the Contractors who utilize this equipment from the responsibility for any damages to the building construction and/or equipment which might result because of its use.

PART 16 - RECORD DRAWINGS

16.1 The Contractor shall insure that any deviations from the design are being recorded daily or as necessary on record drawings being maintained by the Contractor. Dimensions from fixed, visible permanent lines or landmarks shown in vertical and horizontal ways shall be utilized. Compliance shall be a requirement for final payment. Pay particular attention to the location of underfloor or underground exterior in-contract or utility-owned or leased service lines, main switches and other appurtenances important to the maintenance and safety of the Electrical System. Deliver these record drawings to the Engineer at the completion of the work.

PART 17 - MATERIALS AND WORKMANSHIP

17.1 All electrical equipment, materials and articles incorporated in the work shall be new and of comparable quality to that specified. All workmanship shall be first-class and shall be performed by technicians skilled and regularly employed in their respective trades. The Contractor shall determine that the equipment he proposes to furnish can be brought into the building(s) and installed within the space available. All equipment shall be installed so that all parts are readily accessible for inspection, maintenance, replacement, etc. Extra compensation will not be allowed for relocation of equipment for accessibility or for dismantling equipment to obtain entrance into the building(s).

17.2 All conduit and/or conductors shall be concealed in or below walls, floors or above ceilings unless otherwise noted. All devices and wiring required shall be installed to make up complete systems as indicated on the drawings and specified herein.

17.3 All materials, where applicable, shall bear Underwriters' Laboratories label or that of another Engineer-approved testing agency, where such a standard has been established.

17.4 Each length of conduit, wireway, duct, conductor, cable, fitting, and device used in the electrical systems shall be stamped or indelibly marked with the makers mark or name.

17.5 All electrical equipment shall bear the manufacturer's name and address and shall indicate its electrical capacity and characteristics.

PART 18 - QUALIFICATIONS OF WORKMEN

18.1 All contractors bidding this project must have been a licensed company for a minimum of three years to qualify to bid this project. Individual employee experience does not supercede this requirement.

18.2 All low voltage contractors bidding the electrical work must have completed one project of 70% this contract cost size and two projects of 50% this subcontract cost size.

18.3 All work shall be accomplished by qualified workmen competent in the area of work for which they are responsible. Untrained and incompetent workmen as evidenced by their workmanship shall be relieved of their responsibilities in those areas. The Engineer shall reserve the right to determine the quality of workmanship of any workman and unqualified or incompetent workmen shall refrain from work in areas not satisfactory to him. Requests for relief of a workman shall be made through the normal channels of responsibility established by the Architect or the contract document provisions.

18.4 Special electrical systems, such as Fire Detection and Alarm Systems, Telecommunications or Data Systems, Video Systems, Special Electronic Systems, Control Systems, etc., shall be installed by workmen normally engaged or employed in these respective trades. As an exception to this, where small amounts of such work are required and are, in the opinion of the Engineer,

within the competency of workmen directly employed by the Contractor involved, they may be provided by this Contractor.

PART 19 - CONDUCT OF WORKMEN

19.1 The Contractor shall be responsible for the conduct of all workmen under his supervision. Misconduct on the part of any workmen to the extent of creating a safety hazard, or endangering the lives and property of others, shall result in the prompt relief of that workman. The consumption or influence of alcoholic beverages, narcotics or illegally used controlled substances on the jobsite is strictly forbidden.

PART 20 - COOPERATION AND COORDINATION BETWEEN TRADES

20.1 The Contractor is expressly directed to read the General Conditions and all detailed sections of these specifications for all other trades and to study all drawings applicable to his work, including Architectural, Mechanical, Structural and other pertinent Drawings, to the end that complete coordination between trades will be affected.

20.2 Refer to Coordination Among Trades, Systems Interfacing and Connection of Equipment Furnished by Others section of these Specifications for further coordination requirements.

PART 21 - PROTECTION OF EQUIPMENT

21.1 The Contractor shall be entirely responsible for all material and equipment furnished by him in connection with his work and special care shall be taken to properly protect all parts thereof from damage during the construction period. Such protection shall be by a means acceptable to the Engineer. All rough-in conduit shall be properly plugged or capped during construction in a manner approved by the Engineer. Equipment damaged while stored on site either before or after installation shall be repaired or replaced (as determined by the Engineer) by the responsible Contractor.

PART 22 - SMOKE AND FIRE PROOFING

22.1 The Contractor shall not penetrate rated fire walls, ceilings or floors with conduit, cable, bus duct, wireway or other raceway system unless all penetrations are protected in a code compliant manner which maintains the rating of the assembly. Smoke and fire stop all openings made in walls, chases, ceiling and floors. Patch all openings around conduit, wireway, bus duct, etc., with appropriate type material to smoke stop walls and provide needed fire rating at fire walls, ceilings and floors. Smoke and fire proofing materials and method of application shall be approved by the local authority having jurisdiction.

PART 24 - FINAL CONNECTIONS TO EQUIPMENT

24.1 The roughing-in and final connections to all network connected equipment furnished under this and all other sections of the contract documents or by others, shall be included in the Contract and shall consist of furnishing all labor and materials for connection. The Contractor shall carefully coordinate with equipment suppliers, manufacturer’s representatives, the vendor or other trades to provide complete electrical and dimensional interface to all such equipment (elevators, BMS panels, etc.)

PART 25 – NOT USED

PART 26 - ACCESSIBILITY

26.1 The Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate clearance in partitions and above suspended ceilings for the proper installation of his work. He shall cooperate with the General Contractor (or Construction Manager) and all other Contractors whose work is in the same space, and shall advise each Contractor of his requirements. Such spaces and clearances shall be kept to the minimum size required to ensure adequate clearance and access.

26.2 The Contractor shall locate all equipment which must be serviced, operated, or maintained in fully accessible positions. Equipment shall include but not be limited to junction boxes, pull boxes, contactors, panels, disconnects, controllers, switchgear, etc. Minor deviations from drawings may be made to allow for better accessibility, and any change shall be approved where the equipment is concealed.

26.3 Each Contractor shall provide (or arrange for the provision by other trades) the access panels for each concealed junction box, pull box, fixtures or electrical device requiring access or service as shown on Engineer's plans or as required. Locations of these panels shall be identified in sufficient time to be installed in the normal course of work. All access panels shall be installed in accord with the Architect's standards for such work.

26.4 Access Doors; in Ceilings or Walls:

26.4.1 In mechanical, electrical, or service spaces:

14 gauge aluminum brushed satin finish, 1" border.

26.4.3 In finished areas:

14 gauge primed steel with 1" border to accept the architectural finishes specified for the space. Confirm these provisions with the Architect prior to obtaining materials or installing any such work.

26.4.3 In fire or smoke rated partitions, access doors shall be provided that equal or exceed the required rating of the construction they are mounted in.

PART 27 - NOT USED

PART 28 - NOT USED

PART 29 - CUTTING AND PATCHING

29.1 Unless otherwise indicated or specified, the Contractor shall provide cutting and patching necessary to install the work specified in this Division. Patching shall match adjacent surfaces to the satisfaction of the Engineer and shall be in accord with the Architect's standards for such work, as applicable.

29.2 No structural members shall be cut without the approval of the Structural Engineer and all such cutting shall be done in a manner directed by him.

PART 30 - SLEEVES AND PLATES

30.1 Each Contractor shall provide and locate all sleeves and inserts required for his work before the floors and walls are built, or shall be responsible for the cost of cutting and patching required where sleeves and inserts were not installed, or where incorrectly located. Each Contractor shall do all drilling required for the installation of his hangers. Drilling of anchor holes may be prohibited in post-tensioned concrete construction, in which case the Contractor shall request approved

methods from the Architect and shall carefully coordinate setting of inserts, etc., with the Structural Engineer and/or Architect.

30.2 Sleeves shall be provided for all conduit passing thru concrete floor slabs and concrete, masonry, tile and gypsum wall construction. Sleeves shall not be provided for piping running embedded in concrete or insulating concrete slabs on grade, unless otherwise noted.

30.3 Where sleeves are placed in exterior walls below grade, the space between the pipe or conduit and the sleeves shall be packed with oakum and lead, mechanical waterstop or other approved material and made completely water tight by a method approved by the Engineer and/or Architect.

30.4 Where conduit motion due to expansion and contraction will occur, make sleeves of sufficient diameter to permit free movement of pipe. Check floor and wall construction finishes to determine proper length of sleeves for various locations; make actual lengths to suit the following:

30.4.1 Terminate sleeves flush with walls, partitions and ceiling.

PART 31 - WEATHERPROOFING

31.1 Where any work pierces waterproofing, including waterproof concrete, the method of installation shall be as approved by the Architect and/or Engineer before work is done. The Contractor shall furnish all necessary sleeves, caulking and flashing required to make openings absolutely watertight.

31.2 Wherever work penetrates roofing, it shall be done in a manner that will not diminish or void the roofing guarantee or warranty in any way. Coordinate all such work with the roofing installer.

PART 32 - OPERATING INSTRUCTIONS

32.1 Upon completion of all work and all tests, each Contractor shall furnish the necessary skilled labor and helpers for operating his systems and equipment for a period of three days of eight hours each, or as otherwise specified. During this period, instruct the Owner or his representative fully in the operations, adjustment, and maintenance of all equipment furnished. Give at least one week's written notice to the Owner, Architect and Engineer in advance of this period. The Engineer may attend any such training sessions or operational demonstrations. The Contractor shall certify in writing to the Engineer that such demonstrations have taken place, noting the date, time and names of the Owner's representative that were present.

32.2 Each Contractor shall furnish three complete bound sets for approval to the Engineer of typewritten and/or blueprinted instructions for operating and maintaining all systems and equipment included in this contract. All instructions shall be submitted in draft, for approval, prior to final issue. Manufacturer's advertising literature or catalogs will not be acceptable for operating and maintenance instructions.

32.3 Each Contractor, in the above mentioned instructions, shall include the maintenance schedule for the principal items of equipment furnished under this contract and a detailed, easy to read parts list and the name and address of the nearest source of supply.

PART 33 - SCAFFOLDING, RIGGING AND HOISTING

33.1 The Contractor shall furnish all scaffolding, rigging, hoisting, and services necessary for erection and delivery into the premises of any equipment and apparatus furnished. Remove same from premises when no longer required.

PART 34 - CLEANING

34.1 The Contractor shall, at all times, keep the area of his work presentable to the public and clean of rubbish caused by his operations; and at the completion of the work, shall remove all rubbish, all of his tools, equipment, temporary work and surplus materials, from and about the premises, and shall leave the work clean and ready for use. If the Contractor does not attend to such cleaning immediately upon request, the Engineer may cause cleaning to be done by others and charge the cost of same to the responsible Contractor. Each Contractor shall be responsible or all damage from fire which originates in, or is propagated by, accumulations of his rubbish or debris.

34.2 After completion of all work and before final acceptance of the work, each Contractor shall thoroughly clean all equipment and materials and shall remove all foreign matter such as grease, dirt, plaster, labels, stickers, etc., from the exterior of materials, equipment and all associated fabrication. Pay particular attention to finished area surfaces such as lighting fixture lenses, lamps, reflectors, panels, etc.

PART 35 - PAINTING

35.1 Each fixture device, panel, junction box, etc., that is located in a finished area shall be provided with finish of color and type as selected or approved by the Architect or Engineer. If custom color is required, it shall be provided at no additional cost to the Owner. All other equipment, fixtures or devices located in finished or unfinished areas, that are not required to have or are provided with finish color or coating shall be provided in a prime painted condition, ready to receive finish paint or coating. All galvanized metal in finished areas shall be properly prepared with special processes to receive finish paint as directed and approved by the Architect.

PART 36 - INDEMNIFICATION

36.1 The Contractor shall hold harmless and indemnify the Engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for, or on account of any personal injury or property damage received or sustained by any person, persons, (including third parties), or any property growing out of, occurring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the Contractor, any subcontractor, any employee, agent or representative.

PART 37 - HAZARDOUS MATERIALS

37.1 The Contractor is hereby advised that it is possible that asbestos and/or other hazardous materials are or were present in this building(s). Any worker, occupant, visitor, inspector, etc., who encounters any material of whose content they are not certain shall promptly report the existence and location of that material to the Contractor and/or Owner. The Contractor shall, as a part of his work, insure that his workers are aware of this potential and what they are to do in the event of suspicion. He shall also keep uninformed persons from the premises during construction. Furthermore, the Contractor shall insure that no one comes near to or in contact with any such material or fumes therefrom until its content can be ascertained to be non-hazardous.

37.2 CMTA, Inc., Consulting Engineers, have no expertise in the determination of the presence of hazardous materials. Therefore, no attempt has been made by them to identify the existence or location of any such material. Furthermore, CMTA nor any affiliate thereof will neither offer nor make any recommendations relative to the removal, handling or disposal of such material.

37.3 If the work interfaces, connects or relates in any way with or to existing components which contain or bear any hazardous material, asbestos being one, then, it shall be the Contractor's sole responsibility to contact the Owner and so advise him immediately.

37.4 The Contractor by execution of the contract for any work and/or by the accomplishment of any work thereby agrees to bring no claim relative to hazardous materials for negligence, breach of contract, indemnity, or any other such item against CMTA, its principals, employees, agents or consultants. Also, the Contractor further agrees to defend, indemnify and hold CMTA, its principals, employees, agents and consultants, harmless from any such related claims which may be brought by any subcontractors, suppliers or any other third parties.

PART 38 – ABOVE-CEILING AND FINAL PUNCH LISTS

38.1 The Contractor shall review each area and prepare a punch list for each of the subcontractors, as applicable, for at least two stages of the project.

38.1.1 For review of the above-ceiling work that will be concealed by tile or other materials well before substantial completion.

38.1.2 For review of all other work as the project nears substantial completion.

38.2 When all work from the Contractor's punch list is complete at each of these stages and prior to completing ceiling installations (or at the final punch list stage), the Contractor shall request that the Engineer develop a punch list. This request is to be made in writing seven days prior to the proposed date. After all corrections have been made from the Engineer's punch list, the Contractor shall review and initial off on each item. This signed-off punch list and all work prior to the ceilings being installed and at the final punch list review.

38.3 If additional visits are required by the Engineer to review work not completed by this review, the Engineer shall be reimbursed directly by the Contractor by check or money order (due net 10 days from date of each additional visit) at a rate of $125.00 per hour for extra trips required to complete either of the above-ceiling or final punch lists.

PART 39 APPENDIX APPROVED MATERIALS LIST:

Horizontal Cabling		
UTP 4/24 Category 6 PVC Cable (Green)	Amp	1-219560-4
F/UTP 4/24 Category 6A PVC Cable (Green)	Amp	4-1499389-2
Horizontal Termination Hardware

END OF SECTION 270501

SECTION 270503 - SHOP DRAWINGS, LITERATURE, MANUALS, PARTS LISTS, AND SPECIAL TOOLS

1. SHOP DRAWINGS

A. Each Contractor shall submit to the Architect and/or Engineer, within thirty days after the date of the Contract, seven sets of shop drawings and/or manufacturer's descriptive literature on all equipment required for the fulfillment of his contract. Each shop drawing and/or manufacturer's descriptive literature shall have proper notation indicated on it and shall be clearly referenced so the specifications, schedules, light fixture numbers, panel names and numbers, etc., so that the Architect and/or Engineer may readily determine the particular item the Contractor proposes to furnish. All data and information scheduled, noted or specified by hand shall be noted in color red on the submittals. The Contractor shall make any corrections or changes required and shall resubmit for final review as requested. Review of such drawings, descriptive literature and/or schedules shall not relieve the Contractor from responsibility for deviation from drawings or specifications unless they have, in writing, directed the reviewer's attention to such deviations at the time of submission of drawings, literature and manuals; nor shall it relieve them from responsibility for errors or omissions of any nature in shop drawings, literature and manuals. The term "as specified" will not be accepted.

B. If the Contractor fails to comply with the requirements set forth above, the Architect and/or Engineer shall have the option of selecting any or all items listed in the specifications or on the drawings, and the Contractor will be required to provide all materials in accordance with this list.

C. Review of shop drawings by the Engineer applies only to conformance with the design concept of the project and general compliance with the information given in the contract documents. In all cases, the installing Contractor alone shall be responsible for furnishing the proper quantity of equipment and/or materials required, for seeing that all equipment fits the available space in a satisfactory manner and that piping, electrical and all other connections are suitably located.

D. The Engineer's review of shop drawings, schedules or other required submittal data shall not relieve the Contractor from responsibility for the adaptability of the equipment or materials to the project, compliance with applicable codes, rules, regulations, information that pertains to fabrication and installation, dimensions and quantities, electrical characteristics, and coordination of the work with all other trades involved in this project.

E. No cutting, fitting, rough-in, connections, etc., shall be accomplished until reviewed equipment shop drawings are in the hands of the Contractors concerned. It shall be each Contractor's responsibility to obtain reviewed shop drawings and to make all connections, etc. in the neatest and most workmanlike manner possible. Each Contractor shall coordinate with all the other Contractors having any connections, roughing-in, etc., to the equipment, to make certain proper fit, space coordination, voltage and phase relationships are accomplished.

F. In accord with the provisions specified hereinbefore, shop drawings, descriptive literature and schedules shall be submitted on each of the following indicated items as well as any equipment or systems deemed necessary by the Engineer:

Raceways

- Cable tray and each type of cable tray fitting.
- Surface-mounted metal or plastic raceways, with each type of fitting.
- Backboxes

- Floor box and poke-thru, activation plates each by type, with required accessories.
- Data/voice/video wallplates, each by type.
- Any special items not listed above.

Systems

Note: Each system submittal is to be complete with legible cutsheets for all devices, equipment, special wiring, etc. Include system specific wiring schematics showing each device and its specific interconnect/wiring requirements. For rack mounted equipment, provide a scalable elevation drawing with proposed component locations & specific interconnect wiring requirements for each component/panel. Also provide scale building specific layout drawings that indicate device placement, wiring, etc. Refer to the specific system's specification for additional submittal requirements where required.

- Data network.
- Television Distribution System

Miscellaneous

- Control panel assemblies.
- Non-standard junction/pullboxes.

2. SPECIAL WRENCHES, TOOLS AND KEYS

A. Each Contractor shall provide, along with the equipment provided, any special wrenches or tools necessary to dismantle or service equipment or appliances installed by him. Wrenches shall include necessary keys, handles and operators for valves, switches, breakers, etc. and keys to electrical panels, emergency generators, alarm pull boxes and panels, etc. At least two of any such special wrench, keys, etc. shall be turned over to the Architect prior to completion of the project. Obtain a receipt that this has been accomplished and forward a copy to the Engineer.

3. MAINTENANCE AND OPERATION MANUALS

A. Upon substantial completion of the project, the Contractor shall deliver to the Engineers (in addition to the required Shop Drawings) three complete copies of operation and maintenance instructions and parts lists for all equipment provided. Formatting and content shall follow the guidelines outlined in the latest version of ASHRAE Application Handbook, Guideline 4. As a minimum, the following shall be included:

- The operation and maintenance document directory should provide easy access and be well organized and clearly identified.
- Emergency information should be immediately available during emergencies and should include emergency and staff and/or agency notification procedures.
- The operating manual should contain the following information:

I. General Information
   a. Building function

b. Building description
c. Operating standards and logs

II. Technical Information
a. System description
b. Operating routines and procedures
c. Seasonal start-up and shutdown
d. Special procedures
e. Basic troubleshooting

- The maintenance manual should contain the following information:

I. Equipment data sheets
a. Operating and nameplate data
b. Warranty

II. Maintenance program information
a. Manufacturer's installation, operation, and maintenance instructions
b. Spare parts information
c. Preventive maintenance actions
d. Schedule of actions
e. Action description
f. History

- Test reports document observed performance during start-up and commissioning.

END OF SECTION 270503

SECTION 270508 - COORDINATION AMONG TRADES, SYSTEMS INTERFACING AND CONNECTION OF EQUIPMENT FURNISHED BY OTHERS

PART 1 - COORDINATION

1.1 The Contractor is expressly directed to read the General Conditions and all sections of these specifications for all other trades and to study all drawings applicable to his work, including Architectural, Plumbing Fire Protection, Mechanical and Structural drawings, to the end that complete coordination between trades will be affected. Each Contractor shall make known to all other contractors the intended positioning of materials, raceways, supports, equipment and the intended order of his work. Coordinate all work with other trades and proceed with the installation in a manner that will not create delays for other trades or affect the Owner's operations.

1.2 Special attention to coordination shall be given to points where raceways, etc., must cross other ducts or conduit, and where conduit and devices must recess into walls, soffits, columns, etc. It shall be the responsibility of each Contractor to leave the necessary room for other trades. No extra compensation or time will be allowed to cover the cost of removing fixtures, devices, conduit, ducts, etc. or equipment found encroaching on space required by others.

1.3 If any discrepancies occur between accompanying drawings and these specifications and drawings and specifications covering other trade's work, each trade shall report such discrepancies to the Architect far enough in advance so that a workable solution can be presented. No extra payment will be allowed for relocation of fixtures, devices, conduit, and equipment not installed or connected in accordance with the above instructions.

PART 2 - INTERFACING

2.1 Each Electrical Trade, Specialty Trade, Mechanical Trade and the General Trades, etc., shall insure that coordination is affected relative to interfacing of all systems. Some typical interface points are (but not necessarily all):

2.1.1 Coordination of connection of Telecommunications (voice, video, data) lines to Owner's existing or new services.

2.1.2 Connection to equipment furnished by other trades.

2.1.3 Electrical power connections to electrically operated (or controlled) equipment.

PART 3 - CONNECTION OF EQUIPMENT FURNISHED BY OTHERS

3.1 Each Contractor shall make all connections to equipment furnished by others, whenever such equipment is shown on any part of the drawings or mentioned in any part of the Specifications, unless otherwise specifically specified hereinafter.

3.2 All drawings are complementary, one trade of the other. It is the Contractor's responsibility to examine all drawings and specifications to determine the full scope of his work. The project Engineers have arranged the specifications and drawings in their given order solely as a convenience in organizing the project, and in no way shall they imply the assignment of work to specific trades, contractors, subcontractors or suppliers.

3.3 Supervision to assure proper installation, functioning and operation shall be provided by the Contractor furnishing the equipment or apparatus to be connected.

3.4 Items indicated on the drawings as rough-in only (RIO) will be connected by the equipment supplier or Owner, as indicated. The Contractor shall be responsible for rough-in provisions only as indicated. These rough-ins shall be in accord with the manufacturer's or supplier's requirements.

3.5 For items furnished by others, relocated, or RIO, the Contractor shall obtain from the supplier or shall field determine as appropriate, the exact rough-in locations and connection sizes for the referenced equipment.

3.6 The Contractor shall be responsible for coordinating with the General and all other trades, as necessary, to determine any and all final connections that he is to make to equipment furnished by others.

END OF SECTION 270508

SECTION 270526 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Special Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Grounding conductors.
2. Grounding connectors.
3. Grounding busbars.
4. Grounding labeling.

1.3 DEFINITIONS

A. BCT: Bonding conductor for telecommunications.

B. EMT: Electrical metallic tubing.

C. TGB: Telecommunications grounding busbar.

D. TMGB: Telecommunications main grounding busbar.

E. BMG: Building main grounding busbar

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.5 INFORMATIONAL SUBMITTALS

A. As-Built Data: Plans showing as-built locations of grounding and bonding infrastructure, including the following:

1. BCT, TMGB, TGBs, and routing of their bonding conductors.

B. Qualification Data: For testing agency and testing agency's field supervisor.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For grounding to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01 7823 "Operation and Maintenance Data," include the following:

a. Result of the bonding-resistance test at each TGB and its nearest grounding electrode.

1.7 COMMISSIONING: This section specifies a system or a component of a system being commissioned as defined in Section 01 9100 Commissioning. Testing of these systems is required, in cooperation with the Owner and the Commissioning Authority. Refer to Section 01 9100 Commissioning for detailed commissioning requirements.

PART 2 - PRODUCTS

2.1 SYSTEM COMPONENTS

A. Comply with J-STD-607-B.

2.2 CONDUCTORS

A. Manufacturers: Subject to compliance with requirements available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Harger Lightning and Grounding.
2. Panduit Corp.
3. Tyco Electronics Corp.

B. Comply with UL 486A-486B.

C. Insulated Conductors: Stranded copper wire, green or green with yellow stripe insulation, insulated for 600 V, and complying with UL 83.

1. Ground wire for custom-length equipment ground jumpers shall be No. 2 AWG, 19-strand, UL-listed, Type THHN wire.
2. Cable Tray Equipment Grounding Wire: #2 AWG.

D. Cable Tray Grounding Jumper:

1. Not smaller than No. 6 AWG and not longer than 12 inches (300 mm). If jumper is a wire, it shall have a crimped grounding lug with two holes and long barrel for two crimps. If jumper is a flexible braid, it shall have a one-hole ferrule. Attach with grounding screw or connector provided by cable tray manufacturer.

E. Bare Copper Conductors:

1. Solid Conductors: ASTM B 3.
2. Stranded Conductors: ASTM B 8.
3. Tinned Conductors: ASTM B 33.
4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor per drawings.
5. Bonding Jumper: Tinned-copper tape, braided conductors terminated with two-hole copper ferrules; 1-5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.

2.3 CONNECTORS

A. Irreversible connectors listed for the purpose. Listed by an NRTL as complying with NFPA 70 for specific types, sizes, and combinations of conductors and other items connected. Comply with UL 486A-486B.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Chatsworth Products, Inc.
2. Harger Lightning and Grounding.
3. Panduit Corp.
4. Tyco Electronics Corp.

C. Compression Wire Connectors: Crimp-and-compress connectors that bond to the conductor when the connector is compressed around the conductor. Comply with UL 467.

1. Electroplated tinned copper, C and H shaped.

D. Signal Reference Grid Connectors: Combination of compression wire connectors, access floor grounding clamps, bronze U-bolt grounding clamps, and copper split-bolt connectors, designed for the purpose.

E. Busbar Rack and Tray Connectors: Cast silicon bronze, solderless compression or exothermic-type, mechanical connector; with a long barrel and two holes spaced on 5/8- or 1-inch (15.8- or 25.4-mm) centers for a two-bolt connection to the busbar.

F. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.4 GROUNDING BUSBARS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Chatsworth Products, Inc.
2. Harger Lightning and Grounding.
3. Panduit Corp.

B. TMGB: Predrilled, wall-mounted, rectangular bars of hard-drawn solid copper in cross section and length as indicated on Drawings. The busbar shall be NRTL listed for use as TMGB and shall comply with J-STD-607-B.

1. Predrilling shall be with holes for use with lugs specified in this Section.
2. Mounting Hardware: Stand-off brackets that provide a 2-inch clearance to access the rear of the busbar. Brackets and bolts shall be stainless steel.
3. Stand-off insulators for mounting shall be Lexan or PVC. Comply with UL 891 for use in 600-V switchboards, impulse tested at 5000 V.

C. TGB: Predrilled rectangular bars of hard-drawn solid copper in cross section and length as indicated on Drawings. The busbar shall be for wall mounting, shall be NRTL listed as complying with UL 467, and shall comply with J-STD-607-B.

1. Predrilling shall be with holes for use with lugs specified in this Section.
2. Mounting Hardware: Stand-off brackets that provide at least a 2-inch clearance to access the rear of the busbar. Brackets and bolts shall be stainless steel.
3. Stand-off insulators for mounting shall be Lexan or PVC. Comply with UL 891 for use in 600-V switchboards, impulse tested at 5000 V.

D. Rack and Cabinet Grounding Busbars: Rectangular bars of hard-drawn solid copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with J-STD-607-A. Predrilling shall be with holes for use with lugs specified in this Section.

1. Cabinet-Mounted Busbar: Terminal block, with stainless-steel or copper-plated hardware for attachment to the cabinet.
2. Rack-Mounted Horizontal Busbar: Designed for mounting in 19 inch equipment racks. Include a copper splice bar for transitioning to an adjoining rack, and stainless-steel or copper-plated hardware for attachment to the rack.

E. Comply with TIA/EIA-606-A and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

F. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch (10 mm). Overlay shall provide a weatherproof and UV-resistant seal for label.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine the ac grounding electrode system and equipment grounding for compliance with requirements for maximum ground-resistance level and other conditions affecting performance of grounding and bonding of the electrical system.

B. Inspect the test results of the ac grounding system measured at the point of BCT connection.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with connection of the BCT only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Bonding shall include the ac utility power service entrance, the communications cable entrance, and the grounding electrode system. The bonding of these elements shall form a loop so that each element is connected to at least two others.

B. Comply with J-STD-607-B.

3.3 APPLICATION

A. Conductors: Install solid conductor for No. 8 AWG and smaller and stranded conductors for No. 6 AWG and larger unless otherwise indicated.

B. Underground Grounding Conductors: Install bare copper conductor, AWG minimum.

C. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
3. Connections to Structural Steel: Welded connectors.

D. Conductor Support:

1. Secure grounding and bonding conductors at intervals of not less than 36 inches (900 mm.)

E. Grounding and Bonding Conductors:

1. Install in the straightest and shortest route between the origination and termination point, and no longer than required. The bend radius shall not be smaller than eight times the diameter of the conductor. No one bend may exceed 90 degrees.
2. Install without splices.
3. Support at not more than 36-inch (900-mm) intervals.
4. Install grounding and bonding conductors in 3/4-inch (21-mm) PVC conduit until conduit enters a telecommunications room. The grounding and bonding conductor pathway through a plenum shall be in EMT. Conductors shall not be installed in EMT unless otherwise indicated.

    a. If a grounding and bonding conductor is installed in ferrous metallic conduit, bond the conductor to the conduit using a grounding.

3.4 GROUNDING ELECTRODE SYSTEM

A. The BCT between the TMBG and the ac service equipment ground shall be as indicated on the drawings.

3.5 GROUNDING BUSBARS

A. Install busbars horizontally, on insulated spacers 2 inches (50 mm) minimum from wall, 12 inches (300 mm) above finished floor unless otherwise indicated.

B. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down; connect to horizontal bus.

3.6 CONNECTIONS

A. Bond metallic equipment in a telecommunications equipment room to the grounding busbar in that room, using equipment grounding conductors not smaller than No. 6 AWG.

B. Stacking of conductors under a single bolt is not permitted when connecting to busbars.

C. Primary Protector: Bond to the TMGB with insulated bonding conductor.

D. Interconnections: Interconnect all TGBs with the TMGB with the telecommunications backbone conductor. If more than one TMGB is installed, interconnect TMGBs using the grounding equalizer conductor shall be as indicated on the drawings.

E. Telecommunications Enclosures and Equipment Racks: Bond metallic components of enclosures to the telecommunications bonding and grounding system. Install top-mounted rack grounding busbar unless the enclosure and rack are manufactured with the busbar. Bond the equipment grounding busbar to the TGB No. 2 AWG bonding conductors.

F. Shielded Cable: Bond the shield of shielded cable to the TGB in communications rooms and spaces. Comply with TIA/EIA-568-C.1 and TIA/EIA-568-C.2 when grounding screened, balanced, twisted-pair cables.

G. Rack- and Cabinet-Mounted Equipment: Bond powered equipment chassis to the cabinet or rack grounding bar. Power connection shall comply with NFPA 70; the equipment grounding conductor in the power cord of cord- and plug-connected equipment shall be considered as a supplement to bonding requirements in this Section.

1. Waveguides and Coaxial Cable:

    a. Bond cable shields at the point of entry into the building to the TGB and to the cable entrance plate, using No. 2 AWG bonding conductors.
    b. Bond coaxial cable surge arrester to the ground or roof ring using bonding conductor size recommended by surge-arrester manufacturer.

3.7 IDENTIFICATION

A. Labels shall be preprinted or computer-printed type.

1. Label TMGB(s) with "fs-TMGB," where "fs" is the telecommunications space identifier for the space containing the TMGB.
2. Label TGB(s) with "fs-TGB," where "fs" is the telecommunications space identifier for the space containing the TGB.
3. Label the BCT and each telecommunications backbone conductor at its attachment point: "WARNING! TELECOMMUNICATIONS BONDING CONDUCTOR. DO NOT REMOVE OR DISCONNECT!"

3.8 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Tests and Inspections:

1. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
2. Test the bonding connections of the system using an ac earth ground-resistance tester, taking two-point bonding measurements in each telecommunications equipment room containing a TMGB and a TGB and using the process recommended by BICSI TDMM. Conduct tests with the facility in operation.

    a. Measure the resistance between the busbar and the nearest available grounding electrode. The maximum acceptable value of this bonding resistance is 100 milliohms.

3. Test for ground loop currents using a digital clamp-on ammeter, with a full-scale of not more than 10 A, displaying current in increments of 0.01 A at an accuracy of plus/minus 2.0 percent.

    a. With the grounding infrastructure completed and the communications system electronics operating, measure the current in every conductor connected to the TMGB and in each TGB. Maximum acceptable ac current level is 1 A.

C. Excessive Ground Resistance: If resistance to ground at the BCT exceeds 5 ohms, notify Architect promptly and include recommendations to reduce ground resistance.

D. Grounding system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.9 System functional performance testing is part of the Commissioning Process as specified in Section 01 9100. Functional performance testing shall be performed by the contractor and witnessed and documented by the Commissioning Authority.

END OF SECTION 270526

SECTION 270536 - CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Special Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Ladder cable trays.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of cable tray.

1. Include data indicating dimensions and finishes for each type of cable tray indicated.

B. Shop Drawings: For each type of cable tray.

1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
2. Vertical and horizontal offsets and transitions.
3. Clearances for access above and to side of cable trays.
4. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

B. Field quality-control reports.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR CABLE TRAYS

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.

1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Drawings for specific requirements for sizes, and configurations.

C. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:

1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.
2. Concentrated Load: A load applied at midpoint of span and centerline of tray.
3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.2 LADDER CABLE TRAYS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Mono Systems, Inc. or comparable product.

B. Description:

1. Configuration: Two I-beam side rails with transverse rungs welded to side rails.
2. Rung Spacing: 6 inches o.c.
3. Radius-Fitting Rung Spacing: 9 inches (225 mm) at center of tray's width.
4. Minimum Cable-Bearing Surface for Rungs: 7/8-inch width with radius edges.
5. No portion of the rungs shall protrude below the bottom plane of side rails.
6. Structural Performance of Each Rung: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-lb concentrated load, when tested according to NEMA VE 1.
7. Minimum Usable Load Depth: 4 inches.
8. Width: 12 inches, 18 inches, or 24 inches as indicated on Drawings.
9. Fitting Minimum Radius: 12 inches.
10. Class Designation: Comply with NEMA VE 1, Class 12C.
11. Splicing Assemblies: Bolted type using serrated flange locknuts.
12. Hardware and Fasteners: Steel, zinc plated according to ASTM B 633.
13. Splice Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

2.3 MATERIALS AND FINISHES

A. Aluminum:

1. Materials: Alloy 6063-T6 according to ANSI H 35.1/H 35.1M for extruded components and Alloy 5052-H32 or Alloy 6061-T6] according to ANSI H 35.1/H 35.1M for fabricated parts.
2. Hardware: Chromium-zinc-plated steel, ASTM F 1136.

2.4 CABLE TRAY ACCESSORIES

A. Fittings: Tees, crosses, risers, elbows, radius drops, and other fittings as indicated, of same materials and finishes as cable tray.

B. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.5 WARNING SIGNS

A. Lettering: 1-1/2-inch- high, black letters on yellow background with legend "Warning! Not To Be Used as Walkway, Ladder, or Support for Ladders or Personnel."

PART 3 - EXECUTION

3.1 CABLE TRAY INSTALLATION

A. Install cable trays according to NEMA VE 2 and UK CNS Standards.

B. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.

C. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.

D. Remove burrs and sharp edges from cable trays.

E. Join aluminum cable tray with splice plates; use four square neck-carriage bolts and locknuts.

F. Fasten cable tray supports to building structure.

G. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 lb. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems."

H. Place supports to provide clearances shown on Drawings.

I. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze form as required by application.

J. Locate and install supports at each end connection and at mid-span. Support interval shall not exceed 6 feet.

K. Support trapeze hangers trays with 3/8-inch diameter rods.

L. Make connections to equipment with flanged fittings fastened to cable trays and to equipment. Support cable trays independent of fittings. Do not carry weight of cable trays on equipment enclosure.

M. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in NEMA VE 2. Space connectors and set gaps according to applicable standard.

N. Make changes in direction and elevation using manufacturer's recommended fittings.

O. Make cable tray connections using manufacturer's recommended fittings.

P. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078413 "Penetration Firestopping."

Q. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

R. Install cable trays workspace per UK CNS Standards. Tray to have 12” clearance above, 26” to one side, and 6” below.

S. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.2 CABLE TRAY GROUNDING

A. Ground cable trays according to TIA/EIA 607 and UK CNS Standards unless additional grounding is specified. Comply with requirements in Section 270526 "Grounding and Bonding for Communication." Bonding conductor shall be a minimum of #2 copper.

B. Cable trays with communications cable shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

3.3 CABLE INSTALLATION

A. Install cables only when each cable tray run has been completed and inspected.

B. Fasten cables on horizontal runs with cable clamps or cable ties according to NEMA VE 2. Tighten clamps only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.

C. Fasten cables on vertical runs to cable trays every 18 inches (450 mm).

D. Fasten and support cables that pass from one cable tray to another or drop from cable trays to equipment enclosures. Fasten cables to the cable tray at the point of exit and support cables independent of the enclosure. The cable length between cable trays or between cable tray and enclosure shall be no more than 72 inches (1800 mm). Factory radius drops shall be used for all transitions in elevation.

3.4 CONNECTIONS

A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.

B. Physically and electrically connect pathways to cable trays per UK CNS Standards and drawings.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.
2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.
4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
7. Check for improperly sized or installed bonding jumpers.
8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.

B. Prepare test and inspection reports.

3.6 PROTECTION

A. Protect installed cable trays and cables.

1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.
2. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

END OF SECTION 270536

SECTION 270553 - IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and 270010 “Supplemental Requirements for Communications” apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Color and legend requirements for labels and signs.
2. Labels.
3. Signs.
4. Cable ties.

B. Related Requirements

1. Refer to Section 260553, “Identification for Electrical Systems” for additional requirements related to labeling of electrical equipment and cabling.

1.3 REFERENCES

A. Definitions

1. Identifier: An item of information that links a specific element of the telecommunications infrastructure with its corresponding record.

B. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.

1. Underwriters Laboratories Inc (UL)

a. UL 969, “Marking and Labeling Systems”

1.4 SUBMITTALS

A. Product Data: For each product type.

B. Identification Schedule: System Labeling Schedules with proposed designations for cables, outlets, terminations, and equipment.

1.5 COORDINATION

A. All identifications shall be consistent with the owner's standard practices, especially within existing facilities, unless otherwise require by codes. Where the requirements herein are in conflict, the contractor shall notify the engineer in writing prior to ordering any material.

B. All room names and/or numbers for labeling or programming shall use the Owner's approved room name and numbering scheme, not names and numbers indicated on floor plans. All reprogramming shall be included as required to accommodate construction phasing.

C. Coordinate with Owner for approval of all labelling codes and schemes prior to creation and installation of labeling system.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Comply with NFPA 70 and TIA 606 for a Class 2 system.

B. Comply with UL 969 for Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

C. Labels shall be designed to remain permanently affixed and shall not fade under typical environmental conditions for the life of the product identified.

D. Thermal Movements: Allow for thermal movements from ambient temperatures up to 120-deg F and surface temperatures up to 180-deg F.

E. Provide mechanically printed black letters on a white field unless noted otherwise.

F. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Brady
2. Brother
3. Dymo
4. HellermanTyton
5. Panduit

2.2 LABELS AND TAGS

A. Heat Shrink Tubes: Flame-retardant shrinkable polyolefin tube with thermal transfer-printed identification label. Sized to suit diameter of cable and shrinks to fit firmly around cable it identifies. Full shrink recovery at a maximum of 200 deg F.

B. Self-Adhesive Labels: Thermal transfer-printed, minimum 3-mil- thick, flexible labels with acrylic pressure-sensitive adhesive.
1. Wraparound Vinyl or Nylon Cloth Type: Repositionable for wrapping and flagging flexible cables.
2. Self-Laminating Vinyl Type: Clear wrap around tail shield laminates the entire printed legend for abrasion, UV-, weather- and chemical-resistance on flexible cables.

3. General Purpose Polyester Type: for component labelling on flat surfaces.

C. Marker Plate Tags: Thermal transfer printed, UV, weather, and chemical resistant polyolefin suitable for large cables or bundles. Pre-punched holes for attachment with cable ties.

2.3 SIGNS AND NAMEPLATES

A. Engraved Plastic Signs and Nameplates:

1. 3-layer melamine plastic laminate
2. Weather and UV-resistant for Wet and Damp Locations.
3. Thickness:

    a. For signs up to 20 sq. in., minimum 1/16 inch thick.
    b. For signs larger than 20 sq. in.or 8 inches in length, 1/8 inch thick.
    c. Engraved designation with black letters on white face
    d. Punched or drilled for mechanical fasteners with 1/4-inch grommets in corners for mounting. Exception for locations where specifically approved contact type permanent adhesive may be used where screws cannot or should not penetrate substrate.
    e. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.4 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Paint: Comply with requirements in Division 09 painting Sections for paint materials and application requirements. Select paint system suitable for surface material and location (exterior or interior).

B. Fasteners for Labels and Signs:
1. Self-tapping, stainless-steel screws, or stainless-steel machine screws with nuts and flat and lock washers.
2. Pop-Rivets.
3. Two-Part Epoxy Adhesive

C. Cable Ties: Self-extinguishing, one-piece, self-locking, UV-stabilized or plenum rated where required by installed environmental conditions. 3/16-inch minimum width.

PART 3 - EXECUTION

3.1 CABLING ADMINISTRATIVE DRAWINGS

A. Provide professionally produced, scaled drawings using Computer Aided Design software identifying the location and labelling of Communications devices served out of each telecom room.

B. Print on Arch D or E1 size paper and install in a prominent location in each equipment room and wiring closet so as not to interfere with future equipment installation.

C. Provide rigid frame and 1/8-inch clear plastic protective overlay.

D. Supply separate drawings for each Communications Room.

3.2 INSTALLATION

A. Mechanically produce all labels. Write-on labels are not permitted.

B. Install identifying devices before installing acoustical ceilings or similar concealment.

C. Verify identity of each item before installing identification products.

D. Self-Adhesive Identification Products: Before applying communications identification products, clean substrates of substances that could impair bond using materials and methods recommended by manufacturer of identification product and manufacturer of substrate to retain product warranties.

E. For surfaces that require a finish, apply identification devices to surfaces after completing finish work.

F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of communications systems and connected items.

G. Install all labels in a neat manner, plumb and parallel to equipment lines.

H. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.

I. Provide labels within 12-inches from cable termination points and secure tight to surface at a location with high visibility and accessibility for ease of identification after termination.

3.3 IDENTIFICATION SCHEDULE

A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

B. Equipment Room Racks, Cabinets, and Frames:

1. Identify top and bottom, front and rear of each with self-adhesive engraved laminated plastic nameplate containing rack or cabinet identifier (xy).
2. Label Size: minimum 2-inches in height with letters no less than 1-1/2-inches tall.

C. Rack Patch Panels and Fiber Enclosures:

1. Label each fiber enclosure and patch panel with a letter (-r) designating the order of the panel from the top of the cabinet or frame.
2. Label each fiber enclosure adapter panel with self-adhesive label indicating range of port numbers.
3. Label fiber enclosure cover with self-adhesive labels indicating each backbone cable link identifier including:

    a. Near end port numbers
    b. Far end building identifier (b) for inter building cable
    c. Far end Telecomm space identifier (fs)

d. Far end rack identifier (xy)
e. Panel identifier (-r)
f. Panel port numbers (:p)

4. Label each patch panel port or group of ports with a self-adhesive label or manufacturer provided insert indicating the following:

a. Room number of outlet being served.
b. Faceplate number.
c. Patch panel port number

5. Use manufacturer provided labels and mounting surfaces wherever possible.

D. Wall Punch down Blocks
1. Label each cable termination position with a sequential number designator.
2. Where insert type labels are used, install clear plastic cover over mechanically produced labels.
3. Use manufacturer provided labels and mounting surfaces wherever possible.

E. Backbone Cables:
1. Label each cable with a thermal transfer marker tag indicating the backbone cable link identifier including the following:

a. Strand/pair count and cable type
b. Near end identifier and far end identifier including:

1) Building identifier (b) for inter building cable
2) Telecomm space identifier (fs)
3) Rack identifier (xy)
4) Panel identifier (-r)
5) Port grouping(:p)

2. Label Backbone cables at termination points and entrance/exit point of telecom space.
3. Outside plant pathways: In addition to labels at termination points, label each backbone cable at all manholes, handholes, and pull points where cable enters and exits pathway.

F. Horizontal Cables:
1. Label each cable with a vinyl self-laminating label indicating the horizontal cabling link identifier including:

a. Room and faceplate number.
b. Telecomm Space identifier (fs)
c. Rack identifier (xy)
d. Patch Panel identifier (-r)
e. Patch Panel port number (:p)

2. Outside plant pathways: In addition to labels at termination points, label each cable at manholes, handholes, and pull points where cable enters and exits pathway.

G. Faceplates:

1. Label individual faceplates with self-adhesive labels or manufacturer provide insert. Place label at top of faceplate. Each faceplate shall be labeled with its individual, sequential

designation, numbered clockwise when entering room from primary egress, indicating the following:

a. Room number of outlet
b. Faceplate number.

2. Label each individual jack within the same faceplate with its horizontal link identifier.

H. Telecommunications Bonding Busbars and Conductors

1. Label each Busbar with a self-adhesive label indicating the following:

a. Telecomm space identifier (fs)
b. Busbar identifier

2. Label each bonding conductor with a vinyl self-laminating label indicating the far end busbar or object identifier
3. Label each bonding conductor at its attachment point with a thermal transfer marker tag with the following.

a. WARNING: IF CABLE OR CONNECTOR IS LOOSE IT MUST BE REMOVED, PLEASE CONTACT TELECOMMUNICATIONS MANAGER.

4. Warning labels: yellow marker plate type with black print.

I. Underground duct and raceway

1. Label both ends of each underground duct and raceway with self-adhesive label indicating the following:
a. Pathway Identifier and sequence number
b. Far End Building Identifier (b)
c. Far End Telecomm Space Identifier (fs)
d. Far End Outdoor Space Identifier (T)

END OF SECTION 270553

SECTION 271100 - COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Backboards
2. 19-inch equipment racks.
3. 19-inch freestanding equipment cabinets.
4. 19-inch wall-mounted equipment cabinets.
5. Cable Management.
6. Ladder Rack/Cable Runway.
7. Rack Power Distribution.
8. Rack Bonding Busbars.
9. Building Entrance Protection.

B. Related Requirements:

1. Section 270536 "Cable Trays for Communications Systems" for cable trays and accessories.
2. Section 271300 "Communications Backbone Cabling" for copper, optical fiber, and coaxial data cabling and termination devices.
3. Section 271500 "Communications Horizontal Cabling" for copper and coaxial data cabling and termination devices.

1.3 REFERENCES

A. Abbreviations

1. RCDD: Registered communications distribution designer.
2. SBB: Secondary Bonding Busbar (Formerly TGB).
3. PBB: Primary Bonding Busbar (Formerly TMGB).
4. RBB: Rack/Cabinet Bonding Busbar.

B. Definitions

1. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.
2. Ladder Rack: A specialized cable tray with side stringers and cross members, resembling a ladder, which supports cable either vertically or horizontally within an equipment room.
3. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.

1. Building Industry Consulting Service International (BICSI)

a. ANSI/BICSI N1 “Installation Practices for Telecommunications and ICT Cabling and Related Cabling Infrastructure”

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For custom equipment racks and cabinets.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. UL Listed.

B. RoHS compliant.

2.2 BACKBOARDS

A. Backboards: AC grade plywood, fire-retardant treated, 3/4 by 48 by 96 inches.

B. Backboard Paint: Light-colored fire-retardant paint.

2.3 19-INCH EQUIPMENT RACKS

A. Description: Two- and four- post racks with threaded rails designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch equipment mounting with an opening of 17.72 inches between rails.

B. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:

TBD

C. General Requirements:

1. Frames: Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
2. Material: Extruded aluminum.
3. Finish: Manufacturer's standard, baked-polyester powder coat.
4. Color: Black.

D. Floor-Mounted Racks:

1. Overall Height: 84 inches or as indicated on Drawings.
2. Overall Depth: 20 inches.
3. Upright Depth: 3 inches.
4. Two-Post Load Rating: 1000 lb minimum.
5. Four-Post Load Rating: 2000 lb minimum.
6. Number of Rack Units per Rack: 45U or as indicated on Drawings.

    a. Numbering: Every rack unit, on interior of rack.

7. Threads: #12-24 universal hole pattern.
8. Provisions for attaching vertical and horizontal cable management channels, top and bottom cable troughs, and grounding lug.
9. Base shall have a minimum of four mounting holes for permanent attachment to floor.
10. Top shall have provisions for attaching to cable tray or ceiling.
11. Self-leveling.
12. Four post rack shall be adjustable in depth in 1” increments.
13. Horizontal RBB for two post racks, Vertical RBB for four post racks.

E. Wall-Mounted Racks:

1. Height: 40” minimum or as indicated on Drawings.
2. Depth: 29 inches minimum.
3. Load Rating: 150 lbs minimum.
4. Number of Rack Units per Rack: 19U minimum or as indicated on Drawings .
5. Threads: #12-24 universal hole pattern.
6. Wall Attachment: Four mounting holes.
7. Equipment Access: Integral swing.
8. Horizontal RBB.

2.4 19-INCH EQUIPMENT CABINETS

A. Description: Manufacturer-assembled four-post frame enclosed by side and top panels and front and rear doors, designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch equipment mounting with an opening of 17.72 inches between rails.

B. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:
1. TBD

C. General Cabinet Requirements:

1. Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
2. Material: Steel.
3. Finish: Manufacturer's standard, baked-polyester powder coat.
4. Color: Black.

D. Modular Freestanding Cabinets:

1. Overall Height: 84 inches or as indicated on Drawings.
2. Overall Depth: minimum 36-inches.
3. Load Rating: 2500 lb minimum.
4. Number of Rack Units: 45 or as indicated on Drawings.

a. Numbering: Every rack unit, on interior of rack.

5. Threads: #12-24 universal hole pattern.
6. Removable and lockable side and top panels.
7. Perforated, hinged, and lockable front and rear doors.
8. Adjustable feet for leveling.
9. Cable ports with sealed grommets in top panel.
10. Integral lashing brackets and vertical cable management.
11. Vertical RBB.
12. Rack-mounted, minimum 550-cfm fan with filter.
13. Power strip.
14. All cabinets keyed alike.
15. Bonding wires for all panels.

E. Modular Wall Mounted Cabinets:

1. Height: 36 inches or as indicated on Drawings.
2. Depth: 30 inch minimum.
3. Load Rating: 200 lb minimum.
4. Number of Rack Units: 18U or as indicated on Drawings.
5. Threads: #12-24 universal hole pattern.
6. Dual Hinged swing out body
7. Lockable front and rear doors.
8. Louvered side panels.
9. Knockouts for conduit or cable entry grommets in top and bottom rear.
10. Integral lashing brackets and vertical cable management.
11. Grounding lugs.
12. Horizontal RBB.
13. Side-mounted, minimum 100-cfm fan.
14. All cabinets keyed alike.
15. Bonding wires for all panels.

2.5 CABLE MANAGEMENT

A. Description: accommodates the support and orderly routing of cabling inside equipment racks and/or cabinets within the communications rooms. Managers shall protect network equipment by controlling cable bend radius and providing cable strain relief.

B. Source Limitations: Obtain rack/cabinet cable management from same manufacturer or alliance partner as the rack/cabinet.

C. Vertical Cable Management for Racks and Cabinets

1. Double sided, front and rear
2. Mounts to side of rack/cabinet
3. Material: Steel panels and Plastic fingers
4. Cable fingers with rounded edges at 1U intervals
5. Height to match rack/cabinet
6. Width: 6” or as indicated on drawings
7. Cable distribution spools
8. Color: Black
9. Hinged front and rear doors

D. Horizontal Cable Management for Racks and Cabinets

1. Double sided, front and rear
2. Cable finger with rounded edges along top and bottom surfaces
3. Hinged front and rear cover
4. Height: 2U or as indicated on drawings
5. Color: Black

E. Cable Support Rings: NTRL labeled. Designed to prevent degradation of cable performance and pinch points that could damage cable.

1. D-shaped wall mount loop designed for cable management
2. Continuous loop for pull through cable installation or open slot insertion type cable installation
3. Size: various pre-manufactured sizes
4. Mounting holes for attachment with screws
5. Material: Rigid nylon or zinc covered steel

2.6 LADDER RACK/CABLE RUNWAY

A. Description: Accommodates the support and orderly routing of cabling within the communications rooms from the cable pathway to the equipment racks and/or cabinets.

B. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:

1. TBD

C. General Requirements

1. 1-1/2 inch high by 3/8-inch-wide tubular steel
2. Rung spacing: minimum 12-inches on center.
3. Color: Black powder coat
4. Width: 12-inches or as indicated on Drawings
5. Minimum linear cable bearing surface of 1-1/2 inches per linear foot.

D. Fittings and Accessories:

1. Install all fittings, supports, splices, etc. for the ladder rack system to provide a complete assembly- including fasteners, hardware, and other items required to complete the installation as indicated on the drawings.
2. Fittings shall be pre-manufactured and match rung size and spacing, material, and finish of ladder rack.
3. Mechanically connect ladder rack sections and turns together with splices and jumpers to form an electrically continuous pathway.

2.7 RACK POWER DISTRIBTUTION

A. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:

1. TBD

B. Power Distribution Unit: Comply with UL 1363.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Rack mounting.
3. Height: 1 RU.
4. Housing: Metal
5. Minimum Two front-facing 15-A, 120-V ac, NEMA WD 6, Configuration 5-15R and Ten rear facing 20-A, 120-V ac, NEMA WD 6, Configuration 5-20R receptacles.
6. LED indicator lights for power and protection status.
7. LED indicator lights for reverse polarity and open outlet ground.
8. Circuit Breaker and Thermal Fusing: When protection is lost, circuit opens and cannot be reset.
9. Cord connected with 10-foot line cord.
10. Rocker-type on-off switch, illuminated when in on position.
11. Surge Protection: UL 1449, Type 3.
    a. Maximum Surge Current, Line to Neutral: 96 kA and neutral to ground.
    b. UL 1449 Voltage Protection Rating for line to neutral and line to ground shall not be more than 330 V.
    c. EMI/RFI noise filtering: 40-80dB.
    d. AC Suppression Joule Rating: 3800 J minimum.

2.8 RACK BONDING BUSBAR

A. Comply with requirements in Section 270526 - Grounding and Bonding for Communications Systems for bonding conductors and connectors.

B. Source Limitations: Obtain rack/cabinet grounding hardware from same manufacturer or alliance partner as rack/cabinet.

C. Rack and Cabinet Bonding Busbars (RBB): Rectangular bars of electro-plated copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with TIA-606-C. Predrilling shall be with holes for use with lugs specified in this Section.

1. Rack-Mounted Horizontal RBB: Designed for mounting in 19-inch equipment racks. Include stainless-steel or copper-plated hardware and insulator blocks for attachment to the rack.
2. Rack-Mounted Vertical RBB: 72 inches long, with stainless-steel or copper-plated hardware and insulator blocks for attachment to rack.

D. Stand-Off Brackets: Non-conductive nylon “L” brackets mounted to back channel of rack/cabinet, providing tie-down point for grounding and bonding cable runs.

2.9 BUILDING ENTRANCE PROTECTION

A. Description: The building entrance protection terminals safeguard communication equipment from damaging electrical surges on outside plant cables.

B. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:

1. TBD

C. Terminals: Comply with UL497 for primary and secondary protection.

1. Accept UL listed industry standard 5-pin protection modules.
2. Built in splice chamber for input cable
3. 66 block style quick clip connectors for input and output terminals
4. Available in 25, 50, and 100 pair counts
5. Stackable to accommodate future growth
6. Internal 26AWG fuse link.

D. Protection Modules

1. Solid State protector module with self-resetting current limiters.
2. Minimum 5 ns transient surge response time

PART 3 - EXECUTION

3.1 ENTRANCE FACILITIES

A. Contact telecommunications service provider and arrange for installation of demarcation point, protected entrance terminals, and a housing when so directed by service provider.

B. Comply with requirements in Section 270528 - Pathways for Communications Systems for materials and installation requirements for raceways.

3.2 INSTALLATION

A. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

B. Backboards:

1. Install from 6-inches to 8-feet, 6-inches above finished floor on all walls of communications space with A side exposed to the interior. Ensure that fire-rating stamp is visible after installation.
2. Paint all sides of backboard with two coats of fire-retardant paint, leaving fire rating stamp visible.

C. Racks and Cabinets

1. Provide racks and cabinets with a minimum 36-inches of clear, unobstructed space from the front and rear of the rack/cabinet.
2. Securely fasten floor mounted racks and cabinets to the structural floor using manufacturers recommended anchors or as required by local codes.
3. Install wall mounted racks and cabinets with hinged enclosures or frames so that it can be accessed fully without obstruction by other building, storage, or architectural components. Follow the manufacturer's installation instructions for securing the rack/cabinet to the wall and backboard.
4. Install and adjust to position all rack/cabinet accessories including cable management, power distribution, mounting rails, thermal management, and grounding prior to installing any equipment into the rack/cabinet.

D. Cable Management

1. Attach vertical cable managers to the side of the rack/cabinet using the manufacturer’s installation instructions and included hardware.

2. When a single vertical cable manager is used between two racks/frames, attach the vertical cable manager to both racks/frames.
3. Locate horizontal managers so that the number of ports (cables) that each manager supports does not exceed each cable manager's cable fill capacity. Provide a minimum of one horizontal cable manager above each patch panel.
4. The color of the rack(s)/cabinets(s) and cable manager(s) must match.
5. Securely attach covers to the cable manager(s) after cabling is complete.
6. Space rings at maximum intervals of 12 inches along the path of the cables served.
7. Provide rings of sufficient size and quantity so that no ring is utilizing more than 25% of the rated capacity.

3.3 LADDER RACK/CABLE RUNWAY

A. Secure to the structural ceiling, building truss system, wall, or floor and to the tops of equipment racks and/or cabinets using the manufacturer's recommended supports and appropriate installation hardware.

B. Ladder rack splices will be made in mid-span, not over a support, with the manufacturer's recommended splice hardware.

C. Support ladder rack in accordance with TIA-569-E and the following:
1. A minimum of every 5-feet for straight runs.
2. Within 2-feet of every splice.
3. Within 2-feet on all sides of every intersection.
4. Within 2-feet on both sides of every change in elevation.
5. Every 2-feet when attached vertically to a wall.

D. Leave a minimum of 12-inches in between ladder rack and ceiling/building truss structure. Install multiple tiers of ladder rack with a minimum clearance of 12-inches in between each tier of ladder rack.

E. Provide an elevation kit to maintain a minimum of 6-inches in between ladder rack and the tops of equipment racks and/or cabinets.

F. Provide vertical ladder rack and supports where vertical distance between sleeves/pathways and horizontal ladder rack exceeds 5-feet.

G. Within each telecommunications room, bond ladder rack together with manufacturer's recommended ground straps, and bond to the PBB/SBB, unless otherwise noted in the specifications and contract documents.
1. Bond ladder rack and turns across each splice with a bonding kit.
2. Bond ladder rack to the PBB/SBB using an approved ground lug on the ladder rack and a minimum #6 grounding wire or as recommended by the AHJ.
3. Remove paint from the ladder rack where bonding/ground lugs contact the ladder rack so that the lug will contact bare metal.
4. Use antioxidant joint compound in between the bare metal on the ladder rack and ground lug and in between the bus bar and the ground lug.
5. Verify continuity through the bonds at splices, intersections between individual ladder rack sections and turns, and through the bond to the PBB/SBB.

H. Use a radius drop to guide cables wherever cable exits overhead ladder rack to access a rack, cabinet, or termination field. Provide a moveable cross member to attach and align the radius drop in between the welded cross members of a ladder rack.

I. Cover the exposed ends of the ladder rack that do not terminate against a wall, the floor, or the ceiling with end caps made from a rubberized material or an end closing kit.

J. Provide touch-up paint color-matched to the finish on the ladder rack and correct any minor cosmetic damage (chips, small scratches, etc.) resulting from normal handling during the installation process prior to delivery to the owner.

K. Initial cable fill shall not exceed 2-inches in height and shall not exceed 25% of the interior area of the ladder rack. The interior area of ladder rack will be considered to be the width of the ladder rack multiplied by a height of 2-inches. Provide cable retaining posts where initial cable fill is exceeded.

L. Do not exceed load ratings specified by manufacturer.

3.4 GROUNDING

A. Provide bonding conductors and connectors in accordance with requirements in Section 270526 - Grounding and Bonding for Communications Systems.

B. Clean the rack bonding busbar (RBB) and apply a compatible anti-oxidant prior to fastening connectors to the busbar.

C. Install RBB on rack or cabinet using block insulators to provide a minimum of 0.75 inches of separation.

D. Connect RBB to either the Rack Bonding Conductor (RBC) or Telecommunications Equipment Bonding Conductor (TEBC) and to the rack using listed compression two-hole lugs.

3.5 IDENTIFICATION

A. Provide component labelling in accordance with requirements in Section 270553 - Identification for Electrical Systems.

END OF SECTION 271100

SECTION 271500 - COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, Section 260000 “General Requirements for Electrical”, apply to this Section.

1.2 SUMMARY

A. Horizontal Cabling Description

1. Horizontal cable and its connecting hardware provide means of transporting signals between a telecommunications outlet/connector and the horizontal cross connect located in a telecommunications room. The cabling system consists of horizontal cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for horizontal-to-horizontal cross-connection. This cabling and its connecting hardware are called a “permanent link,” a term that is used in the testing protocols.
2. A work area is approximately 100 sq. ft. , and includes the components that extend from the equipment outlets to the station equipment.
3. The maximum allowable horizontal cable length is 295 feet . This maximum allowable length does not include an allowance for the length of 16 feet to the workstation equipment or in the horizontal cross-connect.

B. Section Includes:

1. Twisted Pair Cabling
2. Twisted pair cable connecting hardware, including patch panels and cross connects
3. Telecommunications outlets/connectors, including plugs and jacks.
4. Grounding provisions for twisted pair cable.
5. Source quality control requirements for twisted pair cable.

1.3 REFERENCES

A. Abbreviations

1. EMI: Electromagnetic Interference
2. IDC: Insulation Displacement Contact
3. UTP: Unshielded Twisted Pair

B. Definitions

1. Horizontal Cabling: Distribution media that connects the telecommunications outlet/connector at the work area and the horizontal cross-connect in the telecommunications room or enclosure.

2. Telecommunications Outlet: An assembly consisting of a faceplate, backbox, or supporting bracket, and one or more receptacles or jacks of a telecommunication connector. Also known as a work area outlet.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.

1. Building Industry Consulting Service International (BICSI)

a. ANSI/BICSI N1, “Installation Practices for Telecommunications and ICT Cabling and Related Cabling Infrastructure”

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Twisted Pair and Coaxial Cable Testing Plans:
1. Sample test report sheet for each type of test required
2. Description of the cable testing procedures to be used including equipment to be used and testing standards equipment will test to.

C. Closeout Submittal
1. Operation and Maintenance Data: In addition to the items specified in Division 01 and Section 260000 “General Requirements for Electrical” include the following:
a. Cable Test Results

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Horizontal cabling system shall comply with minimum performance values listed herein and transmission standards in TIA-568.1, when tested according to test procedures of this standard.

2.2 GENERAL CABLE CHARACTERISTICS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with the applicable standard, UL 444, and NFPA 70 for the following types:

1. Plenum Applications: Type CMP complying with NFPA 262.
2. Non-plenum applications: Type CMR complying with UL 1666.
3. Wet Location and Outdoor Applications: OSP.

B. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.

C. RoHS compliant.

2.3 STANDARDS COMPLIANT CATEGORY 6 TWISTED PAIR CABLE

A. Description: Four-pair, balanced-twisted pair cable, certified to meet transmission characteristics of Category 6 cable up to 250 MHz.

B. Manufacturers: Subject to compliance with requirements, provide product indicated or approved equal by one of the following:

1. TBD

C. Standard: Comply with NEMA WC 66/ICEA S-116-732 and TIA-568.2 for Category 6 cables.

D. Conductors: 100-ohm, 23 AWG solid copper.

E. Shielding/Screening: Unshielded twisted pairs (UTP) unless noted otherwise.

F. Jacket: Blue thermoplastic unless noted otherwise.

2.4 TWISTED PAIR CABLE HARDWARE

A. Description: Hardware designed to connect, splice, and terminate twisted pair copper communications cable.

B. General Requirements for Twisted Pair Cable Hardware:

1. Comply with the performance requirements of the twisted pair cabling.
2. Comply with TIA-568.2, IDC type, with modules designed for punch-down caps or tools.
3. Cables shall be terminated with connecting hardware of same category or higher.

C. Source Limitations: Obtain twisted pair cable hardware from same manufacturer or alliance partner as twisted pair cable.

D. Expansion Criteria: Unless otherwise noted, provide spare positions in cross connects and patch panels to accommodate 20% future growth.

E. Connecting Blocks:

1. 110-style IDC
2. 50, 100, and 300 pair footprint.
3. Supports termination of 22-24 AWG solid conductors.
4. Provide blocks for the number of cables terminated on the block, plus 25 percent spare, integral with connector bodies, including plugs and jacks where indicated.

F. Cross-Connect: Modular array of connecting blocks arranged to terminate building cables and permit interconnection between horizontal and backbone cables.

1. Number of Terminals per Field: One for each conductor in assigned cables.
2. Management rings shall be provided between vertical columns of blocks to provide management of cross connect wire.

G. Modular Patch Panel: Metal patch panel with numbered jack units that accept modular type connectors at each jack location for permanent termination of pair groups of installed cables.

1. Features:
    a. Universal T568A and T568B wiring labels.
    b. Labeling areas adjacent to conductors.
    c. Replaceable connectors.
    d. 24 or 48 ports.
    e. Strain Relief Bar
2. Construction: 16-gauge steel and mountable on 19-inch equipment racks.
3. Number of Jacks per Field: One for each four-pair cable indicated, plus spares and blank positions adequate to suit specified expansion criteria.

H. Patch Cords: Factory-made, four-pair cables in various lengths; terminated with an eight-position modular plug at each end.

1. Patch cords shall have bend-relief-compliant boots and color-coded icons to ensure performance. Patch cords shall have latch guards to protect against snagging.
2. Patch cords shall have color-coded boots for circuit identification.
3. Patch cords shall match performance rating of horizontal link.

I. Plugs and Plug Assemblies:

1. Male; eight position; color-coded modular telecommunications connector designed for termination of a single four-pair, 100-ohm, unshielded or shielded twisted pair cable, rated to match performance of horizontal link.
2. Standard: Comply with TIA-568.2.
3. Marked to indicate transmission performance.

J. Modular Jacks and Jack Assemblies:

1. Female; eight position; modular; fixed telecommunications connector designed for termination of a single four-pair, 100-ohm, unshielded or shielded twisted pair cable, rated to match performance of horizontal link.
2. Designed to snap-in to a patch panel or faceplate.
3. Standard: Comply with TIA-568.2.
4. Marked to indicate transmission performance.

K. Faceplate:

1. Four port, vertical single gang faceplates designed to mount to single gang wall boxes.
2. Plastic Faceplate: High-impact plastic. Coordinate color
3. Metal Faceplate: Stainless steel, complying with requirements
4. For use with snap-in modular jacks accommodating any combination of twisted pair, optical fiber, and coaxial work area cords.

L. Surface Mount Box

1. Two port, low profile, surface mount housing, with removeable cover.
2. Plastic housing suitable for installation in plenum air handling spaces. Coordinate color.
3. For use with snap-in modular jacks accommodating any combination of twisted pair, optical fiber, and coaxial work area cords.

M. Legend:

1. Machine printed, in the field, using adhesive-tape label.

PART 3 - EXECUTION

3.1 WIRING METHODS

A. Wiring Method: Install cables in raceways and cable trays, except within consoles, cabinets, desks, and counters. Conceal raceway and cables, except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including plenum ceilings.
2. Comply with requirements for raceways and boxes specified in Section 270528 "Pathways for Communications Systems."
3. Unenclosed wiring methods may be used in accessible ceiling spaces.

B. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools. Install conductors parallel with or at right angles to sides and back of enclosure.

3.2 INSTALLATION OF TWISTED-PAIR HORIZONTAL CABLES

A. General Requirements for Cabling:

1. Provide a minimum of two equipment jacks for each work area outlet unless noted otherwise.
2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications equipment outlet.
3. Bridged taps and splices shall not be installed in the horizontal cabling.
4. Do not untwist twisted pair cables more than 1/2 inch from the point of termination to maintain cable geometry.
5. Maintain the cable jacket to within 1-inch of the termination point.
6. Provide horizontal cabling with the following minimum bending radius:
    a. Twisted Pair Cable: 4 times the outside diameter of the cable.
    b. Coax Cable: 10 times the outside diameter of the cable.
7. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.
8. Use T568B standard for terminations.
9. Coil cables in the outlet boxes if adequate space is present to house the cable coil without exceeding the cable bend radius.
10. Store no more than 12-inches of twisted pair and 36-inches of fiber optic cable in an outlet box or modular furniture raceway after termination. Loosely store excess slack in the ceiling above each drop location.
11. In the telecommunications room, provide minimum 10-foot of slack for all horizontal cables and dress/store on ladder rack system without exceeding the cable bend radius.
12. Store cable slack in a Figure 8, “U” or “S” pattern.
13. MUTOAs shall not be used as a cross-connect point.
14. Provide consolidation point and cabling listed for wet locations at floor boxes in slab-on grade construction.:
    a. Do not use consolidation point as a cross-connect point, as a patch connection, or for direct connection to workstation equipment.
    b. Locate consolidation points for twisted-pair cables at least 49 feet from communications equipment room.

15. The same orientation and positioning of jacks and connectors shall be utilized throughout the installation.
16. Provide blank filler inserts for all unused work area faceplate ports.
17. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
18. Cables shall be neatly bundled and dressed into groups of no more than 48 cables and routed from the point of entrance into the telecommunications space to their respective patch panel or connecting block.
19. Each patch panel or connecting block shall be fed by individual bundles separated and dressed with hook and loop straps.
20. Install lacing bars and distribution spools to restrain cables, prevent straining connections, and maintain minimum bending radii.
21. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation, and replace it with new cable.
22. Cold-Weather Installation: Bring cable to room temperature before de-reeling. Heat lamps shall not be used for heating.
23. Pulling Cable: Comply with BICSI Information Technology Systems Installation Methods Manual (ITSIMM), "Copper Structured Cabling Systems," "Pulling and Installing Cable" Section. Monitor cable pull tensions.
24. Under no circumstances shall the cable or patch cords be painted, treated, or covered with other material unless approved by the manufacturer, Owner, and Engineer.

B. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable management in telecommunications spaces with terminating hardware and interconnection equipment.
2. Cable shall not be run through structural members, attached to ceiling grid/luminaire supports, or in contact with pipes, ducts, or other potentially damaging items.
3. Cable and support hardware shall not obstruct access to panels, equipment, valves, boxes, or other control devices.

C. Group connecting hardware for cables into separate logical fields.

D. Separation from EMI Sources:

1. Comply with recommendations from BICSI's "Telecommunications Distribution Methods Manual" and TIA-569 for separating unshielded copper communication cable from potential EMI sources, including electrical power lines and equipment.
2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

    a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.
    b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.
    c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.

3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:

    a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.
    b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.
    c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

4. Separation between communications cables in grounded metallic raceways, power lines, and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

    a. Electrical Equipment Rating Less Than 2 kVA: No requirement.
    b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.
    c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

5. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.
6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.3 IDENTIFICATION

A. Provide identification of cabling and devices in accordance with Section 270533 “Identification for Communications Systems”.

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections on all new and modified cabling and termination hardware.

B. Tests and Inspections:

1. Visually inspect jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568.1.
2. Visually confirm Category marking of outlets, cover plates, outlet/connectors, and patch panels.
3. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
4. Field-test instruments shall be approved by the cable manufacturer, be within the calibration period recommended by the instrument manufacturer, and meet a minimum Level IV accuracy in accordance with TIA-1152. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
5. Twisted Pair Continuity Tests:

    a. Test twisted pair cabling for shorts, opens, intermittent faults, polarity and pair reversals, crossed pairs, and split pairs. Test operation of shorting bars in connection blocks. Test cables after termination but not cross-connection.

6. Twisted Pair Performance Tests:

    a. Test each cable link to the performance requirements outlined in this specification and manufacturer’s warranty requirements. Perform the following tests according to TIA-568.1, TIA-568.2, and TIA-1152:

        1) Wire Map
        2) Length (physical vs. electrical, and length requirements).
        3) DC resistance.
        4) DC resistance unbalance.
        5) Insertion loss.
        6) Near-end crosstalk (NEXT) loss.

7) Power sum near-end crosstalk (PSNEXT) loss.
8) Equal-level far-end crosstalk (ELFEXT).
9) Power sum equal-level far-end crosstalk (PSELFEXT).
10) Return loss.
11) Propagation delay.
12) Delay skew.

7. Final Verification Tests: Perform verification tests for UTP systems after the complete communication cabling and workstation outlet/connectors are installed.

   a. Voice Tests: After dial tone service has been installed. Connect to the network interface device at the demarcation point. Go off-hook and listen and receive a dial tone. If a test number is available, make and receive a local, long distance, and digital subscription line telephone call.
   b. Data Tests: After Owner's Information Technology Staff has a network installed and is available to assist with testing. Connect to the network interface device at the demarcation point. Log onto the network to ensure proper connection to the network.

C. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report that is formatted similarly to Table 10.1 in BICSI's "Telecommunications Distribution Methods Manual," or shall be transferred from the instrument to the computer, printed, and submitted unaltered.

D. End-to-end cabling will be considered defective if it does not pass tests and inspections. Marginal passes are not acceptable.

E. Remove, replace, and re-test cabling and terminations where test results indicate that they do not comply with specified requirements.

F. Prepare test and inspection reports.

G. The Engineer may request that a 10% random field re-test be conducted on the cabling system, at no additional cost, to verify documented findings. Tests shall conform to the requirements listed above. If findings contradict the documentation submitted by the contractor, additional testing can be requested to the extent deemed necessary by the Engineer, including a 100% re-test. Any re-testing shall be at no additional cost to the Owner.

END OF SECTION 271500

SECTION 281643 - PERIMETER SECURITY SAFETY

PART 1 - GENERAL

1.1 SCOPE

A. This section details product and execution requirements for Security Management System (SMS) for the project.

B. Work includes furnishing all labor, materials, tools and equipment, and documentation required for a complete turnkey working system as specified in this Section. SMS shall consist of but not be limited to Door Controllers, Card Readers, Sensors, Switches, Conduit, Boxes, Cable and Wired Devices. Programming and cardholder enrolling are also considered as part of installation as well as coordination with UKPD.

C. Unless noted otherwise, "Contractor" shall refer to SMS Integrator & Installer.

Communications routing from SMS to door controllers shall be via Owner LAN.

1.2 RELATED WORK

A. Related Sections in other divisions of Work:

087100 – DOOR HARDWARE
260000 - ELECTRIC
270000 - COMMUNICATIONS

1.3 REFERENCES AND STANDARDS

A. Work under this Section is subject to requirements of Division 1 General Requirements.

B. Other applicable standards are as follows:

UL 294 - Access Control System Units.
UL 1076 - Proprietary Burglar Alarm Units and Systems.
FCC Rules and Regulations Part 15, Radio Frequency Devices

C. All work and materials shall conform in every detail to rules and requirements of National Fire Protection Association, Kentucky Electrical Code.

D. All materials shall be listed by UL and shall bear UL label. If UL has no published standards for a particular item, then other national independent testing standards shall apply, and such items shall bear those labels. Where UL has, an applicable system listing, and label entire system shall be so labeled.

1.4 DEFINITIONS AND ABBREVIATIONS

A. SMS – Security Management System

1.5 WORK BY OWNER

A. Owner shall:

Provide list of cardholders for initial SMS programming by Contractor.
Provide scheduling of each door, including:

a. Alarm activations and distribution.
b. Door lock and unlock.
c. Cardholder validation by day and time.

d. Delay time of door open alarm.
e. Duration of lock activation upon credential authorization.

1.6 SUBMITTALS

A. Product Data: For each type of product indicated.

B. System Design drawings with cable routing, device location and labeling.

C. Operation statements for all SMS doors.

D. Communication Closet layout drawings.

E. Certifications for BICSI as required by UKCNS per Division 27.

F. Owner Operation Manuals for all installed equipment as well as documentation of all programing.

G. As built drawings showing cable pathways and routing. As built drawings to also show any changes made to original ESS drawings.

1.7 QUALITY ASSURANCE

A. Security Management System Contractor shall:

Have successfully completed two (2) Security Systems projects in equal magnitude of the system specified in following sections. Contractor shall be a Lenel Authorized VAR in good standing. Proper proof of certifications will be submitted at time of Bid. Be responsible for complete turnkey system up to but not including SMS programing, programing cost will be included in BID with Programing work being done by UKPD's Lenel VAR of Record. Be responsible to coordinate with UKPD's Lenel VAR of Record to complete system installation. Comply with all certification requirements set out in Division 27 as it related to the installation of DATA cabling. Specifically, contractor will comply with the requirement of all DATA cabling being installed by BICSI certified installers and installation supervised by a registered in good standing RCDD in the full-time employee of the project contractor.

1.8 GUARANTEE

A. Warranty requirements for Security Management System (SMS) shall be two (2) years on all parts and labor commencing on Date of Substantial Completion. Those requirements apply to all components covered in this section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Security Management System shall provide ability to:

Unlock electrified door locks upon authentication of submitted credential to local card readers.
Monitor door alarms and remotely unlock.
Lock doors on an automated schedule from central system.
Unlock doors as required by code via fire alarm relays.
Annunciate intrusion alarms from remote sensors.
Unlock individual doors manually via operator interface.
Lock doors from central Operations Center.

B. System must support the Campus Central One Card ID Badge.

2.2 NETWORK SMS

A. Manufacturer: Lenel Security Systems

2.3 SYSTEM CONTROLLER

A. Manufacturer: Mercury Systems LNL-2220. Controllers will include all power supplies, Life Safety FPO250 or Mercury Systems approved equal and Battery Back Up Units. All parts and pieces needed for a complete UL listed working turnkey system. All Lenel Licensing required for UK Campus Enterprise System shall be included Contractors Bid.

2.4 MULTI-DOOR DOOR CONTROLLER

A. Manufacturer: Mercury Systems LNL-1320.

Controller shall accommodate minimum two card readers and associated inputs/outputs.

2.5 MULTI-INPUT / OUTPUT CONTROLLER

A. Manufacturer: Mercury Systems LNL-1100 / LNL-1200.

Controller shall accommodate 16 programmable inputs: 2 programmable relay outputs.

2.6 PROXIMITY CARD READERS

A. Manufacturer: HID

Mullion Mount: 20TKS-T0-000375 (SIGNO PRIORITY LINE)

Standard
Wall-mount: 40TKS-T0-000375 (SIGNO PRIORITY LINE)

B. General

Reader(s) shall:

a. Be furnished in Wiegand, and OSDP, output model and shall be sealed in a polycarbonate enclosure designed to withstand harsh environments.
b. Unless otherwise specified, reader covers shall be furnished in “black” color – Classic design.
c. Recognize iClass 13.56 MHz signals.
d. Contain an indicator to indicate valid and invalid card.
e. Be designed for ambient operating environment.
f. Be powered remotely using centralized power supplies.
g. Read iClass Corporate 1000 sector information.
h. Include Near Field / Bluetooth capabilities.

2.7 BIOMETRIC READERS (Eye Scanners)

Manufacturer: EyeLock

Wall-mount Model: nano iXT

Scanner(s) shall:

a. Be mounted at 54” AFF typically.
b. Be mounted above card reader.
c. Always be installed in conjunction with a Card Reader
d. Be installed with DATA cable connected to POE Network Switch port.
e. Be installed with 12-24 Volt DC Power via hard wire cable to dedicated Life Safety Power Supply located in nearest UKCNS Data Closet. Each Scanner Unit shall be fused at the power supply individually.

2.8 DOOR CONTACTS (DPS / Monitor Points when not included in Door Hardware)

Steel Door contacts.

Manufacturers: GE Interlogix 1078 Series or approved equal.

2.9 REQUEST-TO-EXIT MOTIONS SENSORS (When not included in Door Hardware)

Manufacturers: GE, Honeywell, or approved equivalent.

1. Provide door header mounted request to exit motion sensors as indicated on Drawings.

2. Minimum Specifications

a. Detection technology Passive infrared
b. Detection pattern Narrow beam 35-degree cone
c. Output contact normally open contact is closed when sensing zone is entered or exited.
d. Power requirements 12 – 24 VDC
e. Mounting: Door header

2.10 Panic Button

Under Counter Model:

Manufacturer: Honeywell 270R
Panic button is hard cabled to the nearest access control panel for reporting to UKPD dispatch. Coordinate with UKPD for final placement and programing.

Classroom / Lab Model: (Wall Mounted)

Manufacturer: STI Stopper Station SS2 with Cover
Model: SS2325LD-EN
Coordinate colors and labeling with UKPD

2.11 POWER SUPPLIES

A. As required to support Card Reader(s), Door Controller(s), Strike(s), Sensor(s), Eye Scanners and other components for fully operational turnkey system. Each component connected to power supplies shall be independently fused with rated fuses to match the manufacturer requirements for each specific device. Power supply cabinets shall have door locks included and keys shall be turned over to UKPD at substantial completion.

B. Electrified Door hardware power supplies shall be specified by Division 8. Each component connected to power supplies shall be independently fused with rated fuses to match the manufacturer requirements for each specific device.

2.12 CABLING

A. General

Cable shall be:

a. Plenum Rated.

B. Reader Cable

Construction:

a. 18 AWG stranded or as recommended by system manufacturer.
b. Aluminum/Mylar shield with drain wire applied over assembled conductors.

C. Door Lock Power Cable

Provide and install as required for door hardware. Refer to Architectural Door Schedule and Door Hardware documents.

D. Door Contact / Signal Cable

Door Contact/Signal Cable used for monitoring purposes.
Construction:

a. 22 AWG twisted, stranded, or as recommended by system manufacturer.
b. Aluminum/Mylar shield with drain wire applied over assembled conductors.

E. Request-to-Exit Motion Detector Signal Cable

Motion Detector Signal Cable used for monitoring purposes.
Construction:

a. 20 AWG stranded or as recommended by system manufacturer.
b. Aluminum/Mylar shield with drain wire applied over assembled conductors.

F. Door Controller Cable

Provide all LAN patch cables, jacks, and faceplates

PART 3 - EXECUTION

3.1 PRE-INSTALLATION COORDINATION

A. Coordinate with Electrical Contractor (Division 260000) that:

Section 280000 provided pathways and equipment back boxes are completed and are coordinated with no conflicts for system installation.
Adequate power has been provided and properly located for security system equipment.
Code-complying fire alarm relays will be installed for cable termination. Fire Alarm contractor will provide relay contacts in Com Closet for connection to Access control panels. Contractor is responsible for coordination with Fire Alarm Contractor. Access control Contractor shall provide all parts and pieces including all cabling from Access control panel to Fire Alarm Contact point.
Coordinate scheduling of work to make sure there are no conflicts.

B. Coordinate with Door Frame supplier (Division 8):

Doors and door frames are properly prepared for electric locking hardware and door position switches are furnished by door type.
Locations of all devices prior to installation.
Electric door power supply locations and connections requirements.

C. Coordinate with the Communications Contractor (Division 27):

Locations of all LAN-connected devices with no conflicts.
Coordinate scheduling of work.

D. At a minimum, coordinate the following with Owner:

VLAN/or network partitioning for SMS system.
Owner-provided IP addresses for SMS devices.
Network infrastructure requirements at SMS head-end Next Level Gateway-6100UK.
Initial database programming.
Planned system downtime.
Programming and training for new system.

E. Coordinate with Construction Manager as required providing a fully functioning turnkey Security system.

F. Coordinate with all trades on the operation and installation of ADA entrance doors with relation to Long Range Card Readers and interconnection with door actuator plates, motor units, Fire Alarm and Smoke Evacuation System. Contractor will supply all associated timer boards or additional parts required for complete operating doors system.

G. Coordination Meetings shall be scheduled and conducted beginning within 60 days of contract award and continuing till project conclusion inclusive with the A/E team and Commissioning Agent.

3.2 INSTALLATION

A. General

Verify acceptance of each type of specified request-to-exit hardware for each application with local life safety code officials.
Provide tamper proof fasteners for all equipment in public areas. Fastener finish shall match equipment finish.
Maintain minimum three feet of access in front of class 1 electrical equipment.

B. Delivery, Storage, and Handling

Deliver products to and receive products at site under provisions of General Requirements.
Materials shall be stored according to manufacturer's recommendations at minimum.

C. Equipment

Provide equipment as indicated on Drawings and specified herein. Additional specific installation requirements are as follows:

Door Controllers

a. Provide Door Controllers in Data Closets as shown on Drawings.
b. Provide connection to 120 VAC via hardwire conduit. Coordination with Division 260000.
c. Separate 24 VDC and 120 VAC, wire, cable, and devices by 12” minimum space.
d. Enclose wire and cable in wire ways or bundle with wire exiting wire ways to terminal strips or panel mounted devices.
e. Space controllers according to manufacturer’s requirements. Ensure adequate space is allowed for device heat dissipation.
f. Do not place controller or control devices on enclosure sides.

Card Readers

g. Provide card readers and card reader devices as shown on Drawings.
h. Wire card reader LEDs to indicate valid and invalid card reads, and door locked and unlocked conditions. All card reader LED indicators shall operate identically throughout Project. LED shall be red in normal, secured state, and shall be green on valid card read and while door is unlocked.

Electric Locking Mechanics

i. Interface with electric locking mechanics as required by the door hardware.
j. Provide lock control of electrified locking mechanics through output contacts activated by Door Controller.

Electrified Panic Devices

k. Interface with electrified panic devices as indicated on Drawings. Provide all low-voltage wire and connections between SMS power transfer device and electric locking mechanics.
l. Provide lock control of electrified panic devices through output contacts activated by Door Controller.
m. Provide all 120VAC if required for Device operation per hardware specifications. Provide connection to Fire Alarm connection points as required by Code. Fire Alarm Contractor to provide relay contacts in Com closets for this purpose. Contractor is responsible for all parts and pieces including cable from Access control panel to the Fire Alarm relay contract. Contractor is responsible for coordination with Fire Alarm contractor.

Door Position Switches

n. Install as shown on drawings.
o. Coordinate pathways.

Request-to-Exit Motion Sensors

p. Provide as shown on drawings.
q. Coordinate pathways.

Fire Alarm Interface

r. Connect (hard wire) door controller to building fire alarm system for fail-safe release upon any fire alarm.
s. Interface with low voltage / low current normally closed dry contact from fire alarm system provided by fire alarm Contractor (verify exact location in Data Closet for connection with FA). Contact shall open on any fire alarm condition.
t. Provide all additional UL listed fail-safe relays and power supplies necessary to interface to this contact and unlock all fail-secure doors.

u. Coordination Meetings with Fire Alarm Contractor shall be scheduled and conducted beginning within 60 days of contract award and continuing till project conclusion inclusive with the A/E team and Commissioning Agent.

Cable Installation

v. Visually inspect all wire and cable for faulty insulation prior to installation.
w. Furnish and install all specified wire and cable as required for functioning SMS system.
x. Neatly lace, dress and support cabling.
y. Pull cables in accordance with cable manufacturer's recommendations University of Kentucky CNS and ANSI/EEE C2 Standards.

1) Do not exceed manufacturer's recommended pulling tensions.
2) Do not install bruised, kinked, scored, deformed, or abraded cable.
3) Do not splice cable between indicated termination, tap, or junction points.
4) Remove and discard cable where damaged during installation and replace it with new cable.
5) Pull all cable by hand unless installation conditions require mechanical assistance.

z. Run all wire and cable continuous from device location to final point of termination. No mid-run cable splices shall be allowed.
aa. Cables shall not be attached to existing cabling, plumbing or steam piping, ductwork, ceiling supports, or electrical or communications conduit.
bb. Cable shall never be laid directly on a ceiling grid or attached in any manner to ceiling grid wires.
cc. Furnish and install all cable such that ample slack is supplied at device terminating end of cable to compensate for any final field modifications at install locations.

1) Loosely coil slack in “Figure-eight” in a manner that prevents kinking.
2) Loop radius shall be at least 4X minimum bend radius for cable.
3) Slack length of cable shall be 4 feet (minimum).

dd. Provide code-compliant fire proofing techniques for all penetrations of fire rated partitions and slabs, where penetrations are made by or used for installation of SMS System.
ee. Coordinate routing of wire and cable requiring isolation from power, radio frequency (RF), electromagnetic interference (EMI), telephone, etc. with General Contractor.
ff. At no time, shall any cable be subjected to a bend less than manufacturer’s specified minimum radius and UK CNS Standards.
gg. Provide grommets and strain relief material where necessary to avoid abrasion of wire and excess tension on Wire and Cable.
hh. Make connections with solder-less devices, mechanically and electrically secured in accordance with manufacturers’ recommendations. Wire nuts shall not be an acceptable means of connecting wire and cable.
ii. Utilize conduit and cable trays and or pathways to route SMS cables from each door or device to Door Controller. Follow University of Kentucky CNS standards for low voltage cabling.
jj. No A/C current-carrying conductors are allowed in same pathway as signal or low-voltage power cables.
kk. Wire and cable within Door Controllers, enclosures and or other security enclosures shall be neatly installed, completely terminated, pulled tight with slack removed and routed in such a way as to allow direct, unimpeded access to equipment within

enclosure. All wire and cable shall be bundled and tied. Ties shall be similar to T&B TyRap cable ties.

ll. Use of electrical tape for splices and connections shall not be acceptable.

mm. Make connections with solder less devices, mechanically and electrically secured in accordance with manufacturers' recommendations. Wire nuts shall not be an acceptable means of connecting wire and cable.

nn. All system cabling within vertical risers (as required) shall be bundled, wrapped and tied to structure at three-meter intervals in order to isolate it from other wire and cable within riser. Additionally, all wire and cable within shaft shall be supported at least every two floors using Greenlee Slack Grips (Split Mesh Lace Closing) or approved equal. Provide all personnel and equipment necessary to install and support cable. All equipment shall be UL listed for application.

D. System Programming and Data Entry

Collect all data required to make the Security Management System operational. Deliver data to Owner on data entry forms, utilizing data from Contract Documents, Contractor's field surveys and all or pertinent information in Contractor's possession required for complete installation database. Identify and request from Owner any additional data needed to make SMS System fully operational and integrated. Completed forms shall be delivered to Owner for review and approval at least 30 days prior to Contractor's scheduled needed date. Contractor will coordinate with University of Kentucky Police Department Campus Security System Lenel VAR of Record (Securitas) for database and Campus Cloud Services programming and Integration. Contractor shall provide Door Counts, Panel Counts and locations, Reader Counts and input, output counts. Contractor shall also supply any special devices or operations that may require special programing. Examples would be Elevators, Biometric readers, and others. Contractor shall request a quote for this programing work, two (2) Client Workstation Licenses and any other Lenel Licenses required from Securitas. Securitas Security Group Contact person is Vicky Daugherty (912-246-9466) Vicky.Daugherty@securitas.com. This and any fees associated with the Lenel programing shall be included in Contractor's Bid. Contractors Bid shall be for a complete turnkey total functional system. Contractor shall provide time in Bid to coordinate and participate with Securitas Security during their testing and programing.

Provide all initial system information for SMS setup including, but not limited to following:

a. SMS Card Reader Information

1) Coordinate all card reader values and text, including descriptors, alarm messages, map call up and identification with Owner.

b. Input and output points for SMS. Coordinate all input and output priorities and text, including descriptors, alarm messages, Video Camera call up, and map call up and identification with Engineer.

c. Initial system users, including levels of access. This shall include designation of Owner's representative at "Super User" level immediately upon SMS initialization.

d. Provide Elevator access per cardholder by cab and floor.

E. Furnish and install all SMS wire and cable including LAN cabling.

F. Provide code-compliant fire proofing techniques for all penetrations of fire rated partitions and slabs, where penetrations are made by or used for installation of SMS.

G. 120 VAC power dedicated to security system shall be on provided Emergency Generator Power. Gateways shall be on properly sized UPS units on Emergency Generator backup circuits. UPS units are provided by UKCNS. Contractor shall coordinate with UKCNS to provide power requirements for all equipment. A meeting with UKCNS to coordinate this and other IT related issues will be scheduled within 60 days of Contract award and be inclusive of A / E Team, UKCNS and Commissioning Agent.

H. Connect to AC power with provided UL listed power supplies and transformers to distribute low voltage power to system components as required.

I. Provide hinged cover UL listed terminal cabinets with tamper switches for all power supplies, transformers, and power distribution terminal strips. Provide all conduit and wiring from AC power facilities to terminal cabinets.

J. Provide protection against spikes, surges, noise, and or line problems for all system equipment and components.

K. Provide protection on all exterior, control, power, signal cables and conductors against power surges. Each surge protector shall be UL Listed.

L. In no instance, shall any UL labeled door or frame be drilled, cut, penetrated, or modified in any way.

M. Contractor shall be responsible for replacing any labeled door or frame that is modified without written approval from project Engineer.

N. Label all controls as necessary to agree with their function.

O. Label all Wire and Cable in common at both ends using a permanent method such as self-laminating cable marking tape.

Tags shall be attached to wire and cable nylon cable ties in an accessible location so that they can easily be read.

Tags shall be installed when wire and cables are installed.

Labeling shall be consistent with existing cable labeling system and agree with Record Documentation.

P. Place wire identification numbers at each end of conductor involved by using sleeve type, heat shrinkable markers. Markers shall be installed so as to be readable from left to right or top to bottom.

Q. Mark all connectors with common designations for mating connectors. Connector designations shall be indicated on record drawings.

R. Coil all spare conductors in device back box, panel wire way, or top of panel where wire way is not provided. Conductors shall be neatly bundled and tagged.

S. Install integrated security and communication system in accordance with manufacturer's instructions at locations indicated on the Drawings.

T. Mount equipment plumb, level, square, and secure. For video entrance stations and video door stations, comply with manufacturer's design requirements to provide optimum picture quality of station monitoring.

3.3 DEMONSTRATION AND TRAINING

A. Coordinate with Owner and UKPD to establish required training.

B. Contractor shall be on call during Warranty period to answer any questions Owner might have. The Owner reserves the right to use any excess training hours, not used by time of system completion, for future training as requested by Owner until total number of training hours has been used.

C. Demonstration:

Demonstrate that integrated security and communication system functions properly. Perform demonstration at final system inspection by qualified representative of manufacturer working with UK Lenel VAR of Record.

3.4 SYSTEM START-UP

A. Start-up includes all Contractor-Furnished, Contractor-Installed (CFCI) systems and equipment.

B. Work shall be complete and ready to operate prior to final acceptance.

C. All database programming for systems up to inaugural day of beneficial use of Security System shall be coordinated thru UKPD and UK Lenel VAR of Record.

D. Adjust integrated security and communication system for proper operation in accordance with manufacturer's instructions.

3.5 SYSTEM ACCEPTANCE

A. Final acceptance testing of Work will be coordinated and observed by owner representatives and UKPD in coordination with Securitas Security Solutions.

B. Prior to testing, Contractor shall submit two sets of preliminary (draft) Record Drawings to owner and UKPD. Preliminary Record Drawings are to be used by owner and UKPD to conduct system final test.

C. At completion of Work, remove all waste materials, rubbish, Contractor's and subcontractors' tools, construction equipment, machinery, and all surplus materials.

3.6 PROTECTION

A. Protect installed integrated security and communication system from damage during construction.

END OF SECTION 281643

SECTION 282300 - VIDEO SURVEILLANCE

PART 1 - GENERAL

1.1 SCOPE

This section details product and execution requirements for VIDEO MANAGEMENT SYSTEM for the project.

Work includes furnishing all labor, materials, tools and equipment, and documentation required for a complete turnkey working system as specified in this Section. VMS shall consist of but not be limited to, Cameras, Monitors, Conduit, Boxes, Cable, and Wired Devices. Programming work sheets and camera view setup is considered part of installation as well as coordination with UKPD, Stanley Security and Salient Systems.

Unless noted otherwise, "Contractor" shall refer to VMS Integrator & Installer.

Communications routing from VMS Servers to Cameras shall be via Owner LAN.

Coordinate with any and all trade contractors as required to provide a fully functioning system.

Unless noted otherwise, "Contractor" shall refer to security system integrator & installer.

Applicable provisions of Division 1 shall govern all work under this section.

Video surveillance can be restricted or prohibited by law. This document details technical considerations only. It is assumed that registration, licensing, policies regarding disclosure and privacy (notification, processing of images, time, and date stamping, recording of sound, etc.), and or legal obligations are responsibility of Owner.

1.2 RELATED WORK

Related Division 28 Sections include:

1. 281643 - PERIMETER SECURITY SAFETY

Related Sections in other divisions of Work:

2. 087100 - DOOR HARDWARE
3. 260000 - ELECTRIC
4. 270000 - COMMUNICATIONS

1.3 REFERENCES AND STANDARDS

Work under this Section is subject to requirements of Contract Documents including General Conditions, Supplementary Conditions, and sections under Division 1 General Requirements.

All work and materials shall conform in every detail to rules and requirements of National Fire Protection Association, Kentucky Electrical Code, University of Kentucky Standards and University of Kentucky ITS Standards.

All materials shall be listed by UL and shall bear UL label. If UL has no published standards for a particular item, then other national independent testing standards shall apply, and such items shall bear those labels. Where UL has an applicable system listing and label entire system shall be so labeled.

Other applicable standards are as follows:

1. ANSI/IEEE C2 - National Electrical Safety Code
2. NFPA 70-1999 - National Electrical Code
3. IEEE/ANSI 142-1982 – Recommendations for Grounding of Industrial & Commercial Power Systems.

4. NTSC/EIA RS-170A Video Standard
5. IEEE 802.3 standards for CSMA/CD (Ethernet) based LANs.
6. Emissions: FCC 15, Class A; CE: EN55022 (Emissions)
7. CE: EN50082-01 (Immunity)
8. CE, UL 1950; CUL 1950 CE: EN60950 (Safety)
9. State of Kentucky
10. City of Lexington, KY

1.4 DEFINITIONS AND ABBREVIATIONS

VMS – Video Management System

LAN – Local Area Network

1.5 WORK BY OWNER

Owner shall provide:

1. Verify exact security device mounting locations.
2. Verify Acceptable per-camera field-of-view information.
3. Enterprise-wide Data Network / LAN to be utilized by VMS system.
4. Cross-connections from VMS components to building LAN, contractor provides all interconnection cables (Patch Cables) as needed but may not connect to LAN without ITS oversight and approval.
5. All active LAN components (switches, routers) as required for Security system function.
6. IP-address allotment and management for VMS devices as needed.

1.6 SUBMITTALS

Product Data: For each type of product indicated.

System Design drawings with cable routing, device location and labeling.

Communication and Security Closet layouts.

Camera View Modeling.

1.7 QUALITY ASSURANCE

Video Management System Contractor shall:

1. Have successfully completed two (2) Salient Systems projects in equal magnitude of the system specified in following sections. Be fully certified by Salient Systems for Sales and Installation of Salient equipment. Proper proof of certification with Salient will be submitted at time of Bid.

1.8 GUARANTEE

Warranty requirements for Video Management System (VMS) shall be two (2) years on all parts and labor commencing on Date of Substantial Completion. Those requirements apply to all components covered in this section.

PART 2 - PRODUCTS

2.1 GENERAL

VMS system shall deliver high quality; color video over an IP, UTP structured cable system using H.264 /H.265 compression and shall provide for monitoring and recording of all cameras in system as indicated herein and on project Drawings. The VMS allows event-based monitoring of campus and situational awareness though IP cameras centrally managed from the University of Kentucky Police Department Operations Center. The VMS utilizes analytics to identify potential situations on campus and preserving evidence for authorities to review. The Salient VMS has the capability to be securely monitored via mobile devices or off-campus locations, video sharing with outside public safety first responders.

Video shall be configurable from a workstation on the University LAN using standard Browser software.

2.2 IP VIDEO CAMERA (FIXED)

Interior Camera shall be Hanwha XND-L6080V.

Elevator Camera shall be Axis M3057-PLVE

Exterior Camera shall be Hanwha XNV-L6080R

Multi Imager Camera shall be Hanwha PNM-9002VQ

Dual Imager Camera shall be Hanwha PNM-7002VD

Camera shall:

1. Be ceiling / wall mountable dome-type.
2. Be IP-native.
3. Utilize Power-over-Ethernet (PoE) for device power.
4. Be designed to provide video streams at the minimum HDTV 1080p (1920x1080) resolution at 30 frames per second using H. 264 / H.265.
5. Be equipped with Day/Night functionality, Wide Dynamic Range (WDR), color video to ½ lux, black and white below ½ lux and feature remote back focus capabilities.
6. Be provided complete with standard interior (3-9 mm nominal) auto-iris lens.
7. Per-camera lens selection dependent upon Owner-required field-of-view.
8. Have a smoked bubble.
9. Have housing and mount color to match surrounding architectural colors.

2.3 NETWORK VIDEO SERVER:

Security Cameras shall be connected to the owners Security LAN by UKCNS personnel and SMS VAR of Record, Stanley Security. Cameras shall be routed to Management Servers and Recording Servers via the Owners Security VAN. Installing Integrator shall complete all Camera Programing worksheets and provide to Stanley Security for System Programing and addition of Cameras to the Campus VMS. Integrator shall coordinate with VAR of Record, Stanley Security to include the cost of this programing in their bid for project. Contact Stanley Security. Stanley Security Group Contact person is Vicky Daugherty (912-246-9466) Vicky.Daugherty@sbdinc.com.

2.4 WIRE AND CABLE

General

1. Provide and install all device DATA cables as per UKITS and Division 270000 requirements. DATA cabling for Security cameras shall be terminated in each DATA

Closet, in approved labeled patch panels (As per Division 270000 requirements). Camera cabling should be terminated in jacks at the camera device. Contractor to provide all patch cables. All exterior camera cables shall be provided with Surge protection units on each cable. Proper cable types must be must as per UKITS standards and Division 270000 requirements.

2. Provide all interconnecting system cabling at Security Closets and Communication Closets as well at security device end points. All UKITS standards must be followed. Exterior cameras that exceed the normal distance for copper cable must be installed with Fiber Cable as per UKITS Standards and Division 270000 requirements. At these fiber locations a Rugged / Hardened Switch is required, this switch should be provided by contractor by purchase thru UKITS.
3. Bond metallic system components in all Communications Closets and Security Closets to existing in-room ground bar.
4. Confirm and provide any necessary interface cabling with existing Access Control system.

PART 3 - EXECUTION

3.1 GENERAL

Work performed for installation of VMS system shall be performed by Security System Integrator – “Contractor”.

Provide equipment as indicated on Drawings and specified herein.

Provide all labor and materials necessary to construct systems as described herein to include furnishing and installing all system equipment, interconnecting cabling, programming and start-up, software (including software upgrades and reprogramming as necessary), termination components, mounting hardware, incidentals, accessories, testing, labeling, documentation, and training as detailed in following sections.

1. Neatly lace, dress, and support cabling.
2. Coordinate any downtime with Owner.

Prior to installation:

3. Conduit and equipment back boxes are as required. Contractor is responsible for coordination with all trades to ensure that conduit and back boxes are correctly placed for VMS use. Contractor is responsible for coordinating installation of conduit and boxes to make sure they are installed on schedule with other trades and are coordinated as to not interfere with other systems or pathways.
4. 120V AC Power is as required and is properly located.
5. LAN structured cabling is as required and properly located, and installation has been coordinated with other trades.
6. Coordinate all devices and locations prior to equipment installation with owner.
7. Coordinate Owner-desired camera views, providing camera modeling prior to installation.
8. Coordinate Camera housing and mount finishes with Architect and Owner.

Install and wire equipment in accordance with University of Kentucky ITS Standards, manufacturer’s recommendations, and accepted engineering and installation practices.

Mount system components as recommended by manufacturer. All equipment mounting in Communication Closets must be approved by UK ITS prior to installation.

9. Arrange equipment to facilitate permanent access for use and maintenance.

3.2 CABLE INSTALLATION

Neatly lace, dress, and support cabling.

Pull cables in accordance with cable manufacturer's recommendations and ANSI/EEE C2 Standards as well as University of Kentucky ITS Standards and all Division 270000 requirements.

1. Do not exceed manufacturer's recommended pulling tensions.
2. Do not install bruised, kinked, scored, deformed, or abraded cable.
3. Do not splice cable between indicated termination, tap, or junction points.
4. Remove and discard cable where damaged during installation and replace it with new cable.
5. Pull all cable by hand unless installation conditions require mechanical assistance.

Run all wire and cable continuous from device location to final point of termination. No mid-run cable splices shall be allowed.

Furnish and install all cable such that ample slack is supplied at device terminating end of cable to compensate for any final field modifications in camera location.

6. Loosely coil slack in “Figure-eight” in a manner that prevents kinking.
7. Loop radius shall be at least 4X minimum bend radius for cable.
8. Slack length of cable shall be 4 feet (minimum).

Provide code compliant fire proofing techniques for all penetrations of fire rated partitions and slabs, where penetrations are made by or used for installation of Video System.

Coordinate routing of wire and cable requiring isolation from power, radio frequency (RF), electromagnetic interference (EMI), telephone, etc. with Engineer.

At no time shall any cable be subjected to a bend less than manufacturer’s specified minimum radius. Also refer to UKITS Standards.

Provide grommets and strain relief material where necessary to avoid abrasion of wire and excess tension on Wire and Cable.

Make connections with solder-less devices, mechanically and electrically secured in accordance with manufacturers’ recommendations. Wire nuts shall not be an acceptable means of connecting wire and cable.

3.3 IP VIDEO CAMERAS

Mount Video Cameras per project drawings.

Field-verify exact locations and field-of-views with Owner prior to installation.

Provide video camera lenses to accommodate Owner-coordinated field-of-view per camera.

1. Field verify and confirm views with Owner prior to procurement and final installation and adjust camera positions and lens sizes as required upon installation.

Configure resolution, frame rate, password, etc. to match existing system installation, coordinate with UKPD.

Coordinate with Owner prior to installation to confirm required parameters.

Wire interface(s) to external alarms.

3.4 NETWORK CONNECTION

Cross-connections to building LAN by Owner, NO EQUIPMENT MAY BE CONNECTED TO UK NETWORKS BY ANY SUB CONTRACTOR, ONLY BY UK ITS personnel.

3.5 LABELING AND IDENTIFICATION

Labeling protocols to match all UK Security System installations.

1. Cabling, Hardware, and Equipment shall be clearly labeled using a Code identifying each piece as unique throughout Video Camera System. This code will aid in identifying hardware for servicing and maintenance.
2. Labels and Tags shall be machine-generated using English character set in black ink on white background labels and Tags.

    a. Self-laminating permanent labels are required on cables; permanent non-marring labels are required on all other hardware/cabinets.
    b. No hand-written Labels or Tags shall be allowed.
    c. Dymo or Kroy type adhesive backed lettering is not acceptable.

Identify and tag all cables to denote function.

3. Tag shall indicate:

    a. System of which cable is a part,
    b. Indication of cable destination (e.g., room or component), and
    c. Unique alpha-numeric identifier that distinguishes cable from all others in system.

All labels shall be machine generated. Handwritten labeling is not acceptable.

Label all front panel controls used in normal operation of system using plastic laminate engraved labels or approved equal.

4. Firmly affix to panel or device.

Labeling Formats

5. To be defined by Owner prior to construction following practice for all campus Security System installations.

3.6 SYSTEM TESTING AND ACCEPTANCE

System shall be complete and fully operational before requesting final acceptance and scheduling system Integration into the Campus VMS.

Installation of all field devices will be inspected by Owner or Owner's representative. Inspection will consider overall neatness and quality of installation, functionality of each individual device, mounting, wiring and labeling.

Conduct a seven-day burn-in test. Intent of burn-in test shall be to prove System by placing it in near real operating conditions prior to connection to Campus VMS.

1. During this period System shall be fully functional and programmed so that all points, controls, messages, prompts, etc. can be exercised and validated.

Provide written notification to Owner that system is completely installed, integrated, burn-in testing completed and is fully functional as specified herein.

2. Submit schedule for acceptance testing. Representatives of Owner, UKPD and/or representative may witness test procedures.
3. Notify Owner UKPD and the representative in writing a minimum of two weeks in advance to allow for such participation.
4. Describe test procedures prior to testing and submit sample test form to Owner / Representative.

Prior to final acceptance test, equipment rooms and similar areas should be free of accumulation of waste materials or rubbish caused by operations under Contract.

Equipment shall be on and fully operational during any and all testing procedures.

5. Provide all personnel, equipment, and supplies necessary to perform site testing.

6. Supply a form of communication with remote parties in the team for use during test.
7. A manufacturer's representative shall be present on site to answer any questions that may be
   beyond technical capability of Contractor's employees, if Contractor so elects or by specific request of Representative Owner, at no charge to Representative or Owner.

During course of final acceptance test, Contractor shall be responsible for demonstrating that, without exception, provided VMS complies with contract requirements.

Testing shall include but not be limited to:

8. Continuity and conductor/connector integrity on all cables.
9. Demonstrate functionality of all cameras including:
   a. Owner-acceptable field of view.
   b. Response to alarms.
   c. Response to Access Control System inputs.
10. Confirm remote viewing, configuration, and camera control via Browser and in the UKPD Operations Center. Confirm all Analytic uses on Cameras programmed for Analytic use.
    a. Confirm system rights settings for authorized users.
11. Demonstrate storage and retrieval of recorded video by date/time.

Owner retains the right to suspend and/or terminate testing at any time when system fails to perform as specified.

12. In event it becomes necessary to suspend test, Contractor shall work diligently to complete / repair all outstanding items to condition specified in Specification and as indicated on Security Drawings.
13. All Owner's / Representative Fees and expenses related to suspended test will be deducted from Contractor's retainage.
14. Contractor shall supply Owner with a detailed completion schedule outlining phase by phase completion dates and a tentative date for a subsequent punch list retest.
15. During final acceptance test, no adjustments, repairs, or modifications to system will be conducted without permission of Owner.

Upon successful completion of final acceptance test (or subsequent punch list retest) Owner or Representative will issue a letter of final acceptance.

Records of Test Results shall be included in System Documentation and submitted as detailed below.

3.7 OWNER TRAINING

Training course for system covered in this section shall be a minimum of 6-hours.

Maximum number of students to be (6).

1. Training materials shall be provided to all students.

Record, label, and catalog all training on DVD Videodiscs. Provide discs to Owner for future in-house training sessions and / or reviews. Furnish all temporary equipment necessary for taping all training sessions. Maintain accurate and up-to-date time sheets of all training sessions.

Contractor shall be on call during Warranty period to answer any questions Owner might have. The Owner reserves the right to use any excess training hours, not used by time of system completion, for future training as requested by Owner until total number of training hours has been completed.

3.8 DOCUMENTATION

All Owners manuals and or maintenance information shall be provided in printed form as well as electronic PDF format to the owner and owner representative.

3.9 WARRANTY AND SUPPORT

Unless otherwise noted, Contractor shall guarantee all materials, equipment, etc., two (2) years from date of final Owner acceptance of system. This guarantee shall include all labor, material, and travel time.

Contractor/Integrator and/or manufacturer(s) of system equipment must offer:

1. Technical Support Capabilities (Technician onsite) response time onsite within 4 hours, 24-hours/7-days per week (“24/7”), and 365 days per year.
2. 24-hour turn-around (from receipt of item) for Repair or Replacement of failed components, 7-days per week.

END OF SECTION 282300

SECTION 312000A - EARTH MOVING – FINAL GRADING

PART 1 GENERAL

1.01 DESCRIPTION

A. Perform earthwork as shown and specified. The work includes:

1. Site grading and filling to indicated elevations and contours.

2. Subgrade preparation for site walls, curbs, stairs, walks and paving.

3. Finish grading.

B. Related Work:

1. Section 329113: Planting Soil Systems (Structural Soil)

2. Section 329115: Soil Preparation and Mixes

3. Section 329210: Turf and Grasses.

4. Section 329310: Exterior Planting.

5. Section 334100: Storm Utility Drainage Piping.

1.02 QUALITY ASSURANCE

A. Testing and inspection: Performed by a qualified independent testing laboratory, under the supervision of a registered professional engineer, specializing in geotechnical and soils engineering.

C. Owner shall provide and pay for testing and inspection during earthwork operations as part of Special Inspections. The Contractor shall facilitate and cooperate with the Special Inspector.

D. Materials and methods of construction shall comply with the following standards:

1. Kentucky Department of Transportation Standard Specifications for Road and Bridge Construction, latest edition.
2. American Society for Testing and Materials, (ASTM).
3. American Association of State Highway and Transportation Officials, (AASHTO).
4. National Fire Protection Association, (NFPA).
5. Revised Report of Geotechnical Exploration by Solid Ground Consulting Engineers, PLLC. dated August 1, 2023.

E. Special Inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by Section 1704 of the International Building Code (IBC). The approved soils report and the documents prepared by the registered design professional in responsible charge shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved soils report. The following require verification and inspection of soils:

1. Verify materials below footings, pavements and walks are adequate to achieve the design bearing capacity: Periodically during task listed.
2. Verify excavations are extended to proper depth and have reached proper material: Periodically during task listed.
3. Perform classification and testing of controlled fill materials: Periodically during task listed.
4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of controlled fill: Continuous during task listed.
5. Prior to placement of controlled fill, observe subgrade and verify that site has been properly prepared: Periodically during task listed.

1.03 SUBMITTALS

A. Facilitate and cooperate with Special Inspection personnel for collection of samples of materials proposed for use.

B. Special Inspection engineer shall submit reports and certifications for testing and inspection of the following:

1. Fill and backfill materials.

2. Compaction operations.

3. Foundation excavations and footing subgrade.

1.04 PROJECT CONDITIONS

A. Known underground and surface utility lines are indicated on the drawing. Contractor is responsible for verifying location of existing utilities.

B. Protect existing trees and other features designated to remain as part of the landscaping work.

C. Protect excavations by shoring, bracing, sheeting, underpinning, or other methods, as required to prevent cave-ins or loose dirt from entering excavations. Barricade open excavations and post warning lights at work adjacent to public streets and walks.

D. Underpin adjacent structure(s), including utility service lines, which may be damaged by excavation operations.

E. Promptly repair damage to adjacent facilities caused by earthwork operations. Cost of repair at Contractor's expense.

F. Promptly notify the Architect of unexpected sub-surface conditions.

G. Protect bottoms of excavations and soil beneath and around foundation from frost and freezing.

H. Grade at excavations to prevent surface water draining into excavated areas. Provide ditches or berms to direct surface runoff to locations where it can drain into storm sewer system or be collected and pumped from construction site.

PART 2 PRODUCTS

2.01 MATERIALS

A. All fill material is subject to testing and inspection.

B. Fill materials: Inert subsoil material free of organic matter, rubbish, debris, and rocks greater than 3" diameter and meeting the following requirements:

1. Plasticity index of not more than 30 with a maximum dry density (ASTM D698) greater than 100 pcf.

2. Moisture content of compacted fill shall be maintained at plus 2 percent to minus 2 percent of optimum moisture.

3. Provide and utilize off-site borrow fill material when borrow fill is required to complete the work. Verify suitability of off-site borrow fill material and locations with the Geotechnical Engineer prior to transporting the material to the site.

4. Proposed fill material shall be inspected and tested prior to use in the work.

5. Suitable excavated materials (Lean clay as identified in Geotechnical Report) removed to accommodate new construction may be used as fill material subject to Geotechnical Engineer's inspection and approval. Fat clay that occurs beneath the lean clay on site may remain as long as it does not occur within 3 feet of the sub-grade of building footings or slabs. Fat clays excavated on site may be used as fill in areas outside of the building footprint if they are placed at elevations in excess of 3 feet below sub-grade and compaction requirements can be met. Excess material and unsuitable material shall be wasted off-site at the Contractor’s expense.

C. Granular base: Dense graded aggregate for fill beneath building footings and slabs as noted on plans and details.

D. Granular fill: AASHTO M43, #2, #57 or #9 clean uniformly graded stone or gravel as noted on plans and details.

E. Rip rap: Round carbonate stones or fragmented carbonate rock, dense, sound, and free of cracks or seams, shale, clay, friable materials and debris, placed at thickness indicated on plans. Provide all rip rap materials as required to complete the work.

F. Geotextile filter fabric: KYDOH type IV non-woven soil separator.

G. Silt fence: Propex (formerly Amoco) 2130 or equal.

H. Other materials required for proper completion of work: As selected by Contractor and acceptable to Architect.

PART 3 EXECUTION

3.01 PREPARATION

A. Establish extent of grading and excavation by area and elevation. Designate and identify datum elevation and project engineering reference points. Set required lines, levels, and elevations.

B. Do not cover or enclose work of this Section before obtaining required inspections, tests, approvals, and location recording.

3.02 EXISTING UTILITIES

A. Before starting grading and excavation, establish the location and extent of underground utilities in the work area by contacting utility companies. Exercise care to protect existing utilities during earthwork operations. Perform excavation work near utilities by hand and provide necessary shoring, sheeting, and supports as the work progresses. Damage to utilities will be repaired immediately in a continuous effort until complete at the Contractor's expense.

B. Maintain, protect, relocate, or extend as required existing utility lines to remain which pass through the work area. Pay costs for this work, except as covered by the applicable utility companies.

C. Protect active utility services uncovered by excavation.

D. Remove abandoned utility service lines from areas of excavation. Cap, plug, or seal abandoned lines and identify termination points at grade level with markers.

E. Accurately locate and record abandoned and active utility lines rerouted or extended on project record documents.

3.03 SITE GRADING

A. Perform grading within contract limits, including adjacent transition areas, to subgrade of new elevations, levels, profiles, and contours indicated. Provide subgrade surfaces parallel to finished surface grades. Provide uniform levels and slopes between new elevations and existing grades.

B. Grade surfaces to assure areas drain away from structures and to prevent ponding and pockets of surface drainage. Provide subgrade surfaces free from irregular surface changes and as follows:

1. Rough grading: Plus or minus 0.10 ft. subgrade tolerance. Finish required will be that ordinarily obtained from either blade-grader or scraper operations.

2. Provide subgrade surface free of exposed gravel or stone exceeding 3" in greatest dimension in paved areas or 1" in lawn and planting areas. Areas with concentrated amounts of stone of any size including smaller than 1", such as stockpile/staging areas, edges of pavement or utility trenches, shall be raked clean of stone prior to placement of topsoil.

3. Paved areas: Shape surface of subgrade areas to line, grade, and cross-section indicated. Provide compacted subgrade suitable to receive paving base materials. Subgrade tolerance plus 0, minus 1/2".

4. Granular base: Grade subgrade surface smooth and even, free of voids to the required subgrade elevation. Provide compacted subgrade suitable to receive granular base materials. Tolerance 1/2" in 10'-0".

C. Grading at existing trees to remain:

1. Perform grading, within branch spread of existing trees to remain, by hand methods to elevations indicated.

2. Cut roots cleanly to depth 3" below proposed finish grade. Coat cut roots with tree paint.

3.04 EXCAVATING

A. Previous Bid Package performed mass excavation to subgrades for building footing and slabs. This bid package requires excavation and fill to subgrade for site pavements, walkways, landscape areas, etc. Perform additional excavation to install underground detention system and as necessary to meet elevations indicated on the Grading Plan for all remaining site elements. Remove fat clay soils from within 3 feet in depth beneath walkways and pavements. Fat clay soils may remain at depths in excess of 3 feet deep beneath subgrades. Contractor shall segregate stockpiles of fat clays from lean clays. No room is available on site for soil stockpiling. Contractor shall stockpile soil at off-site locations that cannot be immediately placed in required fill areas due to construction sequencing. Contractor shall stockpile excavated materials necessary for fill required and haul away and dispose of any excess material at the completion of earth moving operations (including any material stockpiled by previous bid packages).

B. Excavate to subgrades indicated on the plans. Obtain inspection and testing of subgrades for paving.

C. Earth excavation shall include the satisfactory removal and disposal of all materials encountered, regardless of the nature of the materials, the condition of the materials at the time they are excavated, or the manner in which they were excavated. **All excavation shall be unclassified.**

D. Unauthorized excavation: Backfill and fill all over excavation to proper grades. Fill over excavation at footings with 1,500 psi concrete. Additional labor and material for unauthorized excavation and remedial work at Contractor's expense.

E. Shore, sheet, or brace excavations as required to maintain them as secure from caving. Remove shoring and bracing as backfilling progresses, when banks are safe against caving.

F. The use of explosives is not permitted.

G. When necessary, cut away rock in bottom of excavations to form level beds that follow natural strata. Form with sharp steps when steps are required. In utility trenches, excavate 6" below invert elevation of pipe and 24" wider than pipe diameter, minimum 36" trench width. Remove loose materials to sound base.

H. Existing storm and sanitary sewerage: Where existing sewers pass beneath new paving, remove existing earth fill to the top of the sewer pipe or to a depth as directed by the Geotechnical Engineer. Install an approved backfill material compacted in maximum 8" layers. Extend compacted fill from top of sewer pipe to proposed paving subgrade elevation.

3.05 DRAINAGE

A. Provide necessary pumps and drainage lines and maintain excavations, including footings, basements and pits, free from water, ice and snow during excavating and subsequent work operations.

B. Provide drainage of the working area at all times.

3.06 FILLING, BACKFILLING, AND COMPACTING

A. Obtain inspection and approval of subgrade surfaces by Geotechnical Engineer prior to filling operations. Scarify, dry, and compact soft and wet areas; remove and replace unsuitable subgrade materials with an approved compacted fill material. Take corrective measures before placing fill materials.

1. Topsoil not permitted as fill or backfill material within structure limits or under paved areas.

B. Spread approved fill material uniformly in layers not greater than 8" of loose thickness over entire fill area.

1. Lift thickness requirements may be modified by Geotechnical Engineer to suit equipment and materials or other conditions when required to assure satisfactory compaction.

2. Moisture-condition fill material by aerating or watering and thoroughly mix material to obtain moisture content permitting proper compaction.

3. Place and compact each layer of fill to indicated density before placing additional fill material. Repeat filling until proposed grade, profile, or contour is attained.

4. Suspend fill operations when satisfactory results cannot be obtained because of environmental or other unsatisfactory site conditions. Do not use muddy or frozen subgrade surface. Do not place fill material on muddy or frozen subgrade surface.

5. Maintain surface conditions, which permit adequate drainage of rainwater and prevent ponding of surface water in pockets. When fill placement is interrupted by rain, remove wet surface materials or permit to dry before placing additional fill material.

C. Filling at existing trees to remain: No fill shall be permitted within the dripline of existing trees to remain.

D. Place backfill materials in uniform layers not greater than 8” loose thickness over entire backfill area and compact each lift properly. Backfill shall be placed in uniform layers not greater than 4" loose thickness over areas where compaction is achieved with hand compactors or manual means.

E. Fill all areas of settlement to proper grade before subsequent construction operations are performed.

F. Compaction:

1. Provide compaction control for all fill and backfill.

2. Compact top 12" of subgrade and each layer of fill or backfill material for future foundations and floor slabs to 98% of maximum dry density at optimum moisture content in accordance with ASTM D698 Standard Proctor Method. Extend compaction at least 5'-0" at both sides of foundations.

2. Compact top 12" of subgrade and each layer of fill or backfill material at future paved areas to 95% of maximum dry density at optimum moisture content in accordance with ASTM D698 Standard Proctor Method. Extend compaction at least 1-0" beyond slabs-on-grade and paving.

3. Compact top 6" of subgrade and each layer of fill material at future lawns and unpaved areas to 85% of maximum dry density at optimum moisture content in accordance with ASTM D698 Standard Proctor Method.

4. Water settling, puddling, and jetting of fill and backfill materials as a compaction method are not acceptable.

5. Maintain moisture content of materials, during compaction operations within required moisture range to obtain indicated compaction density.

6. Provide adequate equipment to achieve consistent and backfill materials.

3.08 EROSION CONTROL

A. Provide erosion control measures as indicated on plans including installation of silt fencing, installation of silt check inlet controls with specified materials.

1. Install silt fence in areas indicated on plans to conform with specified details. Silt fencing shall be installed prior to all grading activity.

B. Contractor shall provide continual maintenance of erosion control structures, including but not limited to:

1. Removal of silt, trash, mud, debris from ditches, channel and from silt fences.

2. Replacement of silt fence that has been damaged or destroyed.

C. Contractor shall keep all public roads free of silt, dirt, mud and debris throughout the entire project. Contractor shall remove and clean any silt, dirt, mud and debris from roadways at their expense.

E. Contractor shall thoroughly read and comply with all aspects of the SWPPP plan. The plan includes certifications that must be signed and submitted by the contractor and appropriate sub-contractors prior to approval of the first application of payment.

F. The Contractor shall be named a co-permittee of the KPDES or General KYR10 Permit and shall agree to the following certification:

“I certify under penalty of law that I understand the terms and conditions of the general Kentucky Pollutant Discharge Elimination System (KPDES) or General KYR10 Permit that authorized the storm water discharges associated with industrial activity from the construction site identified as part of this certification.”

The Contractor shall be responsible for preparing and submitting the Notice of Intent to governing agency 30 days prior to site disturbance.

3.09 FINISH GRADING

A. Topsoil shall be provided from off-site and meet the specifications in sections 329113 and 329115.

B. Prior to finish grading, remove all 1” size and larger gravel from top 6” of subgrade soil in lawn areas and planting bed or tree planting areas. Make certain that areas with concentrated amounts of stone of any size including smaller than 1”, such as stockpile/staging areas, edges of pavement or utility trenches, have been raked clean of stone prior to placement of topsoil. Topsoil mixes shall be placed during dry weather. Do not grade topsoil with equipment that will over compact topsoil preventing the adequate root growth of proposed turf/plants. Bulldozers and backhoes are not suitable for the final step of finish grading. Tractors or skid steers with box graders shall be used to groom the soil and remove the clods and rocks.

C. Fine grade topsoil eliminating rough and low areas to ensure positive drainage. Maintain levels, profiles, and contours of subgrades.

D. Remove stones, roots, weeds, and debris while spreading topsoil materials. Rake surface clean of stones 1" or larger in any dimension and all debris. Provide surfaces suitable for soil preparation provided under lawn and planting work.

E. Landscape Architect shall be notified a minimum of 2 days prior to placement of topsoil so the subgrade may be inspected and the placement of topsoil by the Contractor may be observed.

F. Maintenance:

1. Protect finish graded areas from traffic and erosion. Keep free of trash and debris. Repair and re-establish grades in settled, eroded, and damaged areas.

2. Where completed areas are disturbed by construction operations or adverse weather, scarify, re-shape, and compact to required density.

3.10 FIELD QUALITY CONTROL

A. Contractor shall provide adequate notice, cooperate with, provide access to the work, obtain samples, and assist testing agency and their representatives in execution of their function.

B. Fill materials: Test proposed materials to verify suitability for use, gradation of material, moisture-density relation by ASTM D698 Standard Proctor Method, design bearing value, and percent of organic materials.

C. Subgrade surfaces: Based on visual examination at the site, provide bearing tests as required to verify questionable subgrade surfaces are adequate and meet or exceed design bearing values.

1. Structure slabs and paved areas: Make at least 1 test for each 2,000 sq. ft. of questionable surface.

D. Compaction operations: Coordinate full-time inspection and testing during filling and compaction operations. Test each lift to fill to verify compaction meets specified requirements. Provide periodic inspection and testing during site area filling and compaction operations.

1. Future structure slabs and paved areas: Make at least 1 test for each 5,000 sq. ft. of each 8” thick fill lift. A minimum of two tests per each lift are required.

2. Future foundation wall and retaining wall backfill: Make at least 2 tests at locations and elevations directed by the Geotechnical Engineer.

E. When, during progress of work, field tests or observations indicate that installed compacted materials do not meet specified requirements, provide additional compaction until specified density is achieved, or remove and replace defective materials with new materials as directed by the Geotechnical Engineer. Cost of additional labor, materials, and testing to attain specified density shall be provided at Contractor's expense.

3.11 DISPOSAL OF WASTE MATERIALS

A. Stockpile, haul from site, and legally dispose of waste materials, including deleterious soil, trash, and debris.

B. Maintain disposal route clear, clean, and free of debris. Disposal in any floodplain is not allowed.

3.12 CLEANING

A. Upon completion of earthwork operations, clean areas within contract limits, remove tools, and equipment. Provide site clear, clean, free of debris, and suitable for site work operation.

END OF SECTION 312000

SECTION 315000 - TEMPORARY RETENTION SYSTEM, BRACING, AND UNDERPINNING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:

1. Provide and install all components of the temporary retention system (TRS), bracing and underpinning as may be required by existing conditions.
2. This Contractor shall design and provide all plans, labor, materials, equipment and services, and perform all operations necessary for and incidental to the furnishing, installation and maintenance of the TRS, bracing and underpinning systems.
3. Extent and sequencing of work required by this Section shall be coordinated with the Construction Manager and Excavation Contractor.

B. Related Sections:

1. Section 312000 - Earthwork.

1.3 DESCRIPTION

A. All work of this Section shall be executed on a performance basis.

B. Design, provide, monitor and maintain a temporary retention system where shown on the drawings, and at other locations if necessary, to complete the mass excavation for the project.

1. The TRS shall be capable of resisting all soil and surcharge loads, including those produced by construction equipment for future building construction.
2. Walers and tiebacks shall be located to clear all permanent construction. Coordinate tiebacks with location of all existing utilities, foundations, and other existing obstructions.
3. The maximum height of unsupported excavations shall be determined by site conditions and lateral earth and surcharge loadings such as to prevent loss of soil and/or movement of existing structures, pavements, utilities or property.
4. Tiebacks, if used, shall be installed at elevations indicated on the Contractor's working drawings, and shall be successfully tested by this Contractor before the excavation is taken to a greater depth.
5. The TRS is intended to be at least six feet clear of the foundation walls to allow for installation and removal of formwork and installation of waterproofing.

C. If necessary, underpin, shore or brace existing foundations or other improvements where necessary to complete the excavation for the project. Underpinning shall reestablish solid bearing on existing soil for entire width of footing.

D. Install excavation support and protection systems without damaging existing buildings, pavements, utilities and other improvements adjacent to excavation.

1.4 QUALIFICATIONS

A. This Contractor shall have a minimum of five years of experience in the type of work required by this Section, and within the past five years shall have successfully installed at least two retention systems of the type, size, depth, and conditions proposed for this project.

B. This Contractor shall submit evidence of his experience and have at least one Registered Professional Engineer licensed in the state where this project is located.

C. This Contractor shall have on his staff a supervising engineer for this project having at least five years of design and construction experience in the type of work required by this Section.

D. This Contractor shall have a foreman or superintendent experienced in the type of work required by this Section who will be present while this work is being performed.

E. This Contractor shall engage a Professional Surveyor licensed in the state where this project is located to perform surveys, layouts and measurements for the work of this Section.

1.5 PROJECT CONDITIONS

A. A subsurface investigation has been made and the results are available in the form of a Geotechnical Engineering Report for the project, prepared by the Owner's Geotechnical Engineer and is available for bidders to review. This information was obtained primarily for use in preparing the foundation design, and for evaluating existing conditions that may affect this Contractor's work.

1. Data on indicated subsurface conditions are not intended as representatives or warranties of continuity of such conditions. It is expressly understood that the Owner, Construction Manager, and Architect/Engineer will not be responsible for interpretations or conclusions drawn there from by the Contractor.
2. Data is made available for the convenience of the Contractor and is not guaranteed to represent conditions that may be encountered, nor is it to be included as part of the Contract Documents.
3. It is required that all Contractors or Subcontractors submitting bids for this part of the Work visit the site and make whatever additional investigations, including drilled test holes, they deem necessary to prepare their bids. All additional investigation work requires approval and coordination with the Owner. All test holes shall be filled immediately after investigation is completed to the satisfaction of the Owner. All additional investigations, including drilled test holes, test pits, etc., shall be paid for by the Contractor.

B. Prior to the execution of this work, this Contractor, Construction Manager, Architect and a representative from the Owner shall jointly survey the condition of adjoining structures and properties. Photographs and records shall be made of any prior settlement or cracking of structures, pavement and the like, that may become the subject of possible damage claims.

C. The Contractor is responsible for field locating and verifying the location of all existing utilities before starting the work. Maintain uninterrupted service for utilities designated to remain in service. Notify Construction Manager and Architect of any utility locations different from that shown on the plans.

D. Components of the TRS and bracing systems may penetrate areas of natural soils and fill. Debris, buried foundations and walls, abandoned piles and lagging from past construction, other obstructions, and water may be encountered. Contractor shall, within the Base Bid, be responsible for penetrating all obstructions, preventing caving of soils surrounding holes, and providing water protection and dewatering if necessary.

E. Prior to completion of the project, all components of the TRS and bracing systems (soldier beams and lagging, sheeting, etc.) located within the upper six feet of the public right of way shall be removed. Tieback anchors located within the upper 15 feet of the public right of way shall be de-tensioned.

1.6 DESIGN CRITERIA

A. The TRS, bracing, and underpinning systems, shall be designed by this Contractor to safely support all earth and surcharge pressures, including those from existing buildings and construction equipment, without deflections or settlements that may damage adjacent structures, pavements, utilities or property.

B. This Contractor shall coordinate with the Construction Manager the location and weight of all construction equipment producing surcharge loads on the work of this Section.

C. Lateral pressure diagrams for use in the design of the TRS and bracing systems shall be submitted for review and acceptance of the Geotechnical Engineer.

D. Design, installation, and testing of tiebacks shall be in accordance with Post-Tensioning Institute (PTI) DC35.1 Recommendations for Prestressed Rock and Soil Anchors.

E. Refer to the Geotechnical Report and, if necessary, consult with the Geotechnical Engineer for additional information and recommendations for the design of the TRS and bracing systems. All fees for geotechnical engineering assistance shall be paid by the Contractor.

1.7 SUBMITTALS

A. Prior to starting work, submit for record calculations and working or shop drawings showing each proposed method of supporting adjacent earth and structures (i.e., retention system and tiebacks, sheeting, underpinning, other methods of bracing, etc). The drawings shall include the following:

1. Lists of materials to be used, including design mixes and mill tests.
2. Sequence of operations.
3. Detailed sections clearly illustrating the scope of work.
4. Relationship of components (soldier beams, piles, sheeting, tiebacks, etc.) to new and existing construction.
5. Location of utilities and streets.
6. Procedures and details of all testing.
7. Proposed methods and details for monitoring the performance of the TRS.

B. Drawings and calculations containing the information indicated above shall be prepared under the direct supervision of a qualified Professional Engineer registered in the state where the project is located, and who meets the qualifications outlined herein. The drawings and calculations shall bear this Professional Engineer's seal and signature.

C. The Architect/Engineer's review of the Contractor's working drawings and calculations will be for general compliance with the project scope only. The Contractor is solely responsible for the design and performance of the TRS, bracing and underpinning.

1.8 QUALITY CONTROL AND ASSURANCE

A. The Contractor shall confirm in writing with the Geotechnical Engineer the lateral earth pressure diagrams used for design of the TRS and bracing systems.

B. Construction Monitoring:

1. Construction monitoring will be performed by the Owner's independent Testing Agency.
2. Testing Agency will conduct, monitor, and report results of tests and inspections required under this Section.
3. Testing Agency will observe all TRS operations and perform the following:
   a. Review Contractor's calculations and drawings.
   b. Monitor the performance of the TRS, including measurement of the lateral deflection at the top on not less than a bi-weekly basis. The first reading will be taken before any earth is excavated adjacent to the retention system. The system will be monitored until walls are backfilled.
4. Testing Agency will monitor installation of bracing and underpinning work of this Section.

1.9 WARRANTY

A. Restore and repair to the Owner's satisfaction all structures, pavement, utilities and property damaged due to movement of the TRS, bracing or underpinning.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Tieback anchor materials shall be fabricated in accordance with PTI DC35.1 Recommendations for Prestressed Rock and Soil Anchors.

B. Cast-in-place concrete, including reinforcement and testing, shall comply with American Concrete Institute (ACI) 301 Specifications for Structural Concrete.

1. Concrete for underpinning shall be made with high early strength cement.
2. Grout for underpinning shall be non-shrink.

C. Structural steel components shall comply with American Institute of Steel Construction (AISC) 360 Specification for Structural Steel Buildings.

D. Wood lagging shall be of sufficient size and quality to retain the calculated earth pressures.

PART 3 - EXECUTION

3.1 EXAMINATION

A. This Contractor shall examine areas and conditions under which the work is to be performed. Notify Construction Manager of conditions detrimental to proper and timely completion of the Work.

B. Starting of work constitutes acceptance of existing conditions and substrates.

3.2 PREPARATION

A. Before drilling or driving, verify locations of underground utilities with the utility companies, Owner and Construction Manager. Excavate or survey to establish exact utility locations where necessary. Coordinate all work with the utilities to assure their uninterrupted function.

3.3 PROTECTION

A. Where active utilities are encountered but not shown on Drawings, the Construction Manager, Utility Owner, Architect and Owner shall be notified; and work shall be protected, supported, or relocated as directed. Repair damaged utilities to the satisfaction of the Utility Owner, Owner, and Construction Manager.

B. Inactive and abandoned utilities encountered shall be reported to the Construction Manager and Owner. The utilities shall be removed, plugged or capped as directed by the Utility Owner. In absence of specific requirements, plug or cap such utility lines as required by local regulations.

3.4 TIEBACKS

A. Drill for, install, tension, and grout tiebacks into position. Test load-carrying capacity of each tieback before taking excavation to a greater depth.

B. Replace and retest deficient tiebacks.

3.5 INSTALLATION OF UNDERPINNING

A. After excavation, thoroughly clean contact surface of underside of existing foundations. Bring underpinning concrete up to within 4” of bottom of existing foundations and fill remaining space with grout. Make grout as dry as possible and pack firmly, leaving no voids.

B. Underpinning shall be placed sequentially in such a manner to maintain the safety and stability of the excavation and existing construction.

3.6 COORDINATION WITH OTHER OPERATIONS

A. Installation and sequencing of the TRS, bracing and underpinning work shall be coordinated with the work of all other trades affected by this work, such as demolition, excavation, foundations, and other operations.

3.7 WASTE REMOVAL

A. Remove from the site and legally dispose of all waste material resulting from or caused by the work of this Section.

END OF SECTION

SECTION 316320 - DRILLED PIERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes all labor, material, equipment, special tools and services required to complete all drilled pier work, as herein specified, and as indicated on the Drawings, including but not limited to:

1. Drilling and excavation of pier shafts.
2. Metal casings or shells.
3. Protection of shaft openings.
4. Removal of steel casings or shells.
5. Removal of excavated materials.
6. Concrete and reinforcement for drilled piers.
7. Probe holes at all piers as noted on the drawings, include cost in base bid.

B. Related Sections:

1. Section 033000 - Cast-in-Place Concrete.
2. Section 312000 - Earthwork.

C. Unit prices:

1. Drilled Pier Work shall be on a lump sum basis, based on the sizes and total lengths of drilled piers shown on the Drawings.
2. Unit prices per linear foot for each shaft diameter shall be provided as set forth in the Bid Form for adjustment of Contract Sum by Change Order to reflect net difference between total of design lengths and actual length of piers installed.
3. These unit prices shall apply to both net overages and underages and shall include the costs of drilling, casing, cleaning, concreting, reinforcing, and all other costs associated with the change in footage.
4. Provide separate unit costs for the length of drilled piers installed in rock and the length of drilled piers installed above the rock sockets specified herein and indicated on the Drawings.
5. No payment will be made for increases in concrete volume due to causes other than length change.
6. No payment will be made for over-drilling not directed by the Geotechnical Engineer. Fill the extra depth with concrete if all other conditions are satisfactory.
7. Include a unit price for additional probe holes.

1.3 REFERENCES

A. Comply with the provisions of the latest edition of the following codes, specifications and standards unless a date is indicated. Modifications in this specification, when in conflict with the referenced codes, specifications and standards, shall take precedence.

1. Kentucky Building Code (KBC).

2. ACI (American Concrete Institute) 336.1-01: Specification for the Construction of Drilled Piers Structures is hereby incorporated as part of this Section. Supplemental requirements and modifications listed herein take precedence over the requirements of ACI 336.1. All ACI 336.1 items unless modified by the Contract Documents are incorporated as written. When any part of any item is modified or voided, the unaltered provisions of the part shall apply as written.
3. ACI 301-16: Specifications for Structural Concrete.
4. CRSI (Concrete Reinforcing Steel Institute) Manual of Standard Practice, 29th Edition.

B. A copy of each reference shall be kept in the project's field office at all times. They shall govern the work except as herein modified.

1.4 SUBMITTALS

A. Submit documentation to demonstrate compliance with the Contractor qualifications noted below. Include experience record of supervisory personnel and drillers.

B. Submit written description of equipment and techniques proposed for use, and names of three similar projects completed by installer in last three years.

C. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

D. Submit plan layout of drilled piers along with reinforcing steel shop drawings.

E. Submit proposed concrete mix design per Section 033000 – Cast-in-Place Concrete.

F. Submit a quality control program per ACI 336.1.

G. At regular intervals, the Geotechnical Engineer's Representative will submit drilling logs to the Owner, Architect/Engineer, Contractor, and Construction Manager with the following information:

1. Identification mark.
2. Shaft diameter.
3. Bottom elevation.
4. Top elevation.
5. Bearing strata description.
6. Depth of penetration in bearing strata.
7. Length and location of any permanent casing.
8. Nature and location of obstructions, including durations.
9. Water conditions during drilling and concrete placement.
10. Deviation from design centerline location and deviation from plumb.

1.5 QUALITY ASSURANCE

A. Qualifications:

1. Drilled piers shall be installed by a specialty Contractor with a minimum of ten years of experience in drilled pier construction.
2. Personnel performing the work shall have experience with similar subsurface materials, water conditions, pier sizes, and special techniques required.
3. Contractor shall have successfully completed at least five contracts with similar type soils, bearing stratum, pier diameters and project size.

B. Contractor shall engage a Kentucky-registered surveyor to perform surveys, layouts, and measurements for drilled pier work. Coordinate with services of Geotechnical Engineer's Representative.

C. Comply with ACI 336.1.

D. Comply with applicable laws, ordinances, and the Kentucky Building Code.

E. A Representative of the Owner's Geotechnical Engineer will conduct construction review services to monitor all drilled pier work, examine prepared bearing surfaces, and establish the final installation elevation to which pier bottoms are to be drilled.

F. Testing of concrete in the field will be performed by the Geotechnical Engineer's Representative or a separate independent Testing Agency retained by the Owner.

G. The Contractor shall select and employ an independent testing agency, subject to the Architect/Engineer's approval, to perform all testing required by the Contractor for qualification of proposed materials, establishment of mix designs, and for all other testing services needed or required by the Contractor.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store pier casings and reinforcing steel above ground on platforms.

B. Protect materials from damage, exposure and corrosion.

C. Drilled pier casings or shells ordered and delivered to the site prior to verification of the assumed working capacities and establishment of criteria for excavating piers shall be at the risk of the Contractor.

1.7 PROJECT CONDITIONS

A. Geotechnical information:

1. Subsurface Information: A report of the subsurface investigation for the project, prepared by the Owner's Geotechnical Engineer, is available to bidders for review.
2. Data on indicated subsurface conditions are not intended as representatives or warranties of continuity of such conditions. It is expressly understood that Owner and Architect/Engineer will not be responsible for interpretations or conclusions made by the Contractor.
3. Data is made available for the convenience of the Contractor and is not guaranteed to represent conditions that may be encountered.
4. It is required that all Contractors or Subcontractors submitting bids for this part of the Work visit the site and make whatever additional investigations, including drilled test holes, they deem necessary to prepare their bids. All test holes shall be filled immediately after investigation is completed to the satisfaction of the Owner.
5. No claim for additional compensation or extension of Contract time will be allowed on account of subsurface conditions inconsistent with the data available except as provided elsewhere herein.

B. Drilled piers will penetrate natural soils, rock and fill. Areas of old pavement, limestone floaters, debris, other obstructions, voids, and water may be encountered. Contractor shall, within the Base Bid, be responsible for penetrating all obstructions, preventing all caving of soils surrounding holes, and providing all water protection and dewatering.

C. Drilled piers may be installed in close proximity to existing spread footings which are presumed to bear at shallow depths. Contractor shall advance casings as the holes are drilled and take other precautions as necessary to protect existing foundations located at high bearing elevations.

D. Existing Utilities: Locate existing underground utilities in areas of drilled pier installation. If utilities are to remain in service provide adequate support and protection. Refer to Drawings for additional utilities information.

E. Protection: Protect structures and other construction from damage caused by drilled pier operations.

1.8 SUPPLEMENTAL REQUIREMENTS AND MODIFICATIONS TO ACI 336.1

A. The following statements modify and supplement ACI 336.1. All unaltered parts of ACI 336.1 shall apply as written. The Section and paragraph numbers correspond to those in ACI 336.1.

SECTION 1 (ACI 336.1) – GENERAL REQUIREMENTS

1.6.1.1 Examine areas and conditions under which drilled pier work is to be performed. Notify Construction Manager of conditions detrimental to proper and timely completion of the Work. Starting of work constitutes acceptance of existing conditions.

1.6.1.2 Do not install drilled piers until required earthwork in the area in which the drilled piers are to be installed has been completed.

1.6.3.1 Before drilling, verify locations of underground utilities with the utility companies and/or Owner. Excavate or survey to establish exact utility locations.

1.6.3.1 Active utilities shown on the Drawings shall be adequately protected from damage. Where active utilities are encountered but not shown on the Drawings, the Construction Manager, Architect/Engineer and utility owner shall be advised; the work shall be protected, supported, or relocated as directed; and the Contract Sum adjusted.

1.6.3.2 Inactive and abandoned utilities encountered shall be reported to the Construction Manager and Architect/Engineer. Utilities shall be removed, plugged or capped as directed by the Architect/Engineer or utility owner. In absence of specific requirements, plug or cap such utility lines as required by the local regulations.

1.6.4.1 The Construction Manager shall arrange a pre-construction meeting to be held a minimum of one week before the scheduled start of drilled pier operations. The meeting shall be attended by the Drilled Pier Contractor, Construction Manager, Structural Engineer, Geotechnical Engineer, Testing Agency, and Drilled Pier Contractor's Surveyor. The purpose of the meeting is to review:

1. Drilled pier installation procedures.
2. Drilled pier inspection and material testing procedures.
3. Contractor's procedures for surveying and documenting locations of existing utilities adjacent to drilled piers.
4. Disposal of drilled pier spoils.

SECTION 2 (ACI 336.1) – PRODUCTS

2.2.3.1 Casings shall be a constant circular section with a minimum nominal inside diameter of shaft sizes called for on the Drawings.

2.3.1 Reinforcing steel shall comply with Section 033000 – Cast-in-Place Concrete and have a minimum yield strength of 60 ksi.

2.4.1.1 Concrete strength and mix design shall comply with Section 033000 – Cast-in-Place Concrete.

2.4.3.1 Slump of concrete placed in dry holes that are uncased or which have permanent casing shall be 5 in. plus or minus 1 in. Slump of concrete placed in holes with temporary casing shall be 7 in. plus or minus 1 in. If required, use high-range water-reducer in concrete to provide required slump without exceeding maximum allowable water-cementitious materials ratio specified in Section 033000 – Cast-in-Place Concrete.

2.7 Drilling equipment

2.7.1 Drilled piers shall be installed with portable drilling rigs equipped with two-way leveling and two-way horizontal positioning. Rigs shall have adequate power, weight and shaft length to meet Project requirements, and a minimum 500,000 inch-pounds of torque and 35,000 pounds of downward force.

SECTION 3 (ACI 336.1) – EXECUTION

3.1.1.1 If specified tolerances for plan location or plumbness are exceeded, provide at no additional cost to Owner corrective measures to compensate for the excess eccentricity. Do not proceed until proposed corrective construction methods have been submitted to and accepted by Architect/Engineer.

3.1.2 Location tolerance at cut-off shall be no greater than 1/24 of the specified shaft diameter or 3 in., whichever is less.

3.1.3 Out-of-plumbness of piers shall not exceed 1.5% of length, nor 12.5% of shaft diameter, nor 15 in., whichever is less.

3.1.5 Maximum slope of bottom of drilled pier shall be 1/4 in. per foot.

3.1.7.1 Tolerances for placing anchor bolts and other embedded items for structural steel work (Section 05 12 00) shall be in accordance with the AISC Code of Standard Practice for Steel Buildings and Bridges.

3.1.7.2 Tolerance on horizontal location of dowels placed in tops of drilled piers shall be plus or minus 1/4 in., based on Contract Document location.

3.1.8 Tolerance on vertical deviation of top surface of drilled piers shall be plus 1 in. to minus 3 in.

3.1.9 Tolerance on drilled pier reinforcement shall be plus or minus 1/2 in., horizontal and vertical, based on actual pier location.

3.2.1.1 Drilled piers shall extend a minimum of one pier diameter into competent bedrock that is approved by the Geotechnical Engineer for 85 ksf bearing, unless noted otherwise on the Drawings or as directed by the Geotechnical Engineer.

3.2.1.2 Drilled piers shall be minimum 10 feet long or four times the diameter of the pier, whichever is greater. Minimum length includes depth of the drilled pier cap.

3.2.1.3 Bottom elevations and bearing capacities and lengths of drilled piers as shown on Drawings and specified herein are estimated from available subsurface data. Actual

elevations, drilled pier lengths, and bearing capacities will be determined by Geotechnical Engineer from conditions found in excavations. Final evaluations and acceptance of data will be by Architect/Engineer.

3.2.2.1 Exercise care during drilling operations, so that soil will not slough or cave-in due to drilling. Distribute equipment loads to prevent cave-ins.

3.2.2.2 Protect drilled shaft openings from earth falling in due to drilling of adjacent shafts.

3.2.3 Each drilled pier shaft shall be inspected by Geotechnical Engineer's Representative to ensure that the drilled pier bears in suitable material and that the shaft is free of debris and water. Do not begin concrete work until shaft is inspected and approved.

3.2.3.2.1 Case and provide proper safety equipment for any shaft into which workmen or an inspector will enter.

3.2.5.1 Remove material likely to scale off walls of drilled piers and thoroughly clean bottom, removing all loose material.

3.2.5.2 Pump and remove all water encountered in the drilled pier shafts. Do not allow water to sit on bearing surfaces of pier. Remove any deteriorated bearing material before concreting.

3.2.6.1 Probe holes 2 to 4 inches in diameter are required at each drilled pier where noted on the drawings. Probe holes shall be installed by the Drilled Pier Contractor and shall extend a minimum of 10 feet and at least 2 pier diameters below the bearing surface. The Drilled Pier Contractor shall coordinate installation of the probe holes and recovery of rock core samples for review with the Geotechnical Engineer's Representative.

3.2.7.1 Dispose of all cuttings from the drilling operation off the Project site, unless otherwise directed by the Construction Manager.

3.2.8 Alternate drilling and concreting closely spaced piers. Do not drill a pier closer than 10 feet to an existing pier less than three days old.

3.2.9 All drilled shaft openings not immediately filled with concrete shall be temporarily protected with a metal lid, spot welded in place.

3.2.10 Record and maintain information pertinent to each drilled pier, including actual measurements of each drilled pier's horizontal axial location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other data as required. Make this information available to the Geotechnical Engineer's Representative for inclusion in the drilling log submittals.

3.4.7.1 Splicing of vertical reinforcing bars for the pier shafts, other than as approved by the Architect/Engineer, shall not be permitted.

3.4.10.1 Insert steel reinforcing cage and wedge in place immediately after drilling and inspection. Reinforcing cages shall be rigidly tied, accurately located in shaft and adequately blocked to maintain the location and clearance shown on the Drawings.

3.4.12 Protect exposed portions of dowels and anchor bolts from mechanical damage and exposure to weather. Band tops of dowel cages with 2 in. wide bright orange ribbons.

3.5.4.1 Place concrete immediately after approval by Geotechnical Engineer's Representative and installation of reinforcing. Concrete to be placed the same day the shaft excavation is completed.

3.5.6.1 Place concrete to avoid segregation. In dry holes (defined as 1/4 inch or less rise per minute in groundwater at bottom of hole with total depth no greater than 2 inches) concrete may be placed by unobstructed free fall down the center of the shaft. In wet holes concrete shall be placed by tremie methods or by pumping in a manner acceptable to the Geotechnical Engineer's Representative.

3.5.6.2 Vibrate upper 20 feet of each drilled pier.

3.5.7.1 Place concrete in each drilled pier continuously without interruption.

3.5.7.2 Protect top of drilled pier from entry of soil or foreign matter during concrete placement and until concrete has set.

3.5.10.1 Cure top and all formed concrete surfaces per Section 033000 - Cast-in-Place Concrete.

3.5.11 Form the top of drilled piers as necessary wherever grade is below scheduled top of drilled pier at time of concrete placement.

3.9 Field Quality Control and Assurance

3.9.1 Drilled piers shall be installed under the full-time monitoring of the Geotechnical Engineer's Representative. Provide facilities required to assist in the inspection and testing of excavations. Cooperate with inspecting and testing personnel to expedite the work.

3.9.2 Owner will select and pay an independent Testing Laboratory to secure and test cylinders, perform slump tests, and ensure compliance with Specifications. Contractor is required to arrange for all testing. Also refer to Section 033000 - Cast-in-Place Concrete.

3.9.3 Owner's Testing Agency will take one set of four 6 by 12 in. cylinders or one set of five 4 by 8 in. cylinders for each 150 cubic yards of concrete, or fraction thereof, placed in any one day. One cylinder will be tested in compression at 7 days and two 6 by 12 in. cylinders or three 4 by 8 in. cylinders will be tested at 28 days in accordance with ASTM C 39. One cylinder will be kept in reserve for additional testing if required.

3.9.4 Owner's Testing Agency may take core samples of in-place concrete when inspections or test results are such that there is reasonable doubt about the quality of concrete or specified concrete strengths have not been attained.

1. Complete continuous coring of drilled piers may be required, at Drilled Pier Contractor's expense, where time of removal of temporary casings exceeds specified limits, or where observations of placement operations indicates cause for suspicion of quality of concrete, presence of voids, segregation or other possible defects.
2. Defective piers shall be corrected by the addition of piers and/or cap beams by the Contractor at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS ARE INCLUDED IN ARTICLE 1.8 ABOVE.

PART 3 - EXECUTION

3.1 EXECUTION REQUIREMENTS ARE INCLUDED IN ARTICLE 1.8 ABOVE.

END OF SECTION

SECTION 32 1123

CRUSHED STONE AND DENSE GRADED AGGREGATE (DGA)

PART 1 GENERAL

1.01 SCOPE OF WORK

A. Furnish and install crushed stone aggregates and DGA as indicated on the Drawings and/or required in the Specifications for such uses as surfaces and/or bases of roads, parking areas and walkways; temporary and permanent traffic bound surfacing over trenches; permanent traffic bound roadway surface maintenance; replacement of unsuitable material; and other miscellaneous applications required in the work.

B. Various sizes, types and quality of crushed stone aggregates are specified in this Section depending on applicability which may be specified in detail in other sections of these Specifications.

C. The ENGINEER may require the use of crushed stone aggregates for purposes other than those specified in this or other Specification sections if such use is advisable in his opinion. Payment for crushed stone aggregate shall be by negotiation unless agreed pricing has been previously established.

1.02 RELATED WORK

A. Earthwork is included in Section 31 2000.

1.03 SUBMITTALS

A. Testing Service shall submit required test reports directly to the ENGINEER with copy to CONTRACTOR.

PART 2 PRODUCTS

2.01 MATERIALS

A. Crushed stone aggregate shall meet the applicable requirements for the intended use in accordance with Section 805 of the Kentucky Transportation Cabinet, Department of Highways, Standard Specifications for Road and Bridge Construction.

B. Unless otherwise referred to on the Drawings or in these Specifications, crushed stone aggregate shall be graded size No. 57 according to the table below.

C. When referred to on the Drawings or in these Specifications, dense graded aggregate (DGA) shall have a sand equivalent value of not less than 25 and shall be graded according to the table below.

D. Coarse aggregate gradations referred to by number size on the Drawings or in these Specifications shall conform to the following table (as copied from the above Kentucky Transportation Cabinet Specifications, Table 805.07):

TABLE I - SIZES OF COARSE AGGREGATES - KENTUCKY

Size	Max. Size Square Openings (1)	AMOUNTS FINER THAN EACH LABORATORY SIEVE (SQUARE OPENINGS) PERCENTAGE BY WEIGHT																	
		100 (4)	90 (3 1/2)	75 (3)	63 (2 1/2)	50 (2)	37.5 (1-1/2)	25 (1)	19 (3/4)	12.5 (1/2)	9.5 (3/8)	4.75 (No. 4)	2.36 (No. 8)	2 (No. 10)	1.18 (No. 16)	600 (3) (No. 30)	425 (3) (No. 40)	150(3) (No. 100)	75 (3) (No. 200)
1	90 (3 1/2)	100	90-100		25-60		0-15		0-5										
2	63 (2 1/2)			100	90-100	35-70	0-15		0-5										
23	63 (2 1/2)			100		40-90		0-15		0-5									
3	50 (2)				100	90-100	35-70	0-15		0-5									
357	50 (2)				100	95-100		35-70		10-30		0-5							
4	37.5 (1-1/2)					100	90-100	20-55	0-15		0-5								
467	37.5 (1-1/2)					100	95-100		35-70		10-30	0-5							
5	25 (1)						100	90-100	20-55	0-10	0-5								
57	25 (1)						100	95-100		25-60		0-10	0-5						
610	25 (1)						100	85-100		40-75		15-40							
67	19 (3/4)							100	90-100		20-55	0-10	0-5						
68	19 (3/4)							100	90-100		30-65	5-25	0-10		0-5				
710	19 (3/4)							100	80-100		30-75	0-30							
78	12.5 (1/2)								100	90-100	40-75	5-25	0-10		0-5				
8	9.5 (3/8)									100	85-100	10-30	0-10		0-5				
9-M	9.5 (3/8)									100	75-100	0-25	0-5						
10	4.75 (No. 4)										100	85-100						10-30	
11	4.75 (No. 4)										100	40-90	10-40					0-5	
DGA(2)	19 (3/4)							100	70-100		50-80	30-65				10-40			2-10
GRAVEL BASE(2)	37.5 (1-1/2)					100						25-65					6-30	5-20	
CSB(2)	50 (2)				100		90-100		60-95		30-70	15-55				5-20			0-8

(1) Nominal size in mm (inches), unless otherwise shown (2) Gradation performed by wet sieve KM 64-420 (3) micrometers

E. Testing

1. Unless otherwise required in this Section, the ENGINEER shall determine the tests required for crushed stone aggregates according to Section 805. The CONTRACTOR shall be responsible, initially, and periodically at no cost to the OWNER, to deliver materials proposed for use or being used in the work to a testing laboratory selected by the OWNER. This provision shall apply to any other aggregate tests required in this Section.

2. The OWNER shall be responsible to pay the laboratory testing costs. However, once a material has been tested and accepted for use, the CONTRACTOR shall be responsible throughout the job to use materials which are equal in all respects and from the same source as that accepted material delivered to the testing laboratory.

3. The CONTRACTOR shall pay for additional tests ordered by the ENGINEER after acceptance of tested materials when such tests show the quality of materials has become deficient or when the CONTRACTOR requests a change of material supplier and/or source.

PART 3 EXECUTION

3.01 INSTALLATION

A. Compacted Crushed Stone Aggregate

1. Crushed stone shall be placed in uniform layers not greater than 6 inches deep and shaped by power equipment to required lines, grades, cross sections, and depths. No minimum compacted density, method of compaction, or compaction equipment is required since a nominal amount of compaction effort with vibration can establish the desired intergranular locking of the aggregate under controlled placement depth. Acceptable compaction can be achieved with pneumatic-tired and tracked equipment and rollers.

2. All compaction operations shall be performed to the satisfaction of the ENGINEER.

3. Crushed stone shall be placed in those areas as shown on the Drawings and as may be directed by the ENGINEER.

B. Compacted Dense Graded Aggregate (DGA)

1. Dense graded aggregate shall be plant mixed with water, transported in such a manner as to deliver the mix to the project without loss or segregation, spread, and compacted to produce a density throughout not less than 84 percent of solid volume. Minimum dry density for compacted limestone DGA shall be 139 pounds per cubic foot when S.G. of limestone is 2.65.

2. Density tests shall be required in such number as determined by the ENGINEER. Density tests shall be made by the sand cone method or by nuclear gauges. The CONTRACTOR shall furnish all necessary labor, equipment, and materials for making the density tests under observations of the ENGINEER.

3. In the event compacted material does not meet the required density of an area, the CONTRACTOR shall either continue compaction efforts or rework the entire area until the required density is obtained. If material has to be removed and reworked, the ENGINEER shall determine if removed material can be remixed and used again for fill.

4. All compacted DGA fill shall be included in the CONTRACTOR'S lump sum bid unless otherwise indicated on the Drawings.

END OF SECTION

***

SECTION 321162 – CRUSHED STONE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Granular Crushed Stone Paving

B. Related Sections:
   1. Division 32 Section ‘Metal Edging’
   2. Division 32 Section ‘Soil Preparation and Mixes’
   3. Division 32 Section 'Turf and Grasses’
   4. Division 32 Section 'Exterior Planting’
   5. Division 32 Section ‘Unit Paving’

1.3 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) Relevant standards (most current specification or standards applies) include but are not limited to the following:
   1. ASTM D-2940 Standard Specification for Graded Aggregate Material for Bases or Sub-bases for Highways or Airports
   2. ASTM 136-93 Method for Sieve Analysis of Fine and Coarse Aggregates
   3. ASTM C-33

1.4 ACTION SUBMITTALS

A. Product Data for the following: For each type of product indicated. Include technical data and tested physical and performance properties.
   1. Approval by the Landscape Architect of submitted product data or other submittals does not constitute final acceptance.
   2. For Base Course, submit Material Certification and Analysis Report. Refer to and comply with requirements specified in Division 31 “Earthwork” as applicable.
   3. For Crushed Stone, submit Material Certification and Analysis Report, indicating compliance with Specifications.
   4. Submit product literature or tear sheets giving name of product, manufacturer's name and compliance with Specifications.

B. Samples for Initial Selection: Submit, prior to installation of Crushed Stone Selection Mock-ups, samples to indicate aggregate and mix proportions for each type. Resubmit to confirm product selections after Selection Mock-up completion.

C. Samples for Verification:

1. Granular Crushed Stone material component each type and/or color: In quantity equal to two (2) pounds. Samples shall be the basis for selection of single colors or color mixtures for Field Samples/Mock-ups.
2. Separation Geotextile: Submit two (2) 12 inch x 12 inch squares.

D. Field Samples / Mockups: Construct at the earliest possible time and at approved location, before proceeding with Work and after Landscape Architect's approval of submitted samples. Submit proposed locations for field samples / mockups and receive approval of locations prior to construction of field samples. Provide and construct sample panel of Crushed Stone paving as specified to show appearance, workmanship, and finish of work, complete and in coordination with work of other Sections as applicable.
1. For Crushed Stone Work: After final selection of Crushed Stone material, provide and construct one (1) Crushed Stone paving surfacing sample, 3 feet by 3 feet, complete with base course and compacted Crushed Stone paving surface as specified in this Section.
   a. Coordinate sample work with conditions and material placement of other sample work or completed work for edging and adjacent conditions.
   b. Mock-up construction for Crushed Stone work will be utilized as a visual confirmation of proposed finish components in addition to establishing a standard for Project construction.

E. Work Field Sample/Mock-ups of Crushed Stone surfacing must be approved by the Landscape Architect before actual on-site paving work may proceed. If necessary, remove and reconstruct Field Sample/Mock-up surfacing until approved. Approved sample surfacing serves as standard of acceptance for final Crushed Stone paving work.

F. Demolish and remove Field Samples/Mock-ups at a time approved by the Landscape Architect and the Owner and when no longer required to serve for material selection or as a standard of work. Accepted mockup may be incorporated as part of Work if conforming to specified requirements, and if accepted by the Landscape Architect.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each kind of accessory, from manufacturer.
1. Submit for each manufactured item or treatment of this Section or required to complete Crushed Stone paving work. Include descriptive information, test reports, and other data of manufacturer.
   a. Submit product literature or tear sheets giving name of product, manufacturer's name and compliance with Specifications.
2. For Crushed Stone, submit Material Certification and Analysis Report.
3. Include instructions for handling, storage, installation and protection.

B. Qualification Data: For qualified installer. Include list of completed projects with project names and addresses, names and addresses of Landscape Architects and Owners, and other information specified.

1.6 QUALITY ASSURANCE

A. The work of this section shall be performed by a company which specializes in the type of paving work required for this project, with a minimum of ten (10) years of documented successful experience and shall be performed by skilled workmen thoroughly experiences in the necessary crafts.

B. Installer Qualifications: Installer shall have a minimum of five (5) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere, in the installation of crushed stone paving specified, and the products, systems, and scope specified. An experienced foreman with a minimum of ten (10) years of experience will oversee all work.

C. Source Limitations: Ensure that supplier has adequate supply of material to complete work without delay.

D. Product Testing
   1. Gradation of Crushed Stone materials according to ASTM C 136 “Method for Sieve Analysis for Fine and Course Aggregates.”

E. Pre-installation Meeting: Before beginning paving work, schedule and conduct a meeting at Project site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Contractor, the installer, the installer’s field foreman and manufacturer’s representative. Inform the Landscape Architect ten (10) business days in advance of the scheduled meeting time.

F. Field Engineering: All line and grade work not presently established at the site shall be laid out by a registered Lands Surveyor or Professional Civil Engineer employed by the contractor in accordance with the Contract document. Establish permanent benchmarks and maintain all established benchmarks, bound and replace any which are destroyed or disturbed.

1.7 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaran-teed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration by moisture and temperature during delivery and during storage at site. Protect liquid components from freezing.

B. Time delivery of all Crushed Stone, so as to minimize on site storage time prior to installation. Protect all stored materials and items from weather, careless handling, and vandalism. Repair or replaces damaged items, as determined by the Landscape Architect.

C. Deliver, store, handle and protect aggregate and Crushed Stone material with provision for drainage and intrusion of dirt, debris, or other foreign matter.

D. Store Crushed Stone material under cover to prevent accumulation of moisture until placed.

1.9 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

B. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

C. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

D. Work Protection Requirements: Provide weather protection during entire time of placement of crushed stone system. Maintain protection over entire area storage and work area to maintain specified moisture levels, prevent wind or rain disturbance of setting materials, protect from run-off from adjacent areas, and generally maintain optimum installation conditions.
   1. Contractor is responsible for means and methods for such protection, including physical cover, work sequencing and scheduling and other means of protection, as Contractor deems appropriate.

E. Environmental Requirements: Verify all Environmental Requirements with manufacturer prior to commencing work.
   1. Prevent wind or rain disturbance of setting materials, protect from sheet flow from adjacent areas, and generally maintain optimum installation conditions.
   2. Do not install Crushed Stone paving in conditions of standing water. Surface and sub-drainage must be assured at all times.
   3. Cold-Weather Protection:
      a. Do not undertake work on frozen substrate or using frozen materials or materials mixed with or coated with ice or frost.
      b. Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen sub-grade or setting beds.
      c. Temperature: Do not place Crushed Stone paving when the ambient temperature is below 40 degrees F., or when there is frost in the base course, or any other time when weather conditions are unsuitable for the type of material being placed.
      d. Remove and replace Crushed Stone paving work damaged by frost or freezing.

F. Layout and Grades:
   1. All lines not previously established at the site shall be laid out by a registered Land Surveyor or Professional Engineer employed by the Contractor in accordance with the Contract Documents.
   2. Coordinate surfacing layout with work of other sections.

1.10 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specifications.

1.11 OPERATIONS AND MAINTENANCE DATA

A. Provide Maintenance and cleaning instructions for Owner.

B. Provide to Owner all product warranties provided by manufacturers.

1.12 EXTRA STOCK

A. Crushed Stone: Provide 150 lb. Total, bagged in minimum 25 lb. bags.

PART 2 - PRODUCTS

2.1 GRANULAR CRUSHED STONE SYSTEMS

A. Provide Crushed Stone washed and clean from dust, sand, organic and deleterious material. Crushed Stone material and mixes with approved color range to be as selected and reviewed by Landscape Architect using mock-ups for Crushed Stone paving selection.

B. Subject to compliance with requirements, provide Standard Pathway Mix as available from Kafka Granite, 550 East Highway 153, Mosinee, WI 54455; Telephone: 715-256-8153.
1. Color: To be selected from Supplier's full range.
2. Crushed Stone Grading: Material shall consist of sound, angular, durable particles:

Sieve Size	Percent Passing by Weight
No. 4	80-100
No. 8	65-90
No. 16	40-65
No. 30	25-55
No. 50	15-35
No. 100	10-20
No. 200	5-15

2.2 GEOTEXTILE

A. Product will meet, at a minimum, the following physical requirements, and shall be 140N as manufactured by Mirafi, Inc. or Approved Equal:
1. Grab Strength (ASTM D1682): 180 pounds, min.
2. Puncture Strength (ASTM D3787): 80 pounds, min.
3. Burst Strength (ASTM D3786): 290 psi, min.
4. Trapezoid Tear (ASTM D1117): 50 pounds, min.
5. Equivalent Opening Size (COE CW 02215): Soil with 50 percent or less particles by weight passing U.S. No. 200 sieve, AOS less than 0.6 mm (greater than U.S. No. 30 sieve).
6. UV Resistance (ASTM D4355): 70 percent strength retained for all classes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify the conditions, elevations, and measurements affecting the work of this Section prior to installation. Examine surfaces to receive stonework and do not proceed until any defects detrimental to the finished work are corrected.

B. Notify the Landscape Architect in writing of conditions detrimental to proper completion of Work.

C. Do not begin Crushed Stone paving work until unsatisfactory conditions have been corrected and substrate is ready to receive paving.

D. Examine the subgrades in areas designated to receive Crushed Stone paving system for correct compaction, grade, and pitch as a base for paving system installation.

E. Proof roll prepared subgrade surface to check for unstable areas and areas requiring additional compaction. Compact subgrade under paving systems to a minimum 95% modified Proctor density.
   1. Contractor shall have compaction tests taken and reported at questionable areas as directed by Landscape Architect.

F. Installation constitutes acceptance of existing conditions and responsibility for satisfactory performance.

3.2 PREPARATION

A. Geotextile Installation:
   1. Install as shown in Drawings. Where necessary, fabric will be lap jointed a minimum of 12 inches in a straight line. Fabric will be held tight until setting bed material has been placed and compacted.

B. Crushed Stone Surfacing Installation
   1. Compaction: Compact Crushed Stone paving surface in a minimum of two (2) operations. Compact until surface elevations are within tolerances specified herein and to a uniform density within range of 90 to 92 percent at optimum moisture content. Hand tamp near edges of adjoining material to avoid damage to adjoining curbs, lawns, edge materials, and other work.
      a. First Compaction Operation: While the Crushed Stone mix is still thoroughly moist, roll with a heavy lawn type roller (minimum 225 pounds and maximum 30 inch width), to achieve finish grade and initial compaction. Hand tamp at edges as specified.
      b. Second Compaction Operation: Use a heavy (1 ton minimum) small rider equipment type, after having initially used the lawn roller, to obtain the desired final dense, smooth, uniform texture.
      c. Do not use whackers or vibratory rollers.

C. Tolerances for Crushed Stone Paving
   1. The final paving surface level shall not deviate from the design levels by more than plus or minus 3/16 inch, when measured under a 10-foot long steel or aluminum straightedge.

2. The Crushed Stone surface with adjacent pavements shall not show any difference in level. All humps or depressions exceeding the specified tolerance shall be corrected at no additional cost to the Owner.

3.3 INSPECTION AND ADJUSTMENT

A. Finished Crushed Stone surface shall be smooth, uniform and solid, with no evidence of chipping or cracking.

B. Any significant irregularities shall be smoothed out prior to final acceptance of work. Smoothing shall be accomplished by rewetting/saturating rough areas thoroughly, and then rolling the surface again with a heavy roller.

3.4 CLEANUP

A. Prevent materials used for installing the work of this Section from staining or damaging the exposed surfaces of adjoining construction. Immediately remove Crushed Stone other detrimental materials from exposed sur-faces of stone or adjoining construction.

B. After installation, protect paving from damage or deterioration during subsequent construction activities, and until time of Substantial Completion.

C. All materials generated by construction activities during this phase of work shall be completely removed at the end of this phase and the site shall be left in a safe and clean condition.

D. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day’s work. Burning of material or dumping on the site is prohibited.

E. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 321162

SECTION 321170 – SALVAGED BOULDERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Installation of reclaimed salvaged boulders on site.

B. Related Sections:
   1. Division 03 Section ‘Cast in Place Concrete’
   2. Division 03 Section ‘Miscellaneous Site Concrete’
   3. Division 32 Section ‘Unit Paving’
   4. Division 32 Section 'Soil Preparation and Mixes’
   5. Division 32 Section 'Exterior Planting’

1.3 ACTION SUBMITTALS

A. Product Data: Submit an inventory list and high resolution color photographs and text descriptions of each reclaimed boulder to show the full range of size, shape, color, texture, and finishes for the boulders that are expected for the Work.

B. Stockpile Plan: Submit a stockpiling plan to be followed by the Contractor during construction and by the Owner during the Warranty Period, including provisions, such as temporary planking, to protect boulders from occasional heavy loads.

C. Boulder Selection: The Landscape Architect will select all boulders on site. The Contractor or his representative shall be present for selection of boulders on site. The Contractor shall make all pre-selection arrangements on site to ensure a ready supply of materials, equipment and manpower required for an efficient selection procedure. Request the site visit at least fourteen (14) days in advance of the desired selection date.
   1. Boulders shall be individually chosen and tagged by the Landscape Architect. The contractor shall provide dimensions of selected boulders to the Landscape Architect for determination of placement.

D. Mockups: Build mockups to demonstrate aesthetic effects, and to set quality standards for materials and execution.
   1. Build mockups for a typical installed salvaged boulder. Include a minimum of three full size salvaged boulders installed on site for review.
   2. Protect accepted mockups from the elements with weather-resistant membrane.
   3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification for:
   1. Installer

B. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: The work of this section shall be performed by companies which specialize in the installation of stone and rockwork required for this Project, certified in writing with pictures of similar work, with a minimum of five years of documented successful experience and shall be performed by skilled workmen thoroughly experienced in the necessary crafts.

B. Pre-installation Meeting: Before beginning boulder work, schedule and conduct a meeting at the site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Architect, the Landscape Architect, Owner's Representative, Contactor, the installer, and the installer's foreman. Inform the Landscape Architect fourteen (14) business days in advance of the scheduled meeting time.

1.6 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affection transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.7 PROJECT CONDITIONS

A. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk and expense.

B. Layout and Grades:
   1. All lines not previously established at the site shall be laid out by a registered Land Surveyor or Professional Engineer employed by the Contractor in accordance with the Contract Documents.
   2. Coordinate surfacing layout with work of other sections.

PART 2 - PRODUCTS

2.1 SALVAGED BOULDERS

A. Materials salvaged from the site during excavation for re-installation in locations as indicated in the Drawings. Boulders shall be selected by the Landscape Contractor from the following materials:
   1. Naturally occurring and weathered rocks uncovered during the excavation of the site.

B. Salvaged materials are to be set aside for review and selection for re-installation by the Landscape Architect.
   1. Sort salvaged materials by size and condition.
   2. Salvaged boulders are to be saw-cut as needed to remove broken edges. Any boulders less than 24” x 24” in size will not be accepted.
      a. Salvaged boulders that are determined to be too small, defective, or damaged shall be properly disposed of off-site.
   3. Store materials for re-installation that are sound and free from defects impairing strength, durability or appearance, such as cracks and seams.
   4. Boulders shall be cleaned prior to placing into storage. Remove all residual aggregate base material and dirt.

PART 3 - EXECUTION

3.1 INSPECTION

A. Inspection: Verify the conditions, elevations, and measurements affecting the work of this Section prior to installation. Examine surfaces to receive stonework and do not proceed until any defects detrimental to the finished work are corrected. Notify the General Contractor in writing of conditions detrimental to proper completion of Work. Starting work means acceptance of existing conditions.

B. Verify all measurements and dimensions and coordinate the installation of this work with the work of other trades. Give particular attention to the location and size of cutouts required to accommodate mechanical, electrical, site drainage, and other work or adjoining construction.

3.2 INSTALLATION OF SALVAGED BOULDERS

A. Place all rocks in a stable condition with a minimum of three contact surfaces.

B. Place boulders in the field in accordance with approved layout for verification by the Landscape Architect before setting in aggregate base. Boulders shall be individually placed in consultation with the Landscape Architect on site.

C. After the Landscape Architect’s verification of the positions of the boulders, set bottom of each boulder as indicated in Drawings.

3.3 CLEAN UP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material of dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 321170

SECTION 321216 - ASPHALT PAVING

PART 1 GENERAL

1.01 DESCRIPTION

A. Provide asphaltic concrete paving as shown and specified. The work includes:

1. Cut and removal of existing asphalt pavement.
2. Final subgrade preparation and paving base.
3. Milling of existing asphalt pavement.
4. Hot-mix asphalt pavement patching.
5. Hot-mix asphalt pavement.
6. Hot-mix asphalt pavement overlay.
7. Pavement thermoplastic and paint striping and markings.

1.02 QUALITY ASSURANCE

A. Testing and inspection: Performed by a qualified independent testing laboratory.

B. Contractor shall provide and pay for testing and inspection during paving operations. Laboratory and inspection service shall be acceptable to the Civil Engineer.

C. Materials and methods of construction shall comply with the following standards:

1. Kentucky Department of Transportation Standard Specifications for Road and Bridge Construction, latest edition.

2. American Society for Testing and Materials, (ASTM).

3. American Association of State Highway and Transportation Officials, (AASHTO).

4. Asphalt Institute, (AI).

5. National Crushed Stone Association, (NCSA).

D. Provide material furnished by a bulk asphaltic concrete producer regularly engaged in the production of hot-mix, hot-laid asphaltic concrete paving materials.

E Tolerances:

1. In-place compacted thickness:

a. Base course: Maximum 1/2" plus, minus 0".

b. Surface course: Maximum 1/4" plus, minus 0".

2. Finished surface smoothness:

a. Base course: Maximum 3/8" in 10'-0".

b. Surface course: Maximum 1/4" in 10'-0", any direction.

1.03 SUBMITTALS

A. Product data:

1. Submit complete materials list of items proposed for the work. Identify materials source.

2. Submit asphalt mix design and pavement striping paint product data.

B. Submit reports for testing and inspection of the following:

1. Subgrade surfaces.

2. Base materials.

3. Surface materials.

4. Compaction operations.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Deliver manufactured products in manufacturer's original, unopened, and undamaged containers with labels intact and legible.

B. Store and handle manufactured products to prevent damage and deterioration.

1.05 PROJECT CONDITIONS

A. Weather limitations:

1. Do not install base course materials over wet or frozen subgrade surfaces.

2. Do not apply prime and tack coat materials when temperature is 60 degrees F. or below. Do not apply to wet base surface.

3. Install asphalt base course materials only when air temperature is 40 degrees F. or above and rising at time of placement.

4. Install asphalt surface materials only when base is dry and air temperature is 60 degrees F. or above and rising at time of placement.

5. Apply pavement striping and marking paint only on clean, dry pavement and only when surface temperature is at least 55 degrees F. and not exceeding 95 degrees F. at time of application.

B. Grade control: Establish and maintain the required lines and grades, including crown, inverted crown, and cross-slopes, for each course during paving operations.

C. Provide temporary barricades and warning lights as required for protection of project work and public safety.

D. Protect adjacent work from damage, soiling, and staining during paving operations.

PART 2 PRODUCTS

2.01 MATERIALS

A. Subgrade fill: Inert subsoil material free of organic matter, rubbish, debris, and rocks greater than 4" diameter.

B. Aggregate base: Dense Grade Aggregate (DGA). Comply with Section 805 of the Kentucky Department of Highways Standard Specifications for Road and Bridge Construction.

C. Tack coat: Comply with Section 806 of the KYDOH Standard Specifications for Highway and Bridge Construction.

D. Asphaltic base course: Superpave mixture comforming to AASHTO MP2. CL. 2 1.0D PG 64-22 complying with the KYDOH Standard Specifications for Highway and Bridge Construction.

E. Asphaltic surface course: Superpave mixture comforming to AASHTO MP2. CL. 3 0.38D PG 64-22 complying with the KYDOH Standard Specifications for Highway and Bridge Construction.

F. Joint filler: ASTM D 6690 or AASHTO M 324, commercial grade, hot applied, single-component, polymer-modified bituminous joint filler.

G. Asphalt Sealant: ASTM P 2939 Commercial Grade, asphalt emulsion sealant.

H. Pavement-Marking Paint for parking spaces: Alkyd-resin type, lead and chromate free, ready mixed, complying with AASHTO M 248, Type F; color: as indicated on drawings. Color to match adjacent existing markings.

I. Thermoplastic Extruded Thermoplastic Pavement Markings: Product shall meet KYTC Section 837, consisting of maleic-modified glycerol ester resin (alkyd binder) to formulate the thermoplastic material. Ensure the pigment, pre-mix beads, and filler are uniformly dispersed in the resin.

2.02 EQUIPMENT

A. Paving equipment: Spreading, self-propelled asphalt paving machines capable of maintaining line, grade, and thickness shown.

B. Compacting equipment: Self-propelled rollers, minimum 10 ton weight.

C. Hand tools: Rakes, shovels, tampers, and other miscellaneous equipment required to complete the work.

D. Pavement marking equipment: Provide spray machines specifically designed for pavement marking.

PART 3 EXECUTION

3.01 INSPECTION

A. Cut and remove existing asphalt pavement designated on the plans. Examine subgrades and installation conditions. Do not start asphaltic concrete paving work until unsatisfactory conditions are corrected.

3.02 PREPARATION

A. Proof roll the subgrade and do all necessary rolling and compacting to obtain firm, even subgrade surface. Fill and consolidate depressed areas. Remove uncompactible materials, replace with clean fill, and compact to 95% of the maximum dry density in accordance with ASTM D698 Standard Proctor Method.

B. Frame adjustments:

1. Verify frames for manholes, catch basins, and other such units, within areas to be paved, are at their proper elevation.

2. Adjust frames as required to match paving. Provide temporary closures over openings until completion of rolling operations. Remove closures at completion of the work. Set covers to grade, flush with the surface of adjoining pavement surface.

C. Coordinate junction of new and existing pavement. Saw cut existing pavement to provide a uniform straight line transition. Meet existing surface levels and maintain drainage slopes. Feathering of transitions is not acceptable.

D. Cold Milling: Clean existing pavement surface of loose and deleterious material immediately before cold milling. Remove existing asphalt pavement by cold milling to grades and cross sections indicated.

1. Mill to minimum depth of 1-1/2” or as indicated on plans.
2. Mill to a uniform finished surface free of excessive gouges, grooves and ridges.
3. Control rate of milling to prevent tearing of existing asphalt course.
4. Repair or replace curbs, manholes, and other construction damaged during cold milling
5. Excavate and trim unbound-aggregate base course, if encountered, and keep material separate from milled hot-mix asphalt.
6. Transport milled hot-mix asphalt to asphalt recycling facility.
7. Keep milled pavement surface free of loose material and dust.

D. Apply tack coat to contact surfaces of existing pavement, curbs, and structures abutting pavement.

3.03 INSTALLATION: GENERAL

A. Comply with Asphaltic Institute (AI) MS-3 Asphalt Plant Manual for material storage, control and mixing, and for plant equipment and operation.

B. Transport asphaltic concrete mixtures from the mixing plant to the project site in trucks with tight, clean compartments.

C. Pavement replacement:

1. Remove and waste existing asphaltic concrete pavement surface and unsuitable base materials off site.

2. Obtain inspection, testing and approval of subgrade surfaces by Geotechnical Engineer prior to installing fill or paving base materials.

3. Disc, dry, and recompact or undercut soft and wet subgrade soils prior to placement of any engineered fill. Excavate unsatisfactory soil materials extending below subgrade elevation to depth as directed by the Geotechnical

Engineer. Extra excavating and placement of additional fill will be paid for as a change in work. Obtain Civil Engineer's written authorization before performing extra excavation work.

4. Place engineered fill in layers not to exceed 8" in loose thickness with each layer compacted to 95% of the maximum dry density in accordance with ASTM D698 Standard Proctor Method or as specified by the Soils Engineer.

5. Exercise care during earthwork operations to provide adequate surface drainage of all silty-clay soils. Absorption of heavy rainfall, accumulations of water, and heavy construction traffic may result in softening silty-clay soils, and severely weakening subgrade soils shear strength. Failure to consider forecast of wet weather, protect subgrade from moisture or provide adequate drainage will negate Contractor’s claims for extra excavation.

6. Install geogrid as indicated on the plans per manufacturer’s recommendations.

7. Install DGA base material.

8. Install leveling and surface courses flush with existing adjacent pavement.

D. Repairs:

1. Crack and Joint Filling: Remove existing joint filler material from cracks or joints to a depth of ¼ inch

a. Clean cracks and joints in existing hot-mix asphalt pavement. Use commercial grade, hot-applied joint filler to fill cracks and joints. Fill flush with surface of existing pavement and remove excess filler.

2. Asphalt emulsion sealant: Clean surface of dirt after crack filler has cured. Mix sealant per manufacturer’s recommendations. Apply single coat by brush or two coats by sprayer. Allow to dry for 48 hours prior to opening to traffic.

3.04 INSTALLATION: BASE MATERIALS

A. Install aggregate base materials up to 6" thickness in single course; install 6" and greater thickness in 2 equal courses, base course and top course, total compacted depth as scheduled.

B. Compact aggregate base materials to 84% of the solid volume density as determined by Kentucky Method 64-607 until a uniformly-smooth, hard surface, complying with the lines, grades, elevations, and cross-sections shown has been established. Moisture may be added at job site to aid compaction.

C. Asphaltic base may be used as a wearing surface during construction operations. If used, base shall be inspected and approved by the Geotechnical Engineer, damaged portions removed and replaced, and the entire surface thoroughly cleaned before application of tack coat and finish wearing surface.

3.05 INSTALLATION: SURFACE MATERIALS

A. Remove loose and foreign material from compacted aggregate base immediately before application of asphaltic materials. Do not start surface work until all other work which may damage the finish surface is completed.

B. Install asphaltic base course in multiple courses up to 2” in depth per course, as necessary to provide the total compacted depth as scheduled. Spread at minimum 250 degrees F.

C. When asphalt surface material is not installed immediately following the asphaltic base course installation, apply tack coat on base course, following acceptance by Civil Engineer, at the rate of 0.05 to 0.15 gallons per sq. yd. Allow to dry and cure as required.

D. Place, spread, and strike off the asphalt concrete mixture on a properly prepared and conditioned surface. Inaccessible and small areas may be placed by hand. Place each course to the required grade, cross-section, and scheduled compacted thickness.

E. Place materials in strips not less than 10'-0" wide. After the first strip has been placed and rolled, place all succeeding strips and extend rolling to overlap previous strips. Complete base course for a section before placing surface course materials.

F. Carefully make joints between old and new pavements, and between successive day's work, to ensure a continuous bond between adjoining work. Construct joints to have the same texture, density, and smoothness as other sections of the asphalt concrete course.

G. Apply tack coat to contact surfaces of existing pavement, curbs, and structures abutting pavement.

H. Begin rolling operations when the asphalt concrete mixture will bear the weight of the roller without excessive displacement. Compact areas inaccessible to rollers with vibrating plate compactors.

I. Perform breakdown, second and finish rolling until the asphalt concrete mixture has been compacted to the required surface density and smoothness. Required average density shall be 96% of reference laboratory density according to ASTM D 6927 or AASHTO T 245, but not less than 94% nor greater than 100%. Continue rolling until all roller marks are eliminated. Provide a smooth compacted surface true to thickness and elevations required.

J. After final rolling, do not permit vehicular traffic on the pavement until it has cooled and hardened, and in no case sooner than 8 hours.

K. Protect newly placed material from traffic by barricades or other suitable methods acceptable to the Civil Engineer.

3.06 PAVEMENT SURFACE STRIPING AND MARKING

A. Do not apply pavement-marking paint until layout and placement have been verified with Civil Engineer.

B. Allow pavement to cure for two (2) days prior to beginning pavement markings.

C. Sweep and clean surface to eliminate loose material and dust.

D. Apply thermoplastic pavement markings with heat per the manufacturer's instructions.

E. Apply paint with mechanical equipment to produce pavement markings, of dimensions indicated, with uniform, straight edges. Apply at manufacturer's recommended rates to provide a minimum wet film thickness of 15 mils.

3.07 FIELD QUALITY CONTROL

A. Provide field quality control testing and inspection during asphaltic concrete paving operations.

B. Contractor shall provide adequate notice, cooperate with, provide access to the work, obtain samples, and assist Test Agency and their representatives in execution of their function.

C. Before constructing base course, field verify subgrade surfaces are adequate and meet or exceed design bearing values. Provide testing for each type of paving required.

D. When requested, perform laboratory tests on asphalt pavement mixes to determine compliance with specified requirements.

E. Perform 1 series of compaction tests for aggregate base for each course for each day's work.

F. When requested, test in-place asphalt base course and surface courses for compliance with density and thickness. Take not less than 4" diameter pavement specimens of each completed course. Repair test specimen holes to match adjacent work.

1. Average density of in-place material: Equal to or greater than 96%, with no individual determination less than 94% or greater than 100% of average density of laboratory specimens.

2. Perform 1 test for density for each course for each day's work.

3. Thickness: Make 1 test (minimum) for each 5,000 sq. ft. of each type of paving.

G. Test for surface smoothness with 10'-0" straight-edge. Deficient areas shall be defined, removed, and replaced, or adjusted to design thickness by methods acceptable to the Civil Engineer.

H. When, during progress of work, field tests indicate that installed compacted materials do not meet specified requirements, remove defective material, install new materials, and retest at Contractor's expense, as directed by the Civil Engineer.

3.08 PROTECTION

A. Protect paving from damage due to construction and vehicular traffic until final acceptance.

3.09 CLEANING

A. Perform cleaning during installation of the work and upon completion of the work. Remove from site all excess materials, debris, and equipment. Repair damage resulting from paving operations.

B. Sweep pavement and wash free of stains, discolorations, dirt, and other foreign material immediately prior to final acceptance.

END OF SECTION 321216

SECTION 321313 - CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes exterior cement concrete pavement for the following:
   1. Standard Broom Finish Sidewalks.
   2. Turned Down Slabs.
   3. Curb & Gutters.
   4. Heavy Duty Pavement.
   5. Slabs beneath pavers.
   6. Historic Mix Sidewalks.

B. Related Sections include the following:
   1. Section 312000 "Earth Moving" for subgrade preparation, grading, and subbase course.
   2. Section 033000 "Cast-in-Place Concrete" for general building applications of concrete.
   3. Division 32 Section "Concrete Paving Joint Sealants" for joint sealants in expansion and contraction joints within concrete paving and in joints between concrete paving and asphalt paving or adjacent construction.

1.3 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash and other pozzolans, and ground granulated blast-furnace slag.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of manufactured material and product indicated.

B. Design Mixtures: For each concrete pavement mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified ready-mix concrete manufacturer and testing agency.

B. Material Certificates: For the following, from manufacturer:

1. Cementitious materials.
2. Steel reinforcement and reinforcement accessories.
3. Admixtures.
4. Curing compounds.
5. Applied finish materials.
6. Bonding agent or epoxy adhesive.
7. Joint fillers.

C. Material Test Reports: For each of the following:

1. Aggregates

D. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.

1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").

B. Testing Agency Qualifications: Qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.

1. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.

C. Concrete Testing Service: Engage a qualified testing agency to perform material evaluation tests and to design concrete mixtures.

D. ACI Publications: Comply with ACI 301 unless otherwise indicated.

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockups of full-thickness sections of concrete paving to demonstrate typical joints; surface finish, texture, and color; curing; and standard of workmanship.
2. Build mockups of concrete paving in the location and of the size indicated or, if not indicated, build mockups where directed by Architect and not less than 96 inches by 96 inches.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 PROJECT CONDITIONS

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

PART 2 - PRODUCTS

2.1 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, and smooth exposed surfaces.

1. Use flexible or uniformly curved forms for curves with a radius of 100 feet (30.5 m) or less

B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces.

2.2 STEEL REINFORCEMENT

A. Plain-Steel Welded Wire Reinforcement: ASTM A 185/A 185M, fabricated from steel wire into flat sheets.

B. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420); deformed.

C. Joint Dowel Bars: ASTM A 615/A 615M, Grade 60 (Grade 420) plain-steel bars; zinc coated (galvanized) after fabrication according to ASTM A 767/A 767M, Class I coating. Cut bars true to length with ends square and free of burrs.

D. Tie Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.

E. Hook Bolts: ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), internally and externally threaded. Design hook-bolt joint assembly to hold coupling against paving form and in position during concreting operations, and to permit removal without damage to concrete or hook bolt.

F. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete specified, and as follows:

1. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.

2.3 CONCRETE MATERIALS

A. Cementitious Material: Use the following cementitious materials, of same type, brand, and source throughout Project:

1. Portland Cement: ASTM C 150, portland cement Type II

a. Fly Ash: ASTM C 618, Class C.
b. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.

B. Normal-Weight Aggregates: ASTM C 33, uniformly graded. Provide aggregates from a single source with documented service-record data of at least 10 years' satisfactory service in similar paving applications and service conditions using similar aggregates and cementitious materials.

1. Maximum Coarse-Aggregate Size: 1 inch nominal.
2. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.

C. Historic Concrete Mix
1. Pea Gravel
2. Class A Sand
3. Fly Ash

D. Water: Potable and complying with ASTM C 94/C 94M.

E. Air-Entraining Admixture: ASTM C 260.

F. Chemical Admixtures: Admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.

1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
2. Retarding Admixture: ASTM C 494/C 494M, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
4. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
5. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
6. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

2.4 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) dry.

B. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.

C. Water: Potable.

D. Curing compounds: Sodium silicate type. No dissipating resins are permitted.

1. Products:

a. Chem-Rex Mastertop CST
b. L & M Construction Chemicals – L & M Cure
c. Sonneborn - Sonosil

2.5 CONCRETE CLEANER

A. General purpose acidic cleaner to be used to remove construction dirt or mortar from brick or concrete without burning or streaking.
1. Sure Klean 600 by Prosoco or approved equal.

2.6 WATER REPELLENT

High-performance, penetrating water repellent for concrete. Chem-trete 40 VOC by Protectosil - Evonik Degussa Corporation, 800-828-0919 or approved equal.

2.7 RELATED MATERIALS

A. Joint Fillers: ASTM D 1751, asphalt-saturated cellulosic fiber in preformed strips.

B. Chemical Surface Retarder: Water-soluble, liquid, set retarder with color dye, for horizontal concrete surface application, capable of temporarily delaying final hardening of concrete to a depth of 1/8 to 1/4 inch.

1. Products: Subject to compliance with requirements, provide one of the following:

a. ChemMasters; Exposee.
b. Conspec by Dayton Superior; Delay S.
c. Dayton Superior Corporation; Sure Etch (J-73).
d. Edoco by Dayton Superior; True Etch Surface Retarder.
e. Euclid Chemical Company (The), an RPM company; Surface Retarder Formula S.
f. Kaufman Products, Inc.; Expose.
g. Meadows, W. R., Inc.; TOP-STOP.
h. Metalcrete Industries; Surftard.
i. Nox-Crete Products Group; CRETE-NOX TA.
j. Scofield, L. M. Company; LITHOTEX Top Surface Retarder.
k. Sika Corporation, Inc.; Rugasol-S.
l. SpecChem, LLC; Spec Etch.
m. TK Products, Division of Sierra Corporation; TK-6000 Concrete Surface Retarder.
n. Unitex; TOP-ETCH Surface Retarder.
o. Vexcon Chemicals Inc.; Certi-Vex Envioset.
p. Perk Products; Black Bull Surface Sol for Historic Mix

2.8 CONCRETE MIXTURES

A. Prepare design mixtures, proportioned according to ACI 301, for each type and strength of normal-weight concrete, and as determined by either laboratory trial mixtures or field experience.

1. Use a qualified independent testing agency for preparing and reporting proposed concrete design mixtures for the trial batch method.
2. When automatic machine placement is used, determine design mixtures and obtain laboratory test results that meet or exceed requirements.

B. Proportion mixtures to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 Days): 4500 psi
2. Maximum Water-Cementitious Materials Ratio at Point of Placement: 0.45
3. Slump Limit: 4 inches (100 mm)

C. Cementitious Materials: Use fly ash, pozzolan, as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent. Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows:

1. Fly Ash or Pozzolan: 25 percent.

D. Standard Concrete Mix: Used for curb/gutter, sidewalks in the right-of-way, dumpster & transformer pad, slabs beneath pavers and other designated sidewalks and pads. Mix uses standard angular crushed limestone aggregate.

E. Historic Concrete Mix: Mix design shall be as follows:

Quantity	Material
470 lbs	Type 1 Portland cement
100 lbs	Fly Ash
2340 lbs	Class A Sand
850 lbs	Pea Gravel
35 gallon	Water
5 oz	Water Reducer
1 oz	Air Entrainment

2.9 CONCRETE MIXING

A. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Furnish batch certificates for each batch discharged and used in the Work.

1. When air temperature is between 85 and 90 deg F (30 and 32 deg C), reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F (32 deg C), reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.

B. Proof-roll prepared subbase surface below concrete paving to identify soft pockets and areas of excess yielding.

1. Completely proof-roll subbase in one direction and repeat in perpendicular direction. Limit vehicle speed to 3 mph (5 km/h).
2. Proof-roll with a pneumatic-tired and loaded, 10-wheel, tandem-axle dump truck weighing not less than 15 tons (13.6 tonnes).
3. Correct subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch (13 mm) according to requirements in Division 31 Section "Earth Moving."

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove loose material from compacted subbase surface immediately before placing concrete.

3.3 EDGE FORMS AND SCREED CONSTRUCTION

A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.

B. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.

3.4 STEEL REINFORCEMENT

A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.

C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.

D. Install welded wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

3.5 JOINTS

A. General: Form construction, isolation, and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.

1. When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.

B. Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminates at isolation joints.

1. Continue steel reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
2. Provide tie bars at sides of paving strips where indicated.
3. Butt Joints: Use bonding agent at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
4. Keyed Joints: Provide preformed keyway-section forms or bulkhead forms with keys unless otherwise indicated. Embed keys at least 1-1/2 inches (38 mm) into concrete.
5. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.

C. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.

1. Locate expansion joints at intervals of 50 feet (15.25 m)unless otherwise indicated.
2. Extend joint fillers full width and depth of joint.

3. Terminate joint filler not less than 1/2 inch (13 mm) or more than 1 inch (25 mm) below finished surface if joint sealant is indicated.
4. Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
5. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
6. During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

D. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows to match jointing of existing adjacent concrete pavement:

1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a 1/4-inch (6-mm) radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces.

2. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.

E. Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a 1/4-inch (6-mm) radius. Repeat tooling of edges after applying surface finishes. Eliminate edging-tool marks on concrete surfaces.

3.6 CONCRETE PLACEMENT

A. Before placing concrete, inspect and complete formwork installation, steel reinforcement and items to be embedded or cast-in.

B. Remove snow, ice, or frost from subbase surface and steel reinforcement before placing concrete. Do not place concrete on frozen surfaces.

C. Moisten subbase to provide a uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until they are at required finish elevation and alignment.

D. Comply with ACI 301 requirements for measuring, mixing, transporting, and placing concrete.

E. Do not add water to concrete during delivery or at Project site. Do not add water to fresh concrete after testing.

F. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.

G. Consolidate concrete according to ACI 301 (ACI 301M) by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.

1. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement or side forms.

Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement dowels and joint devices.

H. Screed paving surface with a straightedge and strike off.

I. Commence initial floating using bull floats or darbies to impart an open-textured and uniform surface plane before excess moisture or bleed water appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.

J. Cold-Weather Placement: Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures. Comply with ACI 306.1 and the following:

1. When air temperature has fallen to or is expected to fall below 40 deg F (4.4 deg C), uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F (10 deg C) and not more than 80 deg F (27 deg C) at point of placement.
2. Do not use frozen materials or materials containing ice or snow.
3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in design mixtures.

K. Hot-Weather Placement: Comply with ACI 301 (ACI 301M) and as follows when hot-weather conditions exist:

1. Cool ingredients before mixing to maintain concrete temperature below 90 deg F (32 deg C) at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated in total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
2. Cover steel reinforcement with water-soaked burlap so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
3. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

3.7 FLOAT FINISHING

A. General: Do not add water to concrete surfaces during finishing operations.

B. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.

1. Standard Medium Textured Broom Finish: Provide a medium finish by striating float-finished concrete surface 1/16 to 1/8 inch deep with a stiff-bristled broom, perpendicular to line of traffic. Match adjacent existing concrete sidewalk finish.

3.8 SPECIAL FINISHES

A. Historic Concrete Finish: Begin the second floating operation when bleed-water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is too small or inaccessible to power units.

Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.

1. Finish concrete with a very light wash to expose a small amount of aggregate.

3.9 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.

B. Comply with ACI 306.1 for cold-weather protection.

C. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete but before float finishing.

D. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.

E. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound or a combination of these as follows:

1. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:

    a. Water.
    b. Continuous water-fog spray.
    c. Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with 12-inch lap over adjacent absorptive covers.

2. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover, placed in widest practicable width, with sides and ends lapped at least 12 inches and sealed by waterproof tape or adhesive. Immediately repair any holes or tears occurring during installation or curing period using cover material and waterproof tape.
3. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas that have been subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.

3.10 PAVING TOLERANCES

A. Comply with tolerances in ACI 117 and as follows:

1. Elevation: 3/4 inch.
2. Thickness: Plus 3/8 inch, minus 1/4 inch.
3. Surface: Gap below 10-foot- long, unleveled straightedge not to exceed 1/2 inch.
4. Alignment of Tie-Bar End Relative to Line Perpendicular to Paving Edge: 1/2 inch per 12 inches of tie bar.
5. Lateral Alignment and Spacing of Dowels: 1 inch.
6. Vertical Alignment of Dowels: 1/4 inch.

7. Alignment of Dowel-Bar End Relative to Line Perpendicular to Paving Edge: 1/4 inch per 12 inches of dowel.
8. Joint Spacing: 3 inches.
9. Contraction Joint Depth: Plus 1/4 inch, no minus.
10. Joint Width: Plus 1/8 inch, no minus.

3.11 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Testing Services: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:

1. Testing Frequency: Obtain at least one composite sample for each 5000 sq. ft. (465 sq. m) or fraction thereof of each concrete mixture placed each day.

    a. When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

2. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
3. Air Content: ASTM C 231, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
4. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F (4.4 deg C) and below and when it is 80 deg F (27 deg C) and above, and one test for each composite sample.
5. Compression Test Specimens: ASTM C 31/C 31M; cast and laboratory cure one set of three standard cylinder specimens for each composite sample.
6. Compressive-Strength Tests: ASTM C 39/C 39M; test one specimen at seven days and two specimens at 28 days.

    a. A compressive-strength test shall be the average compressive strength from two specimens obtained from same composite sample and tested at 28 days.

C. Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi (3.4 MPa).

D. Test results shall be reported in writing to Architect, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.

E. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.

F. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect.

G. Remove and replace concrete pavement where test results indicate that it does not comply with specified requirements.

H. Concrete paving will be considered defective if it does not pass tests and inspections.

I. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

J. Prepare test and inspection reports.

3.12 REPAIRS AND PROTECTION

A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Architect.

B. Drill test cores, where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.

C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.

D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 13 13

SECTION 321320 – LANDSCAPE CONCRETE FINISHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Special finish concrete paving

B. Related Sections:
   1. Division 03 Section ‘Cast in Place Concrete’
   2. Division 32 Section ‘Concrete Paving Joint Sealants’
   3. Division 32 Section 'Concrete Paving’

1.3 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash and other pozzolans, and ground granulated blast-furnace slag.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Include plans, sections, details, and attachments to other work.

C. Samples for Initial Selection: For each type of product, ingredient, or admixture requiring color selection.

D. Samples for Verification: For each type of product or exposed finish, prepared as Samples of size indicated below:
   1. Ten (10)-lb sample of integral aggregate for special finish concrete paving.

E. Other Action Submittals:
   1. Design Mixtures: For each concrete paving mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

F. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, sources of supply, and other information as required to identify materials used. Include mix proportions for mortar and source of aggregates.

1. Submittal is for information only. Neither receipt of list nor approval of mockups constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Landscape Architect and approved in writing.

G. Material Certificates: For the following, from manufacturer:
1. Cementitious materials.
2. Steel reinforcement and reinforcement accessories.
3. Fiber reinforcement.
4. Admixtures.
5. Curing compounds.
6. Applied finish materials.
7. Bonding agent or epoxy adhesive.
8. Joint fillers.

H. Coordinate submittals with joint sealant submittals of Division 07 Section “Sitework Joint Sealants”.

I. Minutes of pre-installation conference.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified ready-mix concrete manufacturer and testing agency.

B. Field quality-control reports.

1.6 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials.

C. Procure and pay for permits and licenses required for Work.

1.7 QUALITY ASSURANCE

A. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94 / C 94M requirements for production facilities and equipment.
1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").

B. Installer Qualifications:
1. An experienced installer who has completed concrete Work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance. Installer is to have a minimum of ten (10) years of experience with concrete Work similar to that indicated for this Project.

2. Installer shall demonstrate successful experience with installing exposed/seeded aggregate special finish concrete paving by citing five (5) successful installations in climates that experience seasonal freeze-thaw cycles. At least one project shall by min. 3000 sf. For each project include the following:
   a. Project Description
3. Project location.
4. Date of installation
5. Completed project photos

C. Measurements and Allowable Tolerances: Conform to requirements of referenced standards but provide more restrictive tolerances where required to meet job conditions.

D. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated.

E. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, each aggregate from one source, and each admixture from the same manufacturer.

F. ACI Publications: Comply with ACI 301 (ACI 301M) unless otherwise indicated. Comply with the following, unless more stringent provisions are required by governmental authorities having jurisdiction:

G. Mockups: Build mockups at the earliest possible time, at approved location per Landscape Architect, to verify selections made under sample submittals and to demonstrate aesthetic effects and standard for workmanship.
1. Build mockups of full-thickness sections of concrete paving to demonstrate typical joints; sur-face finish, texture, and color; curing; and standard of workmanship.
2. Build mockups of concrete paving in the location and of the size indicated or, if not indicated, build mockups where directed by Landscape Architect and not less than 96 inches by 96 inch-es.
   a. Install mockup with sample of adjacent curb and including special features, such as expansion joints and paver trays for utility surface expressions. Coordinate with material requirements as specified in other sections.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Landscape Architect specifically approves such deviations in writing.
4. Notify Landscape Architect seven (7) days in advance of dates and times when mockups will be constructed.

H. Samples: Prior to mockup, construct special finish concrete paving samples showing an assortment of seeding rates and aggregate sizes. Each sample shall be 12-inch x 12-inch. Samples will be re-quired until design intent is achieved, and approval is given by Landscape Architect. Only after a sample has been approved shall the contractor commence mockup construction. Samples shall match the approved mockup.

I. Preinstallation Conference: Conduct conference at Project site.
1. Before submitting design mixtures, review concrete pavement mixture design and examine procedures for ensuring quality of concrete materials and concrete pavement construction practices. Require representatives, including the following, of each entity directly concerned with concrete pavement, to attend conference:
   a. Contractor's superintendent.
   b. Independent testing agency responsible for concrete design mixtures.

c. Ready-mix concrete producer.
d. Concrete pavement subcontractor.
e. Landscape Architect
f. Construction Manager
g. Architect

1.8 PROJECT CONDITIONS

A. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk and expense.

B. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

C. Do NOT dispose of excess concrete and water-borne debris from cleaning out equipment in adjacent areas designated to be future planting beds.

1.9 DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packages materials n clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration during delivery and during storage at site.

B. Deliver, store, and handle steel reinforcement to prevent bending and damage.

PART 2 - PRODUCTS

2.1 CONCRETE, GENERAL

A. Comply with requirements outlined in Division 32 Section “Concrete Paving”.

2.2 SITE CONCRETE PAVING MATERIALS

A. For nonvehicular areas, including concrete walk and ramps, refer to Division 32 Section “Concrete Paving” for cementitious materials, mixture design, steel reinforcement, and reinforcement accessories.

2.3 SPECIAL FINISH CONCRETE MIX

A. Cementitious Materials: Refer to Division 32 Section “Concrete Paving”. Use cementitious materials, of same type, brand, and source throughout Project:
1. Cement: Portland Cement, Type I, ASTM C 150

B. Integral (Normal Weight) Aggregate: Selected, hard, and durable; washed; free of materials with deleterious reactivity to cement or that cause staining; from a single source, with gap-graded coarse aggregate as follows:
   1. Light Aggregate Type: #8 Gravel
      a. Manufacturer: Chaney Enterprises, 2410 Evergreen Rd Suite 201, Gambrills, MD 21054
      b. Phone: (301) 932-5000

C. Seeded Aggregate: Selected, hard, and durable; washed; free of materials with deleterious reactivity to cement or that cause staining; from a single source, with gap-graded coarse aggregate as follows:
   1. Aggregate Coverage Rate: 95-100%
   2. Dark Aggregate Type: Northern Black Basalt, 1/4-inch x 1/8-inch.
      a. Manufacturer: Fister Quarries, 1150 Lyon Road, Batavia, IL 60510
      b. Phone: (630) 761-0100
      c. Website: www.fisterquarries.com

D. Aggregate Ratios, per sq ft:
      a. Light Aggregate: 0.86 pounds per square foot
      b. Dark Aggregate: 0.39 pounds per square foot.

E. Water: Potable and complying with ASTM C 94 / C 94M.

F. Location: As indicated in Drawings (Concrete Paving - Pedestrian - Type B).

G. Admixtures: Refer to Division 32 Section “Concrete Paving”.

2.4 RELATED MATERIALS

A. Joint Fillers: ASTM D 1751, asphalt-saturated cellulosic fiber.
   1. Refer to Division 07 Section “Sitework Joint Sealants”.

PART 3 - EXECUTION

3.1 PROTECTION

A. Protect exposed surfaces including flat work as required to prevent damage by impact or stains.

3.2 FINISHES, GENERAL

A. General:
   1. Match Landscape Architect’s design reference sample, identified and described as indicated, to the satisfaction of Landscape Architect.
   2. Maintain uniformity of special finishes over construction joints unless otherwise indicated.

B. Flatwork:
   1. Unless otherwise noted or specified, finish slabs monolithically. Take special care that a smooth, even joint is obtained between successive pours.

3.3 SPECIAL FINISHING

A. Seeded Exposed-Aggregate Finish:
   1. Immediately after initial floating, spread a single layer of Dark Aggregate uniformly on paving surface.
   2. Tamp aggregate into plastic concrete and float finish to entirely embed aggregate with mortar cover of 1/16-inch.
   3. Lightly power-wash paving surface.
   4. Cover paving surface with plastic sheeting, sealing laps with tape, and remove sheeting when ready to continue finishing operations.
   5. Without dislodging aggregate, remove mortar concealing the aggregate by lightly brushing surface with a stiff, nylon-bristle broom. Do not expose more than one-third of the average diameter of the aggregate and not more than one-half of the diameter of the smallest aggregate.

3.4 FLOAT FINISHING

A. General: Do not add water to concrete surfaces during finishing operations.

B. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.
   1. Medium-to-Fine-Textured Broom Finish: Draw a soft-bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.

3.5 PAVING TOLERANCES

A. Comply with tolerances in ACI 117 and as follows:
   1. Elevation: 1/8 inch
   2. Thickness: Plus 3/8 inch, minus 1/4 inch.
   3. Surface: Gap below 10-foot-long, unleveled straightedge not to exceed 1/8 inch.
   4. Joint Spacing: 1/4 inches.
   5. Contraction Joint Depth: Plus 1/4 inch, no minus.
   6. Joint Width: Plus 1/8 inch, no minus.

3.6 DEFECTIVE WORK

A. Defective Work: The following will be deemed as defective work:
   1. Finish which is not true to line and plane.
   2. Finish which is not in conformance with specified finish and appearance requirements.
   3. Finish which exceeds specified tolerances.
   4. Work which does not properly connect to adjoining work.

3.7 REPAIRS AND PROTECTION

A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Landscape Architect.

B. Drill test cores, where directed by Landscape Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with Portland cement concrete bonded to paving with epoxy adhesive.

C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing sur-face stains and spillage of materials as they occur.

D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

3.8 CLEANUP

A. Do NOT dispose of excess concrete and water-borne debris from cleaning out equipment in adjacent areas designated to be future planting beds.

B. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store mate-rial at the end of each day’s work. Burning of material or dumping on the site is prohibited.

C. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 321320

SECTION 321373 - CONCRETE PAVING JOINT SEALANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Expansion and contraction joints within cement concrete pavement.

B. Related Sections include the following:

1. Division 32 Section "Concrete Paving" for constructing joints in concrete pavement.

1.3 SUBMITTALS

A. Product Data: For each joint-sealant product indicated.

B. Samples for Verification: For each type and color of joint sealant required. Install joint-sealant samples in 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.

C. Product Certificates: For each type of joint sealant and accessory, signed by product manufacturer.

D. Qualification Data: For Installer.

E. Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:

1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for sealants.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers trained and approved by manufacturer.

B. Source Limitations: Obtain each type of joint sealant through one source from a single manufacturer.

C. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.

1. Use ASTM C 1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
2. Submit not fewer than eight pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
5. Testing will not be required if joint-sealant manufacturers submit joint preparation data that are based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.

D. Product Testing: Obtain test results for "Product Test Reports" Paragraph in "Submittals" Article from a qualified testing agency based on testing of current sealant products within a 36-month period preceding the commencement of the Work.

1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 for testing indicated, as documented according to ASTM E 548.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration date, pot life, curing time, and mixing instructions for multicomponent materials.

B. Store and handle materials to comply with manufacturer's written instructions to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

1.6 PROJECT CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.
2. When joint substrates are wet or covered with frost.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products listed in other Part 2 articles.

B. Products: Subject to compliance with requirements, provide one of the products listed in other Part 2 articles.

2.2 MATERIALS, GENERAL

A. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer based on testing and field experience.

B. Colors of Exposed Joint Sealants: As selected by Architect from manufacturer's full range.

2.3 COLD-APPLIED JOINT SEALANTS

A. Single-Component Polyurethane Sealant for Concrete: Single-component, non-priming, self-leveling, gun-grade elastomeric polyurethane sealant complying with ASTM C 920 for Type S; Grade P; Class 25; Uses T, M, and, as applicable to joint substrates indicated, O.

1. Available Products:

1) Sonneborn, Sonolastic SL 1.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions.

B. Joint Priming: Prime joint substrates where indicated or where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

3.3 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place sealants so they directly contact and fully wet joint substrates.
2. Completely fill recesses provided for each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

D. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.

1. Remove excess sealants from surfaces adjacent to joint.
2. Use tooling agents that are approved in writing by joint-sealant manufacturer and that do not discolor sealants or adjacent surfaces.

E. Provide joint configuration to comply with joint-sealant manufacturer's written instructions, unless otherwise indicated.

F. Provide recessed joint configuration for silicone sealants of recess depth and at locations indicated.

3.4 CLEANING

A. Clean off excess sealants or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved by manufacturers of joint sealants and of products in which joints occur.

3.5 PROTECTION

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately and replace with joint sealant so installations with repaired areas are indistinguishable from the original work.

END OF SECTION 321373

SECTION 321410 – UNIT PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Precast concrete pavers on slab-on-grade.
   2. Precast concrete pavers on pedestal supports.

B. Related Sections:
   1. Division 32 Section ‘Concrete Paving’
   2. Division 32 Section 'Joint Sealants’
   3. Division 32 Section 'Soil Preparation and Mixes’
   4. Division 32 Section 'Turf and Grasses’
   5. Division 32 Section 'Exterior Planting’
   6. Division 32 Section ‘Metal Edging’
   7. Division 32 Section ‘Salvaged Boulders’

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

   1. Submit product literature or tear sheets giving name of product, manufacturer's name and compliance with Specifications.
   2. For unit paving varieties proposed for use on Project, include test data indicating compliance with physical properties required by referenced ASTM standards.

B. Sieve Analyses: For aggregate setting-bed materials and sand for joints, according to ASTM C 136.

A. Shop Drawings: Submit for fabrication and installation of paving. Submit large scale dimensioned cutting and setting drawings depicting sections and profiles of the paving units, actual dimensions and tolerances, arrangement and provision for jointing, expansion joints (if required), position of anchors and other necessary details for the work. Include all adjacent conditions (utility items and existing top of structure) and field verified conditions and dimensions. Indicate location on the setting drawings with a number system corresponding to number marked on each unit.

   1. Shop drawings to be drafted by qualified draftsman.
      a. Include evidence of experience including project list.

   2. Show location layouts and patterns, including Points of Beginning, coordinated with the design drawing and related survey control points and dimensions.

3. Establish and verify dimensions with work of on-site structures and elements, layouts and patterns of other work, and other like conditions.
4. Show connections for drain frames and grates, and all other site improvements.
5. Show location of soft caulked joints.
6. Show location, type and extent of anticipated field cutting.
7. Show location, type and extent of anticipated oversized pavers.
8. Do not clean or prepare any unit paving (except for samples) until Shop Drawings have been approved for fabrication by Landscape Architect.

B. Samples for Initial Selection: Submit samples of material for joints and accessories involving color selection.

C. Samples for Verification:

1. For each unit paver type and finish indicated. Include at least five (5) samples in each set for each type of unit paver, to be not less than 12 inches by 12 inches, exhibiting extremes of the full range of color and other visual characteristics expected in completed Work.
2. Joint filler materials.

D. Field Samples / Mockups: Construct at the earliest possible time and at approved location, before proceeding with Work and after Architect's approval of submitted samples. Submit proposed locations for field samples / mockups and receive approval of locations prior to construction of field samples. Provide and construct sample of each type of work as specified herein to show appearance, workmanship, and finish of work, complete and in coordination with work of other Sections as applicable (i.e. walls, curbs, stairs, other paving types and sitework sealants).
1. Build mock-ups for each type and finish of unit paving in sizes approximately 96 IN long by 96 IN wide by full thickness.
   a. Include a sealant-filled joint at least 16 inches long in each mockup.
2. Coordinate mock-ups with required mock-ups of other Specification sections.
3. Protect accepted mockups from the elements with weather-resistant membrane.
4. Approval of mockups is for color, texture, and aesthetic qualities of workmanship.
   a. Approval of mockups is also for other material and construction qualities Landscape Architect specifically approves in writing.
   b. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Landscape Architect specifically approves such deviations in writing.
5. The field sample/mockup must be approved by the Architect before the actual paving work may proceed. If necessary, remove and reconstruct field sample until approved. Accepted mockup establishes minimum standard of quality and workmanship for paving work of this Section.
6. Demolish and remove field samples at a time approved by the Architect when no longer required to serve as a standard of work. Mock-up may be incorporated as part of Work if conforming to specified requirements, and if accepted by the Landscape Architect and the Owner.

E. Guarantee: The Contractor shall obtain in Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. All these guarantees shall be in addition to, and not in lieu of, other liabilities which the Contractor may have by law or other provisions of the Contract Documents.

F. Maintenance Program: Submit a maintenance and cleaning program to be followed by the Contractor during construction and by the Owner during Warranty Period.

1.4 INFORMATIONAL SUBMITTALS

A. Submit Qualification Data for:
   1. Draftsman for Shop Drawings- Include evidence of experience including project list.
   2. Fabricator - Include evidence of experience including project list.
   3. Installer - Include evidence of experience including project list.
   4. Testing agencies - Include evidence of experience including project list.
   5. Firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

B. Test Reports: Submit certified reports by an approved testing agency. Make submittals at least three (3) weeks prior to delivery of materials to site. Include data on all properties specified for the respective materials. Reports shall be representative of the current manufacturing of fabrication process and shall be no older than six (6) months.
   1. Joint filler materials.

C. Certificates/Manufacturer’s Data: Submit for approval of Architects sources of supply and manufacturer's specifications, quality control, product data, and test reports for the following: Include instructions for handling, storage, installation and protection.
   1. Cleaning agent

1.5 QUALITY ASSURANCE

A. The work of this section shall be performed by a company which specializes in the type of paving work required for this project, with a minimum of ten (10) years of documented successful experience and shall be performed by skilled workmen thoroughly experiences in the necessary crafts.

B. Fabrication Qualifications: Fabrications shall be by a firm or firms who have successfully fabricated unit paving of each material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than ten (10) years.
   1. Fabricator shall submit qualifications to the Landscape Architect for his review.

C. Draftsman Qualifications: Shop Drawings shall be drafted by a single firm who have provided Shop Drawings successfully similar to the size and scope of this project and who have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere.
   1. Draftsman shall submit qualifications to the Landscape Architect for his review.

D. Installer Qualifications: Installer shall have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere, in the installation of paving work of the sizes and setting beds specified, and the products, systems, and scope specified.
   1. Installer shall submit qualifications to the Landscape Architect for his review.
   2. Installation Foreman: Installation firm for exterior paving and curbing of this Project shall have on staff a supervising Foreman assigned full time to this Project, from time of mock-up installations, who shall have at least twenty (20) years total unit paving installation experience and with at least ten (10) years of experience in installations of equivalent or more extensive type and scope to this Project. Submit detailed resume of past experience with dates, duration and scope identification, Project name and location, and work function of previous projects worked on.

3. Use members of skilled workmen equal to work requirement or occasion. The skilled workmen shall be thoroughly trained and experienced in the necessary crafts and shall be completely familiar with the specific requirements and methods needed for performance of the work in this Section.

E. Source Limitations: Obtain each type of unit paver, regardless of finish, from one manufacturer with resources to provide materials of consistent quality in appearance and physical properties.
1. Material Stock: Before start of fabrication, the Contractor shall certify to the Landscape Architect that there is a sufficient stock of appropriate unit pavers for completion of the Work within the Contract time schedule.
a. The Landscape Architect may, during the course of the work, visit the places of fabrication. The Contractor shall afford these representatives free access and cooperation in the performance of their duties.

F. Source Limitations for Other Materials: Obtain each type of joint material and setting material from single source with resources to provide materials and products of consistent quality in appearance and physical properties.

G. Mock-ups: Build mock-ups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
1. Approved mock-ups may become part of the completed Work if undisturbed at time of Substantial Completion.

H. Pre-installation Meeting: Before beginning paving work, schedule and conduct a meeting at Project site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Contractor, the installer, the installer's field foreman and manufacturer's representative. Inform the Landscape Architect five (5) business days in advance of the scheduled meeting time.

I. Field Engineering: All line and grade work not presently established at the site shall be laid out by a registered Lands Surveyor or Professional Civil Engineer employed by the contractor in accordance with the Contract document. Establish permanent benchmarks and maintain all established benchmarks, bound and replace any which are destroyed or disturbed.

J. Maintenance Program: Submit a maintenance and cleaning program to be followed by the Contractor during construction and by the Owner during Warranty Period, including provisions, such as temporary planking, to protect pavement from occasional heavy loads.

1.6 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.7 DELIVERY, STORAGE AND HANDLING

A. Delivery and Handling: Properly crate and band paving units for shipment and receiving at job site. Handle each paving material type to prevent chipping, marking, breakage, soiling, or other damage both during delivery and during storage at site.
   1. Pavers shall be delivered and unloaded at job site. Care shall be taken to prevent damage to the product during hauling and handling at the job site.
   2. Lift and support units only at designated lifting or supporting points shown on Shop Drawings.

B. Storage and Protection: Store paving units on non-staining wood skids or pallets set not less than four (4) inches above ground, covered with non-staining, waterproof membrane. Place and stack skids and pavers to distribute weight evenly and to prevent breakage or cracking of pavers. If units are not stored in an enclosed location, protect stored unit pavers from weather with waterproof cover to prevent staining or contamination but allow air to circulate around units.

C. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration by moisture and temperature during delivery and during storage at site. Protect liquid components from freezing.

D. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

E. Store aggregates where grading and other required characteristics can be maintained, and contamination avoided.

F. Store liquids in tightly closed containers protected from freezing.

1.8 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

B. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

C. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

D. Work Protection Requirements - Provide weather protection during entire time of placement of paving system. Maintain protection over entire area storage and work area to maintain specified moisture levels, prevent wind or rain disturbance of setting materials, protect from run-off from adjacent areas, and generally maintain optimum installation conditions. Contractor is responsible for means and methods for such protection, including physical cover, work sequencing and scheduling and other means of protection, as Contractor deems appropriate.

1. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen sub-grade or setting beds. Remove and replace unit paver work damaged by frost or freezing.

E. Environmental Requirements:
   1. Verify all Environmental Requirements with manufacturer prior to commencing work.
   2. Weather/Temperature: (Cold Weather Requirements) Do not commence work when a descending air temperature in the shade away from artificial heat reaches 40 deg F, and do not resume until an ascending air temperature in the shade and away from artificial heat reaches 35 deg F.
      a. Do not undertake work on frozen substrate or using frozen materials or materials mixed with or coated with ice or frost.
      b. Protect work from frost and remove and replace any work damaged by frost or freezing.
      c. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
      d. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.
   3. Weather/Temperature: (Hot Weather Requirements) Protect paving work when temperature and humidity conditions produce excessive evaporation of setting beds. Provide artificial shade and windbreaks and use cooled materials as required.
      a. Comply with hot-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

1.9 UTILIZATION RESTRICTIONS

A. Plywood panels must be kept on areas which will be subject to continued movement of materials and equipment.

B. Maintenance of Traffic, Access and Utilities: In accordance with Division 01.

1.10 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specification.

B. Proceed with paving setting work only after curbs, steps, drains, and other projections through substrate have been installed and when substrate construction and framing of openings have been completed.

1.11 CLOSEOUT REQUIREMENTS

A. Project Record Documents: Submit in accordance with Division 01 Section “Project Record Documents”.

B. Final Cleaning: In accordance with Division 01 Section “Cleaning”
   1. Remove all excess joint filler from the paver surface and leave site in an orderly, “broom clean” condition.

1.12 OPERATIONS AND MAINTENANCE DATA, WARRANTIES

A. Provide Maintenance and cleaning instructions for Owner.

B. Provide to Owner all product warranties provided by manufacturers.

1.13 EXTRA STOCK AND SPARE PARTS

A. Concrete Unit Pavers: Provide one (1) pallet or twenty-five (25) paving units of each size and finish.

PART 2 - PRODUCTS

2.1 GRAVEL BASE

A. Gravel base material shall conform to Division 31 “Earthwork”.

2.2 CONCRETE SUB-SLAB

A. Concrete base shall conform to Division 32 Section “Concrete Paving”.

2.3 PAVERS, GENERAL

A. Paving units shall be the best quality material from a single manufacturer.

B. Exposed surfaces and edges of paving units will be free from cracks, broken corners, chipped edges, scratches, or other defects affecting appearance. No patching or hiding of defects will be permitted.

C. Paving units having flaws or imperfections are not acceptable and will be rejected and will be replaced with approved unit pavers at Supplier's expense.

D. Paving units shall be uniformly consistent in color value, graining texture and other features to the extent inherent in each type.

E. Color and value variations shall be within ranges established by approved samples.

2.4 CONCRETE UNIT PAVERS

A. Subject to compliance with requirements, provide Hanover Prest Paver and Traditional Prest Bricks by Hanover Architectural Products, Inc., 5000 Hanover Road, Hanover, PA 17331; Telephone: 717-637-0500; Website: www.hanoverpavers.com
   1. Type 1
      a. Size: 11 3/4” x 23 1/2”
      b. Oversize Paver Size: 11 3/4” x 35 3/8” or 17 5/8” x 23 1/2"
      c. Thickness: 3 inches
      d. Color: Natural
      e. Finish: Tudor

2. Type 2
   a. Size: 11 3/4” x 23 1/2”
   b. Oversize Paver Size: 11 3/4” x 35 3/8” or 17 5/8” x 23 1/2”
   c. Thickness: 3 inches
   d. Color: Limestone Gray
   e. Finish: Tudor
3. Type 3
   a. Size: 11 3/4” x 23 1/2”
   b. Oversize Paver Size: 11 3/4” x 35 3/8” or 17 5/8” x 23 1/2”
   c. Thickness: 3 inches
   d. Color: Charcoal
   e. Finish: Tudor
4. Type 4
   a. Size: 23 1/2” x 47 1/8”
   b. Oversize Paver Size: N/A
   c. Thickness: 2-1/2 inches
   d. Color: Limestone Gray
   e. Finish: Tudor
5. Type 5
   a. Size: 5 7/8” x11 3/4”
   b. Oversize Paver Size: 11 3/4” x 11 3/4” or 5 7/8” x 17 5/8”
   c. Thickness: 3 inches
   d. Color: Limestone Gray
   e. Finish: Tudor
6. Type 6
   a. Size: 5 7/8” x11 3/4”
   b. Oversize Paver Size: 11 3/4” x 11 3/4” or 5 7/8” x 17 5/8”
   c. Thickness: 3 inches
   d. Color: Charcoal
   e. Finish: Tudor

2.5 BITUMINOUS SETTING BED MATERIALS FOR CONCRETE UNIT PAVERS

A. Primer for Base: ASTM D 2028, cutback asphalt, grade as recommended by unit paver Manufacturer.

B. Fine Aggregate for Setting Bed: ASTM D 1073, No. 2 or No. 3

C. Asphalt Cement: ASTM D 3381, Viscosity Grade AC-10 or Grade AC-20

D. Neoprene-Modified Asphalt Adhesive: Paving Manufacturer’s standard adhesive consisting of oxidized asphalt combined with 2 percent neoprene and 10 percent long-fibered mineral fibers containing no asbestos.

2.6 BITUMINOUS SETTING BED MIX FOR CONCRETE UNIT PAVERS

A. Mix bituminous setting-bed materials at an asphalt plant in approximate proportion, by weight, of 7 percent asphalt cement to 93 percent fine aggregate unless otherwise indicated. Heat mixture to 300 deg F.

2.7 JOINT MATERIALS FOR CONCRETE UNIT PAVERS

A. Sand for Joints shall conform to the following gradation in accordance with C-144-84 and shall be a combination of manufactured sand and natural sand:

1.

Sieve Size	Percent Finer by Weight
No. 4	100
No. 8	95-100
No. 16	70-100
No. 30	40-75
No. 50	20-40
No. 100	10-25
No. 200	0-10

% Fracture, by Weight, Minimum: 75
Sand Equivalent, Minimum: 40

2. The fracture requirement shall be at least two mechanically fractured faces and will apply to material retained on each sieve size No. 50 and above.
3. Provide sand of color needed to produce required joint color.

B. Organic Joint Sand Stabilizer: For unit paver installations where sand filled joints are indicated, use mixture of joint sand and stabilizer additive.
1. Base Product: Pave Tech, Prior Lake MN (800-728-3832, www.pavetech.com); SandLock Additive.
2. Comply with manufacturer's written instructions for mixing, applying, activating and protecting stabilized sand joint filling mixture.

2.8 PAVER PEDESTAL SUPPORTS

A. Subject to compliance with requirements, provide Hanover Elevator Pedestal System as manufactured by Hanover Architectural Products, Inc., 5000 Hanover Road, Hanover, PA 17331; Telephone: 717-637-0500; website: www.hanoverpavers.com; the components used shall be:
1. Base
2. Top Plate
3. Coupler
4. StayBar
5. Flexible Leveling Shims
6. Compensator Leveling System
7. Perimeter Spacer

B. Provide 3/8" thick galvanized steel plate to hold small cut pieces of pavers against walls/curbs, by bridging over several adjacent pedestals. Plate shall bear on at least 2 pedestals in each direction from cantilevered portion of plate in order to support small cut pieces of pavers.

C. Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

2.9 PREPARATION

A. Gravel sub-base material, concrete sub-slab, and concrete stair footing shall be compacted and placed in accordance with Division 31 ‘Earthwork’, Division 32 Section “Concrete Paving”, and Division 3 Section “Cast in Place Concrete”.

B. Wash and sweep concrete substrates to remove dirt, dust, debris, and loose particles.

C. Clean paver units prior to setting to remove soil, stains, and foreign materials that could impair bonding, bedding, or appearance. Do not use wire brushes or implements that will mark or damage exposed surfaces. If it is necessary to use cleaning compounds, use only those that are mild or contain no caustic or harsh filler or abrasives.

2.10 INSTALLATION, GENERAL

A. Do not use pavers units with chips, cracks, voids, discolorations, and other defects that might be visible in finished work.

B. Mix pavers units from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.

C. Cut paver units with motor-driven masonry saw equipment to provide clean, sharp, un-chipped edges. Cut units to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting or use of a block splitter is not acceptable.

D. Joint Pattern: As indicated on Drawings.

E. Pavers over Waterproofing: Exercise care in placing pavers and setting materials over waterproofing so protection materials are not displaced, and waterproofing is not punctured or otherwise damaged. Carefully replace protection materials that become displaced and arrange for repair of damaged waterproofing before covering with paving.
   1. Provide joint filler at waterproofing that is turned up on vertical surfaces, unless otherwise indicated; where unfilled joints are indicated, provide temporary filler or protection until paver installation is complete.

F. Tolerances: Do not exceed 1/16-inch unit-to-unit offset from flush (lippage) nor 1/8-inch in 24 inches and 1/4-inch in 10 inches from level, or indicated slope, for finished surface of paving.

G. Expansion and Control Joints: Provide joint filler and sealant at locations and of widths indicated. Install joint filler before setting pavers.

H. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.

I. Pavers abutting light fixtures, building faces, utility surface expressions or vertical elements are to fit around these objects with a maximum of 1/8-inch joint.

2.11 MORTAR SETTING-BED MATERIALS

A. Regional Materials: Provide aggregate, cement, and lime for mortar that has been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.

B. Portland Cement: ASTM C 150, Type I or Type II.

C. Hydrated Lime: ASTM C 207, Type S.

D. Sand: ASTM C 144.

E. Latex Additive: Manufacturer's standard acrylic resin or styrene-butadiene-rubber water emulsion, serving as replacement for part or all of gaging water, of type specifically recommended by latex-additive manufacturer for use with field-mixed portland cement and aggregate mortar bed, and not containing a retarder.

F. Water: Potable.

G. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062 inch in diameter; comply with ASTM A 185/A 185M and ASTM A 82/A 82M except for minimum wire size.

2.12 MORTAR MIXES

A. General: Comply with referenced standards and with manufacturers' written instructions for mix proportions, mixing equipment, mixer speeds, mixing containers, mixing times, and other procedures needed to produce setting-bed and joint materials of uniform quality and with optimum performance characteristics. Discard mortars and grout if they have reached their initial set before being used.

B. Mortar-Bed Bond Coat: Mix neat cement and latex additive to a creamy consistency.

C. Portland Cement-Lime Setting-Bed Mortar: Type M complying with ASTM C 270, Proportion Specification.

D. Latex-Modified, Portland Cement Setting-Bed Mortar: Proportion and mix portland cement, sand, and latex additive for setting bed to comply with written instructions of latex-additive manufacturer and as necessary to produce stiff mixture with a moist surface when bed is ready to receive pavers.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Where pavers are to be installed over waterproofing, examine waterproofing installation, with waterproofing Installer present, for protection from paving operations, including areas where waterproofing system is turned up or flashed against vertical surfaces.

C. Proceed with installation only after unsatisfactory conditions have been corrected and waterproofing protection is in place.

3.2 PREPARATION

A. Remove substances from concrete substrates that could impair mortar bond, including curing and sealing compounds, form oil, and laitance.

B. Sweep concrete substrates to remove dirt, dust, debris, and loose particles.

C. Proof-roll prepared subgrade according to requirements in Division 31 Section "Earth Moving" to identify soft pockets and areas of excess yielding. Proceed with unit paver installation only after deficient subgrades have been corrected and are ready to receive subbase and base course for unit pavers.

3.3 INSTALLATION, GENERAL

A. Do not use unit pavers with chips, cracks, voids, discolorations, or other defects that might be visible or cause staining in finished work.

B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.

C. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.

1. For concrete pavers, a block splitter may be used.

D. Handle protective-coated brick pavers to prevent coated surfaces from contacting backs or edges of other units. If, despite these precautions, coating does contact bonding surfaces of brick, remove coating from bonding surfaces before setting brick.

E. Joint Pattern: Running bond as indicated.

F. Pavers over Waterproofing: Exercise care in placing pavers and setting materials over waterproofing so protection materials are not displaced and waterproofing is not punctured or otherwise damaged. Carefully replace protection materials that become displaced and arrange for repair of damaged waterproofing before covering with paving.

1. Provide joint filler at waterproofing that is turned up on vertical surfaces unless otherwise indicated; where unfilled joints are indicated, provide temporary filler or protection until paver installation is complete.

G. Tolerances: Do not exceed 1/32-inch unit-to-unit offset from flush (lippage) nor 1/8 inch in 10 feet from level, or indicated slope, for finished surface of paving.

H. Expansion and Control Joints: Provide for sealant-filled joints at locations and of widths indicated. Provide compressible foam filler as backing for sealant-filled joints unless otherwise indicated; where unfilled joints are indicated, provide temporary filler until paver installation is complete. Install joint filler before setting pavers. Sealant materials and installation are specified in specification section 321373.

I. Provide edge restraints as indicated by drawings. Install edge restraints before placing unit pavers.

3.4 BITUMINOUS SETTING BED APPLICATIONS

A. Apply primer to concrete slab or binder course immediately before placing setting bed.

B. Prepare for setting-bed placement by locating 3/4-inch deep control bars approximately 11 feet apart and parallel to one another, to serve as guides for striking board. Adjust bars to subgrades required for accurate setting of paving units to finished grades indicated.

C. Place bituminous setting bed where indicated, in panels, by spreading bituminous material between control bars. Spread mix at a minimum temperature of 250 degrees F. Strike setting bed smooth, firm, even, and not less than 3/4-inch thick. Add fresh bituminous material to low, porous spots after each pass of striking board. After each panel is completed, advance first control bar to next position in readiness for striking adjacent panels. Carefully fill depressions that remain after removing depth-control bars.
   1. Roll setting bed with power roller to a nominal depth of 3/4 inch. Adjust thickness as necessary to allow accurate setting of unit pavers to finished grades indicated. Complete rolling before mix temperature cools to 185 deg F.

D. Apply neoprene-modified asphalt adhesive to cold setting bed by squeegeeing or troweling to a uniform thickness of 1/16-inch. Proceed with setting of paving units only after adhesive is tacky and surface is dry to touch.

3.5 CONCRETE UNIT PAVER INSTALLATION ON SLAB-ON-GRADE

A. Unit paver installation shall be plumb, level and true to line and grade and shall coincide and align with adjacent work and elevations. Care shall be taken during the layout to minimize cutting.
   1. Paving of each area will proceed from one side or end; installation will not commence from opposite ends or sides.

B. Starting at paver layout baselines, commence laying the pavers on the undisturbed setting bed in the pattern and color as shown on the Drawings. Hand tamp with rubber mallet to ensure that each paver is in place, completely supported and at final finished grade. If additional leveling of paving is required, and before treating joints, roll paving with power roller after sufficient heat has built up in the surface from several days of hot weather.
   1. Pavers shall be installed with hand-tight joints. String lines shall be used frequently to hold pattern lines true and accurate.
   2. Full units shall be laid first, and cuts done subsequently.
   3. Pavers abutting gutters, building faces, utility surface expressions or vertical elements to fit around these objects with a maximum of 1/8 inch joint.
   4. Cut pavers are to be no smaller than six (6) inches in any dimension on pedestrian areas. Where field cutting would result in pavers below these minimum sizes, use larger pavers adjacent to fill space. All units are to fit together accurately, with joint widths as indicated on Drawings.
   5. Installers shall lay subsequent pavers by moving forward on the top of the previously installed units.

C. Place pavers carefully by hand in straight courses, maintaining accurate alignment and uniform top surface. Protect newly laid pavers with plywood panels on which workers can stand. Advance protective panels as work progresses but maintain protection in areas subject to continued movement of materials and equipment to avoid creating depressions or disrupting alignment of pavers. If additional leveling of paving is required, and before treating joints, roll

paving with power roller after sufficient heat has built up in the surface from several days of hot weather.

D. Joint Treatment: Place unit pavers with hand-tight joints. Fill joints by sweeping sand over paved surface until joints are filled. Remove excess sand after joints are filled.

E. Completion: The completed paver surface shall be cleaned and washed down. The final surface level will not deviate from the design levels by more than plus or minus 1/16-inch. The surface level of the pavers immediately adjacent to drainage outlets, gutters, and channels will not deviate by more than 3/16-inch. The final surface, when measured under a 10-inch-long steel or aluminum straightedge, will not vary by more than 1/4-inch. The surface of the adjacent pavers will not show any difference in level. All humps or depressions exceeding the specified tolerance shall be corrected at no additional cost to the Owner.

3.6 MORTAR SETTING-BED APPLICATIONS

A. Saturate concrete subbase with clean water several hours before placing setting bed. Remove surface water about one hour before placing setting bed.

B. Apply mortar-bed bond coat over surface of concrete subbase about 15 minutes before placing mortar bed. Limit area of bond coat to avoid its drying out before placing setting bed. Do not exceed 1/16-inch thickness for bond coat.

C. Apply mortar bed over bond coat; spread and screed mortar bed to uniform thickness at subgrade elevations required for accurate setting of pavers to finished grades indicated.

D. Place reinforcing wire over concrete subbase, lapped at joints by at least one full mesh and supported so mesh becomes embedded in the middle of mortar bed. Hold edges back from vertical surfaces approximately 1/2 inch.

E. Place mortar bed with reinforcing wire fully embedded in middle of mortar bed. Spread and screed mortar bed to uniform thickness at subgrade elevations required for accurate setting of pavers to finished grades indicated.

F. Mix and place only that amount of mortar bed that can be covered with pavers before initial set. Before placing pavers, cut back, bevel edge, and remove and discard setting-bed material that has reached initial set.

G. Place pavers before initial set of cement occurs. Immediately before placing pavers on mortar bed, apply uniform 1/16-inch-thick bond coat to mortar bed or to back of each paver with a flat trowel.

H. Tamp or beat pavers with a wooden block or rubber mallet to obtain full contact with setting bed and to bring finished surfaces within indicated tolerances. Set each paver in a single operation before initial set of mortar; do not return to areas already set or disturb pavers for purposes of realigning finished surfaces or adjusting joints.

3.7 CONCRETE UNIT PAVER INSTALLATION ON ELEVATOR PEDESTAL SYSTEM

A. Inspect to ensure all substrates have been properly prepared to accept the pedestals. Any surface defect which may impair performance of the pedestals or waterproofing membrane shall be appropriately repaired. Commencement of work shall imply acceptance of surfaces.

B. Assure that the surface to accept the pedestals is clean and free of debris which would impair the performance of the pedestal system. Insulation and/or protection board must be applied over the water-proofing substrate. If specified, drainage mat, insulation and/or protection board must be installed according to manufacturer's recommendations. If protection is specified only under the pedestal, then each pad must extend beyond the edge of the pedestal base by a minimum of one (1) inch.

C. Grid Layout and Elevations
1. Level Installation: Once a starting point and the finished elevation of the paving surface has been determined, the support system elevation (finished elevation less the paver thickness) is established and marked around the perimeter using a transit, water level or laser leveling device.
2. Measurements are to be taken and two (2) perpendicular chalk lines "snapped" on the surface to receive the pedestals. Use these lines as a reference to check the paver layout during installation and to assure a square layout. Install pavers one row at a time.
3. At the starting row of pavers, a pedestal must be placed where each grid line meets the perimeter. Remove two spacer tabs in line with one another from atop each pedestal located along the perimeter. Adjust each to the elevation marked on the perimeter.
4. Position the pedestal as close to the edge of the perimeter as possible, with the two remaining spacer tabs aligned with the grid line. Using the elevation marked on the perimeter, stretch a ma-son's line along and slightly ahead of the second row of pedestals. A laser leveling device may also be used for this purpose.
5. Place pedestals in position prior to the paver installation. As pedestals along the grid lines are loaded, and prior to installing the next row of pavers, make fine vertical adjustment by rotating the base, or bottom of the pedestal. Clockwise rotation of the base will raise the bearing surface, and thus the paver(s). Counterclockwise rotation will lower the bearing surface.
6. If "quality control" slots at the base of the screw cylinder become visible, they indicate that the pedestal is extended beyond the minimum engagement of threads. The next larger size pedestal or a pedestal coupling unit must be used.
7. Slight irregularities in paver thickness can be compensated for by using one or more of four pie-cut segments of the New Leveling Shims which is placed under a paver corner(s) atop the pedestal bearing head.

D. If compensation for slope in the substrate surface is necessary or required, it may be accomplished in one of two ways:
1. New Leveling Shims rubber pads may be used in multiples, whole or segmented, and placed over the Elevator Pedestal System as shims to level the Elevator Pedestals.
2. Compensator Leveling System, base leveler disks may be used under the Elevator Pedestal System base to compensate for up to 1 inch per foot of slope. By placing the disk's thickest edge (where a small finger tab is located at the outer edge) at the downslope side of the pedestal, one disk compensates for 1/4 inch per foot slope. Using two or more disks, rotate in relation to one another to create a level pedestal placement.

E. Placement of Pavers and Final Adjustment
1. Pavers may be placed per the paver manufacturer's written instructions. Use of a stone lifter or other labor-saving device is acceptable. The base of the pedestal support may be rotated for slight adjustment when two pavers are already on the bearing head. Pavers should be leveled in each succeeding row.

F. Field Quality Control
1. Inspect often during installation to assure that grid (spacer) lines are straight and consistent, and that pavers are level. Where necessary, install rubber shims to eliminate the "rocking" of pavers. Unless otherwise specified to allow for expansion, pavers spacing at perimeter walls should not exceed 1/8 of an inch.

3.8 ADJUSTING AND REPAIRING

A. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.

3.9 WASTE DISPOSAL

A. Do not dispose of excess materials and water-borne debris from cleaning out equipment in adjacent areas designated to be future planting beds.

3.10 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 321410

SECTION 321600 – METAL EDGING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Aluminum edge restraints.

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 32 Section ‘Crushed Stone Paving’
   3. Division 32 Section ‘Concrete Paving’
   4. Division 32 Section 'Unit Paving’

1.3 SUSTAINABLE DESIGN SUBMITTALS

A. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

1.4 ACTION SUBMITTALS

A. Product Data for the following: For each type of product indicated.
   1. Submit product literature or tear sheets giving name of product, manufacturer's name and compliance with Specifications.

B. Shop Drawings: Submit for fabrication and installation of paving. Submit large scale dimensioned cutting and setting drawings depicting layout of edging with actual dimensions and tolerances, arrangement and provision for jointing, position of anchors and other necessary details for the work. Include all adjacent conditions (utility items and existing top of structure) and field verified conditions and dimensions.
   1. Shop drawings to be drafted by qualified draftsman.
   2. Include evidence of experience including project list.
   3. Show location layouts, including Points of Beginning, coordinated with the design drawing and related survey control points and dimensions.
   4. Establish and verify dimensions with work of on-site structures and elements, layouts and patterns of other work, and other like conditions.
   5. Do not fabricate any edging (except for samples) until Shop Drawings have been approved for fabrication by Landscape Architect.

C. Samples for Verification: For edging materials and accessories, with specified finishes; 24 inches long for each type of edging, with one anchoring device of each type.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data for:
   1. Draftsman for Shop Drawings- Include evidence of experience including project list.
   2. Fabricator - Include evidence of experience including project list.
   3. Installer - Include evidence of experience including project list.
   4. Firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

B. Product Certificates: For each kind of edge restraint and accessory, from manufacturer.

C. Guarantee: The Contractor shall obtain in Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. All these guarantees shall be in addition to, and not in lieu of, other liabilities which the Contractor may have by law or other provisions of the Contract Documents.

1.6 QUALITY ASSURANCE

A. The work of this section shall be performed by a company which specializes in the type of work required for this Project, with a minimum of ten (10) years of documented successful experience and shall be performed by skilled workmen thoroughly experienced in the necessary crafts.

B. Draftsman Qualifications: Shop Drawings shall be drafted by a single firm who have provided Shop Drawings successfully similar to the size and scope of this project and who have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere.
   1. Draftsman shall submit qualifications to the Landscape Architect for his review.

C. Fabrication Qualifications: Fabrications shall be by a firm or firms who have successfully fabricated metal edging of each material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than ten (10) years.
   1. Fabricator shall submit qualifications to the Landscape Architect for his review.

D. Installer Qualifications: Installer shall have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere, in the installation of stonework of the sizes and setting beds specified, and the products, systems, and scope specified.
   1. Installer shall submit qualifications to the Landscape Architect for his review.
   2. Installation Foreman: Installation firm for metal edging of this Project shall have on staff a supervising Foreman assigned full time to this Project, from time of mock-up installations, who shall have at least twenty (20) years total installation experience and with at least ten (10) years of experience in installations of equivalent or more extensive type and scope to this Project. Submit detailed resume of past experience with dates, duration and scope identification, Project name and location, and work function of previous projects worked on.
   3. Use members of skilled workmen equal to work requirement or occasion. The skilled workmen shall be thoroughly trained and experienced in the necessary crafts and shall be completely familiar with the specific requirements and methods needed for performance of the work in this Section.

E. Source Limitations for Materials: Obtain each type of accessory and other materials from a single manufacturer for each product.

F. Pre-installation Meeting: Before beginning paving work, schedule and conduct a meeting at Project site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Contractor, the installer, the installer's field foreman and manufacturer's representative. Inform the Landscape Architect five (5) business days in advance of the scheduled meeting time.

G. Field Engineering: All line and grade work not presently established at the site shall be laid out by a registered Lands Surveyor or Professional civil Engineer employed by the contractor in accordance with the Contract Documents. Establish permanent benchmarks and maintain all established benchmarks, bound and replace any which are destroyed or disturbed

H. Maintenance Program: Submit a maintenance and cleaning program to be followed by the Contractor during construction and by the Owner during Warranty Period, including provisions, such as temporary planking, to protect pavement from occasional heavy loads.

1.7 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Handling: Properly crate and band metal edging for shipment and receiving at job site. Handle each edging to prevent corrosion, marking, bending, or other damage both during delivery and during storage at site.

B. Lift and support units only at designated lifting or supporting points shown on Shop Drawings.

C. Storage and Protection: Store stone units on non-staining wood skids or pallets set not less than 4 IN above ground, covered with non-staining, waterproof membrane. Protect stored edging from weather with waterproof cover to prevent staining or contamination but allow air to circulate around units.

D. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration by moisture and temperature during delivery and during storage at site. Protect liquid components from freezing.

1.9 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

B. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

C. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

D. Work Protection Requirements - Provide weather protection during entire time of placement of edging system. Maintain protection over entire area storage and work area to maintain specified moisture levels, prevent wind or rain disturbance of setting materials, protect from run-off from adjacent areas, and generally maintain optimum installation conditions. Contractor is responsible for means and methods for such protection, including physical cover, work sequencing and scheduling and other means of protection, as Contractor deems appropriate.

E. Environmental Requirements:
   1. Verify all Environmental Requirements with manufacturer prior to commencing work.
   2. Weather/Temperature: (Cold Weather Requirements) Do not commence work when a descending air temperature in the shade away from artificial heat reaches 40 deg F, and do not resume until an ascending air temperature in the shade and away from artificial heat reaches 35 deg F.
   3. Do not undertake work on frozen substrate or using frozen materials or materials mixed with or coated with ice or frost. Protect work from frost and remove and replace any work damaged by frost or freezing.
      a. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
   4. Weather/Temperature: (Hot Weather Requirements) Protect edging work when temperature and humidity conditions produce excessive evaporation of setting beds and grout. Provide artificial shade and windbreaks and use cooled materials as required.
      a. Do not apply mortar to substrates with temperatures of 100 deg F and above.
      b. Comply with hot-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

1.10 UTILIZATION REQUIREMENTS

A. Plywood panels must be kept on areas which will be subject to continued movement of materials and equipment.

B. Maintenance of Traffic, Access and Utilities: In accordance with Division 01.

1.11 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specifications.

1.12 CLOSEOUT REQUIREMENTS

A. Project Record Documents: Submit in accordance with Division 01 Section “Project Record Documents”.

B. Final Cleaning: in accordance with Division 01 Section “Cleaning”
   1. Leave site in an orderly, “broom clean” condition.

1.13 OPERATIONS AND MAINTENANCE DATA

A. Provide Maintenance and cleaning instructions for Owner.

B. Provide to Owner all product warranties provided by manufacturers.

PART 2 - PRODUCTS

2.1 METAL EDGING AND ACCESSORIES

A. Metal Edge – Type 1 (L-Shaped): Subject to compliance with requirements, provide aluminum edge restraints as manufactured by Permaloc, 13505 Barry Street, Holland, MI 49424; Telephone: 1-800-356-9660.
   1. Product: AsphaltEdge, located and sized per Drawings.
   2. Finish: Mill Finish (Natural Aluminum)

B. Metal Edge – Type 2 (Straight): Subject to compliance with requirements, provide aluminum edge restraints as manufactured by Permaloc, 13505 Barry Street, Holland, MI 49424; Telephone: 1-800-356-9660.
   1. Product: CleanLineXL, located and sized per Drawings.
   2. Finish: Mill Finish (Natural Aluminum)

C. Metal Edge – Type 3
   1. See Division 32 Section ‘Garden Roof Assembly’.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify the conditions, elevations and measurements affecting the work of this Section prior to installation. Examine surfaces to receive edging and do not proceed until any defects detrimental to the finished work are corrected. Notify the General Contractor in writing of conditions detrimental to proper completions of Work. Starting work means acceptance of existing conditions.

B. L-Shaped “Angle” Edging installed on cast in place concrete slab:
   1. Verify that the finish slab elevations in the underlying concrete are constructed as specified, so that the edging can be installed to the design grade and within the specified setting bed tolerances.
   2. Where edging is to be installed over existing waterproofing, examine the condition of the waterproofing and protection board with General Contractor present, for prover protection

from paving operations. Do not proceed with installation unless existing waterproofing system and protection boards are intact and acceptable. If repair is required, do not proceed until repair work is complete.

C. Straight Edging installed adjacent to crushed stone paving:
   1. Install metal edge restraints prior to placing adjacent crushed stone paving.
   2. Metal edging shall be installed at the locations shown in the Drawings and as detailed in the Drawings.
   3. Anchor as detailed in the Drawings or per Manufacturer's instructions. At a minimum, provide anchors at 30 in. O.C. as required to secure and maintain layout as indicated on Drawings.

D. Examine areas to receive metal edging for compliance with requirements and conditions affecting installation and performance.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

F. Coordinate the installation of this work with the work of other trades. Give particular attention to the location and size of cutouts required to accommodate mechanical, electrical, site drainage, and other work or adjoining construction.

3.2 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 321600

SECTION 323113 – FENCES AND GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes all labor, materials, equipment, and services necessary to complete the fabrication and installation of fences and gates on site as shown on the drawings and specified herein, including but not limited to, the following:
   1. Aluminum Picket Fences
   2. Gates: Swing

B. Related Sections:
   1. Division 03 Section ‘Cast in Place Concrete’
   2. Division 07 Section ‘Sitework Joint Sealants’
   3. Division 32 Section 'Soil Preparation and Mixes’
   4. Division 32 Section 'Exterior Planting’

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM)
   1. ASTM E 895 - Specification for Permanent Metal Railing Systems and Rails for Buildings
   2. ASTM E 935 - Test Methods for Performance of Permanent Metal Railing Systems and Rails for Building Systems
   3. ASTM E 894 - Test Methods for Anchorage of Permanent Metal Railing Systems and Rails for Building Systems

   1. SSPC-SP6 - Surface Preparation Specification No. 6: Commercial Blast Cleaning

D. AISC (Manual of Steel Construction)

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design fences and gates, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Structural Performance: fence and gate framework shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated according to ASCE/SEI 7:

1. Minimum Post Size: Determine according to ASTM F 1043 for framework up to 6 feet (3.66 m) high, and post spacing not to exceed 8 feet
2. Minimum Post Size and Maximum Spacing: Determine according to CLFMI WLG 2445, based on mesh size and pattern specified and on the following:
   a. Wind Loads: Shall meet local requirements
   b. Exposure Category: Shall meet local requirements
   c. Fence Height: 6 feet
   d. Material Group: Aluminum

C. Lightning Protection System: Maximum grounding-resistance value of 25 ohms under normal dry conditions.

1.5 SUSTAINABLE DESIGN SUBMITTALS

A. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

1.6 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fences and gates.
   1. Fence and gate posts, rails, and fittings.
   2. Reinforcements, and attachments.
   3. Accessories: None
   4. Gates and hardware.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work. Show accessories, hardware, gate operation, and operational clearances.

C. Samples for Initial Selection: For components with factory-applied color finishes.

D. Samples for Verification: Prepared on Samples of size indicated below:
   1. Polymer-Coated Components: In 6-inch lengths for components and on full-sized units for accessories.

E. Fences and gate framework indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified professional engineer, testing agency, factory-authorized service representative.

B. Product Certificates: For each type of fence and gate, from manufacturer.

C. Product Test Reports: For framing strength according to ASTM F 1043.

D. Field quality-control reports.

E. Warranty: Sample of special warranty.

1.8 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For the following to include in emergency, operation, and maintenance manuals:
   1. Polymer finishes.
   2. Gate hardware.
   3. Gate operator.

1.9 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing fence grounding. Member company of NETA or an NRTL.
   1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Emergency Access Requirements: Comply with requirements of authorities having jurisdiction for gates with automatic gate operators serving as a required means of access.

D. Mockups: Build mockups to set quality standards for fabrication and installation.
   1. Include 8-foot length of fence and single and double gate.

E. Preinstallation Conference: Conduct conference at Project site.
   1. Review sequence of operation for each type of gate operator.
   2. Review coordination of interlocked equipment specified in this Section and elsewhere.
   3. Review required testing, inspecting, and certifying procedures.

1.10 PROJECT CONDITIONS

A. Field Measurements: Field Measurements: Verify layout information for fences and gates shown on Drawings in relation to property survey and existing structures. Verify dimensions by field measurements.

1.11 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of fences and gates that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Faulty operation of gate operators and controls.
      b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

B. Warranty Period: Five (5) years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 FENCE FRAMING

A. Aluminum Fence as manufactured by Sentinel Fence & Rail, 1527 NC Hwy 711 Lumberton, NC 28360; Telephone: 877-999-0089; Website: www.sentinelmfg.com
   1. Model: Industrial Grade Sierra
   2. Material: Extruded and fabricated Aluminum
   3. Color: To be selected by Landscape Architect
   4. Panel width: As Shown on the Drawings
   5. Panel Height: As Shown on the Drawings

2.2 GATE

A. Aluminum Double Gate as manufactured by Sentinel Fence & Rail, 1527 NC Hwy 711 Lumberton, NC 28360; Telephone: 877-999-0089; Website: www.sentinelmfg.com
   1. Model: Industrial Grade Sierra
   2. Material: Extruded and fabricated Aluminum
   3. Color: To be selected by Landscape Architect
   4. Panel width: As Shown on the Drawings
   5. Panel Height: As Shown on the Drawings

2.3 ACCESSORIES

A. Lockable Gate Latch as provided by Sentinel Fence & Rail, 1527 NC Hwy 711 Lumberton, NC 28360; Telephone: 877-999-0089; Website: www.sentinelmfg.com

B. Gate Hinges as provided by Sentinel Fence & Rail, 1527 NC Hwy 711 Lumberton, NC 28360; Telephone: 877-999-0089; Website: www.sentinelmfg.com

C. Gate Drop Pin as provided by Sentinel Fence & Rail, 1527 NC Hwy 711 Lumberton, NC 28360; Telephone: 877-999-0089; Website: www.sentinelmfg.com

2.4 FITTINGS

A. General: Comply with ASTM F 626.

B. Post Caps: Provide for each post.
   1. Provide line post caps with loop to receive tension wire or top rail.

C. Rail and Brace Ends: For each gate, corner, pull, and end post.

D. Rail Fittings: Provide the following:
   1. Top Rail Sleeves: Aluminum Alloy 6063 not less than 6 inches long.
   2. Rail Clamps: Line and corner boulevard clamps for connecting intermediate and bottom rails in the fence line-to-line posts.

E. Tension and Brace Bands: Aluminum Alloy 6063.

F. Tension Bars: Aluminum, length not less than 2 inches shorter than full height of fabric. Provide one bar for each gate and end post, and two for each corner and pull post, unless fabric is integrally woven into post.

G. Truss Rod Assemblies: Mill-finished aluminum rod and turnbuckle or other means of adjustment.

2.5 GROUT AND ANCHORING CEMENT

A. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout, recommended in writing by manufacturer, for exterior applications.

B. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with potable water at Project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended in writing by manufacturer, for exterior applications.

2.6 FENCE GROUNDING

A. Conductors: Bare, solid wire for No. 6 AWG and smaller; stranded wire for No. 4 AWG and larger.
   1. Material above Finished Grade: Aluminum.
   2. Material on or below Finished Grade: Copper.
   3. Bonding Jumpers: Braided copper tape, 1 inch wide, woven of No. 30 AWG bare copper wire, terminated with copper ferrules.

B. Connectors and Grounding Rods: Comply with UL 467.
   1. Connectors for Below-Grade Use: Exothermic welded type.
   2. Grounding Rods: Copper-clad steel, 5/8 by 96 inches.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for[a verified survey of property lines and legal boundaries,] site clearing, earthwork, pavement work, and other conditions affecting performance of the Work.
   1. Do not begin installation before final grading is completed unless otherwise permitted by Architect.

B. Proceed with installation only after unsatisfactory conditions have been corrected

3.2 PREPARATION

A. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet or line of sight between stakes. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.

3.3 INSTALLATION, GENERAL

A. Install fencing to comply with ASTM F 567 and more stringent requirements indicated.

B. Install fencing on established boundary lines inside property line.

3.4 FENCE INSTALLATION

A. Post Excavation: Drill or hand-excavate holes for posts to diameters and spacings indicated, in firm, undisturbed soil.

B. Post Setting: Set posts in concrete at indicated spacing into firm, undisturbed soil.
   1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.
   2. Concrete Fill: Place concrete around posts to dimensions indicated and vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.
      a. Exposed Concrete: Extend 2 inches above grade; shape and smooth to shed water.
      b. Concealed Concrete: Top 2 inches below grade as indicated on Drawings to allow covering with surface material.
      c. Posts Set into Concrete in Sleeves: Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with nonshrink, mixed and placed to comply with anchoring material manufacturer's written instructions, and finished sloped to drain water away from post.

C. Terminal Posts: Locate terminal end, corner, and gate posts per ASTM F 567 and terminal pull posts at changes in horizontal or vertical alignment of as indicated on Drawings.

D. Line Posts: Space line posts uniformly at 8'-0" o.c.

E. Post Bracing and Intermediate Rails: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Diagonally brace terminal posts to adjacent line posts with truss rods and turnbuckles. Install braces at end and gate posts and at both sides of corner and pull posts.
   1. Locate horizontal braces at midheight of fabric 72 inches or higher, on fences with top rail and at two-third fabric height on fences without top rail. Install so posts are plumb when diagonal rod is under proper tension.

F. Tension Wire: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Pull wire taut, without sags. Fasten fabric to tension wire with 0.120-inch- diameter hog rings of same material and finish as fabric wire, spaced a maximum of 24 inches o.c. Install tension wire in locations indicated before stretching fabric. Provide horizontal tension wire at the following locations:
   1. As required by manufacturer

G. Top Rail: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Run rail continuously through line post caps, bending to radius for curved runs and terminating into rail end attached to posts or post caps fabricated to receive rail at terminal posts. Provide expansion couplings as recommended in writing by fencing manufacturer.

H. Intermediate and Bottom Rails: Install and secure to posts with fittings.

I. Tension or Stretcher Bars: Thread through fabric and secure to end, corner, pull, and gate posts with tension bands spaced not more than 15 inches o.c.

J. Tie Wires: Use wire of proper length to firmly secure fabric to line posts and rails. Attach wire at one end to fabric, wrap wire around post a minimum of 180 degrees, and attach other end to fabric per ASTM F 626. Bend ends of wire to minimize hazard to individuals and clothing.
1. Maximum Spacing: Tie fabric to line posts at 12 inches o.c. and to braces at 24 inches o.c.

3.5 GATE INSTALLATION

A. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach fabric as for fencing. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

3.6 GROUNDING AND BONDING

A. Fence Grounding: Install at maximum intervals of 1500 feet except as follows:
1. Fences within 100 Feet of Buildings, Structures, Walkways, and Roadways: Ground at maximum intervals of 750 feet
a. Gates and Other Fence Openings: Ground fence on each side of opening.
1) Bond metal gates to gate posts.
2) Bond across openings, with and without gates, except openings indicated as intentional fence discontinuities. Use No. 2 AWG wire and bury it at least 18 inches below finished grade.

B. Protection at Crossings of Overhead Electrical Power Lines: Ground fence at location of crossing and at a maximum distance of 150 feet on each side of crossing.

C. Fences Enclosing Electrical Power Distribution Equipment: Ground as required by IEEE C2 unless otherwise indicated.

D. Grounding Method: At each grounding location, drive a grounding rod vertically until the top is 6 inches below finished grade. Connect rod to fence with No. 6 AWG conductor. Connect conductor to each fence component at the grounding location, including the following:
1. Make grounding connections to each barbed wire strand with wire-to-wire connectors designed for this purpose.
2. Make grounding connections to each barbed tape coil with connectors designed for this purpose.

E. Bonding Method for Gates: Connect bonding jumper between gate post and gate frame.

F. Connections: Make connections to minimize possibility of galvanic action or electrolysis. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.
1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
2. Make connections with clean, bare metal at points of contact.
3. Make aluminum-to-steel connections with stainless-steel separators and mechanical clamps.

4. Make aluminum-to-galvanized-steel connections with tin-plated copper jumpers and mechanical clamps.
5. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

G. Bonding to Lightning Protection System: If fence terminates at lightning-protected building or structure, ground the fence and bond the fence grounding conductor to lightning protection down conductor or lightning protection grounding conductor complying with NFPA 780.

3.7 FIELD QUALITY CONTROL

A. Grounding-Resistance Testing: Engage a qualified testing agency to perform tests and inspections.
1. Grounding-Resistance Tests: Subject completed grounding system to a megger test at each grounding location. Measure grounding resistance no fewer than two full days after last trace of precipitation, without soil having been moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural grounding resistance. Perform tests by two-point method according to IEEE 81.
2. Excessive Grounding Resistance: If resistance to grounding exceeds specified value, notify Architect promptly. Include recommendations for reducing grounding resistance and a proposal to accomplish recommended work.
3. Report: Prepare test reports certified by a testing agency of grounding resistance at each test location. Include observations of weather and other phenomena that may affect test results.

3.8 ADJUSTING

A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

B. Automatic Gate Operator: Energize circuits to electrical equipment and devices. Adjust operators, controls, safety devices, and limit switches.
1. Hydraulic Operator: Purge operating system, adjust pressure and fluid levels, and check for leaks.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Lubricate hardware, gate operator, and other moving parts.

3.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's personnel to adjust, operate, and maintain fences and gates.

3.10 CLEANING, PROTECTION AND ADJUSTMENT

A. Cleaning and Protection: Protect all work from misuse or damage during construction period with temporary protective coverings approved by ornamental metalwork fabricator. Remove protective covering at the time of Substantial Completion. Work, which is scratched, etched or damaged, may not be accepted by the Landscape Architect, and shall be replaced with acceptable work or, as approved, repaired at no additional cost to Owner

3.11 CLEAN UP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material of dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 323113

SECTION 323223 - SEGMENTAL RETAINING WALLS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes single-depth segmental retaining walls with soil reinforcement.

B. Related Sections:

1. Division 31 Section "Earth Moving" for excavation for segmental retaining walls.

1.2 PERFORMANCE REQUIREMENTS

A. Basis of Design: Design of segmental retaining walls is based on products indicated. If comparable products of other manufacturers are proposed, provide engineering design for proposed products, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. **Delegated Design**: Design segmental retaining walls, including comprehensive engineering analysis by a qualified professional engineer, licensed in the Commonwealth of Kentucky, using performance requirements and design criteria indicated.

C. Structural Performance: Engineering design shall be based on loads due to soil pressures resulting from grades indicated and be according to NCMA's "Design Manual for Segmental Retaining Walls."

D. Seismic Performance: Engineering design shall be based on loads and factors due to soil pressures resulting from grades indicated and be according to NCMA's "Segmental Retaining Walls - Seismic Design Manual."

E. Seismic Stability. Seismic loading shall be evaluated in accordance with AASHTO Load and Resistance Factor Design (LRFD) methodology as referenced in paragraph 1.03, subparagraph C.1.

1.3 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform the following preconstruction testing:

1. Test soil reinforcement and backfill materials for pullout resistance according to ASTM D 6706.
2. Test soil reinforcement and backfill materials for coefficient of friction according to ASTM D 5321.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For each color and texture of concrete unit required.

C. Delegated-Design Submittal: For segmental retaining walls indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Compliance Review: Qualified professional engineer responsible for segmental retaining wall design shall review and approve submittals and field quality-control reports for compliance of materials and construction with design.

1.5 INFORMATIONAL SUBMITTALS

A. Preconstruction test reports.

B. Field quality-control reports. Drainage Pipe

C. Geotextile

D. Geosynthetic Soil Reinforcement (if required by the retaining wall design). The contractor shall provide certified manufacturer test reports for the geosynthetic soil reinforcement material in the manufactured roll width specified. The test report shall list the individual roll numbers for which the certified material properties are valid.

E. Installer Qualification Data. At least 14 days prior to construction, the General Contractor shall submit the qualifications of the business entity responsible for installation of the retaining wall, the Retaining Wall Installation Contractor, per paragraph 1.07, subparagraph A of this section.

PART 2 - PRODUCTS

2.1 SEGMENTAL RETAINING WALL UNITS

A. Concrete Units: ASTM C 1372, Normal Weight, except that maximum water absorption shall not exceed 7 percent by weight and units shall not differ in height more than plus or minus 1/16 inch (1.6 mm) from specified dimension.
1. Basis-of-Design Product: Subject to compliance with requirements, provide Big Block Gravity Retaining Walls as licensed by Verti-block, 16120 S. Pony Express Road Bluffdale, UT 84065, Phone: 801-571-2028, www.verti-block.com. or comparable product such as Redi-rock XL or Reading Rock ReCon.
2. Color & texture: As selected from manufacturer’s standard colors and forms.

B. All units shall be wet-cast precast modular concrete retaining wall units that form the external fascia of a modular unit retaining wall system.

C. All units for the project shall be obtained from the same manufacturer. The manufacturer shall be licensed and authorized to produce the retaining wall units by the precast modular block system patent holder/licensor and shall document compliance with the published quality control standards of the proprietary precast modular block system licensor for the previous three (3) years or the total time the manufacturer has been licensed, whichever is less.

D. Concrete used in the production of the precast modular block units shall be first-purpose, fresh concrete. It shall not consist of returned, reconstituted, surplus or waste concrete. It

shall be an original production mix meeting the requirements of ASTM C94 and exhibit the following:

1. Minimum 28-day compressive strength of 5,000 psi as tested in accordance with ASTM C 140.
2. Shall be free of water soluble chlorides and chloride based accelerator admixtures.
3. 6% +/- 1½% air-entrainment in conformance ASTM C94.
4. Maximum slump of 5 inches +/- 1½ inches (125 mm +/- 40 mm) per ASTM C143 for conventional concrete mix designs.
5. Slump Flow for Self-Consolidating Concrete (SCC) mix designs shall be between 18 inches and 32 inches (450 mm and 800 mm) as tested in accordance with ASTM C1611.
6. Moisture absorption rate of 5 percent to ensure adequate freeze-thaw protection.

E. Each concrete block shall be cast in a single continuous pour without cold joints with a maximum tolerance of plus or minus 1/8” for each dimension.

F. All precast modular block units shall be sound and free of cracks or other defects that would interfere with the proper installation of the unit, impair the strength or performance of the constructed wall. PMB units to be used in exposed wall construction shall not exhibit chips or cracks in the exposed face or faces of the unit that are not otherwise permitted. Chips smaller than 1.5” (38 mm) in its largest dimension and cracks not wider than 0.012” (0.3 mm) and not longer than 25% of the nominal height of the PMB unit shall be permitted. PMB units with bug holes in the exposed architectural face smaller than 0.75” (19 mm) in its largest dimension shall be permitted. Bug holes, water marks, and color variation on non-architectural faces are acceptable. PMB units that exhibit cracks that are continuous through any solid element of the PMB unit shall not be incorporated in the work regardless of the width or length of the crack.

I. Substitutions. Technical information demonstrating conformance with the requirements of this specification for an alternative precast modular block retaining wall system must be submitted for preapproval at least 14 calendar days prior to the bid date. Acceptable alternative PMB retaining wall systems, otherwise found to be in conformance with this specification, shall be approved in writing by the owner 7 days prior to the bid date. The Owner’s Representative reserves the right to provide no response to submissions made out of the time requirements of this section or to submissions of block retaining wall systems that are determined to be unacceptable to the owner.

2.02 GEOGRID REINFORCEMENT

A. Geogrid reinforcement shall be a woven or knitted PVC coated geogrid manufactured from high-tenacity PET polyester fiber with an average molecular weight greater than 25,000 (M_n > 25,0000) and a carboxyl end group less than 30 (CEG < 30). The geogrid shall be furnished in prefabricated roll widths of certified tensile strength by the manufacturer. The prefabricated roll width of the geogrid shall be 12” (300 mm) +/- 1/2” (13 mm). No cutting of geogrid reinforcement down to the 12” (300 mm) roll width from a larger commercial roll width will be allowed under any circumstances.

B. The ultimate tensile strength (T_{ult}) of the geogrid reinforcement shall be measured in accordance with ASTM D6637.

C. Geogrid – Soil Friction Properties
1. Friction factor, F*, shall be equal to 2/3 Tan ϕ, where ϕ is the effective angle of internal friction of the reinforced fill soil.
2. Linear Scale Correction Factor, α, shall equal 0.8.

D. Long-Term Tensile Strength (T_{al}) of the geogrid reinforcement shall be calculated in accordance with Section 3.5.2 of FHWA-NHI-10-024 and as provided in this specification.
   1. The creep reduction factor (RF_{CR}) shall be determined in accordance with Appendix D of FHWA-NHI-10-025 for a minimum 75 year design life.
   2. Minimum installation damage reduction factor (RF_{ID}) shall be 1.25. The value of RF_{ID} shall be based upon documented full-scale tests in a soil that is comparable to the material proposed for use as reinforced backfill in accordance with ASTM D5818.
   3. Minimum durability reduction factor (RF_D) shall be 1.3 for a soil pH range of 3 to 9.

E. Connection between the PMB retaining wall unit and the geogrid reinforcement shall be determined from short-term testing per the requirements of FHWA NHI-10-025, Appendix B.4 for a minimum 75-year design life.

F. The minimum value of T_{al} for geogrid used in design of a reinforced precast modular block retaining wall shall be 2,000 lb/ft (29 kN/m) or greater.

G. The minimum length of geogrid reinforcement shall be the greater of the following:
   1. 0.7 times the wall design height, H.
   2. 6 feet (1.83 m).
   3. The length required by design to meet internal stability requirements, soil bearing pressure requirements and constructability requirements.

H. Constructability Requirements. Geogrid design embedment length shall be measured from the back of the precast modular block facing unit and shall be consistent for the entire height of a given retaining wall section.

I. Geogrid shall be positively connected to every precast modular block unit. Design coverage ratio, Rc, as calculated in accordance with AASHTO LRFD Bridge Design Specifications Figure 11.10.6.4.1-2 shall not exceed 0.50.

J. Preapproved Geogrid Reinforcement Products.
   1. Miragrid XT Geogrids as manufactured by TenCate Geosynthetics of Pendergrass, Georgia USA and distributed by Manufacturers of the Redi-Rock Retaining Wall System.

K. Substitutions. No substitutions of geogrid reinforcement products shall be allowed.

2.03 GEOTEXTILE

A. Nonwoven geotextile fabric shall be placed as indicated on the retaining wall construction shop drawings. Additionally, the nonwoven geotextile fabric shall be placed in the v-shaped joint between adjacent block units on the same course. The nonwoven geotextile fabric shall meet the requirements Class 3 construction survivability in accordance with AASHTO M 288.

B. Preapproved Nonwoven Geotextile Products
   1. Mirafi 140N
   2. Propex Geotex 451
   3. Skaps GT-142
   4. Thrace-Linq 140EX
   5. Carthage Mills FX-40HS
   6. Stratatex ST 142

2.04 DRAINAGE AGGREGATE AND WALL INFILL

A. Drainage aggregate (and wall infill for retaining walls designed as modular gravity structures) shall be a durable crushed stone conforming to No. 57 size per ASTM C33 with the following particle-size distribution requirements per ASTM D422:

U.S. Standard Sieve Size	% Passing
1-½" (38 mm)	100
1" (25 mm)	95-100
½" (13 mm)	25-60
No. 4 (4.76 mm)	0-10
No. 8 (2.38 mm)	0-5

2.05 REINFORCED FILL

A. Material used as reinforced backfill material in the reinforced zone (if applicable) shall be a granular fill material meeting the requirements of USCS soil type GW, GP, SW or SP per ASTM D2487 or alternatively by AASHTO Group Classification A-1-a or A-3 per AASHTO M 145. The backfill shall exhibit a minimum effective internal angle of friction, ϕ = 34 degrees at a maximum 2% shear strain and meet the following particle-size distribution requirements per ASTM D422.

U.S. Standard Sieve Size	% Passing
3/4" (19 mm)	100
No. 4 (4.76 mm)	0-100
No. 40 (0.42 mm)	0-60
No. 100 (0.15 mm)	0-10
No. 200 (0.07 mm)	0-15

B. The reinforced backfill material shall be free of sod, peat, roots or other organic or deleterious matter including, but not limited to, ice, snow or frozen soils. Materials passing the No. 40 (0.42 mm) sieve shall have a liquid limit less than 25 and plasticity index less than 6 per ASTM D4318. Organic content in the backfill material shall be less than 1% per AASHTO T-267 and the pH of the backfill material shall be between 5 and 8.

C. Soundness. The reinforced backfill material shall exhibit a magnesium sulfate soundness loss of less than 30% after four (4) cycles, or sodium sulfate soundness loss of less than 15% after five (5) cycles as measured in accordance with AASHTO T-104.

D. Reinforced backfill shall not be comprised of crushed or recycled concrete, recycled asphalt, bottom ash, shale or any other material that may degrade, creep or experience a loss in shear strength or a change in pH over time.

2.06 LEVELING PAD

A. The precast modular block units shall be placed on a leveling pad constructed from crushed stone or unreinforced concrete. The leveling pad shall be constructed to the dimensions and limits shown on the retaining wall design drawings prepared by the Retaining Wall Design Engineer.

B. Crushed stone used for construction of a granular leveling pad shall meet the requirements of the drainage aggregate and wall infill in section 2.04 or a preapproved alternate material.

C. Concrete used for construction of an unreinforced concrete leveling pad shall satisfy the criteria for AASHTO Class B. The concrete should be cured a minimum of 12 hours prior to

placement of the precast modular block wall retaining units and exhibit a minimum 28-day compressive strength of 2,500 psi (17.2 MPa).

2.07 DRAINAGE

A. Drainage Pipe
   1. Drainage collection pipe shall be a 4" (100 mm) diameter, 3-hole perforated, HDPE pipe with a minimum pipe stiffness of 22 psi (152 kPa) per ASTM D2412.
   2. The drainage pipe shall be manufactured in accordance with ASTM D1248 for HDPE pipe and fittings.

B. Preapproved Drainage Pipe Products
   1. ADS 3000 Triple Wall pipe as manufactured by Advanced Drainage Systems.

PART 3 - EXECUTION

3.01 GENERAL

A. All work shall be performed in accordance with OSHA safety standards, state and local building codes and manufacturer's requirements.

B. The General Contractor is responsible for the location and protection of all existing underground utilities. Any new utilities proposed for installation in the vicinity of the retaining wall, shall be installed concurrent with retaining wall construction. The General Contractor shall coordinate the work of subcontractors affected by this requirement.

C. New utilities installed below the retaining wall shall be backfilled and compacted to a minimum of 98% maximum dry density per ASTM D698 standard proctor.

D. The General Contractor is responsible to ensure that safe excavations and embankments are maintained throughout the course of the project.

E. All work shall be inspected by the Inspection Engineer as directed by the Owner.

3.02 EXAMINATION

A. Prior to construction, the General Contractor, Grading Contractor, Retaining Wall Installation Contractor and Inspection Engineer shall examine the areas in which the retaining wall will be constructed to evaluate compliance with the requirements for installation tolerances, worker safety and any site conditions affecting performance of the completed structure. Installation shall proceed only after unsatisfactory conditions have been corrected.

3.03 PREPARATION

A. Fill Soil.
   1. The Inspection Engineer shall verify that reinforced backfill placed in the reinforced soil zone satisfies the criteria of this section.
   2. The Inspection Engineer shall verify that any fill soil installed in the foundation and retained soil zones of the retaining wall satisfies the specification of the Retaining Wall Design Engineer as shown on the construction drawings.

B. Excavation.
   1. The Grading Contractor shall excavate to the lines and grades required for construction of the precast modular block retaining wall as shown on the construction drawings. The

Grading Contractor shall minimize over-excavation. Excavation support, if required, shall be the responsibility of the Grading Contractor.

2. Over-excavated soil shall be replaced with compacted fill in conformance with the specifications of the Retaining Wall Design Engineer and "Division 31, Section 31 20 00 – Earthmoving" of these project specifications.
3. Embankment excavations shall be bench cut as directed by the project Geotechnical Engineer and inspected by the Inspection Engineer for compliance.

C. Foundation Preparation.
1. Prior to construction of the precast modular block retaining wall, the leveling pad area and undercut zone (if applicable) shall be cleared and grubbed. All topsoil, brush, frozen soil and organic material shall be removed. Additional foundation soils found to be unsatisfactory beyond the specified undercut limits shall be undercut and replaced with approved fill as directed by the project Geotechnical Engineer. The Inspection Engineer shall ensure that the undercut limits are consistent with the requirements of the project Geotechnical Engineer and that all soil fill material is properly compacted according project specifications. The Inspection Engineer shall document the volume of undercut and replacement.
2. Following excavation for the leveling pad and undercut zone (if applicable), the Inspection Engineer shall evaluate the in-situ soil in the foundation and retained soil zones.
   a. The Inspection Engineer shall verify that the shear strength of the in-situ soil assumed by the Retaining Wall Design Engineer is appropriate. The Inspection Engineer shall immediately stop work and notify the Owner if the in-situ shear strength is found to be inconsistent with the retaining wall design assumptions.
   b. The Inspection Engineer shall verify that the foundation soil exhibits sufficient ultimate bearing capacity to satisfy the requirements indicated on the retaining wall construction shop drawings per paragraph 1.06 I of this section.

D. Leveling Pad.
1. The leveling pad shall be constructed to provide a level, hard surface on which to place the first course of precast modular block units. The leveling pad shall be placed in the dimensions shown on the retaining wall construction drawings and extend to the limits indicated.
2. Crushed Stone Leveling Pad. Crushed stone shall be placed in uniform maximum lifts of 6" (150 mm). The crushed stone shall be compacted by a minimum of 3 passes of a vibratory compactor capable of exerting 2,000 lb (8.9 kN) of centrifugal force and to the satisfaction of the Inspection Engineer.
3. Unreinforced Concrete Leveling Pad. The concrete shall be placed in the same dimensions as those required for the crushed stone leveling pad. The Retaining Wall Installation Contractor shall erect proper forms as required to ensure the accurate placement of the concrete leveling pad according to the retaining wall construction drawings.

3.04 PRECAST MODULAR BLOCK WALL SYSTEM INSTALLATION

A. The precast modular block structure shall be constructed in accordance with the construction drawings, these specifications and the recommendations of the retaining wall system component manufacturers. Where conflicts exist between the manufacturer's recommendations and these specifications, these specifications shall prevail.

B. Drainage components. Pipe, geotextile and drainage aggregate shall be installed as shown on the construction shop drawings.

C. Precast Modular Block Installation
1. The first course of block units shall be placed with the front face edges tightly abutted together on the prepared leveling pad at the locations and elevations shown on the con-

struction drawings. The Retaining Wall Installation Contractor shall take special care to ensure that the bottom course of block units are in full contact with the leveling pad, are set level and true and are properly aligned according to the locations shown on the construction drawings.

2. Backfill shall be placed in front of the bottom course of blocks prior to placement of subsequent block courses. Nonwoven geotextile fabric shall be placed in the V-shaped joints between adjacent blocks. Drainage aggregate shall be placed in the V-shaped joints between adjacent blocks to a minimum distance of 12” (300 mm) behind the block unit.
3. Drainage aggregate shall be placed in 9 inch maximum lifts and compacted by a minimum of three (3) passes of a vibratory plate compactor capable exerting a minimum of 2,000 lb (8.9 kN) of centrifugal force.
4. Unit core fill shall be placed in the precast modular block unit vertical core slot. The core fill shall completely fill the slot to the level of the top of the block unit. The top of the block unit shall be broom-cleaned prior to placement of subsequent block courses. No additional courses of precast modular blocks may be stacked before the unit core fill is installed in the blocks on the course below.
5. Base course blocks for gravity wall designs (without geosynthetic soil reinforcement) may be furnished without vertical core slots. If so, disregard item 4 above, for the base course blocks in this application.
6. Nonwoven geotextile fabric shall be placed between the drainage aggregate and the retained soil (gravity wall design) or between the drainage aggregate and the reinforced fill (reinforced wall design) as required on the retaining wall construction drawings.
7. Subsequent courses of block units shall be installed with a running bond (half block horizontal course-to-course offset). With the exception of 90 degree corner units, the shear channel of the upper block shall be fully engaged with the shear knobs of the block course below. The upper block course shall be pushed forward to fully engage the interface shear key between the blocks and to ensure consistent face batter and wall alignment. Geogrid, drainage aggregate, unit core fill, geotextile and properly compacted backfill shall be complete and in-place for each course of block units before the next course of blocks is stacked.
8. The elevation of retained soil fill shall not be less than 1 block course (18” (457 mm)) below the elevation of the reinforced backfill throughout the construction of the retaining wall.
9. If included as part of the precast modular block wall design, cap units shall be secured with an adhesive in accordance with the precast modular block manufacturer’s recommendation.

D. Geogrid Reinforcement Installation (if required)
1. Geogrid reinforcement shall be installed at the locations and elevations shown on the construction drawings on level fill compacted to the requirements of this specification.
2. Continuous 12” (300 mm) wide strips of geogrid reinforcement shall be passed completely through the vertical core slot of the precast modular block unit and extended to the embedment length shown on the construction plans. The strips shall be staked or anchored as necessary to maintain a taut condition.
3. Reinforcement length (L) of the geogrid reinforcement is measured from the back of the precast modular block unit. The cut length (L_c) is two times the reinforcement length plus additional length through the block facing unit. The cut length is calculated as follows:

$$L_c = 2*L + 3 \text{ ft } (2*L + 0.9 \text{ m}) \text{ (28” (710 mm) block unit)}$$
$$L_c = 2*L + 5 \text{ ft } (2*L + 1.5 \text{ m}) \text{ (41” (1030 mm) block unit)}$$

4. The geogrid strip shall be continuous throughout its entire length and may not be spliced. The geogrid shall be furnished in nominal, prefabricated roll widths of 12” (300 mm)+/- ½” (13 mm). No field modification of the geogrid roll width shall be permitted.

5. Neither rubber tire nor track vehicles may operate directly on the geogrid. Construction vehicle traffic in the reinforced zone shall be limited to speeds of less than 5 mph (8 km/hr) once a minimum of 9 inches (230 mm) of compacted fill has been placed over the geogrid reinforcement. Sudden braking and turning of construction vehicles in the reinforced zone shall be avoided.

E. Construction Tolerance. Allowable construction tolerance of the retaining wall shall be as follows:
   1. Deviation from the design batter and horizontal alignment, when measured along a 10’ (3 m) straight wall section, shall not exceed 3/4” (19 mm).
   2. Deviation from the overall design batter shall not exceed 1/2“ (13 mm) per 10’ (3 m) of wall height.
   3. The maximum allowable offset (horizontal bulge) of the face in any precast modular block joint shall be 1/2” (13 mm).
   4. The base of the precast modular block wall excavation shall be within 2” (50 mm) of the staked elevations, unless otherwise approved by the Inspection Engineer.
   5. Differential vertical settlement of the face shall not exceed 1’ (300 mm) along any 200’ (61 m) of wall length.
   6. The maximum allowable vertical displacement of the face in any precast modular block joint shall be 1/2“ (13 mm).
   7. The wall face shall be placed within 2” (50 mm) of the horizontal location staked.

3.05 WALL INFILL AND REINFORCED BACKFILL PLACEMENT

A. Backfill material placed immediately behind the drainage aggregate shall be compacted as follows:
   1. 98% of maximum dry density at ± 2% optimum moisture content per ASTM D698 standard proctor or 85% relative density per ASTM D4254.

B. Compactive effort within 3’ (0.9 m) of the back of the precast modular blocks should be accomplished with walk-behind compactors. Compaction in this zone shall be within 95% of maximum dry density as measured in accordance with ASTM D698 standard proctor or 80% relative density per ASTM D 4254. Heavy equipment should not be operated within 3’ (0.9 m) of the back of the precast modular blocks.

C. Backfill material shall be installed in lifts that do not exceed a compacted thickness of 9” (230 mm).

D. At the end of each work day, the Retaining Wall Installation Contractor shall grade the surface of the last lift of the granular wall infill to a 3% ± 1% slope away from the precast modular block wall face and compact it.

E. The General Contractor shall direct the Grading Contractor to protect the precast modular block wall structure against surface water runoff at all times through the use of berms, diversion ditches, silt fence, temporary drains and/or any other necessary measures to prevent soil staining of the wall face, scour of the retaining wall foundation or erosion of the reinforced backfill or wall infill.

3.06 OBSTRUCTIONS IN THE INFILL AND REINFORCED FILL ZONE

A. The Retaining Wall Installation Contractor shall make all required allowances for obstructions behind and through the wall face in accordance with the approved construction shop drawings.

B. Should unplanned obstructions become apparent for which the approved construction shop drawings do not account, the affected portion of the wall shall not be constructed until the Retaining Wall Design Engineer can appropriately address the required procedures for construction of the wall section in question.

3.07 COMPLETION

A. For walls supporting unpaved areas, a minimum of 12” (300 mm) of compacted, low-permeability fill shall be placed over the granular wall infill zone of the precast modular block retaining wall structure. The adjacent retained soil shall be graded to prevent ponding of water behind the completed retaining wall.

B. For retaining walls with crest slopes of 5H:1V or steeper, silt fence shall be installed along the wall crest immediately following construction. The silt fence shall be located 3’ to 4’ (0.9 m to 1.2 m) behind the uppermost precast modular block unit. The crest slope above the wall shall be immediately seeded to establish vegetation. The General Contractor shall ensure that the seeded slope receives adequate irrigation and erosion protection to support germination and growth.

C. The General Contractor shall confirm that the as-built precast modular block wall geometries conform to the requirements of this section. The General Contractor shall notify the Owner of any deviations.

END OF SECTION 323223

SECTION 323300 – SITE FURNISHINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Standard Bicycle Rack
   2. Electric Bicycle Rack
   3. Trash and Recycling Receptacle
   4. Bollard

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 32 Section ‘Concrete Paving’
   3. Division 32 Section 'Unit Paving’

C. Warranty: Provide Manufacturer’s standard warranty.

1.3 ACTION SUBMITTALS

A. Product Data for the following: For each type of product indicated.
   1. Submit product literature or tear sheets giving name of product, manufacturer's name and compliance with Specifications.

B. Samples for Initial Selection: For units with factory-applied color finishes and other items involving color and finish selection.

C. Samples for Verification: For each type of exposed finish required.

D. Shop Drawings: showing fabrication and installation of benches and tiered seating including plans, elevations, details of components, and attachments to other units of Work. Indicate materials and profiles of each member, fitting, joinery, finishes, fasteners, anchorages, and accessory items.

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution. Construct mockups as described in Quality Assurance section herein.

F. Maintenance and Cleaning Data: For site furnishings to include in maintenance manuals.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified installer and testing agency. Include list of completed projects with project names and addresses, names and addresses of Landscape Architects and owner, and other information specified.

B. Product Certificates: For each type of site furnishing, from manufacturer.

C. Guarantee: Obtain in the Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. Guarantees shall be in addition to, and not in lieu of, other liabilities, which the Contractor may have by law or other provisions of the Contract Documents.

D. Maintenance Data: For site furnishings to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. General:
   1. Work of this Section shall be fabricated and installed by experienced fabricator(s) or manufacturer(s), who have been previously engaged in ornamental metal, or wood work of equal scope and fabrication standards to Project requirements.
   2. Materials, methods of fabrication, fitting, assembly, bracing, supporting, fastening, operating devices, and erection shall be in accordance with Project Contract Drawings and Specifications, approved shop drawings, and be of highest quality practices of the industry.
   3. Use new and clean materials as specified, having structural properties sufficient to safely sustain or withstand stresses and strains to which materials and assembled work shall be subjected.
   4. All work shall be accurately and neatly fabricated, assembled and erected with smooth finished surfaces.
   5. Field Measurements and Coordination: Verify dimensions with work specified in other sections which adjoins or to which this work will be attached.
      a. Effect coordination with related work of other sections, including work of other separate Contracts.
      b. Measurements of adjoining work shall be taken, so that work specified in this Section shall fit closely into the spaces and conditions provide.
      c. If any unusual conditions are encountered, the nature and location of conditions shall be shown on shop drawings submitted to Landscape Architect for determination and approval prior to fabrication.
   6. Coordination with other Trades: Coordinate with and furnish all necessary templates and patterns required by work of other sections. Furnish components of assemblies that are to be built into work specified as part of other sections. Supervise and be responsible for the correct location and installation of such built-in items.

B. Fabrication Qualifications: Fabrications shall be by a firm or firms which have successfully fabricated each material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than five (5) years.

C. Installer Qualifications: Installers shall have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere, in the installation of the metal and wood materials specified, and the products, systems, and scope specified.

D. Welding: Procedures and personnel to the following:
   1. AWS D1.1, “Structural Welding Code – Steel”
   2. AWS D1.3, “Structural Welding Code – Sheet Steel”
   3. Certify that each welder has satisfactorily passed AWS qualification tests for the related processes, and if pertinent, has undergone certification.

E. Shop Assembly: Insofar as is practical, fitting and assembly of work shall be done in shop in order to minimize field splicing and assembly.
   1. Work that cannot be permanently shop-assembled shall be completely assembled, marked for re-assembly and disassembled in shop before shipment to ensure correct assembly in field.
   2. Shop assembles work in largest practical sizes to minimize field work.
   3. Shop fabricated items shall correctly fit the field condition. In event that shop- fabricated items do not fit the field condition, the item shall be returned to the shop for correction, unless otherwise approved by Landscape Architect.

F. This Specification Section does not define or establish the extent of work performed by sub-trades. Contractor shall assign sub trade work as he deems appropriate for a complete, coordinated, cost effective and proper execution.

G. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

H. Pre-installation Meeting: Before beginning the work of this section, schedule and conduct a meeting at Project site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Contractor, the installer, and the installer’s field foreman. Inform the Landscape Architect five (5) business days in advance of the scheduled meeting time.

I. Source Limitations: Obtain each type of site furnishing through one source from a single manufacturer where possible.

1.6 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.7 DELIVERY, STORAGE, AND HANDLING

A. In accordance with Division 01 - General Requirements.

B. The Contractor shall be responsible for timing delivery of all site improvement items not requiring weathering, so as to minimize on-site storage time prior to installation. All stored materials and items must be protected from weather, careless handling and vandalism. Damaged items shall be repaired or replaced, as determined by the Landscape Architect.

C. Load and store primed and coated articles off the ground and under cover to prevent formation of wet storage film. Allow air between and around surfaces and allow for continuous drainage of units until installed and painted.

D. Protect finishes against soiling, staining, or damage from scratches and abrasion. Maintain protection during construction until project completion.

1.8 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

B. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

1.9 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specifications.

1.10 CLOSEOUT REQUIREMENTS

A. Project Record Documents: Submit in accordance with Division 01 Section “Project Record Documents”.

B. Operations and Maintenance Data
   1. Provide Maintenance and Cleaning instructions for Owner.
   2. Provide manufacturer’s standard warranty.

PART 2 - PRODUCTS

2.1 BICYCLE RACK

A. Subject to compliance with requirements, provide standard bicycle racks as manufactured by Ground Control Systems, 708 Alhambra Blvd, Suite 200, Sacramento, CA, 95816, 1-800-630-7225, Fax: 1-866-532-9049, Website: www.groundcontrolsystems.com
   1. Model: DV215
   2. Color: Black
   3. Finish: Polyester Powder Coat
   4. Mount: Surface Mounted

2.2 ELECTRIC BICYCLE RACK

A. Subject to compliance with requirements, provide electric bicycle rack as manufactured by DERO BIKE RACK CO., 5522 Lakeland Ave. N., Minneapolis, MN 55429, 1-888-337-6729. Fax: 612-331-273. Website: www.dero.com.
   1. Model: Bikeep Smart Bike Parking Station
   2. Capacity: 5 Bikes
   3. Finish: Powder Coat
   4. Mount: Surface Mounted

2.3 TRASH AND RECYCLING RECEPTACLE

A. Subject to compliance with requirements, provide trash and recycling receptacle as manufactured by Landscape Forms, Inc., 7800 E. Michigan Ave, Kalamazoo, Michigan 49048. Phone: (800) 521-2546. Fax (269) 381-3455. Website www.landscapeforms.com.
   1. Model: Scarborough Litter Receptacle
   2. Style: Side-Opening, Vertical Strap.
   3. Mounting: Surface Mounted
   4. Finish: Powder Coat
   5. Color: Black
   6. Lids:
      a. Custom Opening and Ocean Blue Lid for Recycling Receptacle
      b. Black Lid for Landfill Receptacle

2.4 BOLLARD

A. Subject to compliance with requirements, 6” Flat Top Bollard Cover as manufactured by Barrier Defense Systems; Address 986 Rosedale Drive, Hiram, Georgia 30141; Telephone 678-915-2080
   1. Part Number: BC6F0630-4
   2. Cover Height: 30”
   3. Material: 316L Stainless Steel
   4. Finish: #4 Circumferential Brushed

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspection: Verify the conditions, elevations, and measurements affecting the work of this Section prior to installation. Examine surfaces to receive site furnishings and do not proceed until any defects detrimental to the finished work are corrected. Take proper precautions so as not to disturb or damage subsurface elements of utilities, conduits, underdrainage systems, water proofing, insulation, or foam fill.

B. Install all site improvements as per manufacturer’s instructions unless otherwise noted in specifications or shown on Drawings.

3.2 INSTALLATION

A. Install all site furnishing according to manufacturer's instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.

B. Install site furnishings level, plumb, true to line or radius, accurately fitted and located, with flush tight joints, with provision to allow for thermal movements, with provision to exclude water and with attachment devices as required for secure and rigid installation and securely anchored at locations indicated on Drawings.
   1. Make field assembly and connections with the same level of quality as shop fabricated work.
   2. Install work to provide items with capabilities to safely sustain or withstand stresses and strains to which materials and assembled work will be subjected.
   3. Install, or coordinate with other work as required to install bases, grouts, fillers, flashings, sealants, and other components as the work progresses.

C. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.

D. Restore protective coverings which have been damaged during shipment or installation of work. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at the same location.

E. Field Welding: Comply with the applicable AWS specification for procedures of manual shielded metal-arc welding, for appearance and quality of welds made.

3.3 ATTACHMENTS

A. All attachment devices shall be of type, size and spacing to suit condition and as approved by Landscape Architect. When exposed to view, finish shall match item attached.
   1. Provide shims, slotted holes, or other means necessary for leveling, plumbing, and other required adjustments.
   2. Mechanical Fastenings: Limit fasteners to concealed and inconspicuous locations as approved.

B. Do all necessary drilling, tapping, cutting or other preparation of surrounding construction in the field accurately, neatly, and as necessary for the attachment and support of work of this Section.

C. Do not cut or abrade finishes, which cannot be completely restored in the field, without the Landscape Architect’s approval. Do not weld fabrications after shop priming.

D. After completing site furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

3.4 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day’s work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store

materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 323300

SECTION 328000 - IRRIGATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Underground/roof garden irrigation system.
2. Pipe and fittings, valves, sprinkler heads, dripline, and accessories.
3. Automatic control system.
4. Excavation and backfilling for installation of underground system components.

1.2 SYSTEM DESCRIPTION

A. Layout design: Modify layout as needed to obtain required and complete coverage with manufacturer's standard heads as specified.
1. Provide irrigation layout with separate plant type zones:
    a. Lawns.
    b. Shrub/Groundcover Beds
2. Provide flow velocities that do not exceed 5.0 ft. per second.
3. Provide irrigation of lawn areas with no overspray into planting beds or pavements, unless so designed on the drawings.
4. Provide independent irrigation of individual bed zones or planters.

B. Only similar types of heads with matched precipitation rates may run on same zone.

C. Piping Design: Do not mix different heads for each line. Provide main size as needed for proper flow, but not less than specified on plan.

D. Provide electric solenoid controlled underground irrigation system manufactured especially for control of automatic circuit valves of underground irrigation system. Provide unit of capacity to suit number of circuits indicated.
    a. Source Power: 120 volts
    b. Low Voltage Controls: 24 volts AC.

E. Provide controller to control all zones.

F. The extent of the irrigation system is shown on the Drawings.

1.3 SUBMITTALS - REVIEW

A. Product Data: System components.

B. Shop Drawings:
1. Indicate piping layout to water source.
2. Include piping layout and details illustrating location and types of sprinkler heads, valves, control system and wiring, and schedule of fittings.
3. Indicate location of sleeves under pavements and conflicts with existing utilities.

C. Samples
1. Submit the following material samples:
    a. Piping and fittings.
    b. Wire connectors and sealer.
    c. Control wire.
    d. Sprinkler heads, one of each type, complete with housing.
    e. Drip tubing, 5' length minimum.
    f. Valves and access boxes.
    g. Controller.
2. Approved equipment samples will be returned to the Contractor and may be used in the work before final approval.

1.4 SUBMITTALS - CLOSE-OUT

A. Comply with the requirements of the General Conditions.

B. Record Drawings:
1. Indicate exact location of gate valves, wire splice locations; sprinkler head layout, automatic valves, quick couplers, sleeving under walks and roads and all irrigation and drainage piping, etc.
2. At the time of the irrigation mainline test, provide a preliminary set of “Record” drawings to the Owner’s Authorized Representative.

C. Operation and Maintenance Data:
1. Provide instructions for operation and maintenance of system and controls, seasonal activation and shutdown, and manufacturer’s parts catalog.
2. Provide schedule indicating length of time each valve is required to be run to provide a determined amount of water.
3. Include complete parts list with manufacturer’s designations for each component.
4. Loose Equipment to Furnish: Loose irrigation equipment, operating keys and spare parts will be furnished by the Irrigation Contractor in quantities as shown on the plans.
5. Two (2) quick coupler keys and matching swivel hose ells.
6. Two (2) valve keys for gate valves.
7. Two (2) keys for each controller.

1.5 QUALITY ASSURANCE

A. Installer’s Qualifications: Single firm specializing in irrigation work with a minimum of five years’ experience properly installing irrigation systems of comparable size. Provide references of your last five consecutive systems, and five systems of comparable size with bid proposal.

B. Materials, equipment, and methods of installation shall comply with the following codes and standards:
1. City/State Building Codes.
2. American Society for Testing and Materials (ASTM).
3. National Sanitation Foundation (NSF).

C. Requirements of Regulatory Agencies:
1. All work and materials shall be in full accordance with the latest rules and regulations of safety orders of Division of Industrial Safety; the Uniform Building Code and other applicable laws or regulations, including any local Plumbing Codes.
2. Should the Contract documents be at variance with the aforementioned rules and regulations, notify the Owner’s authorized representative for instructions before proceeding with work affected.

D. Testing:
1. Preliminary review of completed installation will be made prior to backfilling of trenches and hydrostatic testing.
2. Final review and testing shall be made in conjunction with the final review of lawn, shrub, and tree planting.

E. Permits and Inspections:
1. Any permits for the installation or construction of any work included under this contract, which are required by any of the legally constituted authorities having jurisdiction, shall be obtained and paid for by the contractor, each at the proper time.
2. The Contractor shall also arrange for and pay all costs in connection with any inspection and examination required by these authorities.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver irrigation system components in manufacturer’s original, undamaged, and unopened containers, with labels intact and legible.

B. Deliver plastic pipe in bundles, packaged to provide adequate protection of pipe ends.

C. Store and handle materials to prevent damage and deterioration.

D. Provide secure, locked storage for valves, sprinkler heads and similar components that cannot be immediately replaced to prevent installation delays.

E. Contractor is responsible for materials through final acceptance.

1.7 PROJECT CONDITIONS

A. Protect existing trees, plants, and lawns and other features designated to remain as part of the final landscape.

B. The Contractor shall carefully coordinate with the landscape work and other site developments, including all new and existing utilities.

C. The Contractor shall verify the correctness of all finish grades within the work area to ensure the proper soil coverage of the irrigation pipes.

D. Irrigation system layout is diagrammatic. Exact location of piping, sprinkler heads, valves, and other components shall be established by Contractor in the field at time of installation.

E. Space sprinkler components as indicated. Do not exceed sprinkler spacing shown on Drawings.

F. Locate existing utilities in areas of work. If utilities are to remain, provide adequate means of protection during the system installation. Repair utilities damaged during the work to the satisfaction of the Utility Owner and at the Contractor's expense. Notify local Utility Protection Service three days prior to beginning excavation work.

G. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, notify the Owner's Authorized Representative immediately for direction as to procedure. Cooperate with the Owner and Utility companies in keeping active services and facilities in operation.

H. Minor adjustments in system layout will be permitted to clear existing field obstruction. Final system layout shall be acceptable to the Owner's Authorized Representative.

1.8 WARRANTY

A. Warranties are subject to the General and Supplementary Conditions.

B. Irrigation Contractor is responsible to ensure complete coverage as specified herein of the areas to be irrigated. During the warranty period the Irrigation Contractor shall make any adjustments as necessary to maintain proper coverage.

C. If, within one year from the date of completion, settlement occurs, and adjustments in pipes, valves and sprinkler heads, lawn areas or paving are necessary to bring the system, grade or paving to the proper level of the permanent grades. The Contractor, as part of the work under his Contract, shall make all adjustments without extra cost to the Owner, including the restoration of all damaged planting, paving or other improvements of any kind.

D. Should any operational difficulties in connection with the irrigation system develop within the specified guarantee period, which, in the opinion of the Owner's Authorized Representative may be due to inferior material and/or workmanship, said difficulties shall be immediately corrected by the Contractor to the satisfaction of the Owner at no additional cost to the Owner, including any and all other damages caused by such defects.

1.9 OPERATION & MAINTENANCE — IRRIGATION SYSTEM

A. The entire irrigation system shall be under fully automatic operation for a period of three days prior to any planting.

B. It is the Landscape Contractor's responsibility to determine water application rates and controller cycling. The Irrigation Contractor will instruct the Landscape Contractor on the operation

and programming of the controller and will assist the Landscape Contractor as necessary in such operations throughout the one-year maintenance period. Any adjustments, repairs, etc., other than programming are the total responsibility of the Irrigation Contractor.

C. The Irrigation Contractor shall service the system at the request of the Owner's Authorized Representative during the guarantee period and shall be paid for work performed which is not covered by the guarantee. The Irrigation Contractor shall winterize the system the first year as part of this contract and provide written instructions to the Owner's Authorized Representative for future service and maintenance.

D. The Irrigation Contractor shall return to the site during the subsequent spring season and demonstrate to the Owner's Authorized Representative the proper procedures for the system start-up, operation, and maintenance.

PART 2 - PRODUCTS

2.1 UNAUTHORIZED MATERIALS

A. Materials and products required for work of this section shall not contain asbestos. Polychlorinated biphenyl (PCB) or other hazardous materials identified by the Owner.

2.2 IRRIGATION SYSTEM MANUFACTURERS

A. All irrigation system components shall be supplied by regionally authorized distributors to provide single source responsibility for warranty service and operations to conform to specifications in all aspects. Unless specifically stated otherwise, the Irrigation Contractor may assume the phrase "Acceptable Substitute," except that the burden is upon the Contractor to prove such equality. If the Contractor elects to prove such equality, he/she must request the Landscape Architect's and the Owner's Authorized Representative's approval in writing (one week prior to bid) to substitute such item for the specified item, stating the cost difference involved with supporting data and samples to permit a fair evaluation of the proposed substitute with respect of quality, serviceability, warranty, and cost. If sprinkler heads or remote-control valves are requested to be substituted, each zone affected by such substitution shall be recalculated for pressure loss, GPM, and shall be submitted to the Owner's Authorized Representative for his review.

2.3 MATERIALS

A. All materials to be incorporated in this system shall be new and without flaws or defects and of quality and performance as specified and meeting the requirements of this system.

B. Plastic Pipe

1. All piping shall be from virgin parent material. The pipe shall be homogeneous throughout and free from visible cracks, holes, foreign materials, blisters, deleterious wrinkles, and dents.
2. For all irrigation piping, use polyvinyl chloride (PVC) 1120 with a minimum class rating of 200, sized to maintain a maximum flow velocity of less than 5 ft. per second (FPS).
3. Pipe shall be marked at intervals (not to exceed 5') with the following information: Manufacturer's name or trademark, nominal pipe size, schedule, PVC type and grade (i.e., PVC 1120), SDR rating class rating.
4. When connection is plastic to metal, male adapters shall be used. The male adapter shall be hand tightened, plus one turn with a strap wrench.
5. Comply with pipe sizes indicated on drawings. No substitution of smaller pipe will be permitted. Larger sizes may be used subject to acceptance of the Owner's Authorized Representative. Remove damaged and defective pipe from site.
6. All PVC pipe to be furnished in 20' lengths.

C. Piping for Sleeving

1. For sleeves under six inches (6”) in size, high impact type, polyvinyl chloride (PVC) 1120, minimum Schedule 40.
2. For sleeves six inches (6”) and above in size shall be Polyvinyl Chloride (PVC) 1120 Class 200.
3. Irrigation Contractor shall be responsible for the coordination of sleeves for all piping passing through concrete curbing, under paved areas, concrete or masonry walls and floors while the same are under construction.

D. Fittings
1. Fittings for Solvent -weld PVC Pipe
    a. Schedule 40 or 80, polyvinyl chloride (PVC), Type 1 injection molded fittings suitable for solvent weld or threaded connections, to meet ASTM standards, NSF approved. Fittings made of other materials are not permitted.
2. Threaded PVC nipples shall be Schedule 80. Use high quality grade of Teflon tape for threaded fittings.
    a. Saddle fittings are not permitted.
    b. Use high quality grade of Teflon tape for sprinkler head and electric remote control valve connections.

E. Isolation Valves
1. Gate valves under 3” shall be 200 psi rated W.O.G. 200 domestically manufactured with bronze bodies. Valves shall be equipped with tee handles. As manufactured by Watts Regulator or approved equal.

F. Master valve
1. Rainbird 300-BPES compatible with IQ control system.

G. Quick Coupling Valves
1. Valve shall be 1” female.
2. Acceptable Products:
    a. Rain Bird model 5RC or approved equal.
3. Furnish one valve key fitted with 1” swivel hose ell.
4. Acceptable Products:
    a. Rain Bird model 55K-1.
5. All quick coupling valve keys and hose swivels shall be of the same manufacturer as the quick coupler.

H. Valve Boxes
1. Tapered rib reinforcement enclosure of rigid tensile strength plastic material components chemically inert and unaffected by moisture, ultraviolet light, corrosion, and temperature changes. Lid and base shall withstand normal loads exerted by turf equipment without collapsing. Lid to be green in color.
2. Acceptable Manufacturers:
    a. Armor
    b. NDS
    c. Rain Bird
3. For remote control valves and quick coupler valves use rectangular standard turf box, 16” x 12”.
4. For Isolation valves use 10” circular turf box.
5. For green roof valves use boxes indicated on the drawings.

I. Spray heads
1. Description: Manufacturer's standard spray bodies designed to provide uniform coverage over entire area of spray shown on drawings at available water pressure or as follows:
2. Parts and components to withstand harsh operating conditions using chemically treated recycled water (reclaimed/non-potable), dirty water containing grit, debris, and other particulates, high operating pressures common in commercial irrigation and resistant to ultra-violet light.
3. Parts and components resistant to corrosion in treated recycled water containing chlorine and other chemicals.
4. Wiper seal material shall resist degradation caused by chlorine in reclaimed water.

5. Sprinkler shall have an operating pressure range of 15 to 100 PSI and shall include a ½" NPT female threaded bottom inlet.
6. Exposed cover shall be purple to indicate the use of non-potable water.
7. All spray body components shall be removable from the top without special tools in order to provide quick and easy flushing and maintenance of the sprinkler.
8. The spray body, stem, nozzle, and screen shall be constructed of ultra-violet resistant plastic.
9. It shall have a heavy-duty stainless steel retract spring for positive pop-down.
10. The spray body shall have a pre-installed flush plug.
11. When indicated on the Drawings, the sprinklers shall have an integral check valve (SAM device) capable of holding back 8' of elevation.
12. The plug shall prevent debris from clogging the sprinkler during installation and allow for the system to be flushed before nuzzling.
13. The plug shall be bright orange in color and constructed of polypropylene material.
14. Pop-up heights: 4 inches (see drawings).
15. Acceptable Products:
    a. Rain Bird RD04-S-P30-FN or RD1804SAM-P45-NP or approved equal.
16. Spray nozzles for sprinkler heads shall be of the same manufacturer as the spray head.

J. Short-Range Turf Rotors
1. The full or part circle rotor sprinkler shall be a single stream, water lubricated, gear drive.
2. The sprinkler shall have an integral flow shutoff device that shall be capable of restricting the flow from the head by using a standard flat-bladed screwdriver.
3. The sprinkler shall have adjustable arc coverage from 40 to 360 degrees in one unit.
4. The sprinkler shall have a pressure-activated multi-function wiper seal that positively seals against the nozzle flange to keep debris out of the rotor and to clean debris from the pop-up stem as it retracts. The wiper seal shall prevent sprinkler from sticking up and be capable of sealing the sprinkler cap to sprinkler body under normal operating pressures.
5. The sprinkler shall be fully adjustable from the top using only a flat-blade screwdriver.
6. The sprinkler shall have a screen attached to the drive housing to filter inlet water, protect the drive from clogging and simplify its removal for cleaning and flushing of the system. It shall have a 1/2" (FNTP) bottom inlet.
7. The sprinkler shall have a stainlesss-steel adjusting screw capable of reducing the radius up to 25%.
8. The sprinkler shall have a strong stainless steel retract spring for positive pop down.
9. Acceptable Product:
    a. Rain Bird 3500-SAM-PC or approved equal.

K. Mid-Range Turf Rotors
1. The full or part circle rotor sprinkler shall be a single stream, water lubricated, gear drive.
2. The sprinkler shall have adjustable arc coverage from 40 to 360 degrees in one unit.
3. The sprinkler shall have a pressure-activated multi-function wiper seal that positively seals against the nozzle flange to keep debris out of the rotor and to clean debris from the pop-up stem as it retracts. The wiper seal shall prevent sprinkler from sticking up and be capable of sealing the sprinkler cap to sprinkler body under normal operating pressures.
4. The sprinkler shall be fully adjustable from the top using only a flat-blade screwdriver.
5. The sprinkler shall have a screen attached to the drive housing to filter inlet water, protect the drive from clogging and simplify its removal for cleaning and flushing of the system. It shall have a ¾" (FNTP) bottom inlet.
6. The sprinkler shall have a stainless-steel adjusting screw capable of reducing the radius up to 25%.
7. The sprinkler shall have a strong stainless steel retract spring for positive pop down. It shall have a check valve to check 7 feet of elevation change (if specified on the Drawing).
8. When indicated on the Drawings, the sprinklers shall have an integral check valve (SAM device) capable of holding back 8' of elevation.
9. Acceptable Product:
    a. Rain Bird model 5004+-SAM-R or approved equal.

L. Drip Tubing

1. Tubing shall consist of nominal sized one-half inch low density, linear polyethylene tubing, housing internal pressure compensating, continuously self-flushing, integral drip emitters.
2. The tubing shall be brown in color and conform to an outside diameter (O.D.) of 0.67 inches, and an inside diameter (I.D.) of 0.57 inches. The emitters shall have the ability to independently regulate discharge rates, with an output pressure of 7 to 70 PSI, at a constant flow.
3. The emitter discharge rate shall be 0.61 gallons per hour utilizing a combination turbulent flow/reduced pressure compensation cell mechanism and a diaphragm to maintain uniform discharge rates. The emitters shall continuously clean themselves while in operation. The dripline shall have *18"* spacing between emitters as noted on drawing.
4. Acceptable Product:
    a. Rain Bird XFS-06-18 or approved equal.
    b. Drip Control Valves as shown on irrigation plan.

M. Automatic Controller

1. The irrigation system controller shall be of a modular hybrid type that combines electro-mechanical and microprocessor-based circuitry capable of fully automatic and manual operation.
2. The controller will be housed in a weatherproof, lockable plastic cabinet.
3. The controller shall operate on a 117 VAC ± 10% power input and be capable of actuating up to two 24 VAC, 7VA solenoid valves per station plus a master valve or pump start relay. The controller shall be capable of operating four stations plus the master valve simultaneously. Controller output shall be protected against severe electrical surge.
4. The controller shall have four separate irrigation programs (A, B, C, D) which can have different start times, watering days, day cycles, and station timing. Each program shall have eight start times per day.
5. The controller shall have base capability of 8 stations and shall be expandable up to 32 stations, with each station capable of an operating time of 0 to 2 hours in one-minute increments and 2 to 12 hours in 10-minute increments. Controller station operation shall be of automatic sequential stacking to avoid overlapping operation unless programmed to overlap.
6. The controller shall have a 365-day calendar with day-of-the month OFF feature. Programs will run on an ODD/EVEN day cycle, day-of-the-week ON/OFF cycle, or in cycles from 1 to 99 days. In addition, the controller shall have a programmable rain shutdown from 1 to 99 days.
7. The controller shall be capable of being operated manually at any time. A manual single station, a group of stations or a program can be selected to run for the programmed time without affecting the normal program. This controller shall be capable of running a variable system test program without affecting the normal program.
8. The controller shall have an internal non-volatile memory, which will retain the irrigation program and the programmed date and time without power. A 9 VDC rechargeable battery and recharging circuit shall also be included for counting down the program-in-progress during power outage and shall allow programming of the controller when it is disconnected from the main power supply.
9. There shall be a station status indicator light and a master valve status indicator light. These lights will indicate station operation and circuit integrity. An indicator for sensor status will be found on the front panel along with a switch to suspend sensor operation. This indicator and override will work with a sensor wired to the controller's sensor terminals.
10. Acceptable Product:
    a. Rain Bird model ESP-LXD-LXMM with IQ cartridge, NCC Ethernet Cartridge.

N. Flow Sensor

1. One device shall be provided for each controller, installed per manufacturer's latest printed instructions.
2. Verify with Landscape Architect as to final location.
3. Acceptable Product:
    a. Rain Bird model FS150B or approved equal compatible with IQ control system.

O. Rain Sensor

1. One device shall be provided for each controller, installed per manufacturer's latest printed instructions.
2. Verify with Landscape Architect as to final location of rain shutoff.
3. Acceptable Product:
    a. Rain Bird model WR2-RC or approved equal.

P. Control Wire
1. Two conductors of single strand solid copper wire type, with PVC jacket. UF 600-volt AWG #14 minimum size, approved for direct burial. For runs over 2,000 L.F. use AWG #12. Contractor is to verify that wire sizes are within recommended wire run lengths for proper solenoid operation.

Q. Line Decoders
1. The factory pre-coded decoders shall be fully waterproof and have a working range shall be 0 degrees C to 50 degrees C at up to 100% humidity.
2. Decoders shall be capable of operating from one to six solenoids depending on the model specified on the Drawings.
3. Four and six address decoders shall have integral surge protection.
4. Acceptable Product:
    (a) Rain Bird LD series

R. Splicing Material
1. Splicing material shall be 3M Direct Bury (DBY) splice kits as manufactured by 3M Corporation or approved equal. Use DBR for larger wires.

S. Remote Control Valves
1. The remote-control valve shall be normally closed 24 VAC 50/60-cycle solenoid actuated globe pattern. The pressure rating shall not be less than 200 PSI.
2. The valve shall have a self-cleaning stainless-steel screen designed for use in dirty water applications.
3. The valve body and bonnet shall be constructed of heavy-duty glass-filled nylon and have stainless steel screws; diaphragm shall be of nylon reinforced nitrile rubber.
4. The valve shall have both internal and external manual open/close control (internal and external bleed) to manually open and close the valve without electrically energizing the solenoid. The valve's internal bleed shall prevent flooding of the valve box.
5. The valve shall house a fully encapsulated, one-piece solenoid. The solenoid shall have a captured plunger with a removable retainer for easy servicing, and leverage handle for easy turning. This 24 VAC 50/60 Hz solenoid shall open with 19.6-volt minimum at 200 PSI.
6. The valve shall have a stainless-steel flow control stem for accurate manual regulation and/or shut-off of outlet flow. The valve must open or close in less than 1 minute at 150 PSI.
7. The valve construction shall be such as to provide for all internal parts to be removable from the top of the valve without disturbing the valve installation.
8. The valve shall have a purple flow control handle to indicate that non-potable water is being used.
9. Acceptable Product:
    a. Rain Bird PGA or approved equal, sized as noted on Drawing.

R. Accessory materials
1. Drainage fill at valve boxes:
    a. Provide 1/2" to 3/4" washed pea gravel.
2. Trench backfill:
    a. Conform to requirements of backfill materials as specified in other sections.
3. Suitable excavated materials removed to accommodate the irrigation system work shall be used as fill materials provided it conforms to the requirements of fill as noted above.

S. PVC Solvent Cement:
1. Provide professional grade cement, Whitlam #PR32 or acceptable Substitute for PVC pipe and fittings.

T. PVC Primer/Cleaner

1. Provide professional grade primer/cleaner, Whitlam #PP32 or acceptable Substitute (purple) primer.

U. Green Roof Tray Irrigation System
1. Provide complete irrigation system with all components indicated on the drawings.

PART 3 - EXECUTION

3.1 GENERAL

A. Provide sleeves wherever piping or electrical wires are placed under paved surfaces.

B. Lay out work as accurately as possible to Drawings. Drawings are diagrammatic to the extent that swing joints, offsets, and fittings are not shown.

C. The Irrigation Contractor shall carefully schedule his work with the Landscape Contractor and all other site developments.

D. Sleeves are required wherever piping or electrical wires are placed under paved surfaces (installed as part of other sections and Contract). Irrigation Contractor is responsible for coordination of all sleeves.

E. Full and completed coverage is required. Contractor shall make any necessary minor adjustments to layout as required to achieve full coverage of irrigated areas at no additional cost to the Owner.

F. Where piping is shown on drawings to be under paved areas but running parallel and adjacent to planted areas, the intent is to install piping in planted areas. Do not install directly over another line in the same trench.

G. It shall be the Contractor's responsibility to establish the location of all sprinkler heads in order to assure proper coverage of all areas. In no case shall spacing of sprinkler heads exceed distances shown on the drawings and/or those specified. Pipe sizes shall conform to those shown on drawings. No substitution of smaller pipe sizes will be permitted, but substitutions of larger sixes may be approved. All pipe damaged or rejected because of defects shall be removed from the site at the time of said rejection.

H. Install irrigation system after completion of site grading, the irrigation system shall be installed and completely operational three days prior to the installation of any planting operations.

3.2 EXCAVATING AND BACKFILLING:

A. All piping is to be trenched, other than 1" which may be pulled.

B. Excavate to depths required to provide 2" depth of sand bedding material for piping when unsuitable bearing materials are encountered.

C. Should utilities not shown on the plans be found during excavations, the Contractor shall promptly notify the Owner's Authorized Representative for instructions as to further action. Failure to do so will make Contractor liable for any and all damage thereto arising from his operations subsequent to discovery of such utilities. Indicate such utility crossings on the record drawings promptly.

D. Install main line irrigation lines with a minimum cover 16" and a maximum cover of 24" based on finished grades.

E. Install lateral irrigation lines with a minimum cover of 12" and a maximum cover of 24" based on finished grades.

F. Perform all excavations as required for installation of work included under this Section, including shoring of earth banks, if necessary. Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations, to their original condition.

G. Trenches shall be open, vertical sided construction wide enough to provide free working space around work installed and to provide adequate space for backfilling and compacting.

H. When two pipes are to be placed in the same trench, a 6” space is to be maintained between the pipes. The Contractor shall not install two pipes with one directly above the other.

I. The Contractor shall cut trenches for pipe to required grade lines and compact trench bottom to prove accurate grade and uniform bearing for the full length of the line.

J. The Contractor shall be held responsible for damages caused by these operations and shall immediately repair or replace damaged parts.

3.3 PIPELINE ASSEMBLY

A. General

1. Install pipes and fittings in accordance with manufacturer’s latest printed instructions.
2. Clean all pipes and fittings of dirt, scales, and moistures before assembly.
3. All pipe, fittings, and valves, etc., shall be carefully placed in the trenches. Interior of pipes shall be kept free from dirt and debris and when laying is not in progress, open ends of pipe shall be closed by approved means.
4. All lateral connections to the main line as well as all other connections shall be made to the side of the main line pipe. No connections to the top of the line shall be allowed.

B. Solvent-Welded Joints for PVC Pipe

1. Use solvents and methods approved by solvent and pipe manufacturers.
2. Cure joint a minimum of one hour before applying any external stress on the piping and at least 24 hours before placing the joint under water pressure, unless otherwise specified by the manufacturer.
3. Cut all pipe with square ends and remove burrs, ridges, and dirt. Check dry fit pipe and fitting. Clean pipe and fitting with purple primer and apply thin coat of cement to fitting with a liberal coat to pipe. Quickly push pipe fully into fitting using a 1/4 turning motion. Hold pipe and fitting together a minimum of 30 seconds, wipe off excess with cloth.

C. Threaded Joints for PVC Pipe

1. Use Teflon tape on all threaded PVC fittings.
2. Use strap-style friction wrench only. Do not use metal-jawed wrench.

D. Laying of Pipe

1. Pipes shall be bedded in at least in at least 2” of finely divided material with no rocks or clods over 1” diameter to provide a uniform bearing.
2. Pipe shall be snaked from side to side of trench bottom to allow for expansion and contraction. One additional foot per 100 feet of pipe is the minimum allowance for snaking.
3. Do not lay PVC pipe when there is water in the trench.
4. Plastic pipe shall be cut with PVC pipe cutters or hacksaw, or in a manner so as to ensure that a square cut. Burrs at end cuts shall be removed prior to installation so that a smooth unobstructed flow will be obtained.
5. All plastic-to-plastic joints will be solvent-weld joints or slip seal joints. All plastic pipe and fittings shall be installed as outlined and instructed by the pipe manufacturer and it shall be the Contractor’s responsibility to make arrangements with the pipe manufacturer for any field assistance that may be necessary. The Contractor shall assume full responsibility for the correct installation.

3.4 PVC SLEEVES AND ELECTRICAL CONDUIT

A. Provide all sleeves indicated and as otherwise required for the successful completion of the irrigation system. Coordinate sleeving efforts with General Contractor and the Owner's Authorized Representative.

B. All PVC sleeves shall be a minimum of twice the diameter of pipe to be sleeved.

C. All PVC control wire conduit shall be of sufficient size to hold the required quantity of control and common wires. Electrical wires are not to be placed in the same trench with water pipes.

3.5 ISOLATION VALVES

A. Shall be located in the following locations:
1. After backflow preventer and prior to main supply loop.
2. Between main line and each remote-control valve.
3. Between main line and each quick coupler valve.
4. As located on irrigation system drawings within lawn areas.

B. Install each isolation valve in an individual valve box with a 6" (deep) layer of washed gravel below the bottom of the valve.

C. Seal threaded connections with Teflon tape.

3.6 IRRIGATION CONTROL VALVES
1. Install control valves in valve boxes grouped together where practical. Place no closer than 12" to walk edges, buildings, and walls.
2. All irrigation control valves shall be installed with ductile iron service tees (if mainline is 3" or larger).
3. Install line size bronze gate valve on pressure side of each control valve. Locate in valve box with control valve.
4. Install each electric control valve in an individual valve box with a 6" (deep) layer of washed gravel below the bottom of the valve.
5. Seal threaded connections with Teflon tape.
6. Valves shall be installed as shown in detail and in accordance with manufacturer's instructions and specifications.

3.7 QUICK COUPLING VALVES
1. Shall be set a minimum of 12" from walks, curbs, or paved areas where applicable or as otherwise noted. Quick coupling valves shall be housed in standard size valve boxes.
2. All quick coupler valves shall be installed on to ductile iron service tee.
3. Install 1" bronze gate valve on pressure side of each quick coupler valve. Locate in valve box with quick coupler valve.
4. Valves shall be installed on a three-elbow PVC Schedule 80 swing joint assembly.
5. Provide 6" (deep) layer of washed gravel below the bottom of the valve. Top of quick coupler valves shall be as close to the top of the valve box as possible. Top of gravel layer shall be 3" below the top of the valve.
6. Quick coupling valves shall be set perpendicular to finished grade unless otherwise designated on the plans.

3.8 VALVE BOXES

A. Valve boxes shall be set flush with grade in lawn areas and 1/2" above finish grade in ground cover and shrub bed areas.

B. Install valve access boxes on a suitable base of gravel to provide a level foundation at proper grade and to provide drainage of the valve box.

3.9 SPRAY HEADS AND ROTORS

A. All sprinkler heads shall be pop-up type heads. Permanent shrub risers are not permitted.

B. All sprinkler heads within a zone shall have matched precipitation rates.

C. Install plumb to within 1/16”, unless otherwise noted (see detail for heads on sloped areas on detail sheet). Top of collar (not nozzle) should be flush with finish grade.

D. Place part-circle pop-up sprinkler heads at least 2” and no more than 6” from edge of adjacent walks, curbs and mowing bands, or paved areas at time of installation.

E. Install pop-up sprinkler heads, and accessories in accordance with manufacturer’s latest printed instructions, except as otherwise noted.

F. All sprinkler nozzles shall be adjusted for the proper radius and direction of spray pattern. Make adjustments where possible to prevent over spraying onto walks, pavement or buildings.

G. Tighten nozzles on spray type sprinklers after installation. Adjust sprinkler adjusting screw as required for proper radius.

H. Install pop-up spray heads with approved flexible thick wall polyethylene swing pipe with spiral barb fittings. Do not install to side inlet of sprinkler head.

I. Polyethylene swing joints are not to be used to extend head more than 18” from lateral.

J. Heads to be installed at the top of a slope shall be tilted toward the toe of the slope. They shall also be installed slightly down from the top edge of the slope to decrease wind drift.

K. Mid-slope sprinkler heads shall be installed at an angle halfway between vertical and perpendicular to the slope. For example, a 2:1 or 50% slope has an angle of 26 degrees, so tilt the heads 13 degrees into the slope from the perpendicular.

L. Heads installed at the toe of the slope shall be tilted slightly away from the slope to avoid driving water into the slope directly in front of the sprinkler.

M. Do not mix different types of heads within a zone.

3.10 DRIP TUBING

A. Tubing is designed for use in surface and sub-surface applications utilizing a grid design, the result being a complete wetted area within the grid. It can also be installed as single or “snaked” lines where grids are not justified. The most uniform way to install tubing is sub-surface at a uniform depth as specified.

B. The drippers are designed to regulate flow at the specified output from 7 to 70 PSI with maximum recommended pressure of 45 PSI when using unclamped insert fittings. The choice of dripper spacing and lateral spacing is dependent on the soil type and plants being used. See drawing for details.

C. Dripline shall be staked down using 6” galvanized sod staples. Staples shall be spaced no further than 24” on center, but the contractor will place staples as closely as necessary to ensure that dripline will not work its way to the surface.

3.11 AUTOMATIC CONTROLLER

A. The automatic controller shall be installed at the approximate location shown on the drawings.

B. Install per local code, manufacturer’s latest printed instructions, and as detailed.

C. Valve wires shall be neatly stripped to expose 1/4” of copper conductor for connections to the controller terminal strip. The common wire shall be connected directly to the controller’s common terminal.

D. Valve control wires shall be numbered at the terminal strip.

3.12 CONTROLLERS POWER SUPPLY & DATA CONNECTION

A. Power to the controller(s) shall be supplied from a dedicated circuit, installed as part of work of other sections and Contract.

B. Data connection to the controller(s) shall be supplied, installed as part of work of other sections and Contract. Provide 2D from CNS Entry to building. Provide typical backbox, rough-in installation. Extend cables from terminated faceplate as required to irrigation controller.

3.13 CONTROL WIRING

A. All electrical equipment and wiring shall comply with local and state codes and be installed by those skilled and licensed in the trade.

B. Wiring shall occupy the same trench and shall be installed along the same route as pressure supply or lateral lines whenever possible and shall have a minimum of 12” cover.

C. Control wires shall be installed to the side of the main line whenever possible. Placement over pipes is not permitted.

D. Where more than one wire is placed in a trench, the wiring shall be taped together at intervals of 20’.

E. An expansion curl shall be provided within 3’ of each wire connection and at least every 100’ of wire length on runs of more than 100’ in length. Expansion curls shall be formed by wrapping at least five turns of wire around a 1” diameter pipe, then withdrawing pipe.

F. Control wire splices at remote control valves to be crimped and sealed with specified splicing materials. Line splices will be allowed only on runs of more than 500’ and they must be located in10” round splice boxes which are green in color. The connector shall be 3M DBY splice kit by 3M Corporation, or accepted Substitute. Use one splice per connector sealing pack.

G. The main line shall have two spare wires installed its entire length and to the automatic controller. Label each end “spare wire.” Spare wires to be blue in color.

H. Tracer Wire shall be run the Entire Length of the Mainline.

3.14 RAIN SENSOR

A. Install one sensor in a location approved by the Owner’s Authorized Representative and connect to the irrigation system.
1. All exposed wire shall be installed in metal electrical conduit.

3.15 CLOSING OF PIPE AND FLUSHING OF LINES

A. All testing shall be done under the supervision of the Owner’s Authorized Representative. Submit written requests for inspections to the Owner’s Authorized Representative at least three days prior to anticipated inspection date.
1. Thoroughly flush out all water lines under a full head of water before installing heads, valves, quick coupler assemblies, etc. Maintain flushing for a minimum of three minutes at the valve located furthest from water supply.
2. After flushing, cap or plug all openings to prevent entrance of materials that would obstruct the pipe or clog heads. Leave in place until removal is necessary for completion of installation.
3. Test as specified below.
4. Upon completion of testing, complete assembly and adjust sprinkler heads for proper distribution.

3.16 TESTING

A. Make hydrostatic when welded PVC joints have cured as per manufacturer’s instructions.
1. Pressurized mainlines:
    a. Completely install water meter, mains, isolation valves and control valves. Do not open laterals.
    b. Open all isolation valves.
    c. Fill all lines with water and shut off at meter.

d. Pressurize the main with air to 70 PSI. monitor gauge for pressure loss for a minimum of four hours.
e. Leave lines and fittings exposed throughout testing period.
f. Leaks resulting from tests shall be repaired and tests repeated until the system passes.
g. Test all isolation valves for leakage.

B. Non-pressurized laterals:
a. Test piping after laterals and risers are installed and system is fully operational.

3.17 INSPECTIONS

A. The contractor shall maintain proper facilities and provide safe access for inspection to all parts of the work.

B. Irrigation inspection shall consist of a minimum of:
a. Mainline pressure test.
b. Coverage test.
c. Final irrigation inspection.

C. If the specifications, the Owner's Authorized representative's instructions, laws, ordinances, or any public authority require any work to be tested or approved, the contractor shall give the Owner's Authorized Representative three days' notice of its readiness for inspection.

D. The contractor shall be solely responsible for notifying the Owner's Authorized Representative where and when such work is in readiness or testing.

E. If any work should be covered up without the approval of the Owner' Authorized Representative it must be uncovered, if required, for examination at the contractor's expense.

F. No inspection will commence without "Record" drawings and without completing previously corrections, or without preparing the system for inspection.

3.18 BACKFILLING AND COMPACTING

A. After system is operating and required tests and inspections have been made, backfill trenches.

B. Backfill for all trenches, regardless of the type of pipe to be covered, shall be compacted to minimum 95 percent density under pavements, 85 percent under planted areas.

C. Backfill material shall be suitable material. Unsuitable material, including clods and rocks over 2" in size shall be removed from the site.

D. A fine granular material shall be placed initially on all lines with a minimum of 3" cover. No foreign matter larger than 1/2" in size shall be permitted in the initial backfill.
1. Trenches located under paving shall be backfilled with sand (a layer 6" below the pipe and 3" above the pipe) and compacted in layers of 95 percent compaction.
2. Compact trenches in areas to be planted, by thoroughly flooding the backfill.
3. Within all planting and lawn areas, the existing four 4" layer of topsoil shall be restored to its original condition and finish grade.
4. Surplus earth remaining after backfilling shall be disposed of off-site by the contractor.

3.19 CLEANING AND DISPOSAL OF WASTE MATERIAL

A. Perform clean-up during installation of the work and upon completion of the work. Remove from site all excess materials, soil, debris, and equipment as fast as it accumulates.

B. Restore and repair all disturbed or damaged areas resulting form irrigation installation operations to original condition in a manner acceptable to the Owner's Authorized Representative.

C. Stockpile, haul from site, and legally dispose of waste materials, including unsuitable excavated materials, rock, trash, and debris.

END OF SECTION 328000

SECTION 329113 – PLANTING SOIL SYSTEMS (STRUCTURAL SOIL)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
1. Evaluation of rough subgrade water infiltration.
2. Planting soil material procurement.
3. Testing and analysis for specification conformance.
4. Inspection and testing of subgrade for preparation of subgrade.
5. Preparation of mixes and testing for conformance.
6. Installation of soils.
7. De-compaction of soils.
8. Mock-up of planting soil profiles.
9. Final in-place testing of soils.

B. Related Requirements:
1. Division 32 Section ‘Concrete Paving’
2. Division 32 Section ‘Unit Paving’
3. Division 32 Section ‘Metal Edging’
4. Division 32 Section ‘Exterior Planting’

1.3 DEFINITIONS

A. Compaction: Compaction of soil is any force applied to the soil that reduces porosity and where 90 percent of all compaction can be accomplished with only three applications of force under optimum soil moisture conditions.

B. Dry Soil: The condition of the soil where available water is at or below a plant’s wilting point; the soil is powdery and subject to blowing.

C. Frozen Soil: The point at which the soil water has frozen and the soil has become very hard and cloddy. Ice crystals can be seen in the pore spaces of the soil.

D. Field Capacity: The percentage of water remaining in a soil two or three days after having been saturated and gravitational drainage has ceased.

E. Moist Soil: The condition of the soil when it can be formed into a ball and maintain its shape. Deformation of the soil is difficult with hand pressure. Free water is not visible; usually considered the point between the wilting point and field capacity of the soil.

F. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

G. Saturated: All the pore space within a soil is filled with water and the remaining water is under gravitational forces to drain through the profile.

H. Scarification: The loosening of the surface of a soil by mechanical or manual means to alleviate compaction of the soil surface. Depth of scarification is dependent on material and extent of compaction. Depths are noted within the specifications.

I. Subsoil: The soil layer directly below topsoil that provides water holding and structural support to plants. Source of the majority of micro-nutrients.

J. Sub-grade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

K. Topsoil: The mineral surface layer of soil that exhibit obliteration of all or much of the original rock structure and must show the following: (1) an accumulation of humified organic matter closely mixed with the mineral fraction and not dominated by properties characteristic of subsurface horizons; (2) has reasonable tilth (biological, chemical and physical properties) to support plant growth; and have two or more of the following:
    a. A bulk density of less than 1.5g/cc installed
    b. Less than 15 percent by weight coarse fragments greater than 2mm
    c. Identifiable structure between clods called peds, no massive structure
    d. No contamination (ie. Toxic weeds, chemicals, heavy metals, construction debris)

L. Wet Soils: Soils that are considered wet will easily be deformed by hand pressure, maintain their shape, and free water will be visible within the pore spaces. The water content at this soil condition is considered at field capacity or wetter.

1.4 QUALITY ASSURANCE

A. Work and materials shall meet the standards of the following references:
    1. International Society of Arboriculture
    2. American Society for Testing Materials (ASTM)
    3. Environmental Protection Agency (EPA)

B. Installer Qualifications: A qualified landscape installer whose work has resulting in successful establishment of exterior plants.
    1. Installer’s Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site who has at least 5 years experience with projects of similar scale and complexity.
    2. The Landscape Contractor shall have experience in the proper and safe transportation and installation of soil material.
    3. The Landscape Contractor shall have adequate supervision, staff, equipment and experience needed to complete a project of this magnitude.
    4. The Landscape Contractor shall prepare and present to the Landscape Architect required soil submittals, and their associated specified test results six months prior to the scheduled soil and plant installation.
    5. The Landscape Contractor shall have at between 3 to 5 years experience in installing designed soil mixes.

C. Soil Mixing Contractor Qualifications:
1. Shall be able to provide soil mixes that meet the specifications within tolerances assigned.
2. Shall be able to produce enough consistently uniform soil material for the project to meet the scheduled demands.
3. The soil mixing contractor shall be engaged at least six months prior to scheduled soil installation to allow for sufficient time for material searches and initial planting mix approval.

D. Testing Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.
1. Employ a qualified independent testing and inspection laboratory acceptable to the Landscape Architect and Owner to perform tests and certifications indicated.
2. It is the responsibility of the Contractor to submit material for the soil and compost tests.
3. Tests shall be made in strict compliance with the standards of the Association of Official Analytical Chemists and follow standards from ASTM, EPA, and/or Methods of Soil Analysis, Soil Science Society of America.

1.5 SUBMITTALS

A. Certificates: Provide certificates required by authorities having jurisdiction, including any composted materials containing sewage sludge. Approval as EPA Type 1 “exceptional quality” is required.

B. Sources for Soil Components and Planting Soil Mixes: Submit information identifying sources for all soil components and the contractor responsible for mixing of planting soil mixes.
1. Owner or Landscape Architect shall have the right to reject any soil supplier.
2. Soil mix supplier shall have a minimum of five years experience at supplying custom planting soil mixes.
3. Submit supplier name, address, telephone and fax numbers and contact name.
4. Submit certification that accepted supplier is able to provide sufficient quantities of materials and mixes for the entire project. Indicate quantity and type of material from each supplier.

C. Samples: Planting soils requires a long lead time. Prior to ordering the listed materials, submit representative samples of the same organic batches and soil mixes that will be used to the Soil Scientist for selection and approval. Do not order materials until the Owner’s approval has been obtained. Schedule at least 4 months for soil ingredient search and initial submittal approval. Delivered materials shall closely match the approved samples.
1. Organic amendment: duplicate samples of 1 quart.
2. Soil Mix: duplicate samples of 1 quart for each soil layer after mixing organic material and soil. The Soil Mix shall match the material being placed as closely as possible.

D. Analysis and Testing of Materials: For each type of packaged material required for the work of this Section, provide manufacturer’s certified analysis. For all other materials, provide complete analysis by a recognized laboratory made in strict compliance with the standards and procedures of the following:
1. American Society of Testing Materials (ASTM)
2. American Society of Agronomy
3. Soil Science Society of America
4. Association of Official Agricultural Chemists.

1.6 SOURCE QUALITY CONTROL

A. Testing Intervals for Organic Amendments, Planting Soil Mixes and Subgrade: Testing is required at the following intervals:
   1. Testing of the organic compost material: Test certificates required for producers of municipal yard waste composts or composted biosolids are described within Section 1.5 and shall follow criteria listed within Part B of this section.
   2. After test results for the composted organic material have been accepted the Contractor shall create sample soil mixes for each of the soil layers for the planting soil mix and perform tests described within Part B of this section.
   3. Permeability of the subgrade shall be tested for at least three locations within each defined planting area. Landscape Architect will specify locations and numbers of tests based on the complexity of each planting area.
   4. During the placement of planting soils, test every 1000 cubic yards (or one test for every planting area) of planting soil mix delivered to the job site. Tests shall be for soil mix quality assurance to maintain adherence to particle size distribution, pH, organic matter, salts, and Ammonium. Report organic matter content on a percent by weight basis. Testing applies to all soil layers of the Soil Profile (S2, S3).
   5. Planting Soil In-place Density Test Intervals:
      a. For general planting soils, random penetration resistance testing shall be done at approximately one probe for every 100 ft2 of installed designed planting soil for S2 – S3 layer installation interval and at the completed (S2-S3) soil profile installation interval to track zones of compaction in excess of the specifications.
      b. For soils prescribed under sidewalks, density testing shall be completed using either ASTM D1556 or ASTM D6938-07b for at least four tests of surface soil density per sidewalk installation section.

B. Test Procedures and Reporting: Submit certified report for each test required.
   1. Compost: Analyses of composted organic materials, including composted biosolids, are required prior to initial soil mix acceptance. Analyses shall include all tests specified below and meet the criteria listed in Part 2 of this section.
      a. Maturity index either by Solvita, Dewar Self Heating or CO2 evolution sometimes called respirometry.
      b. Reaction in 1:1 water
      c. Carbon/Nitrogen ratio
      d. Foreign Material on a dry weight basis
      e. Organic Mater percent on a dry weight basis
      f. Ammonium-N using an extract method
      g. Salinity using a 1:1 water paste method
      h. Basic Nutrient content of macro nutrients (P, K, Ca, Mg)
      i. If the compost material contains any biosolids, heavy metals must be tested to meet EPA Chapter 503 and/or Pennsylvania Department of Environmental Protection levels for human use.
   2. Soil Mixes and Topsoil: Testing shall be performed and reported for particle size requiring percent of gravel (>2.0 mm), very coarse sand (2.0 – 1.0 mm), coarse sand (1.0 – 0.5 mm), medium sand (0.5 – 0.25 mm), fine sand (0.25 – 0.10 mm), very fine sand (0.10 – 0.05 mm), silt (0.05 – 0.002 mm) and clay (< 0.002 mm). Saturated conductivity, bulk density, pH, total porosity, salt content, Ammonium content and organic matter percentage on a dry weight basis shall also be tested.
      a. Particle size distribution by ASTM F1632-03 for all soil layers and topsoil. Fines passing the #270 sieve are to be measured using the hydrometer method as outlined in ASTM F1632. If any alternate method is used such as ASTM D422, the results still must be reported at the specified particle size breaks listed below or by plotting as a particle size distribution curve on a five cycle semi-log graph.

b. Organic matter content by ASTM F 1647-02a, commonly known as loss on ignition.
c. Salts and Ammonium test using Woods End Research Laboratory # 104 Soluble Ion Test or 1:2 soil/water extract test as specified in Methods of Soil Analysis, Part 3 and must be tested and made available to the Landscape Architect at least two weeks before planned soil installation.
d. Plant available Phosphorous, Potassium and Cation Exchange Capacity tested for the S1 Planting Soil Mix ONLY.
e. Soil moisture testing by gravimetric oven dry method as described in Soil Science Society of America, Methods of Soil Analysis, Part 1, 1986.

1.7 DELIVERY, STORAGE AND HANDLING

A. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, injury and theft.

B. Sequence deliveries to avoid delay. On-site storage space is permissible only with written notice from Owner. Deliver soil materials only after preparations for placement of planting soil have been completed.

C. Prohibit vehicular and pedestrian traffic on or around stockpiled planting soil.

D. Soil that is to be stockpiled longer than two weeks, whether on or off site, shall not be placed in mounds greater than six feet high. If soil stockpiles greater than six feet high are to be stored for more than two weeks, the contractor shall break down and disperse soil so that mounds do not exceed the six-foot height restriction or thoroughly mix the stockpile once a month.

E. Vehicular access to the site is restricted. Prior to construction the Contractor shall submit for approval a plan showing proposed routing for deliveries and site access which shall include, but not limited to equipment movements and staging locations

F. Soil materials shall be covered at least two weeks prior to installation to prevent excess moisture from saturating the soil stockpile. Test for the moisture content of the soil mix using the gravimetric oven dry method as described in Soil Science Society of America, Methods of Soil Analysis, Part 1, 1986 at least two days prior to soil installation.

G. Soil materials shall not be handled or hauled, placed or compacted when it is wet, as after precipitation, nor when frozen. Soil shall be handled only when the moisture content is less than 8 percent by volume.

H. The planting soil shall be mixed in a ball mill or tub mill fitted with proper screening and paddles. Windrowing the materials is not acceptable, as it does not produce uniform mixing of the components.

1.8 ACCEPTANCE AND MAINTENANCE

A. Soil Installation Acceptance: Notify the soil scientist at least 10 days in advance of date of soil placement. Inspection of the soil installation shall take place during placement of the S3 layer while some of the subgrade is visible and another inspection during the placement of the S2 layer before placement of the S1 layer. Final inspection shall take place during S1 installation.

B. Partial Acceptance: Acceptance of partial areas or portions of the total work may be granted at the option of the Landscape Architect only if the area to be inspected for acceptance is large, well defined and easily described. The Landscape Architect is not obligated to provide partial acceptance of the work.

C. Final Acceptance: Final acceptance shall be defined as the date after which the Landscape Architect and Soil Scientist determine that all work, including Punch List items has been satisfactorily completed.

PART 2 - PRODUCTS

2.1 SOIL LAYERS (HORIZONS):

A. General
1. All plant mix material shall fulfill the requirements as specified and be tested to confirm the specified characteristics.
2. Samples of individual components of plant mixes in addition to blended plant mixes including mulch materials shall be submitted by the Contractor for testing and analysis to the approved testing laboratory. Include verification testing of on site sub soils. Comply with specific materials requirements specified.
    a. No base component material or soil components for plant soil mixes shall be used until certified test reports by an approved agricultural chemist have been received and approved by the Landscape Architect and Soil Scientist.
    b. If necessary, testing of the soil material components may be requested by the Soil Scientist to facilitate approval of the plant soil mix.
    c. As necessary, make any and all plant soil mix amendments and resubmit test reports indicating amendments until approved.
3. The Landscape Architect and Soil Scientist may request additional testing by the Contractor for confirmation of mix quality and/or plant soil mix amendments at any time until completion.

B. Suppliers:
1. In the event that any of the soil materials are not available from the supplier or are not in compliance with specifications herein, the Contractor shall obtain material from other suppliers and conduct tests specified herein to provide materials in compliance with these specifications.
2. The Landscape Architect shall be notified of all soil mix substitutions or problems with the planting soil supply in order to assist with a smooth delivery and installation.

C. Planting Soils:
1. Soil layer (S3): Planting Soil Drainage Layer consisting of a 6-inch layer of coarse sand.
    a. Soil reaction with a pH between 4.5 – 7.0.
    b. An estimated permeability of 20 - 25 cm/hour.
    c. There shall be no visible organic material present in this layer.
    d. Particle size distribution shall be:

S3 Soil Layer Particle Size Distribution

Particle Size Class	Passing Sieve No	Range in Percent Passing ASTM F 1632-03
fine gravel	10	95 – 100
very coarse sand	18	80 – 95
coarse sand	35	60 - 80
medium sand	60	10 – 40
fine sand	140	8 – 15
very fine sand	270	3 – 10
silt*		2 – 6
clay*		0 – 4
Organic Matter %	ASTM F 1647-02a	<0.25
pH	1:1 Water	4.5 – 7.0

*determined by hydrometer method in ASTM F1632-03.

2. Soil layer (S2): A variable thickness layer of sand to loamy sand of a maximum of 30 inches. The thickness of the S2 is dependent on the soil profiles for individual planting areas, underground obstructions and transition areas.
   a. The soil specifications shall be that the minimum infiltration rate stays above 15 cm/hour (6 in/hr) after installation.
   b. There should be no coarse fragments over 2.5 cm (1 in.) in size. The soil shall have soil moisture content less than 8% by weight for installation.
   c. The S2 layer shall have a uniformly increasing with depth, penetration resistance of < 200 lbs/in2 after installation.
   d. The particle size distribution shall be:

S2 Soil Layer Particle Size Distribution

Particle Size Class	Passing Sieve No	Range in Percent Passing ASTM F 1632-03
fine gravel	10	95 – 100
very coarse sand	18	90 – 100
coarse sand	35	65 – 85
medium sand	60	30 – 40
fine sand	140	15 – 25
very fine sand	270	8 – 14
silt*		5 – 8
clay*		3 – 6
Organic Matter %	ASTM F 1647-02a	<1
pH	1:1 Water	5.5 – 6.5
EC	1:1 paste	1.5 dS/m

*determined by hydrometer method in ASTM F1632-03.

3. Soil layer (S1): Planting Soil Surface layer. Consisting of a layer of sand to loamy sand (S2) amended with organic matter. (must be tested to meet specs after compost is approved and added)

a. The soil specifications shall be that the minimum infiltration rate for planting soil areas stays above 5 cm/hour (2 in/hr) after installation.
b. The soil shall have soil moisture content less than 8% by weight for installation.
c. The S1 layer shall have a uniformly increasing with depth, penetration resistance of < 120 lbs/in2 after installation.
d. The particle size distribution shall be:

S1 Soil Layer Particle Size Distribution

Particle Size Class	**Passing Sieve No**	**Range in Percent Passing** ASTM F 1632-03
fine gravel	10	95 – 100
very coarse sand	18	90 – 100
coarse sand	35	65 – 85
medium sand	60	30 – 40
fine sand	140	15 – 25
very fine sand	270	8 – 14
silt*		5 – 8
clay*		3 – 6
Organic Matter %	ASTM F 1647-02a	2 – 4%
pH	1:1 water	5.5 – 6.5
EC	1:1 paste	1.5 dS/m
Phosphorous (P)	extract	20 – 100 ppm
Potassium (K)	extract	200 – 600 ppm
Cation Exchange (CEC)	Extract	>10 Meq/100g

*determined by hydrometer method in ASTM F1632-03.

D. Organic Amendment:
1. Composted Biosolid and municipal yard waste compost producers shall provide the heavy metal certificate of the material delivered as per EPA and PADEP standards. Composted organic matter shall have the following criteria:

Criteria	**Test Method**	**Acceptable Range**
Type		Brewer's waste, or leaf mulches are also acceptable. Composted municipal waste (chipped, shredded and screened wood, leaves, bark, etc.) alone is not acceptable unless it meets all of the criteria noted
Carbon/Nitrogen Ratio		11:1 – 22:1
Degree of Maturity	Dewer Self Heating or	VI – V
	Solvita Maturity Index or	6 – 8
	CO_2 Evolution	1.2 % C/day
Foreign Material	Dry wt.	< 1" dia. And < 2% (of total)
Organic Matter %	Dry wt.	25 – 55%
Reaction	1:1 water	5.5 – 8.0
Ammonium	extract	< 200 ppm

Salinity	1:1 paste	< 1.5 dS/m
Nutrient Content	extract	Contains some nitrogen, phosphorus, potassium, calcium, magnesium, sodium and micronutrients including iron, copper, boron, and manganese. Nutrients shall be present in appropriate agricultural and horticultural proportions to prevent ion antagonism.
Heavy Metals	extract	Concentrations of zinc, mercury, cadmium, lead, nickel, chromium, and copper must be below EPA and the Pennsylvania Department of Environmental Protection standards for biosolid applications to soils with human activity.

E. Planting Soil Mix Equivalency Table:
1. The mix ratios are rough estimates based on usual components found in the area and their physical properties. Slight adjustments to the mix may be needed to achieve the required planting soil properties.

Layer Designation	**Base Material or Equivalent**	**Second Soil Mix Component**	**Third Soil Mix Component**	**Mix Ratio (Volume)**
S3 Layer	US Silica USGA straight sand or Masonry Sand	None	None	None
S2 Layer	US Silica 80/20 Turf Mix	None	None	None
	Approved S3 material	sandy loam*	None	3:1
		sandy clay loam*	None	5:1
		loam*	None	4:1
S1 Layer	S2 planting soil mix	Approved Compost	None	4:1

2.2 SOIL PROFILES

A. Sand Based Structural Soil Profile: This planting soil profile consists of two soil horizons (See Soil Profile Detail Drawings). This soil profile shall be areas as noted on the drawings. A S2 layer of variable thickness averaging around 24 inches, but thinned for subsurface utilities and thickened for larger B&B root balls to achieve final grade. The basis for the S2 layer is the loamy sand specified in Part 2.1. The drainage layer (S3) is coarse sand specified in Part 2.1 of this section.

PART 3 - EXECUTION

3.1 COORDINATION

A. Pre-Installation Examination Required: The Contractor shall examine previous work, related work, and conditions under which this work is to be performed and shall notify the Owner in writing of all deficiencies and conditions detrimental to the proper completion of this work.

Beginning work means the Contractor accepts substrates, previous work, and conditions. The Contractor shall not place any planting soil until all work in adjacent areas is complete and approved by the Owner.

B. Planting Soil Preparation: Examine soil and remove foreign materials, stones over 1", and organic debris over 2" in length. Mix-in amendments as required by tests and as approved by the Owner. All preparation and mixing shall be accomplished when the soil moisture content is less than 8 percent by volume.

C. Coordinate activities with other project contractors so that there is no soil disturbance from traffic or other construction activities subsequent to placement.

3.2 EXCAVATION AND SCARIFICATION

A. Excavation of the soils shall be accomplished to a depths noted for each soil profile area. All construction debris shall be removed from the planting areas prior to placement of the soil layers. Care shall be taken to avoid working the soil when it has 8 percent moisture content or above.
   1. Excavation Depths: (of the subgrade below final grade)
      a. Tree Planting Areas shall be excavated to depth below final grade as shown on drawings.
   2. Subgrade pitch: The subgrade shall be pitched toward the underdrainage with an average around 1.5 percent or about 2.0 inches fall per 10 feet.

B. Scarification of the Subgrade: After the specified engineering compaction for the subgrade is accomplished, scarification must loosen the compacted surface of the subgrade following final rough grade to a depth of 4 to 6 inches prior to the designed soil placement. The subgrade shall have a permeability of not less than 0.1 inches/hour. Determine permeability of the subgrade using a single ring infiltrometer method after it has been scarified. If infiltration of the subgrade is below 0.1 in/hr, scarify perpendicular to previous scarification to a depth of 6 to 8 inches and retest for infiltration.

3.3 MIXING OF TOPSOIL

A. The planting soil shall be mixed in a ball mill or tub mill fitted with proper screening and paddles. Windrowing the materials is not acceptable, as it does not produce uniform mixing of the components.

B. Mixing of the compost for the S1 layer (topsoil) shall be accomplished in the same manner as the other mixing procedures. The compost shall be moist, but not overly wet. Compost shall not be so wet as to have water squeezed out by hand or so dry as to be easily blown by wind.

3.4 PLACEMENT OF SOIL LAYERS (HORIZONS)

A. Examination of Subgrade: The subgrade shall be examined by the Contractor prior to the start of soil placement and planting. Any deficiencies shall be noted and related to the Owner in writing prior to acceptance of the subgrade by the Landscape Contractor:

B. Planting Soil Placement:
   1. For areas designated Sand Based Structural Soil Profile (See Drawings):

a. Scarify the subgrade to a depth of 4 to 6 inches. Run tests in several randomly selected areas per work unit for infiltration requirement.
b. Place the S3 drainage layer in one 6 inch lift over the scarified subgrade that is correctly pitched to the underdrainage piping. Compaction of this lift shall consist of light tamping by the installers foot traffic. No mechanical compaction shall be allowed except where otherwise noted.
c. Place 24 inches of S2 material in 6 inch lifts. Compact each lift to 90 percent of Standard Proctor below optimum moisture. DO NOT compact soils above optimum moisture content.
d. Scarify each lift surface before applying additional lifts to a depth of 2-3 inches. The final lift shall be compacted to 90% and shall not be scarified.

2. Complete all hardscape construction after installation of the S2 layer and Clean Subsoil has occurred.
   a. Limit all traffic during construction to areas designated for hardscape placement.
   b. After hardscape construction is complete, the S2 layer and Clean Subsoil shall be scarified to loosen compacted areas adjacent to where construction occurred. Penetration resistance shall not exceed 200 lbs/ft2 except where noted. Resistance shall be uniformly increasing with depth.
   c. The scarification shall be such that care is taken not to damage the hardscape.
   d. The depth of the scarification shall be 2 to 3 inches. Deeper loosening may be required if compaction is extensive. Test with cone penetrometer.
   e. Scarify any other areas that have been compacted prior to S1 layer or Topsoil placement.

CONSTRUCTION NOTE: For all utility boxes and structures that will be placed completely within the designed soil shall require compacted pedestals to support the structures.

3.5 FIELD QUALITY CONTROL

A. In-place designed soil testing:
   1. General planting soil installation shall be tested using a cone penetrometer or equivalent for one point every 100 ft2 at an interval for S2 layer installation and complete soil profile installation.
   2. In-place Density Tests for soils prescribed under sidewalks and pervious parking surfaces shall be conducted for at least three tests of surface soil density per segment as noted on the drawings. The surface that is to support pavement construction is to be tested. Density testing shall conform to ASTM standards using either ASTM D1556 or ASTM D6938-07b and shall be at 90% of Standard Proctor measured at below optimum moisture content (Do not compact planting soils at moisture contents above the “Optimum” line).

3.6 PROTECTION AND REPAIRS

A. General:
   1. Protect newly graded areas from traffic, freezing and erosion. Keep free of trash, debris or construction materials. Landscape contractor shall be the only personnel allowed on areas where planting soil has been installed.
   2. Within the installation warranty period repair and re-establish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or compacted due to subsequent construction operations or weather conditions.

3. Scarify or remove and replace material to a depth as directed by the Owner; reshape and re-compact by only hand tamping at the prescribed moisture content.
4. Where settling occurs, before sidewalk construction and final soil installation acceptance, backfill with additional approved material, compact to specified rates, and restore any disturbed areas to a condition acceptable to the Owner.

3.7 POST INSTALLATION MAINTENANCE

A. Where settling occurs, backfill with additional approved material, compact to specified rates, and restore any disturbed areas to a condition acceptable to the Owner.
   1. Any post installation changes or amendments to previously approved soils without the Landscape Architect's consent are the responsibility of the Owner.

B. Fertilization of planting areas shall be handled after establishment after soil tests have been taken to determine the optimum fertilizer rates.

C. The following items are the responsibility of the Owner after the Guarantee Period to ensure the sustainability of the designed soil and plants for the life of site.
   1. After one year, collect soil samples in each of the various soil areas and submit them for laboratory testing for fertilizer and liming recommendations.
   2. Soil and planting area shall be sampled separately, but similar areas can be grouped. For example, areas of designed soil in turf areas, planting beds (flower and shrub), and turf areas of pre-existing plantings shall to be sampled and tested separately. Fertilization and liming needs to be tailored to each area for maximum effect and to reduce over fertilizing and liming and possible contamination of ground water and runoff.
   3. Repeat soil sampling for these areas every two years after first sampling and fertilize and lime to test recommendations.

END OF SECTION 329113

SECTION 329115 – SOIL PREPARATION AND MIXES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included: provide labor, materials and equipment necessary to complete the work of this section, including but not limited to the following:
   1. Furnishing and testing all soils and plant mix materials, including salvaged on-site topsoil, off site borrow materials, amendment materials, manufactured growing media and other component materials for approved use in planting mixes. These consist of:
      a. A Base Mix comprised of loam, sand, organic matter and soil amendment materials.
      b. Various Planting Mixes comprised of a Base Mix, additional organic matter and soil amendment materials.
   2. Preparing transition zone and subgrade at planting areas, including areas over structure.
      a. Preparation shall include amending and mixing planting soil with existing on-site soil to the depths indicated for transition zones of each area.
      b. Preparation of subgrade shall include verification and scarification of the subgrade prior to placement of planting soil mixes.
   3. Placing, spreading, and fine grading pre-mixed planting soil material of the type(s) indicated for plant areas, including areas over structural slabs.
      a. For areas over structural slabs: Inspect existing conditions and provide protection measures for structural deck, waterproofing, drainage and EPS fill.
   4. Testing installed planting soil mixes and Growing Media to ensure compaction rates as specified.
   5. Protecting all stock piles and plant mix installations with approved means until substantial completion.
   6. Supplying and installing erosion control material(s).
   7. Protection of finished paving, light standards, utility or other finished work over the area of construction concurrent with any and all construction operations.

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 04 Section ‘Site Stone Masonry’
   3. Division 32 Section ‘Crushed Stone Paving’
   4. Division 32 Section ‘Salvaged Boulders’
   5. Division 32 Section ‘Concrete Paving’
   6. Division 32 Section 'Unit Paving’
   7. Division 32 Section 'Metal Edging’

   9. Division 32 Section 'Exterior Planting’

1.3 REFERENCE STANDARDS

A. Agricultural Chemist: Qualified, experienced public or private soils testing laboratory, capable of providing test results as specified, and approved by the Contracting Officer.

B. ASTM: American Society of Testing Materials
   1. ASTM D422-63 Particle size distribution
   2. ASTM D5084: Saturated Hydraulic Conductivity (performed on material compacted to 85% proctor)
   3. Any other test criteria as specified or required by other references.

C. USDA: United States Department of Agriculture

D. AASHTO: American Association of State Highway and Transportation Officials

E. AOAC: Association of Official Agricultural Chemists

F. SSSA: Soil Science of America, Methods of Soil Analysis

G. TMECC: Test Methods for the Examination of Composting and Compost

H. NER493: Recommended Soil Testing Procedures for the Northeastern U.S.

1.4 DEFINITIONS

A. Finish Grade: Elevation of finished surface of planting soil.

B. Growing Medium: A manufactured mix of mineral materials, stabilizing organic amendments and stabilized aggregates to provide a mixture that promotes good growing conditions for the plants specified.

C. Manufactured Soil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce planting soil.

D. Planting Soil: Native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with soil amendments as specified.

E. Soil: A naturally occurring material of differing horizons, of which the uppermost is often used as a component in a soil mix or growing medium.

F. Topsoil: Natural surface-soil or prepared planting mix layer containing organic matter and sand, silt and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil materials including, clay lumps, gravel, and other objects more than 2 inches in diameter; and free of weeds, roots, toxic materials, or other non-soil or non-specified materials.

G. Transition Mix: Imported topsoil / loam or manufactured soil, mixed with soil amendments as specified, such as sand that is homogeneously blended as specified to create a conversion layer between the existing native soil and imported planting soil.

H. Base Mix Composite: Homogenously blended mix of sand and loam component materials which is then used for mixing with organic matter to create planting soils.

I. Salvaged On-site Topsoil: Stripped native loam removed within the limits of work, but outside of the “Tree Protection Areas”, to its entire natural depth.

J. Subgrade: Surface or elevation of subsoil remaining after completing excavation or backfill immediately beneath planting soil or lightweight fill material, that is integrated with Specified Soil or Growing Media by tilling in a layer of Transition Mix.

K. Debris: Elements including, but not limited to, concrete, concrete masonry, wood, excavated rock and rock fragments, rubble, overburden soils, abandoned utility structures, trash, refuse and litter.

1.5 ACTION SUBMITTALS

A. Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer's product testing and analysis and installation instructions for manufactured or processed items and materials.
   1. Organic matter: Include source, guaranteed analysis, and weight for packaged material.
   2. Ground Limestone: Include guaranteed analysis, and weight for packaged material.
   3. Fertilizer: Include guaranteed analysis.
   4. Systemic Herbicide: Include complete information including manufacturer’s recommendations for use.
   5. Soil stabilization materials.

B. Mix or Amended Soil Suppliers
   1. Locations: Submit locations of material sources. Submit location of mixing sites, including off site mixing of plant mix or soil amendment components.
   2. Landscape Architect shall have the right to reject any soil supplier or salvaged on-site topsoil.
   3. Soil Mix supplier shall have a minimum of five (5) years experience at supplying custom planting soil mixes.
   4. Submit supplier name, address, email, telephone, and fax email numbers and contact name.
   5. Submit certification that accepted supplier is able to provide sufficient quantities of materials and mixes for the entire project and within the limitations of the Project Schedule.
   6. Statement(s) of Qualifications: Submit within 45 days of notice to proceed to confirm qualifications.
   7. Submit written statement from proposed agricultural chemist or laboratory that required tests can be performed in accordance with the specifications, comply with all formats and classification specified herein.

C. Test reports – Soil, Soil Amendment and Plant Mix Component Analysis: The Contractor shall submit representative samples of sand, salvaged on-site topsoil, organic material components and all plant mix materials and which are intended to be used for planting soil mixes and final mixes, to an independent Soil and Plant Testing Laboratory acceptable to the Landscape Architect.
   1. All tests shall be performed in accordance with the current standards of the Association of Official Agriculture Chemists.
   2. All reports shall be submitted to the Landscape Architect for approval.
   3. Samples of all soil materials to be brought to the site must be approved before delivery.
   4. Deficiencies in the soils shall be corrected by the Contractor, as directed by the Landscape Architect after review of the testing agency report.

5. Each report must comply with the formats and classifications specified herein. Reports not providing like analysis format will be rejected. Each report shall include the following as a minimum and such other information required specific to material tested:
    a. Date issued.
    b. Project Title and names of Contractor and supplier.
    c. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
    d. Date, place, and time of sampling or test, with record of temperature and weather conditions.
    e. Location of material source.
    f. Type of test.
    g. Results of tests including identification of deviations from acceptable ranges.
    h. Recommendations for soil additives, including organic and inorganic soil amendments, necessary to accomplish particular planting objectives noted.
6. Certified reports on analyses from producers of composted organic materials are required, additional tests are required when sources are changed.
7. Although the report(s) are to contain the laboratory's comments or recommendations to the Landscape Architects regarding amendment requirements or procedures, the report shall not be interpreted to prescribe or dictate procedures or quantities of soil materials for the work of this Contract without the Landscape Architect’s written permission.
8. Tests to be conducted for each component and Planting Mix are listed in Part 2 of this Specification.
9. Testing Agencies: The following firms are acceptable testing agencies for the various components.
    a. Wallace Laboratories, 365 Coral Circle, El Segundo, CA 80245; Telephone: 310-615-0116.
    b. Approved Equal.

D. All samples to be submitted to the Landscape Architect for approval:
1. Organic Compost Material, each source, 5 lb. packaged.
2. Sand, each source, 5 lb packaged.
3. Loam Topsoil, each source, 5 lb packaged.
4. Base Mix Composite, each source, 5 lb. packaged.
5. Planting Soil Mix, each specified, 5 lb. packaged.
6. Soil Stabilization Material, each type: 12" x 12" piece.
7. Stakes for use with Soil Stabilization Material, One sample.

E. Equipment Data: Submit descriptive information with wheel load data for each proposed item of equipment to be used for execution of earthwork of this Contract. Equipment Data will be evaluated for conformance to site restriction of use.

F. Statement(s) of Qualifications: Submit within 45 days of notice to proceed.

G. Schedule and Protection Plan: Submit a detailed plan for scheduling and sequencing of all contract work and for protection of soil mixes and other completed work including coordination with contractors requiring access through the site. Indicate with schedules and plans the utilization of soil mix and subsoil protection measures over the surface area of plant bed installations, until Substantial Completion. Indicate with schedules and plans the utilization of finished work protection measures (wooden protection boards or other approved methods) over the work area of construction operations concurrent with all construction operations until substantial completion.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For each testing agency.

B. Preconstruction Test Reports: For preconstruction soil analyses specified in “Preconstruction Testing” Article.

C. Field quality-control reports.

D. Certificates:
1. Submit certified analysis for each soil treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged materials.

E. Equipment Data: Submit descriptive information with wheel load data for each proposed item of equipment to be used for execution of earthwork of this Contract. Equipment Data will be evaluated for conformance to site restriction of use.

F. Schedule and Protection Plan: Submit a detailed plan for scheduling and sequencing of all contract work and for protection of soil mixes and other completed work including coordination with contractors requiring access through the site. Indicate with schedules and plans the utilization of soil mix and subsoil protection measures over the surface area of plant bed installations, until Substantial Completion. Indicate with schedules and plans the utilization of finished work protection measures (wooden protection boards or other approved methods) over the work area of construction operations concurrent with all construction operations until substantial completion.

G. Settlement Methodology: Submit a plan with a schedule describing the proposed method intended for settling installed work.

1.7 QUALITY ASSURANCE

A. The Base Mix Composite and each Composite Planting Mix are comprised of various components including loam, sand, organic matter and other soil amendment materials. Each individual component must meet the specification herein and be verified by testing as specified herein, prior to manufacturing the specified Planting Mixes.

B. The specified Planting Mixes are comprised of the Base Mix Composite with additional organic matter and soil amendment materials. Each Planting Mix must meet the specification herein and be verified by testing as specified herein, prior to delivery to the site.

C. No component or composite mix will be accepted unless it meets all submittal, testing and certification requirements including testing and certification report format specified herein.

D. Inspections and Testing
1. Sand, soil, compost, and other material testing and soil mix testing required in this Section or additionally required by the Landscape Architect shall be furnished and paid for by Contractor.
2. The Landscape Architect reserves the right to take and analyze at any time such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested.

E. Qualifications

1. The work of this section shall be performed by a company which specializes in the type of work required for this Project, certified in writing by manufacturer, with a minimum of five (5) years of documented successful experience and shall be performed by skilled workmen thoroughly experienced in the necessary tasks.
   a. Work shall be performed in compliance with Owner's insurance underwriters' requirements.
2. Installation and maintenance foreman on the job shall be competent English-speaking supervisor(s), with a minimum of five (5) years experience in soil installation and general landscape construction and maintenance. Perform work with personnel totally familiar with planting soil preparation and lawn and planting installations under the supervision of a foreman experienced with landscape work.
   a. Notify Landscape Architect of the name and phone number of the foreman five (5) business days in advance of the first day of each phase of soil placement including transition soil layer and all Planting Soil Mixes.
3. Testing Laboratory: Experienced person or persons employed by public or private soils testing laboratory, qualified and capable of performing tests, making soil recommendations, and issuing reports as specified. The Testing Laboratory shall be as approved by the Landscape Architect.
4. It shall be the responsibility of the Contractor to see that the specifications are being adhered to. Failure of the Landscape Architect to immediately reject unsatisfactory workmanship or to notify the Contractor of his/her deviation from the specifications shall not relieve the Contractor of his/her responsibility to repair and/or replace unsatisfactory work.

F. Arrange a pre-construction meeting between Landscape Architect, Contractor, and Testing Laboratory representative. Such meeting shall seek to review the soil testing and soil work schedule, phasing, review of specifications and construction procedures. Inform the Landscape Architect five (5) business days in advance of the scheduled meeting time.

G. Pre-Installation Conferences: Person(s) responsible for soil preparation and mixes of this Section shall attend Pre-Installation Conference(s) to coordinate with work of other sections.

1.8 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.9 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

1. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

B. Investigate the conditions of site and public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of this work site. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.

C. The Contractor shall be responsible for pedestrian and vehicular safety and control within the work site. He/she shall provide the necessary warning devices and ground personnel needed to give safety, warning and protection to persons and vehicular traffic within the area.

D. During site preparation, soil installation and protection, the Contractor shall be responsible for all damage to existing features above and below finished grade (structural decking, waterproofing, drainage, utility lines, irrigation pipes, paving surfaces, existing vegetation, site furnishings) incurred as a result of work operations. Repairs or replacements shall be made to the satisfaction of the Owner.

E. Should the Contractor, in the course of Work, find any discrepancies between Contract Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Owner, it will be Contractor's duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

F. Perform both off-site mixing and on-site soil work only during suitable weather conditions. Do not disc, rototill, or work soil when frozen, excessively wet (as defined by Landscape Architect), or in otherwise unsatisfactory condition.

G. Soil mixes shall not be handled, hauled or placed during rain or wet weather or when near or above the point where maximum compaction will occur (as defined by Landscape Architect).

1.10 SEQUENCING AND SCHEDULING

A. Sequencing and Scheduling: Adjust, relate together and otherwise coordinate work of this Section with work or Project and all other Sections of Project Specifications.

B. Sequence work of soil mix placement to allow for adequate settlement and redressing prior to installation of plant material.

C. Coordinate earthwork, soil preparation and seeding work. Do not allow planting soil mix to be exposed for longer than seven (7) days without temporary or permanent cover, or other erosion control cover.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials to the location where soils are to be mixed, in unopened bags or containers, each bearing the name, guarantee, and trademark or the producer, material composition, manufacturer’s certified analysis, and the weight or the material. Retain packages for the Landscape Architect.

B. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, and theft.

C. Bulk Materials: Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.

D. Soil or amendment materials stored on site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All temporary storage means and methods shall be approved by the Landscape Architect.

E. After mixing, soil mixtures shall be covered with a tarpaulin until time of actual use and protected from contamination or erosion.

1.12 GUARANTEE

A. In addition to the specific guarantee requirements of the General Conditions and Supplementary General conditions, the Contractor shall obtain in the Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. All these guarantees shall be in addition to, and not in lieu of, other liabilities, which the Contractor may have by law or other provisions of the Contract Documents.

PART 2 - PRODUCTS

2.1 MANUFACTURED PLANTING MIXES: COMPONENT MATERIALS

A. General
   1. All planting mix materials shall fulfill the requirements for new plant mixes as specified.
   2. Samples of individual components of planting mixes and blended planting mixes shall be submitted by the Contractor for testing and analysis to the approved testing laboratory. Include verification testing of on-site sub soils. Comply with specific materials requirements specified.
      a. Perform tests as specified herein, see Article 1.5 Submittals. Failure to include any of the criteria will be sufficient cause for rejection of the test reports.
      b. No base component or soil components for plant mixes shall be used until certified test reports by an approved agricultural chemist have been received and approved by the Landscape Architect.
      c. As necessary, make any and all soil mix amendments and resubmit tests reports indicating amendments including type and amount until approved.
   3. The Landscape Architect may request additional testing by Contractor for confirmation of mix quality and compliance to specification at any time until completion.
   4. Physical Analysis (Soil Texture) test results must be submitted for percent passing as well as percent retained for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.

B. Base Mix – Sand Component
   1. The sand shall be a clean, sharp, natural silica or limestone sand that has been suitably washed and classified (sieved). Suitable sands may be referred to in commerce as a uniform, ASTM-33 concrete sand (preferred) or a coarse mason's sand or a coarse U.S.G.A. root zone sand. The selected sand must meet the following U.S.D.A. particle

size distribution as well as the other gradation characteristics listed in Part C when tested in accordance with the ASTM D-422 using U.S.D.A. particle size classifications.

2. The allowable particle size distribution is as follows:

U.S.D.A. Particle Class	Particle Size (mm)	Percent Retained
Gravel	>3.34	0 - 3
Fine Gravel	2.00 – 3.34	0 - 10 Not More than 12% combined Gravel + Fine Gravel
VeryCoarse Sand	1.00 – 2.00	10 – 25
Coarse Sand	0.50 – 1.00	20 – 40
Medium Sand	0.25 – 0.50	20 – 40
Fine Sand	0.10 – 0.25	0 – 10
Very Fine Sand	0.05 – 0.10	0 – 10
Silt + Clay	< 0.05	0 – 10

3. Sand sieve test reports must be submitted for percent (%) retained as well as for percent (%) passing for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.
4. Other Gradation Characteristics must fall within the limits specified below:
   a. Fineness Modulus (FM) - 2.5 to 3.1.
   b. Coefficient of Uniformity - 2.5 to 3.5 preferred (< 4.1 acceptable).
5. The sand shall meet the following specifications. Perform the following tests and submit test reports showing the following criteria are met:
   a. The particle size analysis/distribution as defined above.
   b. The pH shall be 5.0 to 7.0.
   c. The soluble salts shall be less than 0.5 mmoh/cm as determined by electrical conductivity of a 1:2 soil/water sample measured in Millimhos per cm.
   d. The organic matter content shall be less than 1.0% as determined by Loss on Ignition; Ash Burn Test, ASTM D 2974-87.
   e. The material drainage rate or saturated hydraulic conductivity (ASTM F1815) shall be greater than 20 inches per hour.
   f. Analysis for levels of toxic elements and compounds including Arsenic, Boron, Cadmium, Chromium, Copper, Lead, Mercury, Molybdenum, Nickel, Zinc, and PCBs. Test results shall be cited in milligrams per kilogram.

C. Base Mix – Topsoil Component
1. Provide a loamy, friable mineral soil essentially free from heavy or stiff clay lumps, stones, cinders, concrete, brick, roots, sticks brush, litter, plastics, metals, refuse or other deleterious materials in accordance with ASTM D 5286-92.
2. The soil shall be free of herbicides, petroleum-based materials or other substances of a hazardous or toxic nature which may inhibit plant growth.
3. The soil shall be free of noxious weeds, seeds or vegetative parts of weedy plants that cannot be selectively controlled in the planting.
4. The soil shall be taken from the A Horizon of a well-drained site and have a USDA soil texture classification of a Clay Loam or Loam. The topsoil shall have the following particle size distribution:

Particle Name	Size (mm)	Allowable Limit
Gravel	2.00 – 4.75	Less than 5%
Sand	0.05 – 2.00	25 – 40%
Silt	0.002 – 0.05	20 – 50%
Clay	< 0.002	20 – 35%

5. Soil Texture test results must be submitted for percent (%) retained as well as for percent (%) passing for all sieve size. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.
6. The topsoil component shall meet the following specifications. Perform the following tests and submit test reports showing the following criteria are met:
    a. The particle size analysis as defined above.
    b. The pH shall be 5.0 to 7.0.
    c. Cation Exchange Capacity (CEC) per NER493 or NCR221 using the pH 7 ammonium acetate method.
    d. The soluble salts shall be less than 1.5 mmoh/cm as determined by electrical conductivity of a 1:2 soil/water sample measured in Millimhos per cm.
    e. The organic matter content shall be 3.0 to 6.0% as determined by Loss on Ignition; Ash Burn Test, ASTM D 2974-87.
    f. Saturated hydraulic conductivity shall be (ASTM F1815) shall be greater than .5 inches per hour.
    g. Analysis for levels of toxic elements and compounds including Arsenic, Boron, Cadmium, Chromium, Copper, Lead, Mercury, Molybdenum, Nickel, Zinc, and PCBs. Test results shall be cited in milligrams per kilogram.
7. Off-site (borrow) topsoils meeting the criteria shown above must be used for the Base Mix and their source or location communicated to the Landscape Architect.

D. Base Mix - Organic Amendment
1. The organic amendment shall be stable, mature aerobically composted yard debris (green waste) compost.
    a. Leaf humus compost, manure composts, bio-solids compost, peat, peat-humus and mushroom compost products are not acceptable.
    b. The compost material must meet the requirements of all state and local Composting Regulations and have the following characteristics:
        1) The compost shall be a homogeneous material essentially free of soil clods, lumps, roots and stones.
        2) The compost shall have a man-made foreign material (hard plastics, metal, glass, etc.) content less than 1.5% as material retained on a U.S. Std.No.5 (4 mm) sieve (TMECC 03.06).
        3) The compost shall be screened such that a minimum of 100% passes a US.Std. 3/4” sieve and that no more than 10% passes a U.S. Std. No.10 sieve on a dry weight basis.
        4) The compost shall have a pH of 5.0 to 7.0.
        5) The compost shall have a soluble salts content less than 6.0 millimhos per cm. when determined on a 1:5 compost/water slurry sample measured in Millimhos per cm.
        6) The compost shall have an organic matter content of not less than 40% by weight determined by Loss on Ignition; Ash Burn Test ASTM D2974-87 Method C on material passing a U.S. Std.1/4” sieve.
        7) Ash content shall not exceed 40% as determined by Loss on Ignition.
        8) The compost shall have a carbon to nitrogen (C:N) ratio less than 36:1.
        9) The compost shall have a Solvita® Maturity Index between 6 and 7.
        10) The compost shall have a moisture content of 45% to 65%.
        11) The compost shall have a dry bulk density of 0.17 to 0.35 grams per cubic centimeter (g/cc).
        12) Saturated hydraulic conductivity shall be tested and reported in inches per hour per ASTM F1815.
        13) The compost shall be tested for Nitrate nitrogen, Ammonium nitrogen, Nitrite, Phosphorus, Potassium, Calcium, Magnesium, Iron, Manganese, Zinc, Copper, Boron, Sodium and extractable Aluminum using the SME-DTPA extraction method.

14) The heavy metal content as determined by TMECC 04.06 shall not exceed the following limits:

Element	Concentration Limits (mg/Kg d.w.)
Arsenic	41
Cadmium	39
Chromium	1200
Copper	1500
Lead	300
Mercury	17
Molybdenum	50
Nickel	420
Selenium	36
Zinc	2800

15) Yard waste composts that may contain grass clippings shall be tested for chlopyralid and picloram.
16) The compost shall meet all applicable state regulations based on the feedstock type.
17) All compost testing shall be done in conformance with the U.S. Compost Council's publication "Test Methods for the Examination of Composting and Compost" (TMECC) otherwise specified above.

2.2 MANUFACTURED PLANTING MIXES: BASE MIX PREPARATION

A. Prepare the Base Mix by thoroughly blending the Sand component and the Topsoil Component.
   1. The Base Mix shall have a granular consistency essentially free of soil lumps larger than 1". The topsoil used to make the Base Mix must be pre-screened to achieve a granular consistency essentially free of soil lumps.
   2. Mixing shall be done using equipment designed for soil blending and screening.
   3. The Base Mix shall substantially conform to a mix of 4 parts of the approved Sand and 1 part of the approved Topsoil.

B. Testing of the Base Mix:
   1. Manufacture 20 to 30 cu.yds of Base Mix and compare to a test mix prepared by the soil testing laboratory in the same ratio of 4 parts approved Sand to 1 part approved Topsoil.
   2. Test the manufactured Base Mix and the laboratory test mix for its USDA Soil Texture Analysis with Gravel/Sand Classifications using the same particle size classifications shown for the Sand component report.
   3. If the manufactured Base Mix results do not substantially match the laboratory test mix, manufacture another 20 to 30 cu.yds following the recommendations provided by the soil testing laboratory. Repeat as necessary until the test results substantially match.
   4. The saturated hydraulic conductivity of the Base Mix shall be 3 to 8 inches per hour. The Saturated Bulk Density shall be not more than 114 lbs./cu.ft. Adjust the proportion of the approved Sand and the approved Topsoil in the manufactured Base Mix to meet these criteria.
   5. These test results and criteria, when approved by the Landscape Architect, shall establish the standard to which all subsequent Base Mix tests must conform.

2.3 PLANTING MIXES

A. Adequate quantities of planting mix materials shall be provided to attain, after compaction and natural settlement, all design finish grades. Verify quantities for placement as specified to suit site conditions.

B. Uniformly mix components using a mechanical soil blender designed for such purpose as specified for each Planting Mix Type.
   1. Mixing of Base Mix and Organic Amendment (Compost): Add compost as recommended by the testing laboratory to achieve the specified organic matter content by Planting Mix type. Other amendments shall not be added to Planting Mixes unless approved by the Landscape Architect and additional tests have been conducted to verify type and quantity of amendment.

C. Testing of Planting Mixes:
   1. Perform initial tests to confirm compliance with the Planting Mix organic matter content specifications. These test results, when approved, will establish the standard to which all other test results must conform.

D. Planting Mix Types: Provide the following Planting Mix types at the locations and depths as indicated on the Contract Drawings. Mix ratio volumes, will be established upon completion of the testing for the individual components of the Planting Mixes. The controlling factor will be the percent (%) organic matter by weight as specified for each Planting Mix, percentage of sand content, as well as the soil pH. Note that volume ratios of the Base Mix and the Organic Amendment (compost) components will be, in large part, determined by the organic matter content of the compost. Follow the recommendations on mix design provided by the soil testing laboratory to achieve the target organic matter content for all Planting Mixes.
   1. Planting Soil Mix for Tree, Shrub, and Perennial Plantings:
      a. Base Mix: 60%
      b. Organic Amendment: 40%
      c. Goal for percent (%) of Organic Material in Mix (by weight): 6-8%
      d. Soil depth: As indicated on drawings.
      e. Additional Sand Content: 0%
   2. Planting Soil Mix for Turfgrass Plantings:
      a. Base Mix: 70%
      b. Organic Amendment: 20%
      c. Goal for percent (%) of Organic Material in Mix (by weight) 3-4%
      d. Soil depth: As indicated on drawings.
      e. Additional Sand Content: 10%

E. Testing of Planting Soil Mixes (all mixes): Take one (1) composite sample upon arrival to the site from each 500 cubic yards or as required by the Landscape Architect for testing each type of Planting Mix and test the following by way of a Licensed vendor to provide certified results for the following tests:
   1. Particle size analysis: Use sieve sizes as specified for the Base Mix.
   2. Organic matter content as per Loss on Ignition; Ash Burn Test ASTM D2974-87.
   3. Nutrient Analysis to include Nitrate nitrogen, Ammonium nitrogen, Nitrite, Phosphorus, Potassium, Calcium, Magnesium, Iron, Manganese, Zinc, Copper, Boron and Extractable Aluminum. Request testing laboratory recommendations for fertilizer requirements for plant types being used.
   4. Soil pH and Buffer pH.
   5. Carbon to Nitrogen Ration (C:N Ratio).
   6. Cation Exchange Capacity (CEC) per NER493 or NCR 221 using the pH7 ammonium acetate method.

7. Soluble salt content shall be less than 2.5 mmoh/cm as determined by electrical conductivity of a 1:2 soil/water sample measured in Millimhos per cm.
8. Saturated hydraulic conductivity shall be tested and reported in inches per hour per ASTM F1815.
9. Analysis for levels of toxic elements and compounds including Arsenic, Boron, Cadmium, Chromium, Copper, Lead, Mercury, Molybdenum, Nickel, Zinc, and PCBs. Test results shall be cited in milligrams per kilogram.
10. California Bearing Ratio test results for each Structural Soil sample compacted to peak standard density. The soaked CBR shall equal or exceed a value of 50.
11. Measured dry-weight percentage of stone in the Structural Soil mixture.
12. Proctor Test.

F. Stockpiling
1. General: Stockpiling on-site, off-site, and at the source should be restricted to no more than the needs of what can be used in a 72-hr. period. Under no circumstances shall on-site or off-site stored material exceed 500 cubic yards. Stockpiles should be no more than 6 feet in height to prevent anaerobic conditions within the pile. Stockpiled composts should be turned every other week (unless otherwise instructed by the Landscape Architect) to prevent excessive water absorption and anaerobic conditions.

2.4 SOIL STABILIZATION MATERIALS

A. Soil Stabilization Blankets for slopes from 3:1 to 2:1: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples. Staples should be a minimum of 11 gauge steel wire and U-shaped with 8” legs and 2” crown. Blankets must support a 3:1 to 2:1 slope and biodegrade or photo-degrade within 24 months, but without substantial degradation for five months.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. North American Green, Poseyville, IN; BioNet S150BN Double Net Straw Blankets.
b. American Excelsior Company, Arlington TX; Curlex CL Blankets.
c. Western Excelsior Products, Manco, CO; R-1.
d. Approved Equal.

PART 3 - EXECUTION

3.1 VERIFICATION

A. Prior to construction and soil placement operations at planting areas ascertain the location of all electric cables conduits under drainage systems and utility lines. Take proper precaution so as not to disturb or damage sub-surface elements. Contractor failing to take these precautions shall be responsible for making requisite repairs to damaged utilities at Contractor’s own expense.

B. Verify that required underground utilities are available, located, and ready for use. Coordinate with other trades.

C. Verify that all work requiring access through or adjacent to areas where plant mixes are to be placed has been completed and no further access will be required. In the event that access will be required, this must be coordinated with the Contractor.

3.2 SITE PREPARATION FOR PLANTING SOIL MIXES

A. Do not proceed with the installation of the Soil material until all walls, curb footings and utility work in the area have been installed. For site elements dependent on Soil for foundation support, postpone installation until immediately after the installation of Soil.

B. Install subsurface drain lines as shown on the Drawings prior to installation of Soil material.

C. Excavate and compact the proposed subgrade to depths, slopes and widths as shown on the Drawings. Maintain all required angles of repose of the adjacent materials as shown on the drawings. Do not over excavate compacted subgrades of adjacent pavement or structures.

D. Confirm that the subgrade is at the proper elevation and compacted as required. Subgrade elevations shall slope parallel to the finished grade and or toward the subsurface drain lines as shown on the drawings.

E. Clear the excavation of all construction debris, trash, rubble and any foreign material. In the event that fuels, oils, concrete washout silts or other material harmful to plants have been spilled into the subgrade material, excavate the soil sufficiently to remove the harmful material. Fill any over excavation with approved fill and compact to the required subgrade compaction.

F. All subsurface drainage systems shall be operational prior to installation of Soils.

G. Protect adjacent walls, walks and utilities from damage or staining by the soil. Use ½" plywood and or plastic sheeting as directed to cover existing concrete, metal and masonry work and other items as directed during the progress of the work.
   1. Clean up all trash and any soil or dirt spilled on any paved surface at the end of each working day.
   2. Any damage to the paving or architectural work caused by the soils installation Contractor shall be repaired by the general contractor at the soils installation contractor's expense.

H. Maintain all silt and sediment control devices required by applicable regulations. Provide adequate methods to assure that trucks and other equipment do not track soil from the site onto adjacent property and the public right of way.

3.3 PREPARATION & PLACEMENT OF TRANSITION LAYER

A. Prior to preparation and placement of Transition Layer the Contractor shall verify as-constructed or existing elevations and do whatever additional grading is necessary to bring the subgrade to a true, smooth slope as indicated on Drawings.
   1. Clean up subgrade and dispose of all debris and garbage prior to inspection.
   2. Any soils polluted by gasoline, oil, mortar and grout debris, construction debris, unacceptable soils, or other substances which would render the soils unsuitable for a proper plant growth shall be removed from the premises whether or not such pollution occurs or exists prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes shall be reviewed and approved by the Landscape Architect.

B. Transition layer can be formed by blending the specified Planting Soil Mix with the in situ rough graded sub-soils (Existing Subgrade) to a depth per the drawings in plant beds to permit soil mixing and bonding of the native soil to the Planting Soil Mix.

1. Blend specified Planting Soil Mix with existing subsoil to the depths indicated and at the approximate rate of 50% existing subsoil to 50% Planting Soil Mix.
2. Transition Layer shall be blended in situ and shall be thoroughly mixed such that the components of the Transition Layer are not individually discernible.

3.4 PLANTING MIXTURES

A. Planting mixture for planters and plant backfill shall be of the type(s) indicated in accordance with the planting details and shall be pre-mixed and placed as specified.
   1. For ericaceous plants lower the pH by using elemental sulfur product. Peat moss or copper sulfate may not be used to lower pH.
   2. All amendments shall be thoroughly incorporated into the mixture to assure uniform distribution. Delay mixing of fertilizers if planting will not follow within a few days.

3.5 Additional amendments shall be mixed into the soil as recommended by the testing laboratory and as approved by the Landscape Architect for each plant type and condition of installation.

3.6 PLACING PLANTING SOIL MIXES

A. Remove all large clods, lumps, brush, roots, stumps, litter, and other foreign material and stones one-half inch (1/2”) in diameter or larger. Dispose of removed material legally off-site.

B. Do not place a muddy or wet soil mix (as defined by the Landscape Architect).

C. Transition Layer Conditions
   1. Refer to Article 3.3 herein.

D. Place and spread planting soil mix of the type specified over approved subgrade or transition zone areas to a depth sufficiently greater than the depth required for planting areas so that after settlement as previously approved by Landscape Architect, the completed work will conform to the lines, grades, and elevations shown or otherwise indicated.

E. For Plant Bed Areas:
   1. Required Transition Layer depth per drawings.
   2. Required Planting Soil depths shall be as indicated on drawings with a total of Planting Soil Mix(es) to be a minimum per the drawings as measured in place in a settled position.
   3. Place fills lightly in layers of a maximum of six-inch (6”) lifts and very carefully settle soils to eliminate air pockets and to minimize future settling. Lightly scarify previously placed surfaces prior to placing subsequent lifts. Proposed method of settlement shall be as previously approved by the Landscape Architect. Method may include, but is not limited to, natural settlement over an approved period of time or light hand-tamp, light water misting of each layer and/or light rolling. Do not over compact Planting Soil Mixes.
   4. After settlement has occurred, add soil to maintain finished grades. If for any reason soil is left exposed for a long duration prior to planting, add soil and re-grade as required if erosion occurs. Fills shall not be so compacted as to in any way restrict the flow of water or air through the soil.

3.7 For Lawn Areas:
   1. Required Transition Layer depth shall be per drawings.

2. Required Planting Soil depth shall be as indicated on drawings with a total of Planting Soil Mix(es) to be a minimum per the drawings as measured in place in a settled position.
3. Place fills lightly in layers of a maximum of six inch (6") lifts and very carefully settle soils to eliminate air pockets and to minimize future settling. Lightly scarify previously placed surfaces prior to placing subsequent lifts. Proposed method of settlement shall be as previously approved by the Landscape Architect. Method may include, but is not limited to, natural settlement over an approved period of time or light hand-tamp, light water misting of each layer and/or light rolling. Do not over compact Planting Soil Mixes.
4. Roll the whole surface of lawn bed with a hand roller weighing approximately one hundred pounds (100 lb.) per foot (12") of roller width. During the rolling, fill all depressions caused by settlement with additional planting soil and then re-grade. Lightly roll and rake until the surface presents a smooth, even, and uniform finish that is at required grade.
5. Allow plant mix in lawn areas to remain undisturbed until fully settled in accordance with settlement methodology submitted as approved by the Landscape Architect. After any additional settlement has occurred, restore areas to finished grade prior to sodding.
6. Protect plant mix against construction activity with site protection fence as specified and the eroding effects of wind and rain with filter fabric as approved for the protection plan.
7. If soils are placed in the fall, the use of winter rye will be permitted. Where winter rye is used, the rye grass shall be roto-tilled into the soil in the spring and soil preparation and rolling shall be repeated as specified.

B. Backfilling for trees in this area shall use material specified in this section but be installed as specified in Section 329310 "Exterior Planting." Removal or shoring is the responsibility of the Contractor for Soil Preparation and Mixes.

C. Protect the soil from compaction after placement. Any area which becomes compacted shall be tilled to a depth of six (6") inches. Any uneven or settled areas shall be filled and re-graded to the plan.

D. Grading Tolerances: Planting areas shall be fine graded within ±1/10 (0.10) feet of grades indicated on drawings. Maintain all flat areas and slopes to allow free flow of surface drainage without ponding.

3.8 PREPARATION FOR SOIL STABILIZATION MATERIALS

A. Prepare area as specified in Articles 3.2 through 3.5 herein.

B. For erosion-control blanket or mesh, install from top of slope, working downward, and as recommended by material manufacturer for site conditions. Fasten as recommended by material manufacturer.

C. Moisten prepared area before planting if surface is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

3.9 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store

materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 329115

SECTION 329210 – TURF AND GRASSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included: provide labor, materials and equipment necessary to complete the work of this section, including but not limited to the following:
   1. Seeding.
   2. Sodding.
   3. Preparing subgrade.
   4. Soil amendments.
   5. Protecting and maintaining all sodded areas until Substantial Completion.
   6. Turf renovation.
   7. Final clean-up.

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 04 Section ‘Site Stone Masonry’
   3. Division 32 Section ‘Crushed Stone Paving’
   4. Division 32 Section ‘Concrete Paving’
   5. Division 32 Section 'Unit Paving’
   6. Division 32 Section 'Soil Preparation and Mixes’
   7. Division 32 Section 'Metal Edging’

1.3 DEFINITIONS

A. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

B. Finish Grade: Elevation of finished surface of planting soil.

C. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

D. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

E. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

F. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

G. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or top surface of a fill or backfill before planting soil is placed.

H. Subsoil: All soil beneath the topsoil layer of the soil profile and typified by the lack of organic matter and soil organisms.

I. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil, but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.4 ACTION SUBMITTALS

A. Product Data: Submit product literature or tear sheets giving name of product indicated, manufacturer's name and compliance with Specifications for each type of product indicated.
   1. Pesticides and Herbicides: Include product label and manufacturer's application instructions specific to this Project and safety information.
   2. Mulch.
   3. Commercial fertilizer: Include guarantee analysis, and weight for packaged materials.

B. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture stating the botanical and common name, percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.

C. Certification of each seed mixture for turfgrass sod. Include identification of source and name and telephone number of supplier.

D. Product Certificates: For soil amendments and fertilizers, from manufacturer.
   1. Commercial Fertilizers: Include guaranteed analyses.
   2. Ground Limestone: Include guaranteed analysis, and weight for packaged material.

E. Schedule and Work Plan: Submit detailed schedule and Work plan, indicating location and installation dates for each area of lawn.

F. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of turf during a calendar year. Submit before expiration of required initial maintenance periods.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified landscape installer.

1.6 QUALITY ASSURANCE

A. Lawn work shall be performed by a single firm specializing in lawn construction, which has been previously engaged for a period of at least five (5) years in the installation of lawn construction.

B. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful turf establishment.
   1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
   2. Experience: Five (5) years experience in turf installation.
   3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   4. Personnel Certifications: Installer's field supervisor shall have certification in all of the following categories from the Professional Landcare Network:
      a. Certified Landscape Technician - Exterior, with installation, maintenance and irrigation specialty areas, designated CLT-Exterior.
      b. Certified Turfgrass Professional, designated CTP.
      c. Certified Turfgrass Professional of Cool Season Lawns, designated CTP-CSL.
   5. Maintenance Proximity: Not more than two (2) hours normal travel time from Installer's place of business to Project site.
   6. Pesticide Applicator: State licensed, commercial.

C. Pre-installation Conference: Conduct conference at Project site.

D. Installer: Perform work with personnel totally familiar with lawn construction under the supervision of an experienced landscape foreman at all times during the construction. Notify the Landscape Architect of the name and phone number of the foreman five (5) business days in advance of the first day of lawn construction.

E. Arrange a preconstruction meeting between the Landscape Architect, General Contractor and Lawn Subcontractor. Such meeting shall seek to review the lawn construction schedule, phasing, review of specifications and construction procedures.

1.7 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials.

C. Procure and pay for permits and licenses required for Work.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Seed and Other Packaged Materials: Deliver packaged materials in original, clearly marked, unopened containers showing net weight, certified analysis, name and address of manufacturer and indication of conformance with state and federal laws, as applicable. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration during delivery and during storage at site.

B. Sod: Harvest, deliver, store, and handle sod according to requirements in “Specifications for Turfgrass Sod Materials” and “Specifications for Turfgrass Sod Transplanting and Installation” in TPI’s “Guideline Specifications to Turfgrass Sodding.” Deliver sod in time for planting within 24 hours of harvesting. Protect sod from breakage and drying.

C. Bulk Materials:
1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk fertilizers, lime, and soil amendments with appropriate certificates.

1.9 PROJECT CONDITIONS

A. Existing Conditions
1. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.
a. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.
2. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions. Do not place sod when the ground is frozen, or the soil is otherwise in an unsatisfactory condition for lawn construction.

C. Planting Restrictions: Plant during one of the following periods:
1. Spring: March 15 to May 31.
2. Fall: September 1 to October 15.
3. Seeding or sodding at any time other than within the above seasons shall be allowed only when the Contractor submits a written request for permission to do so and permission is granted in writing by the Owner. Newly seeded or sodded areas, if sown or sodded out of season, must be continuously watered according to good practice. Contractor shall be responsible for providing an acceptable stand of grass as specified.

D. Coordinate planting periods with initial maintenance periods to provide required maintenance from date of planting completion.

1.10 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specification.

1.11 MAINTENANCE SERVICE

A. Initial Turf Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in Part 3 herein. Begin maintenance immediately after each area

is planted and continue until acceptable turf is established but for not less than the following periods:

1. Seeded Turf: 60 days from the date of planting completion.
2. Sodded Turf: 30 days from date of planting completion.
3. When initial maintenance period has not elapsed before end of planting season, or if turf is not fully established, continue maintenance during next planting season.

B. Continuing Maintenance Proposal: From Installer to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.12 INSPECTION FOR SUBSTANTIAL COMPLETION

A. Refer to Division 01 Specification Sections for provisions regarding guarantees for the Work.

B. Maintain all lawn areas until Substantial Completion. Maintenance will be in accordance with requirements specified in Part 3 of this Section.

C. The Landscape Architect will make an inspection for Substantial Completion of the Work of this Section at the time of Substantial Completion of the entire Contract. The Contractor shall furnish a full and complete written program for maintenance of the turf for review by the Landscape Architect at the time of the request for Substantial Completion.

1. Submit a written request for inspection at least two (2) weeks prior to the day on which the inspection is requested.
2. The Contractor shall prepare a list of items to be completed or corrected for review by the Landscape Architect, prior to inspection.
3. All seeded areas shall show a uniform, thick, well developed stand of grass. If the grass stand is unsatisfactory, as determined by the Landscape Architect, the Contractor's maintenance responsibility shall continue until an acceptable stand of grass is achieved.

D. Upon completion of the inspection, the Landscape Architect shall amend the list of items to be completed or corrected and indicate the time period for their completion or correction.

E. Lawns areas will not be accepted until all items have been completed or corrected. The Landscape Architect, after an additional inspection, shall recommend in writing the Substantial Completion of the Work of this Section. The Contractor's responsibility for maintenance shall terminate, under issuance of a certificate of Substantial Completion for the entire Contract.

1.13 GUARANTEE

A. In addition to the specific guarantee requirements of the General Conditions and Supplementary General conditions, the Contractor shall obtain in the Owner's name the standard written manufacturer's guarantee of all materials furnished under this Section where such guarantees are offered in the manufacturer's published product data. All these guarantees shall be in addition to, and not in lieu of, other liabilities which the Contractor may have by law or other provisions of the Contract Documents.

PART 2 - PRODUCTS

2.1 WATER

A. Potable, clean, fresh and free from harmful materials. Water shall be furnished by the Owner. All hoses and other irrigation equipment required for the Work shall be furnished by the Contractor.

2.2 LOW-GROW SEED

A. Low-Grow Seed: Mix 1 – Low-Grow Full Sun. This seed mix will consist of the following by weight:
   1. 33% Buffalo Grass
   2. 33% Blue Grama Grass
   3. 33% Poverty Oatgrass

2.3 TURFGRASS SOD

A. Turfgrass Sod: Certified complying with "Specifications for Turfgrass Sod Materials" in TPI's "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.

B. Turfgrass Species: Tall Turf Type Fescue (Schedonorus arundinaceus) / Kentucky Bluegrass (Poa pratensis) Mix

C. All sod shall be vigorously growing, thick, uniform, fully established turf grasses freshly harvested in forty-eight (48) inch widths.

D. Sod shall be thick, well developed, machine cut strips 3/4-inch thick, from an approved sod farm. Individual sod pieces shall be cut to a uniform size with square corners. Standard sections shall be strong enough to support their own weight when held vertically. Each piece shall be uniformly moist, and not excessively dry or wet.

E. Sod shall be free from noxious weeds, annual grasses, moss, large stones, tree roots, or other materials harmful to growth, or that will interfere with future mowing or other maintenance of the sodded areas.

F. Pegs where required for holding sod shall be of approved sound soft wood and be at least 3/4 inch in thickness, square or round, and at least 8 inches long.

G. Sod shall be harvested, delivered and installed within a period of 24 hours. Sod not installed within this period must be approved by the Landscape Architect prior to installation.

2.4 SOIL AMENDMENTS

A. Soil Amendments: See Division 32 Section “Soil Preparation and Mixes.”

2.5 FERTILIZERS

A. Fertilizers: Fertilizer recommendation will be made by the testing agent after soil testing. Fertilizer additions may include micronutrients, lime, gypsum, sulfur, nitrogen, phosphorus, and potassium. Commercial fertilizer shall be a product complying with the State and Federal fertilizer laws. Deliver to the site in the original unopened containers that shall bear the manufacturer's certificate of compliance covering analysis, which shall be furnished to the Landscape Architect. At least 33% of the nitrogen content by weight shall be cold water insoluble nitrogen.

B. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of 1 to 4 percent nitrogen and 10 to 20 percent phosphoric acid.

C. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.

D. Humic Extract: Provide “Feedback” as supplied by the Troubled Soils Company, New Haven, CT 06519 (1-800/326-3361), or approved equal.

E. Ground Limestone: Provide a ground limestone with a minimum of 88% of calcium and magnesium carbonates. Material shall have a total 100% passing the 10-mesh sieve, minimum of 90% passing the 20-mesh sieve, and a minimum of 60% passing the 100-mesh sieve.

F. Fertilizer: Use of fertilizer as amendment or for maintenance condition shall be subject to soil test results:
   1. Fertilizer for lawns shall be twenty percent (20%) super phosphate and 19-26-5-organic fertilizer, the elements of which are derived from organic sources and shall contain the following percentages by weight:
      a. Water Insoluble Nitrogen: 10%. One-quarter (1/4) of the nitrogen shall be in the form of nitrates, one-quarter (1/4) in the form of ammonia salts, and one half (1/2) in the form of natural organic nitrogen.
      b. Phosphoric Acid: 6%. Available phosphoric acid to be from super phosphate, bone or tankage.
      c. Potash: 4%. The potash to be in the form of Sulphate of Potash.
   2. Fertilizer shall be delivered mixed as specified in standard size bags, showing weight, analysis and name of manufacturer, and shall be stored in a weatherproof storage place and in such manner that its effectiveness will not be impaired.

2.6 MULCHES

A. Straw Mulch: Provide air-dry, clean, mildew- and seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.

2.7 PESTICIDES AND HERBICIDES

A. Pesticide registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.
   1. Pesticides containing petrochemicals will not be accepted.

B. Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer. Do not use restricted pesticides unless authorized in writing by Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.
   1. Pesticides containing petrochemicals will not be accepted.
   2. Preen or other form of gluten-based products.

C. Post-Emergent Herbicide (Selective and Non-Selective): Effective for controlling weed growth that has already germinated. Do not use restricted pesticides unless authorized in writing by Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.
   1. Pesticides containing petrochemicals will not be accepted.
   2. Roundup, as manufactured by Monsanto Agricultural Products Company, C3NJ, St. Louis, MO 63166, or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to be planted for compliance with requirements and other conditions affecting performance.
   1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
   2. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
   3. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
   4. Uniformly moisten excessively dry soil that is not workable and which is too dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Landscape Architect and replace with new planting soil.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by planting operations.
   1. Protect grade stakes set by others until directed to remove them.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 TURF AREA PREPARATION

A. Limit turf subgrade preparation to areas to be planted.

B. Newly Graded Subgrades: Loosen subgrade to a minimum depth of 6 inches. Remove stones larger than 1-1/2 inches any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
   1. Apply superphosphate fertilizer directly to subgrade before loosening.
   2. Thoroughly blend planting soil off-site before spreading.
      a. Delay mixing fertilizer with planting soil if planting will not proceed within a few days.
      b. Mix lime with dry soil before mixing fertilizer. Weight of lime per 1000 sq. ft: 40 lb. Weight of commercial fertilizer per 1000 sq. ft: 40 lb.
   3. Spread planting soil to a depth as indicated on Drawings but not less than required to meet finish grades after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.
      a. Spread approximately 1/2 the thickness of planting soil over loosened subgrade. Mix thoroughly into top 4 inches of subgrade. Spread remainder of planting soil.
      b. Reduce elevation of planting soil to allow for soil thickness of sod.

C. Unchanged Subgrades: If turf is to be planted in areas unaltered or undisturbed by excavating, grading, or surface-soil stripping operations, prepare surface soil as follows:
   1. Remove existing grass, vegetation, and turf. Do not mix into surface soil.
   2. Loosen surface soil to a depth of at least 6 inches. Apply soil amendments and fertilizers according to planting soil mix proportions and mix thoroughly into top six (6) inches of soil. Till soil to a homogeneous mixture of fine texture.
      a. Apply superphosphate fertilizer directly to surface soil before loosening.
   3. Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, trash, and other extraneous matter.
   4. Legally dispose of waste material, including grass, vegetation, and turf, off Owner's property.

D. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Grade to within plus or minus 1/2 inch of finish elevation. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit finish grading to areas that can be planted in the immediate future.

E. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

F. Before planting, obtain Landscape Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.4 SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.
   1. Do not use wet seed or seed that is moldy or otherwise damaged.

B. Sow seed at a total rate of 5 lb/1000 sq. ft.

C. Rake seed lightly into top 1/8 inch of soil, roll lightly, and water with fine spray.

D. Protect seeded areas from hot, dry weather or drying winds by applying compost mulch within 24 hours after completing seeding operations. Soak areas, scatter mulch uniformly to a thickness of 3/16 inch, and roll surface smooth.

3.5 SODDING

A. Sodding shall consist of soil preparation, sodding, weeding, watering and otherwise all labor and materials necessary to secure the establishment of acceptable turf.

B. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.

C. After soil mix has been placed and grading is complete, irrigate the soil mix bed twelve to twenty-four (12-24) hours prior to sodding to a depth making the lawn mix evenly moist. Sod shall not be laid on soil that is powdery dry or excessively moist or slippery.

D. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

E. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Do Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
   1. Lay sod strips perpendicular to slope.

F. Tamp the sod lightly to ensure good contact with the soil surface. When laying is completed, dress top surface lightly with screened soil mix free of any material larger than one-half inch, which shall be worked into the seams between the pieces with a brush. When finished, the sod should present a smooth and uniform surface parallel to the finish grade.

G. Water all sod areas immediately following its installation so that the sod surface and lawn mix surface are thoroughly soaked. Cut and maintain established sod in accordance with the requirements contained herein.

3.6 TURF RENOVATION

A. Renovate existing turf.

B. Renovate existing turf damaged by Contractor's operations, such as storage of materials or equipment and movement of vehicles.
   1. Reestablish turf where settlement or washouts occur or where minor regrading is required.
   2. Install new planting soil as required.

C. Remove sod and vegetation from diseased or unsatisfactory turf areas; do not bury in soil.

D. Remove topsoil containing foreign materials such as oil drippings, fuel spills, stones, gravel, and other construction materials resulting from Contractor's operations, and replace with new planting soil.

E. Mow, dethatch, core aerate, and rake existing turf.

F. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.

G. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of them off Owner's property.

H. Till stripped, bare, and compacted areas thoroughly to a soil depth of 6 inches.

I. Apply soil amendments and initial fertilizers required for establishing new turf and mix thoroughly into top 4 inches of existing soil. Install new planting soil to fill low spots and meet finish grades.

J. Apply sod as required for new turf.

K. Water newly planted areas and keep moist until new turf is established.

3.7 TURF MAINTENANCE

A. Maintenance shall begin immediately after each portion of lawn is installed. Maintenance is hereby defined as: re-seeding, re-sodding, repair of ruts and erosion, regarding, repair of protective devices, watering, weeding, fertilizing, cutting and the repeating of any or all phases of lawn work construction as required to establish healthy, viable turf. Provide materials and installation the same as those used in the original installation.
   1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
   2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
   3. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.

B. Watering: Install and maintain temporary hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches.
   1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
   2. Water turf with fine spray at a minimum rate of 1 inch per week unless rainfall precipitation is adequate.

C. Lawn work shall be maintained on daily basis, weekends and holidays excluded, except as otherwise required herein, until Substantial Completion.

D. Mow turfgrass sod as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than 1/3 of grass height. Remove no more than 1/3 of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain the following grass height:
   1. Mow grass to a height of 2 inches.

E. Turf Post fertilization: Apply fertilizer after initial mowing and when grass is dry.
   1. Use fertilizer that will provide actual nitrogen of at least 1 lb/1000 sq. ft. to turf area.

3.8 SATISFACTORY TURF

A. Turf installations shall meet the following criteria as determined by Landscape Architect:

1. Satisfactory Seeded Turf: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 sq. ft. and bare spots not exceeding 5 by 5 inches.
2. Satisfactory Sodded Turf: At end of maintenance period, a healthy, well-rooted, even-colored, viable turf has been established, free of weeds, open joints, bare areas, and surface irregularities.

B. Scattered bare or dead spots, none of which are larger than 36 square inches, will be allowed up to a maximum of two percent (2%) of any lawn area after initial installation. After the grass has been established, all areas which fail to show a uniformly thick and well developed stand of grass and all scattered base or dead spots, for any reason whatsoever, shall be reseeded repeatedly until all areas are covered with a satisfactory growth of grass. Lawn areas shall show no joints or dead spots at Substantial Completion and shall be anchored to lawn mix bed with vigorous, healthy root growth. Prior to Substantial Completion, damage resulting from erosion, gulleys, washouts or other causes shall be repaired by filling with lawn mix, tamping, re-fertilizing, re-seeding, and re-sodding.

C. Use specified materials to reestablish turf that does not comply with requirements and continue maintenance until turf is satisfactory.

3.9 PROTECTION OF LAWN AREAS

A. Protect all lawn areas continuously against damage with a fence as specified. Maintain continuously in a condition acceptable to the Landscape Architect. Remove fence and any protective devices remaining on site after Substantial Completion unless directed otherwise by the Landscape Architect.

B. Contractor shall pay cost of replacement of lawn areas except where it can be definitely shown that the loss resulted from vandalism or deleterious effects caused by maintenance procedures performed by the Owner without the concurrence of the Contractor. Fully restore all lawn areas, damaged or disturbed by replacement or repair operations to their original condition.

3.10 PESTICIDE APPLICATION

A. Apply pesticides and other chemical products and biological control agents in accordance with requirements of authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

B. Post-Emergent Herbicides (Selective and Non-Selective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written recommendations.

3.11 WATERING

A. A. The Contractor shall provide all labor and arrange for all watering necessary for establishment of lawn areas. In the absence of adequate rainfall, watering shall be performed daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least four (4) inches.

3.12 CLEANUP AND PROTECTION

A. Promptly remove soil and debris created by turf work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Erect temporary fencing or barricades and warning signs as required to protect newly planted areas from traffic. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.

C. Remove non-degradable erosion-control measures after grass establishment period.

D. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to inspection of Work. Leave the site in a neat, orderly condition, "broom clean".

END OF SECTION 329210

SECTION 329310 – EXTERIOR PLANTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Work included: provide labor, materials and equipment necessary to complete the work of this section, including but not limited to the following:
   1. Furnishing and installing trees, shrubs, groundcovers and bulbs.
   2. Mulching
   3. Fertilizing
   4. Guarantee
   5. Maintenance prior to substantial completion
   6. Clean-up

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 04 Section ‘Site Stone Masonry’
   3. Division 32 Section ‘Crushed Stone Paving’
   4. Division 32 Section ‘Salvaged Boulders’
   5. Division 32 Section ‘Concrete Paving’
   6. Division 32 Section 'Unit Paving’
   7. Division 32 Section 'Soil Preparation and Mixes’
   8. Division 32 Section 'Turf and Grasses’
   9. Division 32 Section 'Metal Edging’

1.3 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.

B. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.

C. Balled and Potted Stock: Plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required.

D. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.

E. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

F. Finish Grade: Elevation of finished surface of planting soil.

G. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

H. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

I. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

J. Planting Area: Areas to be planted.

K. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

L. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.

M. Root Flare: (Also called "trunk flare") The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.

N. Stem Girdling Roots: Roots that encircle the stems (trunks) or root balls of trees below the soil surface.

O. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

P. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

Q. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

R. Agricultural chemist: Qualified, experienced public or private soils testing laboratory, capable of providing test results as specified, and approved by the Landscape Architect.

1.4 REFERENCES

A. ASNS: "American Standard for Nursery Stock," ANSI Z60.1 latest edition, published by the American Association of Nurserymen, (AAN).

B. SPN: "Standardized Plant Names," latest edition, by the American Joint Committee on Horticultural Nomenclature.

1.5 ACTION SUBMITTALS

A. General: Make submittals in accordance with the provisions and procedures of Division 01 Section – “Submittals”. Render submittals and receive approval prior to delivery or installation.
   1. Approval by the Landscape Architect of submitted product data, samples, test reports, and certificates, or material inspected at source of supply, does not constitute final acceptance.

B. Plant material sources: Submit proposed sources for deciduous trees over four inches (4”) in caliper and multi-stem deciduous trees and evergreen trees over seventeen feet (17’) in height within forty-five (45) days of award of contract.
   1. Submit proposed sources for all other plants within ninety (90) days of award of contract. Provide names and locations of nurseries, contact persons, and telephone numbers.

C. Testing: Submit written statement from proposed agricultural chemist that required test can be performed in accordance with the specifications.

D. Product Data: Submit product literature or tear sheets giving name of product indicated, manufacturer's name and compliance with Specifications for each type of product indicated.
   1. Commercial fertilizer: Include guarantee analysis, and weight for packaged materials.
   2. Herbicides, pesticides and fungicides: Include product label and manufacturer's application instructions specific to this Project and safety information.
   3. Anti-desiccant.
   4. Weed control barrier.

E. Samples for Verification: For each of the following:
   1. Mulch: 1-quart volume of each mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.
   2. Sand: Two (2) pound bag.

F. Test Reports: Submit certified reports by an agricultural chemist. Make submittals at least three (3) weeks prior to delivery of materials to site.
   1. Sand: Provide sieve analysis report for physical characteristics.

G. Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
   1. Manufacturer's certified analysis of standard products.
   2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
   3. Plants: Furnish certificates of inspection as may be required by Federal, State or other authorities that plants are free of disease or hazardous insects.

H. Schedule and Work Plan: Submit detailed schedule and Work plan, indicating start and finish dates of planting activities, including layout, soil preparation, and delivery of plants from nursery sources, excavation, and installation. If planting work is being installed in phases, submit plan with definable areas outlined and keyed, and provide schedule for planting work within each area.

I. Maintenance Program: Submit full and complete written program for maintenance of the planting up to substantial completion. Submit prior to installation of plantings.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified landscape installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful establishment of plants.
   1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
   2. Experience: Five (5) years experience in landscape installation in addition to requirements in Division 01 Section "Quality Requirements."
   3. Notify the Landscape Architect of the name and phone number of the foreman five (5) business days in advance of the first day of planting operations.
   4. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   5. Personnel Certifications: Installer's field supervisor shall have certification in all of the following categories from the Professional Landcare Network:
      a. Certified Landscape Technician - Exterior, with installation, maintenance, and irrigation specialty area(s), designated CLT-Exterior.
      b. Certified Ornamental Landscape Professional, designated COLP.
   6. Pesticide Applicator: State licensed, commercial.

B. Plant Material: Meet or exceed applicable American Standard for Nursery Stock (ANSI Z60.1) standards.
   1. Plant List: Investigate sources of supply prior to submitting bid. Confirm that size, variety and quantity of plants specified on Plant List can be supplied. Failure to take this precaution will not relieve the successful bidder from his responsibility for furnishing and installing all plants in strict accordance with the Contract requirements and without additional expense to the Owner.
      a. Substitutions will not be permitted unless substantiated written proof is supplied that a specified plant is not obtainable. In this situation a proposal to use the nearest equivalent size or variety with an equitable adjustment of Contract Price will be considered.
   2. Trees: Measure according to ANSI Z60.1. Do not prune to obtain required sizes. Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements six (6) inches above the root flare for trees up to 4-inch caliper size, and twelve (12) inches above the root flare for larger sizes.
   3. Plant Material: Meet or exceed applicable American Standard for Nursery Stock (ANSI Z60.1) standards.

C. Plants will be inspected, and approval given by the Landscape Architect at the source for conformity to Specification requirements. Such approval shall not affect the right of inspection and rejection during delivery and installation.

D. All material specified as ball and burlap (B&B) must be in the ground at the growing source at the time of inspection. Pre-dug plant material, and pre-dug healed in plant material, at the growing source will not be reviewed or accepted.

E. Arrange for adequate manpower and equipment on site at the time of plant material inspection and installation to provide a complete staked layout and to unload, open and handle plant material during inspection.

F. Arrange a preconstruction meeting between the Landscape Architect, General Contractor and Planting Subcontractor. Such meeting shall seek to review the proposed plant schedule, source of plants, consideration of substitutions, general review of specifications and planting procedures. Inform the Landscape Architect at least ten (10) business days in advance of the scheduled meeting time.

1.8 PLANT SELECTION AND INSPECTION

A. Landscape Architect will inspect and select all plants except bulbs and ground covers at the source of supply for compliance with requirements for genus, species, variety, cultivar, size, and quality. Locate all plants and be present for inspection of plants at the source. Make all pre-selection arrangements at the source of supply to ensure a ready supply of materials, equipment and man power required for an efficient selection procedure. Request the visit at least fourteen (14) days in advance of the desired inspection date.

B. Plants will be inspected, and approval given by the Landscape Architect at the source for conformity to Specification requirements. Landscape Architect retains right to observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and to reject unsatisfactory or defective material at any time during delivery and installation. Remove rejected trees or shrubs immediately from Project site.

C. All plants specified as balled and burlap (B&B) must be in the ground at the growing source at the time of inspection and selection. Pre-dug material will not be accepted.

D. All specified deciduous trees over four inches (4”) in caliper, multi-stem deciduous trees over seventeen feet (17’) in height and evergreen trees over seventeen feet (17’) in height are to be selected twelve (12) weeks prior to installation.

E. Arrange for adequate manpower and equipment on site at the time of plant inspection and installation to provide a complete staked layout and to unload, open and handle plants during inspection.

1.9 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials.

C. Procure and pay for permits and licenses required for Work.

1.10 SEQUENCING AND SCHEDULING

A. Coordinate Work of this Section with Work of all other Sections of Specification.

1.11 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. All plant labels to remain on plants until Landscape Architect removes them. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration during delivery and during storage at site. Upon delivery to the site, request, in writing, inspection of materials by Owner's representative and by Landscape Architect.

B. Bulk Materials:
   1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
   2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
   3. Accompany each delivery of bulk fertilizers, lime, and soil amendments with appropriate certificates.

C. Plant Material:
   1. Notify the Landscape Architect seven (7) days in advance of any delivery of plants to the site.
   2. Immediately before moving plant material from its source, spray all deciduous woody plants with an anti-dessicant, applying an adequate film over trunks, branches, twigs and foliage. Plants may be re-sprayed after planting.
   3. Dig and handle plants with care to prevent injury to trunks, branches and roots. Handle planting stock by root ball.
   4. Do not prune prior to delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such manner as to damage bark, break branches or destroy natural shape. Pack and ship to ensure arrival at site in good condition. Provide protective covering during delivery. No plants will be accepted if ball is cracked or broken.
   5. Deliver trees after preparations of planting areas have been completed and approved and plant immediately.
      a. If planting is delayed more than twenty-four (24) hours after delivery, set balled and burlapped plants in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage and keep roots moist, on the ground well protected with soil, straw, hay or other acceptable material. Protect balls and roots and container grown material from freezing, sun, drying winds, and/or mechanical damage. Water as necessary until planted.
      b. Heeling in plants shall not be allowed for more than three (3) days without approval of the Landscape Architect.
   6. Immediately remove rejected plants from the site.
   7. Set balled stock on ground and cover ball with soil, expanded shale mulch, sawdust, or other acceptable material.
   8. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.

1.12 PROJECT CONDITIONS

A. Existing Conditions
   1. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.
      a. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.
   2. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

B. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.

C. Interruption of Existing Services or Utilities: Do not interrupt services or utilities to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary services or utilities according to requirements indicated:
   1. Notify Construction Manager no fewer than two days in advance of proposed interruption of each service or utility.
   2. Do not proceed with interruption of services or utilities without Construction Manager's written permission.

D. Planting Restrictions: Plant only within the following dates, weather permitting. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion. Do not plant when the ground is frozen, or the soil is otherwise in an unsatisfactory condition for planting.
   1. Plant balled and burlapped deciduous trees and needled evergreen trees and shrubs and container grown trees and shrubs between March 1 and June 15 and September 1 and November 15.
   2. The following plants are listed in three groups according to lessening degrees of risk for fall planting. The list is not based on controlled experiments, but on years of observation by nursery men. Planting at times other than spring shall be done at Contractor's risk and shall not relieve him of the obligation of Guarantee.
      a. Plants with significant risk of loss. Best to postpone planting these until spring.
         1) Cercis Canadensis, Eastern Redbud
         2) Magnolia spp., Magnolias
         3) Nyssa sylvatica, Black Gum
         4) Quercus alba, White Oak
         5) Quercus coccinea, Scarlet Oak
         6) Quercus macrocarpa, Bur Oak
         7) Quercus rubra, Red Oak
      b. Plants with some degree of risk. But these can be transplanted if stock is freshly dug and moved quickly and carefully. Stake, wrap, and provide extra care.
         1) Acer rubrum, Red Maple
         2) Betula spp., Birches
         3) Cornus florida, Flowering Dogwood
         4) Crataegus spp., Hawthorns
      c. Plants not at great risk but avoid late planting. These are best planted in late August or September: they may have trouble if planted later.
         1) Ilex crenata, Japanese Holly

2) Rhododendron spp., Rhododendrons and Azaleas, evergreen types

3. Plant shrubs in the spring only, when dormant, as close to April 1 as possible.
4. Plant perennials and groundcovers as soon as the ground is workable in spring until November 15, weather and soil conditions permitting.
5. Plant bulbs between September 1 and November 15, as soon as they become available from suppliers.

E. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

1.13 INSPECTION FOR SUBSTANTIAL COMPLETION

A. Maintain all plants until Substantial Completion.

B. The Landscape Architect, with the Contractor and the Owner’s Representative, will make an inspection for Substantial Completion of the Work of this Section. Furnish full and complete written program for maintenance of the planting for review by the Landscape Architect at the time of the request for Substantial Completion.
1. Submit a written request for inspection at least two (2) weeks prior to the day on which the inspection is requested.
2. All planting shall be alive, healthy and installed as specified to be accepted.
3. Prepare a list of items to be completed or corrected for review by the Landscape Architect.

C. Upon completion of the inspection, the Landscape Architect shall amend the list of items to be completed or corrected, and indicate the time period for their completion or correction.

D. The Landscape Architect will make another inspection after notification from the Contractor that all items have been completed and corrected. If the work is complete and acceptable, the Landscape Architect will certify in writing to the Owner the Substantial Completion of the Work. The guarantee period will not begin until certification is received from the Owner.

1.14 WARRANTY/GUARANTEE

A. Contractor is not responsible for acts of vandalism occurring after the beginning of Guarantee Period, nor shall Contractor be held responsible for deleterious effects caused by maintenance procedures performed by the Owner without the concurrence of the Contractor or caused by Owner's failure to follow maintenance program.

B. During this time the Owner shall maintain all plants; however, during the Guarantee Period it shall be the Contractor's responsibility to inspect the plants to satisfy himself that the areas are receiving proper care.
1. If the Contractor is of the opinion that the care being given the plants by the Owner is insufficient or may cause them to die prematurely, he shall immediately, and in sufficient time to permit the condition to be satisfactorily rectified, notify the Landscape Architect in writing; otherwise no consideration will be given to his claim at a later date.

C. Guarantee for plants other than herbaceous material:
1. Replace at no additional cost for a period of eighteen (18) months after the establishment of the beginning date of Guarantee Period, any trees except as listed below, shrubs, or

ground covers that have died or that are, in the opinion of the Landscape Architect, in unhealthy or unsightly condition, or that have lost their natural shape due to dead branches, excessive pruning, excessive defoliation, or inadequate or improper maintenance.

a. Replace unacceptable plants no later than two (2) weeks after the determination is made by the Landscape Architect, unless planting is restricted due to season and weather as noted within this specification.
b. Replace unacceptable plants in accordance with original Specification. Cost is considered to be included in the Bid and Contract price. Guarantee all replaced material for a period of eighteen (18) months from date of replacement.
c. Deciduous trees larger than four inches (4") in caliper shall be guaranteed for a period of two (2) years.
d. Multi-stem deciduous trees and evergreen trees taller than seventeen feet (17') in height shall be guaranteed for a period of two (2) years.

1.15 FINAL ACCEPTANCE

A. The Landscape Architect will make an inspection for Final Acceptance of the Work of this Section at the end of the Guarantee Period.
   1. Submit a written request for inspection at least two (2) weeks prior to the day on which the inspection is requested.
   2. All planting shall be alive, healthy and maintained as specified to be accepted.

B. Upon completion of the inspection, the Landscape Architect will submit to the Owner a list of items to be completed or corrected and indicate the time period for their completion or correction.

C. The Final Acceptance will not occur until all items have been completed or corrected. The Landscape Architect, after additional inspection, will recommend in writing to the Owner Final Acceptance of the Work. Final Acceptance will be certified in writing by the Owner.

1.16 MAINTENANCE SERVICE

A. Initial Maintenance Service for Trees, Shrubs, Ground Cover and Other Plants, Shrubs, Ground Covers and Other Plants: Provide maintenance by skilled employees of Landscape Installer. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until Substantial Completion.

B. Continuing Maintenance Proposal: From Installer to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

PART 2 - PRODUCTS

2.1 PLANTING PIT MATERIALS

A. Soil and Soil Mixes: See Division 32 Section "Soil Preparation and Mixes."

B. Sand: Natural, medium to coarse grained in texture, free from decomposed organic matter like roots, sticks, leaves, paper and of any other undesirable trash-like glass, plastic or metal fragments that could interfere with soil drainage and planting operations. Sand shall be salt-free.

2.2 COMMERCIAL FERTILIZER FOR MAINTENANCE PERIOD

A. Soluble fertilizer, with analysis of 20-20-20 or 23-29-27, such as Ra-Pid-Gro or an approved equal for non-ericaceous plants, unless otherwise recommended by soil test results.

B. Miracid, Holly-tone, or an approved equal, for ericaceous and other evergreen plants, unless otherwise recommended by soil test results.

2.3 WATER

A. Potable, clean, fresh and free from harmful materials. Water shall be furnished by the Contractor. All hoses and other irrigation equipment required for the Work shall be furnished by the Contractor.

2.4 PLANT MATERIAL

A. Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule or Plant Legend shown on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement. Contractor to conduct a meeting with Landscape Architect at beginning of project as Tree Propagation may be desired as a means for contract growing and selecting plant materials.
   1. Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch in diameter; or with stem girdling roots will be rejected.
   2. Trees shall be dug so that the root flare is located at the top of the rootball. Care shall be taken to remove any soil that has accumulated on top of the root flare during digging prior to wrapping and tying root ball.
   3. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.
   4. Nomenclature: Agree with SPN or as accepted in the nursery trade for varieties not listed therein.
      a. Clonal types shall be true.

B. Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Landscape Architect, with a proportionate increase in size of roots or balls. Large plants cut back to sizes specified will not be accepted.
   1. Measure height or spread and quality in accordance with standards specified in ASNS (unless otherwise specified).

C. Provide balled and burlapped stock (B&B) with a compact natural ball of earth, firmly wrapped and tied in burlap so that upon delivery the soil in the ball is still firm and compact about the small feeding roots. Root ball sizes shall be in accordance with standards specified in ASNS.

D. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which shall begin at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

E. Labeling: Label at least one plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant as shown on Drawings. Do not remove label until Landscape Architect has inspected the plants.

F. If formal arrangements or consecutive order of plants are shown on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.

2.5 MULCH MATERIALS

A. Expanded Shale Mulch: Free from deleterious materials and suitable as a top dressing of trees, shrubs, and perennials, consisting of the following:

1. Type: KENLITE
2. Size: 1 inch maximum.
3. Color: Gray with tan and oranges.

B. Crushed Stone Aggregate Mulch (Applicable to Trees in Pavement): Hard, durable stone, washed free of loam, sand, clay, and other foreign substances, of the following type, size range, and color:

1. Type: Crushed Stone, as available from Kafka Granite, 550 East Highway 153, Mosinee, WI 54455; Telephone: 715-256-8153.
2. Size: 3/8 inch x 1/8 inch.
3. Color: To be selected from Supplier’s full range.

2.6 PESTICIDES AND HERBICIDES

A. Pesticide registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.
1. Pesticides containing petrochemicals will not be accepted.

B. Pre-Emergent Herbicide (Selective and Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer. Do not use restricted pesticides unless authorized in writing by Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.
1. Pesticides containing petrochemicals will not be accepted.

C. Post-Emergent Herbicide (Selective and Non-Selective): Effective for controlling weed growth that has already germinated. Do not use restricted pesticides unless authorized in writing by

Landscape Architect and local, state and/or federal agencies with jurisdiction for type and rate of application.

1. Pesticides containing petrochemicals will not be accepted.

2.7 PLANT TREATMENT MATERIALS

A. Herbicides, Fungicides, Pesticides: Approved before use for type and rate of application by Landscape Architect and local, state and/or federal agencies with jurisdiction.
   1. Pesticides containing petrochemicals will not be accepted.

B. Anti-dessicant: "Wiltproof" as manufactured by Wiltproof Products, Inc., P.O. Box 4280, Greenwich, Ct. 06830, 203-531-4740.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to excavation of planting areas, ascertain the location of all electric cables, conduits, underdrainage systems and utility lines. Take proper precautions so as not to disturb or damage sub-surface elements. If sub-surface elements are uncovered, promptly notify the Landscape Architect, who will relocate the plants. If Contractor fails to follow this procedure he is responsible for making requisite repairs to damaged utilities at his own expense.
   1. Verify that required underground utilities are available, in proper location and ready for use. Coordinate with other trades.
   2. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

C. Coordinate with Division 32 Sections “Concrete Paving”, “Unit Paving”, “Metal Edging”, “Site Stone Masonry”, “Crushed Stone Paving” and “Turf and Grasses.”

3.3 LAYOUT

A. Stake out locations for new plants and outlines of planting areas for approval by the Landscape Architect where shown on Drawings except where obstructions exist below ground, overhead, or where changes have been made during construction. Adjustments shall be approved by the Landscape Architect. Layout planting beds and pits completely before seeking approval by the Landscape Architect.

3.4 INSTALLATION

A. Excavation: All plant pits and trenches shall be excavated in accordance with the Planting Details after approval of staked locations by the Landscape Architect. Excavation of plant pits shall be done after soil testing, and analysis and approval by the Landscape Architect

B. Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Dig to depth of root ball minus 1-2 inches so that tree is firmly supported with root flare above finish grade. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
   1. Excavate as indicated on the Drawings for balled and burlapped and container-grown stock.
   2. Do not excavate deeper than depth of the root ball, measured from where the root flare meets the top of the root ball to the bottom of the root ball.
   3. If area under the plant was initially dug too deep, add soil to raise it to the correct level and fully compact the added soil to prevent settling.
   4. Maintain required angles of repose of adjacent materials as shown on the Drawings. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
   5. Maintain supervision of excavations during working hours.
   6. Keep excavations covered or otherwise protected when unattended by Installer's personnel.
   7. If drainage pipe is shown on Drawings or required under planting areas, excavate to top of porous backfill over pipe.
   8. When compacted soil is encountered, sides and bottoms shall be loosened by scarifying.
   9. Exercise extreme caution during excavation to avoid damaging or interrupting existing under-ground utilities. Use appropriate detection equipment to locate utilities during excavation of pits to the required depth.
   10. Erect barricades, warning signs, or other protective devices as is required by local, state or federal laws and regulations to protect open excavation.
   11. Excavated material shall be removed and disposed off-site, unless approval, in writing, has been obtained from the Landscape Architect.
   12. Topsoil removed from excavations may be used as planting soil as long as it meets the necessary specification requirements.

C. Drainage of Pits: Verify by testing that pits are free draining. If pits are not free draining notify Landscape Architect and Owner and submit alternative method of drainage for approval.
   1. Check planting drainage system to insure it is functioning correctly prior to planting. Refer to Drawings for layout and design of planting drainage system.
   2. Do not install plants in pits until the pits have been approved by the Landscape Architect.

D. Obstructions below Ground
   1. In the event that rock, underground construction work, utilities or obstructions are encountered in any plant pit excavation work under this Contract, alternate locations may be selected by the Landscape Architect.
   2. Where locations cannot be changed, the obstruction shall be removed, subject to the Landscape Architect's approval, to a depth of not less than three (3) feet below grade and no less than six (6) inches below bottom of ball or roots when plant is properly set at the required grade. Payment shall be made in accordance with the Contract.

E. Placement of Plants
   1. Plants shall be set in center of pits, plumb and straight, in accordance with the planting details, and faced to give best appearance and relationship to adjacent plants and structures.

2. Do not plant until plants have been approved by the Landscape Architect at site.
3. Plant to such depth that the finished grade level of the plant, after settlement, will be the same as that at which the plant was grown, and so that the root flare is slightly above finish grade.
4. Remove all burlap and ropes from the top third of root balls. Clip and remove top 1/3 of wire baskets.
5. Do not pull burlap out from under balls. Remove platforms, wire and surplus binding from top and sides of ball. Cleanly cut off all broken, encircling, girdling or frayed roots.
6. Remove all non-biodegradable materials from the plant pit.
7. Remove plants from containers by cutting or inverting the container.
8. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

F. Set balled and potted or container-grown stock plumb and in center of planting pit or trench with root flare one to two (1-2) inches above adjacent finish grades.
1. Use planting soil for backfill.
2. Carefully remove root ball from container without damaging root ball or plant.
3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
4. Continue backfilling process. Water again after placing and tamping final layer of soil.

G. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

H. When planting in paved areas, install trees and backfill with soil prior to installation of adjacent pavers.

I. Backfilling
1. Use Planting Soil for backfill.
2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
4. Spread out the roots of bare root plants properly and work backfill mix among them. Prune off broken roots in a natural position. Water thoroughly while backfilling.
5. Continue backfilling process. Water again after placing and tamping final layer of soil.

J. Installation Inspection
1. The Landscape Architect will inspect trees for planting depth, injury to trunks, evidence of insect infestation and improper pruning before wrapping. Treat injuries of infestation by accepted methods. Remove and replace plants determined by the Landscape Architect to have injuries or infestations which cannot be treated or which have caused unacceptable damage to the plant.
2. Trees shall stand plumb at installation.

3.5 TREE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines as directed by Landscape Architect.
   1. Remove broken or badly bruised branches with a clean cut. Perform pruning with clean, sharp tools.
   2. Accidental damage to trees occurring during the course of planting operations which is not so great as to require removal of a branch or the replacement of the plant shall be promptly traced and treated in accordance with recognized horticultural practices as directed by the Landscape Architect.

C. Do not apply pruning paint to wounds.

3.6 WATERING

A. Upon completion of planting operation, water plant material thoroughly on the interior of the mulch saucer until it is filled or over the entire planting bed.

B. Apply water slowly so as to penetrate the entire root system and at a rate which will prevent relocation/displacement of the soil.

3.7 PLANTING AREA MULCHING

A. Mulch backfilled surfaces of planting areas and other areas indicated.
   1. Trees in Turf Areas: Apply expanded shale mulch ring of 2-inch average thickness, with 24-inch radius around trunks or stems. Do not place mulch within six (6) inches of trunks or stems.
   2. Expanded Shale Mulch in Planting Areas: Apply 2-inch average thickness of expanded shale mulch over whole surface of planting areas, and finish level with adjacent finish grades. Do not place mulch within three (3) inches of trunks or stems of shrubs.

3.8 MAINTENANCE PRIOR TO SUBSTANTIAL COMPLETION

A. Immediately begin maintenance after each plant is planted. Plants shall be watered, mulched, weeded, pruned, sprayed, fertilized, cultivated, and otherwise maintained and protected until Substantial Completion. Tree turnbuckles and stakes shall be tightened and repaired as required. Defective work shall be corrected as soon as possible after it becomes apparent and weather and season permit. Settled plants shall be reset to proper grade and position, planting saucer restored and dead material removed.

B. Upon completion of planting, and prior to Substantial Completion, remove from site excess soil and debris and repair all damage resulting from planting operations.

C. As part of maintenance, provide protection and extermination measures against gophers, rabbits, or other rodents, and repair damage caused by their activities.

D. Adjust irrigation systems as required.

E. Do not prune without approval of the Landscape Architect.

F. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

3.9 MAINTENANCE DURING GUARANTEE PERIOD

A. Arrange a meeting with the Landscape Architect, the Owner and the Owner's designated maintenance personnel to review the approved maintenance program for the duration of the Guarantee Period.

B. Perform procedures set forth in the submitted and approved Maintenance Program for the duration of the Guarantee Period. The program based on the requirements of the Specification must be approved by the Landscape Architect and Owner.

C. Plants other than herbaceous material:
   1. Prune periodically, as necessary, to remove dead or damaged branches.
   2. Fertilizing
      a. Fertilize trees approximately one year after installation between October and December, or between February and April. Unless otherwise indicated by soil test results, mix specified fertilizer at the rate of 7 pounds to 100 gallons of water and apply by liquid injection method. Make insertion points approximately 2-1/2 feet apart, at a depth of 1 foot, applying 1 gallon at each insertion point. Applying fertilizer in the ball and backfill area, and to approximately 1 foot outside of the planting hole.
      b. Fertilize shrubs and ground covers with the specified fertilizer every three weeks between May 1 and August 1, unless otherwise indicated by soil test results. Apply at the manufacturer’s recommended dilution ratio, to achieve a total of 3 lbs. of actual nitrogen per thousand square feet of bed per year.
   3. Completely remove all weeds within mulch areas. Under no circumstances are weeds to attain more than two (2) inches of growth.
   4. Restore mulch and saucers around plants as necessary to preserve their appearance and to control weed growth. Total depth of mulch shall not exceed 4” and shall remain 6 inches from root flare.
   5. Water as necessary to keep the plant materials in their best condition. Coordinate schedules and procedures with Owner. Apply water slowly so as to penetrate the entire root zone.
   6. If any plant settles from its proper elevation, raise it to the proper level, do not merely fill in with additional material.
   7. Spray as necessary to control insects, fungus and other diseases. Continue spraying throughout the guarantee period.
   8. The Landscape Architect and Contractor will inspect the site to observe the completed Work, approximately three (3) months after the beginning of Guarantee Period. Contractor shall perform necessary remedial work immediately following inspection.

3.10 CLEAN UP AND DISPOSAL

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day’s work. Burning of material or dumping on the site is prohibited.
   1. Maintain segregation of man-made materials, debris, organic matter, and soil material as may be required for conditions of disposal.
   2. Transport materials over legal haul routes and obtain necessary permits for transporting and disposal as required by Federal, State and local regulations.
   3. Removals at Completion: Remove all temporary preparation and protection measures installed on Project site at completion of Work and at a time approved by Landscape Architect.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 329310

SECTION 329500 – GARDEN ROOF ASSEMBLY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Tray-type vegetated roof assemblies.
   2. Pregrown sedum mats.

B. Related Requirements:
   1. Division 32 Section "Exterior Planting"

1.3 DEFINITIONS

A. Captured Water: Water that is retained in the drainage layer of a vegetated roof assembly after new water additions have ceased and that cannot escape the roof except through evaporation or plant transpiration.

B. Finish Elevation: Elevation of finished growing-media surface of planting area.

C. Planting Area: Areas to be planted.

D. Plant; Plants; Plant Material: Vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.

E. Growing Medium: Manufactured, lightweight soil mixture that promotes good growing conditions for specific varieties of plants.

F. FLL Greenroof Guidelines: German Guidelines for Planning, Execution, and Upkeep of Green Roof Sites, Current Release. Worldwide acknowledged state-of-the-art technology as scientific foundation for successful and thriving green roofs.

G. FM Approval: Class Number 4477, Approval Standard for Vegetated Roof System.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.
   1. Arrange, in accordance with Division 01.
   2. Attendance: Contractor, Installer, Owner Architect, vegetated roofing system and membrane roofing system manufacturer representatives, roofing installer, and those requested to attend.

3. Meeting Date: Minimum 2 weeks prior to beginning work of this Section, and to prior work of related Sections affecting work of this Section.
4. Agenda:
   a. Discuss drainage mats, root barriers, filter fabrics, slip-sheets, protection course, and other requirements of the roofing manufacturer.
   b. Verify water source and connections for irrigation system.
   c. Discuss post-installation care including establishment period and maintenance regimen.

1.5 ACTION SUBMITTALS

A. Product Data: For each vegetated roof assembly.
1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include material descriptions for each growing medium.
3. Include material descriptions for each plant type and characteristics.

B. Shop Drawings: For each vegetated roof assembly.
1. Include plans, sections, slopes, and edger locations.
2. Indicate dimensions, weights, and loads.
3. Detail field assembly of components, metal edger connections, and attachments to other work.
4. Indicate walkway pavers, geofoam fill, locations of irrigation, coordination with lighting, and accessories.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer**.**
1. Written submittal by manufacturer indicating that installer is certified as qualified to perform the work of this section.

B. Product Certificates: For each type of manufactured product.
1. Manufacturer's technical data sheets for standard products.
2. Analysis of other materials by a recognized laboratory, according to methods established by the Association of Official Analytical Chemists, where applicable.

C. Product Test Reports: For complete analysis of each growing medium, for tests performed by manufacturer and witnessed by a qualified testing agency or by a qualified testing agency. Confirm that growing medium meets FFL Green Roof Guidelines.

D. Field quality-control reports.

E. Sample Warranty: For special warranties.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For vegetated roof assembly and plants, including a recommended maintenance plan with procedures for inspection and care during a calendar year. Submit before start of required warranty and maintenance periods.

B. Continuing Maintenance Proposal: From vegetated roof assembly Installer approved by roofing-membrane manufacturer to Owner, in the form of a standard two-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.8 QUALITY ASSURANCE

A. Installer Qualifications: A qualified vegetated roof assembly Installer, approved, authorized, or licensed by vegetated roofing system provider, whose work has resulted in successful establishment of vegetated roofs.
   1. Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when vegetated roof assembly work is in progress.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and Federal laws if applicable. Store away from sources of ignition and extremely high temperatures. Avoid exposure to heat, sparks, and open flames,

B. Bulk Materials:
   1. Do not dump or store bulk materials on or near structures, utilities, walkways and pavements, or existing roof areas or plants.
   2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of debris-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
   3. Store growing medium in a dry area, free of contaminants which may adversely affect the engineered blend, including weed seeds.
   4. Accompany each delivery of bulk materials with product certificates.

C. Plant Materials:
   1. Maintain health of plants as recommended by nursery guidelines prior to installation. Store vegetated planters and materials over plywood panels or protective sheeting on the roof.
   2. Rolled sedum mats may be stored in a cool location, below 75 deg F, for a maximum of twenty-four hours. Do not leave plants in hot storage areas.
   3. Provide water source for irrigating plants per manufacturer's recommendations until permanent irrigation system is in place.

D. Handle and store materials, and place equipment in a manner to avoid overloading roof structure or damaging roofing membrane.

1.10 FIELD CONDITIONS

A. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when optimum results may be obtained. Install plant materials when temperatures are between 40 deg F and 95 deg F, except as otherwise instructed by manufacturer. Do not install if extended freezing temperatures are expected or if ambient soil temperature is expected to remain below 50 deg F. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

1.11 WARRANTY

A. Manufacturer's Standard Full System Warranty: Limited warranty on materials: The manufacturer warrants to the Owner that all green roof "hard parts" supplied by the manufacturer will be free from defects in materials and workmanship for the warranty periods set forth below:
   1. Warranty Period: Twenty years, or the duration of the membrane manufacturer's warranty, whichever is less.

B. Extended Overburden Warranty for Vegetated Roof Assembly: Manufacturer will provide removal and replacement of vegetated roof assembly.
   1. Warranty Period: Twenty years, or the duration of the membrane manufacturer's warranty, whichever is less.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain vegetated roof assembly components, growing medium, plants, and accessories from single source from single manufacturer.

2.2 VEGETATED ROOF ASSEMBLIES

A. Tray-Type Vegetated Roof Assembly: Modular assembly consisting of manufacturer's standard, planted-in-place trays for field assembly adjacent to and interlocking with each other over roofing system.
   1. Basis-of-Design Product: Provide Columbia Green Technologies Planted-in-Place Tray Green Roof System, no substitutions.
   2. Tray Depth, Nominal: 4-5/8 inches.
   3. Tray Size: 24 by 24 inches.
   4. Tray Material: Injection molded, 100 mil polypropylene, 88 percent post-consumer recycled content.
   5. Tray Design: Trays must be fully interlocking and overlap adjacent trays by a minimum of 1/4 inch. Tray bottom to have ridges and trough design to maximize air flow and retain stormwater.
   6. Connection Holes and Fasteners:
      a. Four 3/8 inch holes, aligned and centered in each vertical side panel.
      b. Plastic Tray Pin: Provided by manufacturer.
   7. Growing Medium Depth: Overfill trays to a minimum depth of 8 inches. Greater depth shall be provided in valleys of roof slopes to provide uniform surface elevation of growing medium.
   8. Assembly Weight: Maximum 52 lb/sq. ft, including growing medium and plants and saturated with captured water, but not including weight of roofing system.
   9. Recycled Content: Trays shall have post-consumer recycled content of not less than 88 percent.

2.3 MANUFACTURED GROWING MEDIA

A. Growing Media: Vegetated roof assembly manufacturer's lightweight, manufactured soil mixture designed for planted-in-place trays.

1. Basis of Design Product: Columbia Green Technologies; Intensive Growing Media.
2. General Condition at Time of Planting: Free of aggregates 1/2 inch or larger in any dimension; free of roots, plants, clods, pockets of sand, paint, building debris, oils, solvents, roofing materials, and other extraneous materials harmful to plant growth; free of weeds, disease-causing plant pathogens, and other undesirable organisms.
3. Maximum Media Density: ASTM E 2399, 85 lb/cu. ft. for growing-medium mixture.
4. Maximum Media Water Retention: ASTM E 2399, 35 to 65 percent by volume for growing-medium mixture at maximum media density per FLL Green Roof Guidelines.

2.4 PLANTS

A. Sourced and approved by Columbia Green Technologies for warranty to apply.

B. Conform to Project landscape design requirements, recommendations of local horticulturalists, and requirements of authorities having jurisdiction, including Fire Marshal, for specific recommendations and regulations.

C. Pregrown Sedum Mat: 47 inch by 77 inch pregrown sedum mat with minimum 80 percent plant coverage.

D. Entire surface of green roof trays shall be planted with pregrown sedum mats, followed by plugs inserted through the sedum mats, into the growing medium.

2.5 ACCESSORIES

A. Protection Board: As recommended by roofing-membrane manufacturer.

B. Soil Retainer: Vegetated roof assembly manufacturer's formed stainless-steel edging.
1. Basis-of-Design Product: Columbia Green Technologies Standard Tray Edger
2. Tray Edger: 8.5” x 7.5” 26 gauge aluminum with prefabricated tray pin receiving slot for tray attachment. Manufacturer’s 8” metal plate shall be used to extend height of edger in valleys of roof slopes in order to maintain consistent elevation for top of edger. Metal plate is screwed to edger with stainless steel screws at each end and at 18” o.c. for length of each plate.
   a. Color: Mill finish.
   b. Corners: Provide manufacturer's Prefabricated Standard Tray Edger Inside Corner and Prefabricated Outside Corner at 90 degree corners. Match color to tray edger.
3. At perimeter trays, cut trays and trays adjacent to roof drains, install filter fabric within trays and extend up to top of edger and/or metal plate extension of edger to prevent growing medium from filtering out between tray and edger.
4. Method of Attachment, Tray System: Tray edger is held in place to surface of roof by the weight of the system. Use manufacturer's standard removable pin fastener to attach edger to sides of tray.

C. Roof Drain Box & Lid: Provide (2) 24”x24”x8”HT. per pair of roof drains by Columbia Green. Alternatively, a single 24”x48”x8”HT. box & lid may be substituted for each pair of roof drains. Surround and cover drain box and lid with 2” diameter smooth river rock to meet the surface elevation of the adjacent edger and growing medium.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine each area to receive vegetated roof assembly for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Verify that roof insulation over roofing membrane is in place, secure, and flush along all seams.
   2. Verify that perimeter and other flashings are in place and secure along entire lengths where they will be covered by vegetated roof assembly.
   3. Verify protection course over membrane roofing is in place and conforming to roofing manufacturer instructions, as inspected and accepted by roofing manufacturer's technical representative.

B. Inspect growing medium.
   1. Verify that no foreign or deleterious material or liquid, such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in growing medium within a planting area.
   2. If growing medium is contaminated by foreign or deleterious material or liquid, remove growing medium and contamination and replace with new growing medium.

C. Install growing medium in trays. Growing medium shall fully fill all trays and shall be mounded above top of trays to the top of edger and at the interior of large areas, in order to provide a consistent surface elevation and eliminate the slopes resulting from the trays being placed on variable slopes of the roof beneath.

3.2 INSTALLATION, GENERAL

A. Protection Course: Cover roofing system with protection board if required by roofing manufacturer with butted and fully taped joints before roofing system is subject to vegetated roof assembly installation work.

B. Sweep with broom and then use air compressor to blow remaining dust and debris from substrate.

C. Install vegetated roof assembly according to manufacturer's written instructions. Install trays, locking all trays to adjacent trays with pins. Install edger and metal plate extension around entire perimeter of green roof limits, as well as around roof drains. Install roof drain boxes and lids and surround/cover with river rock. Install irrigation supply through trays extend and piping to valve box locations. Install filter fabric at all locations where growing medium could escape between trays/edger, cut trays, pipe penetrations, etc.

3.3 TRAY PLACEMENT

A. Install trays according to manufacturer's written instructions and details.

B. Place trays directly over protection cover provided under roofing work.

C. Position bottom troughs of trays perpendicular to direction of roof slope, except minor crickets.

D. Orient and overlap interlocking sides to hold trays in place.

3.4 TRAY EDGER & ACCESSORIES INSTALLATION

A. Install edger according to manufacturer's written instructions and details.

B. Install tray edger at vegetated roof perimeter to conceal tray sides and define limits of river rock around roof drains.

C. Place short end of edging under tray so that it is held in place by weight of tray.

D. Abut lengths of edging neatly. Allow 1/8 inch gap maximum between edging sections. Adjust and trim edging to align sections and achieve a tight fit.

E. Screw 8” ht. metal plate to top of edger in order to raise the top edge to a consistent height where the roof valleys occur. Edger and metal plates come in 8’ lengths and must be trimmed to fit the peaks and valleys of the roof. Stainless steel screws shall be used to secure the metal plate to the edger at each end and at 18” intervals in between.

F. Corners: Utilize manufacturer's prefabricated corners.

G. Install filter fabric at perimeter of tray system to the top of the edger in order to prevent loss of growing medium leaking between them. Install filter fabric at cut trays and secure it snuggly around pipe penetrations through trays to prevent loss of growing medium.

H. Install roof drain boxes and lids over pairs of roof drains. Surround and cover with river rock to height of adjacent edger and growing medium.

I. Install irrigation piping, wiring and valves in valve boxes. Install drip lines and all components of irrigation system.

J. Install pregrown sedum mats and plant plugs through the mats.

3.5 ADJUSTING

A. Make adjustments and alignments of trays and metal edger as necessary to give a uniform and finished appearance.

B. Replace plant material that appears to be stressed or damaged.

3.6 CLEANING

A. Leave installations clean, premises free from debris and residue resulting from work of this Section.

B. Remove stains from adjacent surfaces with manufacturer's recommended cleaning agents.

3.7 PROTECTION

A. Protect vegetated roof assemblies from damage, including growing-medium contamination, due to operations of other contractors and trades. Repair or replace damaged vegetated roof assemblies.

3.8 MAINTENANCE SERVICE

A. Maintenance Service: Provide maintenance by skilled employees of vegetated roof assembly Installer approved by roofing-membrane manufacture**r**. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than the specified maintenance period.
   1. Assembly and Plant Maintenance: During maintenance period, maintain plantings by pruning, cultivating, watering, weeding, fertilizing if necessary, mulching, restoring planting saucers, adjusting and repairing devices, resetting plants to proper elevations or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.
      a. Replace growing medium that becomes displaced or eroded because of settling or other processes.
      b. Apply treatments as required to keep plant materials, planted areas, and growing medium free of pests and pathogens or disease. Use integrated past management practices whenever possible to minimize the use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.
      c. Use only products and methods acceptable to roofing-membrane manufacturer.
      d. Following maintenance period, instruct Owner and furnish written maintenance instructions as necessary for planting materials to develop and maintain healthy root structure.
   2. Maintenance Period: 24 months from date of Planting Completion.

END OF SECTION 329500

SECTION 33 0101

SEWER AND DRAIN PIPE

PART 1 GENERAL

1.01 SUMMARY

A. All pipe and accessories supplied for use on this project shall be as specified herein.

B. All pipe supplied for this project shall be of the pipe material called for on the Drawings.

1.02 RELATED WORK

A. For bedding and backfill stone see Section 321123.

1.03 REFERENCES

A. Where referenced specifications (ASTM, AWWA, etc.), are mentioned, these standards are deemed to be the minimum standard of quality of materials or methods to apply to this project.

1.04 SUBMITTALS

A. Copies of the manufacturer's directions for handling and installing the particular pipe supplied and accepted by the ENGINEER shall be furnished to the ENGINEER at the first delivery of pipe to the project in numbers that will permit the ENGINEER to retain 3 copies.

B. The manufacturer's instructions shall be strictly followed unless a conflict exists between the manufacturer's instructions and those contained herein. In such cases, the ENGINEER shall determine which methods are to be followed and no pipe shall be installed until the CONTRACTOR has received written instruction from the ENGINEER as to which procedure to follow.

1.05 QUALITY ASSURANCE

A. Where pipe enters manholes, the pipe manufacturer shall certify that their pipe is compatible with the watertight, flexible seal to be used at manhole openings as specified in Section 330513 of these Specifications, and that their combined use will produce a flexible watertight installation.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. All pipe, fittings and jointing materials shall be of one manufacturer unless different types are shown on the Drawings or otherwise accepted by the ENGINEER.

2.02 MATERIALS-SEWER AND DRAIN PIPE

A. Sewer Transition Joints

1. Where sewer pipes of different materials are to be joined, i.e., VC pipe to DI pipe, VC pipe to PVC pipe, or some other combination, an adapter made for this purpose shall be used. The adapter shall be made of polyurethane or polyvinyl chloride with stainless steel clamps and shall be equal to Can-Tex C-T Adapter, Can-Tex Industries, Cannelton, Indiana; or Fernco Adapter by Fernco Joint Sealer Company, Ferndale, Michigan.

B. PVC (Polyvinyl-Chloride) Sewer Pipe

1. Pipe

a. PVC pipe 4-inch through 15-inch diameter supplied for use on this project shall be Type PSM Polyvinyl Chloride (PVC) Sewer Pipe as specified per ASTM D 3034. PVC pipe 18-inch through 27-inch diameter shall be as specified in ASTM F 679.

b. The pipe shall be made of PVC plastic having a cell classification of 12454 as defined in ASTM D 1784. Compounds having different cell classifications due to one or more properties being superior to those of the specified compound are acceptable. Clean rework material, generated from the pipe manufacturer's pipe or fittings production may be used by the same manufacturer provided the reworked products meets the requirements stated herein.

c. The pipe shall be homogeneous throughout, free of cracks, holes, foreign inclusions or other injurious defects. The pipe shall be uniform in color, wall thickness, density and other physical properties. The maximum laying length for all PVC pipe supplied shall be 13.0± feet. Wall thickness shall be SDR-35 per ASTM D 3034 or ASTM F 679. Marking and identification of pipe shall be per ASTM D 3034 or ASTM F 679 as applicable.

d. The maximum laying length for all PVC pipe supplied shall be 13.0± feet.

e. PVC pipe for use on interior piping shall meet the general specification for exterior piping with the socket dimensions conforming to Table 4 of ASTM D 3034.

2. Fittings

a. PVC fittings supplied for use on this project shall meet all the physical and quality requirements as hereinbefore specified for PVC pipe.

b. Where 90° bends are used, they shall be the long radius type.

c. PVC fittings for 4-inch through 15-inch diameter pipe shall meet the dimensional requirements of the tables as shown in ASTM D 3034 except that saddle type wyes or tee branches shall not be allowed for use on new sewer mains. Where 90° bends are used, they shall be the long radius type. PVC fittings for 15-inch through 27-inch diameter pipe shall conform to the requirements of ASTM F 679.

3. Joints - Exterior Piping

a. Joints for PVC pipe and fittings for sewer mains and exterior plant gravity sewers shall be of the "Push-On Type" composed of an elastomeric ring gasket compressed in the annular space between a bell end or socket and spigot end of the pipe.

b. All surfaces of the bell, socket or spigot end of the pipe against which the ring gasket may bear shall be smooth, free of cracks or other imperfections that could adversely affect the sealing capacity of the joint.

c. Lubricant for use in assembling joints shall be supplied with the pipe or be of the specific manufacturer as recommended by the pipe manufacturer for use with the specific pipe supplied. The lubricant shall not cause deterioration of either the elastomeric ring gasket or pipe material.

d. Where PVC pipe and fittings are connected to piping of other materials, the manufacturer's standard adapters or transition pieces shall be used. Should manufacturer not produce an adapter for a specific pipe of other material, the adapters or transition fittings as specified in this section of these Specifications shall be used.

4. Joints - Interior Piping

a. Joints for PVC pipe and fittings for interior piping systems shall be the solvent weld type.

b. The solvent cement for use with PVC pipe and fittings shall be as specified in ASTM D 2564. The cement shall be provided with the pipe by the pipe manufacturer or be of a specific brand as recommended by the manufacturer of the pipe unless otherwise accepted by the ENGINEER.

C. Polyethylene (PE) Sewer Pipe

1. Pipe

a. Polyethylene pipe shall be manufactured from virgin polyethylene resins conforming to Type III, Class C, Category 5, Grade P34 polyethylene as defined in ASTM D 1248. Minimum cell classifications of the polyethylene material shall be 335433C as referenced in ASTM D 3350.

b. For determination of minimum wall thickness, the maximum allowable deflection is 5 percent, with the pipe installed in accordance with these Specifications. Calculations shall be based on backfill material of 130 pound per cubic foot, H-20 live load plus 50 percent impact and no internal pressure. The live load and impact may be disregarded for trenches with 8 feet or more cover. Hydrostatic loading shall be considered when the pipe is to be installed below permanent water table. The pipe manufacturer shall furnish calculations to verify the pipe wall thickness for these various conditions for the ENGINEER'S review before the materials are sent to the job site.

c. No cracks, holes, foreign materials, blisters or other deleterious faults are permitted in the polyethylene pipe. It shall be homogeneous throughout including the heat fused joint. Polyethylene pipe will not be installed containing gouges or cuts that penetrate more than 10 percent of the wall thickness.

d. Each length of polyethylene pipe shall be marked containing the manufacturer's name, pipe size and other data, as required by ASTM D 3350 to enable an accurate tracing of the raw material source.

2. Fittings

a. Polyethylene fittings for use on this project shall be fabricated from the same materials as specified herein for the pipe. Fittings shall meet the same quality standards as stated herein for the pipe and shall be from the same manufacturer as the pipe unless otherwise accepted by the ENGINEER.

b. Branch fittings for lateral pipes shall be made using wye or tee branches. Sidewall fused connections using pipe manufacturer's

recommended procedures are also acceptable. Saddle type branches for use on new polyethylene sewer lines will not be allowed.

3. Joints

a. Polyethylene pipe shall be joined by the heat fusion process. The pipe and joint (butt or sidewall fusion) shall be leakproof and all fusion must be performed by personnel trained by the pipe supplier or otherwise equally qualified person, as determined by the ENGINEER.

b. The fusion equipment shall have hydraulic controls and gauges for monitoring the fusion pressures and temperatures. The equipment shall have a motor powered facing unit to trim the irregularities of the pipe ends and an electrically or gas-fired heated and thermostatically controlled heater plate capable of producing fusion temperatures as recommended by the pipe manufacturer for the particular polyethylene extrusion used on the project.

c. Threaded or solvent weld joints and connections are not permitted. The manufacturer's standard adapters shall be used to connect polyethylene pipe to other types of non-pressure pipe.

d. Where joints must be made in the ditch, and conditions are such that use of the fusion machine is impossible, a stainless steel coupling may be used, if accepted by the ENGINEER.

e. Where pipe enters manholes, the pipe manufacturer shall certify that their pipe is compatible with the watertight, flexible seal to be used at manhole openings and that their combined use will produce a flexible watertight installation.

D. Ductile Iron Sewer Pipe

1. Pipe

a. This specification covers 4 to 64-inch ductile iron gravity sewer pipe designated "DI" on the Drawings. Pipe furnished under this Specification shall comply with all provisions of ANSI/ASTM A 746. Maximum design thickness shall be based on depth of cover, trench loadings and other conditions per ANSI/AWWA C150/ A21.50.

b. Metal Design Strength psi (Minimum)

Tensile Strength	60,000
Yield Strength	42,000
Percent Elongation	10

c. The net weight, class or nominal thickness, and casting period shall be shown on each pipe. The manufacturer's mark, the year in which the pipe was produced, and the letters "DI" or "DUCTILE" shall be cast or stamped on the pipe.

2. Fittings

a. Fittings for ductile iron sewer pipe shall be mechanical joint or rubber ring slip joint fittings.

b. Ductile iron mechanical and rubber ring slip fittings shall conform to ANSI/AWWA C110/A21.10 for gray iron and ductile iron fittings. Mechanical joints and rubber slip ring joints shall also conform in all respects to ANSI/AWWA C111/A21.11 and ANSI/AWWA C 153.

c. All fittings shall be manufactured for the size and pressure class of the pipeline in which they are to be used. All fittings shall be furnished complete with all joint accessories.

3. Joints

a. General

(1) Pipe joints shall be mechanical joint, rubber ring slip joint or restrained joint as shown on the Drawings.

(2) All items used for jointing pipe shall be furnished with the pipe. The joints shall be made with tools and lubricant in strict conformity with the manufacturer's instructions. Copies of the instructions shall be delivered to the ENGINEER at start of construction in sufficient numbers that will permit the ENGINEER to retain 3 copies.

b. Mechanical Joints

(1) Mechanical joints are to be furnished according to ANSI/ AWWA C111/A21.11-95. All pipe joints must be furnished complete with all accessories. Mechanical joint bolts and nuts shall be of alloy cast iron or alloy steel (Corten type such as U.S. Alloy) or equal. Rubber gaskets shall be made of plain first grade rubber, free of imperfections and porosity. Hardness shall be 70 to 75 durometer.

c. Rubber Ring Slip Joint (Push On)

(1) Rubber ring slip joint shall be equal to ANSI/AWWA C111/ A21.11-95. The joints shall be of the following materials and assembled in the sequence outlined below:

(a) Rubber ring gasket compressed in groove in bell of pipe.

(b) Beveled spigot end of pipe for initial centering into rubber gasket in bell.

d. Restrained Joints

(1) For Pipe

(a) Restrained joint for push-on type bell with rubber O-ring shall meet the applicable requirements of ANSI/AWWA C111/A21.11. The bell/spigot configuration for the restrained joint shall be such that restraint shall be provided for the joint based on a sustained pressure equal to the pressure class of the pipe without separation.

(b) The restrained joint shall allow the same deflection as standard push-on joint pipe.

(c) Where field welding is required for restrained field cut pipe, the welder shall be properly instructed in the methods and materials for use on ductile iron pipe by the manufacturer, on site.

(2) For Fittings

(a) Where restrained joint fittings are called for, the bell configuration for the fitting shall be the same as for the pipe.

(b) Where fittings with restrained joint bell configurations are not available, restraint materials for use with mechanical joint bell configurations shall be as follows:

(i) Connect mechanical joint bell assemblies with stainless steel, all thread rods.

(ii) Install restraint glands on each side of the fitting. The restraining glands shall be “Meg-A-Lug,” as manufactured by EBAA Iron sales, Inc. of Eastland, Texas; “Grip Ring,” as manufactured by Romac Industries, Inc. of Seattle, Washington; or equal.

4. Coating and Linings

a. All ductile iron pipe and fittings for gravity sewer service shall be bituminous coated outside in accordance with ANSI/AWWA C151/ A21.51 for pipe and ANSI/AWWA C110/A21.10 for fittings.

b. All ductile iron pipe and fittings for gravity sewer service shall be cement-mortar lined with seal coat in accordance with ANSI/AWWA C104/A21.4.

E. Underdrain Pipe

1. Pipe

a. Underdrain pipe and fittings shall be of the sizes, with and without perforations, as indicated on the Drawings.

b. Pipe shall be polyvinyl chloride (PVC) pipe, Type S, as follows:

(1) Smooth—Conform to ASTM D 1785 for Schedule 40, or ASTM D 2241 for SDR-17.

(2) Ribbed—Conform to ASTM F 794 for Series 46.

(3) Corrugated—Conform to ASTM F949.

c. Manufacturer shall certify to ASTM requirements.

2. Fittings and Couplings

a. Couplings for perforated pipe shall be the flexible plastic type and couplings for unperforated pipe shall be watertight, standard couplings with solid rubber rings. All fittings and couplings shall be as recommended by pipe manufacturer.

2.03 SOURCE QUALITY CONTROL

A. PVC Polyvinyl-Chloride Sewer Pipe

1. Pipe shall be tested and inspected at the factory and inspected at the job site. Testing shall be accomplished in conformance with the following ASTM specifications utilizing the test methods specified therein:

Dimensions	ASTM D 3034 or ASTM F 679 and D 2122
Extrusion Quality	ASTM D 2152
Pipe Stiffness (5%)	ASTM D 2412
Impact Resistance	ASTM D 2444

2. In addition, a typical joint assembly, both gasket type joint and solvent weld joint, shall be tested by a qualified independent laboratory per test requirements of ASTM D 3212. The manufacturer shall submit through the CONTRACTOR sufficient copies of certification and test results for each lot of material represented by shipment to the job site that will permit the ENGINEER to retain 3 copies.

B. Polyethylene (PE) Sewer Pipe

1. All polyethylene pipe and materials shall be tested by the manufacturer of the pipe using the following referenced ASTM methods and procedures:

Density	ASTM D 1505
Flow Rate	ASTM D 1238
Flexural Modules	ASTM D 790
Tensile Strength	ASTM D 638
Stress Crack Resistance	ASTM D 1693
Hydrostatic Design Basis	ASTM D 2837
Thermal Stability	ASTM D 3350
Carbon Black Content	ASTM D 1603

2. Results of tests on the raw materials and the polyethylene pipe shall be furnished along with catalogs and other descriptive literature, in sufficient copies for the ENGINEER'S review before the materials are sent to the job site that will permit the ENGINEER to retain 3 copies.

3. Polyethylene pipe and fittings may be rejected for failure to meet any of the requirements of this specification.

C. Ductile Iron Pipe (Mechanical Joint and Rubber Slip Joint Type)

1. Hydrostatic and physical acceptance tests shall be in accordance with ANSI/AWWA Specification C151/A21.51-81 for ductile iron pipe centrifugally cast in metal molds or sand lined molds for water or other liquids.

2. The ENGINEER shall be provided with sufficient copies of each of the tests for each Contract to permit the ENGINEER to retain 3 copies.

3. All items used for jointing pipe shall be tested before shipment.

PART 3 EXECUTION

3.01 TRENCH EXCAVATION-SEWER AND DRAIN PIPE

A. General

1. All excavation shall be open trenches, except where the Drawings call for tunneling, boring, or jacking under structures, railroads, sidewalks, roads or highways.

B. Trees and Shrubs

1. Trenching shall include all clearing and grubbing, including all weeds, briars, trees, and stumps encountered in the trenching, regardless of size. The CONTRACTOR shall dispose of any such material by burning, burial or hauling away or as noted on the Drawings, at no extra cost to the OWNER. Ornamental shrubs, hedges, and small trees (3 inches in diameter or less) shall be removed, protected, and replanted, at no extra cost to the OWNER.

2. Where pipelines run through wooded terrain, cutting of trees within limits of maximum permissible trench widths, as set forth in this article, will be permitted. However, cutting of additional trees on sides of trench to accommodate operating of trenching machine will not be permitted. The CONTRACTOR shall obtain specific permission of the OWNER before cutting any tree larger than 4 inches in diameter.

C. Highways, Streets and Railroads

1. Trenching also includes such items as railroad, street, road, sidewalk, pipe, small creek crossings, cutting, moving, or repairing damage to fences, poles or gates and other surface structures, regardless of whether shown on the Drawings.

2. The CONTRACTOR shall so coordinate his work as to produce a minimum of interference with normal traffic on highways and streets. He may, with the approval of the governing agency, close a street to traffic for such length of time considered necessary, provided persons occupying property abutting the street have an alternate route of access to the property which is suitable for their needs during the time of closure. It shall be the responsibility of the CONTRACTOR to give 24 hours advance notice to fire and police departments and to occupants of a street which will be closed, in a manner approved by the governing body.

3. Where located within city streets and/or roads, the opening of more than 200 feet of trench ahead of pipe laying and more than 100 feet of open ditch left behind pipe laying, before backfilling, will not be permitted, except upon written consent of the OWNER. Where located outside roadway or parking areas, longer distances for opening and closure may

be allowed provided the longer distance does not affect the safety of the general public. No trench shall be left open or work stopped on same for a considerable length of time. In case of objectionable delay trench shall be refilled according to backfill specifications.

4. Construction equipment will not be approved for use where treads are injurious to paving encountered. Curbs, sidewalks, and other structures shall be protected by the CONTRACTOR from damage by his construction equipment.

5. In case of damage to any existing structures, repair and restoration shall be made at once and backfill shall not be replaced until this is done. In all cases, restoration and repair shall be such that the damaged structure will be in as good condition and serve its purpose as completely as before, and such restoration and repair shall be done without extra charge, except as set forth under the applicable provisions of the General Conditions.

6. Where trenching is cut through paving which does not crumble on the edges, trench edge shall be cut to at least 2 inches deep to straight and neat edges, before excavation is started, and care taken to preserve the edge to facilitate neat repaving.

7. The CONTRACTOR shall maintain road crossings in a passable condition for traffic until the final acceptance of the work, being paid only by unit price for crushed rock used, within limitations as hereinafter specified.

8. Railroad company and Department of Highways requirements in regard to trenching, tunneling, boring and jacking shall take precedence over the foregoing general specifications and the following tunneling and boring or jacking specifications, where they are involved. Where work is within railroad right-of-way, Railroad Protective Insurance shall be carried by the CONTRACTOR in the amounts required by the Railroad Company.

9. The insurance policy shall name the railroad as the insured and the original policy shall be delivered to the railroad after submitting same to the OWNER for review. The cost of flagmen required by the railroad and/or highway departments shall be paid by the CONTRACTOR.

D. Existing Utilities

1. The CONTRACTOR shall determine, as far as possible in advance, the location of all existing sewer, culvert, drain, water, electric, telephone conduits, gas pipes, and other subsurface structures and avoid disturbing same in opening his trenches. In case of sewer, water and gas services and other facilities easily damaged by machine trenching, same shall be uncovered without damage ahead of trenching machine and left intact or removed without permanent damage ahead of trenching and restored immediately after machine has passed, without extra cost to the OWNER.

The CONTRACTOR shall protect such existing facilities, including power and telephone poles and guy wires, against danger or damage while pipeline is being constructed and backfilled, or from damage due to settlement of his backfill. It shall be the responsibility of the CONTRACTOR to inform the customers of utilities of disruption of any utility service as soon as it is known that it has been or will be cut off.

2. Where there is the possibility of damage to existing utility lines by trenching machine, the CONTRACTOR shall make hand search excavation ahead of machine trenching, to uncover same, at no extra cost to the OWNER. Hand trenching is required, at no extra payment, where undue damage would be caused to existing structures and utilities by machine trenching.

E. Pipelines in Same Trench

1. Pipelines, force mains, and sewers laid in same trench shall, in all cases, be bedded on original earth, crushed stone, or other specified bedding materials, regardless of divergence in their elevations, unless otherwise specified. They shall never be laid in unsupporting backfill or one above the other. The CONTRACTOR shall receive applicable unit prices for each pipeline, force main, and sewer so laid, the same as if laid in widely separated trenches.

F. Location of Proposed Pipelines

1. The location of pipelines and their appurtenances, as shown on the Drawings, are those intended for the final construction. However, conditions may present themselves before construction on any line is started that would indicate desirable changes in location. Also, development of property traversed may require location changes. In such cases, the OWNER reserves the right to make reasonable changes in line and structure locations without extra cost, except as may be determined by the application of the unit prices bid to the quantities actually involved. The OWNER is under no obligation to locate pipelines so they can be excavated by machine.

G. Construction Stake-out

1. The ENGINEER will provide geometric base data for the CONTRACTOR'S use in locating sewers and facilities in the design location. The locations for vertical control (benchmarks) are shown on the Drawings with elevation and description duly noted. Each manhole, pumping station wetwell, or other notable sewage system component shall have the coordinates shown at the individual location or listed with the General Notes of the Drawings. It shall be the CONTRACTOR'S responsibility to locate the new facilities in their intended position using survey grade GPS survey equipment. It should also be the CONTRACTOR'S responsibility to

provide offset hubs at each manhole or such reference points as may be required to maintain the location of each new installation.

2. Where the CONTRACTOR elects to use grades (batter) boards for sewer construction, offset line and grade stakes shall be set and cut sheets prepared before trenching work is started. All stake-out work and cut sheet preparation shall be accomplished by the CONTRACTOR, the ENGINEER being responsible for review and checking the finished cut sheets. The CONTRACTOR shall provide all material, equipment, and labor for all stake-out work. Cut sheets, where required, shall be prepared on forms acceptable to the ENGINEER.

3. The cut sheets shall contain the following minimum information:

    a. Manhole stations

    b. Grade between manholes

    c. Centerline and offset stations

    d. Amount and direction of offset

    e. Centerline elevation

    f. Centerline cut

    g. Offset elevation

    h. Offset cut

    i. Average trench depth

    j. Utilities information and depths and/or any other pertinent information.

4. Where the CONTRACTOR elects to use grade (batter) boards for sewer construction, offset hubs shall be set perpendicular to each 25 foot centerline station. Where laser beam equipment is to be used, the offset line shall be as required for the specific type of laser equipment used. In either case, the CONTRACTOR shall be required to maintain at least the offsets at manholes until the sewer main has been constructed. The CONTRACTOR shall also, in either case, be required to obtain the original ground elevation along centerline, at each 25 foot station, for the purpose of calculation of the average trench depth.

5. Grades shown on the Drawings or as revised in the field are invert of pipe and NOT trench subgrade. The centerline cuts on the cut sheets shall have this calculation made, original ground surface to invert of sewer

pipe, which is the depth which shall be used for calculation of the average depth of trench and backfill.

H. Trench Requirements

1. All trenches must be dug neatly to lines and grades as shown on the Drawings, as established in the field and/or as established on the cut sheets. Trenches shall be of sufficient width to properly assemble or bolt joints.

2. Trenching shall be completed between one grade control point and the next in advance of the laying of pipe, where pipes, culverts, or other structures may be encountered whose grade cannot reasonably be determined ahead of trenching. Should the CONTRACTOR lay pipe closer to the opening of trench ahead, he shall bear cost of any removal and relaying which may be required to avoid location conflict.

3. The extra cost of trenching in difficult locations, such as stream, railroad, or highway crossing, if not covered by other Contract unit prices, shall be included in the unit price for furnishing, laying, trenching, and backfilling.

4. Where grade (batter) boards are used to establish finish grade, they shall be set by the CONTRACTOR, with at least 3 boards set at all times where installation is in progress. These will be set each 25 feet or less and will be set perpendicular to and spanning the centerline of the trench, such that the grade string is in the vertical plane of the pipe flow line. Grade boards shall be supported by stakes driven firmly on each side of the trench, unless otherwise acceptable to the ENGINEER. Where laser beam equipment is used, the setup shall be per the laser manufacturer's instructions and/or the permission of the ENGINEER.

5. Grades shown on the Drawings and/or profiles, cut sheets and offset stakes are the elevations of the invert of the pipe in all cases and excavation in open trench or tunnel must be made of sufficient depth to take care of required bedding of pipe and bells below these lines.

6. No additional compensation will be allowed for the extra depth trenching so required below invert.

7. Where bottoms of trench for 6-inch through 16-inch size pipe are in or on solid rock or where concrete cradle or arch is to be used, trenches or tunnels shall be dug to a depth of at least 6 inches below bottom of barrel of pipe. Where in earth, they shall be dug to at least 4 inches below bottoms of pipe barrels and bells.

8. In pipe sizes 18-inch through 72-inch, the trench shall be dug to a depth of 1/4 of the outside diameter of the pipe below the bottom of the pipe barrel in earth or solid rock subgrade, with a maximum of 9 inches, and a

minimum of 6 inches. This requirement shall also apply where concrete arch or cradle is used to protect the pipe.

9. When trench or tunnel is dug below required grade, the pipe must be brought to grade by filling with crushed rock for pipe bedding as specified in this Section 321123 of these Specifications, at the CONTRACTOR'S expense. Fill for pipe support shall not be made with material excavated from trench.

I. Excavation Unclassified

1. Excavation for pipelines shall be unclassified and the cost of all excavation of whatever nature and state, including solid rock, shall be included in the CONTRACTOR'S unit price bid for furnishing, trenching, laying and backfilling the pipe.

2. Excavation for structures such as manholes, pump stations, and vaults is likewise unclassified and the cost of all excavation of whatever nature and state, including solid rock, shall be included in the CONTRACTOR'S lump sum or unit price bid, as the case may be.

3. Solid rock is defined as materials of one-third cubic yard or more in one location (in a native state or concrete) that rings under the hammer which cannot be removed economically without the use of explosives. Paving removal is excluded; also shale rock.

4. In the event the ENGINEER finds it necessary to specifically order mechanical removal of solid rock, it will be measured by the cubic yard for such materials actually removed limited in depth to required depths of bedding below outside of pipe barrel and in width to the following dimensions:

TABLE 3.01

For 6" Pipe 2'-6"	For 15" Pipe 2'-10"	For 27" Pipe 4'-0"
For 8" Pipe 2'-9"	For 16" Pipe 2'-11"	For 30" Pipe 4'-4"
For 10" Pipe 2'-9"	For 18" Pipe 3'-2"	For 33" Pipe 4'-7"
For 12" Pipe 2'-9"	For 20" Pipe 3'-5"	For 36" Pipe 5'-6"
For 14" Pipe 2'-9"	For 21" Pipe 3'-6"	For 42" Pipe 6'-0"
	For 24" Pipe 3'-8"	For 48" Pipe 6'-6"
		For 54" Pipe 7'-0"

5. Mechanical removal of solid rock is defined as solid rock in its native state which is ordered to be fractured and broken up for removal by hand tools and/or hand held power or pneumatic tools to provide protection of utilities, structures, etc. which might otherwise be subject to damage by conventional drilling and shooting or heavy excavating equipment.

6. Payment for mechanical removal will not be authorized for solid rock excavation which is accomplished by drilling and shooting or by crawler or wheel mounted excavators, trenching machine, and similar equipment.

J. Dewatering of Trenches

1. Dewatering of trenches shall be considered a part of trenching, at no extra cost to the OWNER. Dewatering of trenches shall include ground-water and storm or sanitary sewage. Suitable pumping and other dewatering equipment is to be provided by the CONTRACTOR, to insure the installation of the pipeline structure in a dewatered trench and under the proper conditions. Dewatering shall include all practical means available for prevention of surface runoff into trenches and scouring against newly laid pipe.

2. Piles of excavated materials shall be trenched or temporarily piped to prevent, as far as practical, blockage of drainage ditches and gutters, and water carriage of excavated materials over street and highway surfaces.

3. Where subgrade of trench has insufficient stability to support the pipeline and hold it to its original grade, the ENGINEER may order stabilization by various means. Exclusive of dewatering normally required for construction and instability caused by neglect of the CONTRACTOR, it shall be paid for at unit prices set up in the Contract, such as extra excavation, crushed rock for pipe bedding, concrete cradle or piling.

3.02 LAYING SEWER PIPE

A. General

1. Checking of Pipe

a. The selection of pipe strength class shall be based on earth weight of 130 pounds per cubic foot and a safety factory of 1.50.

b. All pipe and fittings must be tested for uniform diameter, straightness, and defects by the CONTRACTOR before being lowered into trench, and rejected pipe marked in a way not to impair its value. Rejected pipe must be separated from accepted pipe and removed from the project. The ENGINEER will make periodic observations of pipe in storage and/or incorporated into the work. Pipe found defective, not meeting Specifications, or improperly installed shall be rejected and replaced.

2. Alignment and Grade

   a. All pipe, after being inspected and accepted, shall be laid to correspond with lines and grades staked out by the CONTRACTOR. All sewer lines shall be laid to constant grades between invert elevations shown on the Drawings. Grades shown on the Drawings are invert of pipe and NOT trench subgrade. The pipe lengths shall be fitted together and matched, so that they will form a sewer with a smooth and uniform invert, visible as a full circle from manhole to manhole, except in special cases where curved sewer lines are planned.

3. Unstable Subgrade

   a. In wet, yielding, and mucky locations where pipe is in danger of sinking below grade or floating out of grade or line, or where backfill materials are of such a fluid nature that such movements of pipe might take place during the placing of the backfill, the pipe must be weighted or secured permanently in place by such means as will prove effective. If crushed rock fill is necessary, it will be paid for per ton of such material used, except in cases where instability is caused by neglect of the CONTRACTOR.

4. Control of Quantities Laid

   a. Laying of pipe may be held up by the ENGINEER until trench has progressed far enough ahead to remove the possibility of having to change grade or alignment on account of other structures, pipelines, or conduits.

   b. Unless permitted or directed, not less than 100 feet of pipe shall be laid at one operation except for the following reasons:

      (1) Street and railroad crossings.

      (2) Wet caving trenches.

      (3) Business houses or institutions damaged by prolonged disconnection from street.

      (4) Less than 100 feet distance between manholes or pipe control sections.

5. Bedding of Pipe

   a. Six-inch through 16-inch pipe shall be laid with bottom quadrant of barrel and bells of pipe bedded in at least 4-inch depth of crushed stone when on earth subgrade and in at least 6-inch depth of crushed stone, below the bottom of the barrel of pipe when on

solid rock subgrade. Stone for bedding of 6 inch through 16-inch pipe shall be Kentucky Department of Highways Size 9 crushed rock as specified in Section 321123 of these Specifications, spaded into place. It shall be included in price for furnishing and laying pipe. Payment for the extra stone required for bedding pipe in solid rock for 6-inch through 16-inch pipe shall be included in the price bid for solid rock excavation in the case of classified excavation and in the price bid for trenching and backfilling in the case of unclassified excavation.

b. In case of pipe sizes 18-inch through 72-inch in both earth and solid rock trench, the subgrade shall be shaped to provide for a crushed stone pad, Kentucky Department of Highways Size 9, for a depth under the pipe barrel at least 1/4 the outside diameter of the pipe, with a minimum of 6-inch depth and a maximum of 9-inch depth. The bedding material shall be thoroughly spaded into place, in order to give a uniform bearing for at least the bottom quadrant of the pipe. Payment for such bedding shall be included in the price paid for trenching and backfilling or laying, even when in or on solid rock.

c. For PVC or polyethylene pipe, alternate bedding materials will be allowed with permission of the ENGINEER. In order to qualify for use with sewer pipes of these compositions, the bedding material must be of the type of material delineated as Class IA embedment materials per Table 1 of ASTM D 2321, namely, coral, slag, cinders, crushed stone or crushed shells. The alternate bedding materials must also be of the same gradation of the crushed stone previously specified, namely, Kentucky Department of Highways Size 9. The crushed stone previously specified shall be used for all other piping materials.

d. No filling of trench with earth to bring pipe to grade will be permitted. If trenches are dug too deep, they must be brought to grade and supported by crushed rock for pipe bedding (No. 9) as specified in Section 321123 of these Specifications at the CONTRACTOR'S expense. No pipe shall be laid in the trench until the subgrade is inspected and found correct.

6. Laying of Pipe (Mains)

a. Laying crew foreman shall direct subgrade preparation and plumbing and leveling invert of pipe to grade and line, the pipe layer following his directions in placing the pipe. The pipe layer will be responsible for pipe bedding, cleaning joint, proper placement of joint annular ring or gasket, tight jointing and homing pipe, securing pipe against settlement or other movement,

and inspecting and swabbing out any jointing material from inside of pipe.

b. No joints will be accepted that show leakage and, after backfilling and inspection, any joints are found that are allowing groundwater to enter the sewer must be excavated and repaired.

c. Plugs in branch fittings to future building sewers shall be protected from excavators by the method as shown on the Drawings for protecting the ends of laterals and shall be so constructed and joined in bell of pipe that they will be watertight, yet removable without breaking the bell or coupling when removed.

7. Laying of Branch Pipes and Laterals

a. Branch pipes shall be laid to serve the abutting property at points to be designated by the ENGINEER. Such pipes shall be connected to sewer main through tees or Y-branches of size of running sewer barrel and 6-inch side opening, with 6-inch 30 degree or 45 degree bends. Branch fittings in sewer and the connected bend, shall be supported from bottom of trench per standard details shown on Drawings.

b. At locations where the sewer is within street or road rights-of-way, house lateral pipes shall be laid to the property line or right-of-way line.

c. At locations where the sewer is within easement obtained by the OWNER, house lateral pipes shall be laid to the permanent easement line.

d. Branch tees or wyes for house laterals will be located during construction, regardless of where shown on the Drawings. House lateral location shall be at the convenience of the property owner or as directed by the OWNER and/or ENGINEER.

e. The end openings of house laterals shall be plugged with appropriate watertight plugs of permanent materials in the bell of the sewer lateral, removable without breakage of the pipe bell. Dead ends of sewers shall be plugged similarly.

f. Under normal conditions, where elevations are not critical, branch service sewers to customers shall be laid on not less than .01 foot per foot of length grade. Where elevations are critical, minimum grade shall be .005 foot per foot laid with batter boards or laser, same as specified for street sewers.

g. In the case of deep sewers, branch pipes may be brought up to a depth of approximately 5 feet below ground level with suitable bends and sewer pipe. These pipes shall be laid on a slant outside sewer trench, so they will be supported on original earth and not dragged down and cracked by backfill settlement.

h. In case of deep sewers in rock or narrow places, branch pipes shall be of cast iron soil pipe installed vertically per standard details of Drawings, with branch fittings in sewer main encased in Class 2,500 concrete. Payment for such concrete and forms above wye or tee branch shall be at the price bid per encasement.

i. All lateral sewers and branch pipes installed on this Contract shall have a detectable mylar tape placed in the backfill over and running with the lateral sewer. The tape shall be readily detectable employing the same type metal locators as used for the location of metal pipelines. The tape shall be green in color and have the words "CAUTION: BURIED SEWER LINE BELOW" printed on it. The tape shall be installed as shown on the standard details of the Drawings.

j. The tape shall be Type II, Detectable Mylar Marking Tape as manufactured by Line Guard, Inc. or equal. The cost of purchase and placement of the marking tape shall be included in the CONTRACTOR'S unit price bid for the lateral pipe and fittings.

8. Piping Connections at Structures

a. Lines

(1) Pipes shall be laid free from all structures other than manholes. Any pipe entering structures underground unsupported by original earth shall be supported by Class 3000 concrete, brick and mortar masonry, or Class 4000 concrete beams and columns as shown on detailed Drawings.

(2) Pipe shall be connected to manholes by fabricated manhole entry seals, specified in Section 330513 of these Specifications.

(3) Pipe stubbed out of manholes for future connections shall be plugged and tightly sealed with same jointing material used to plug laterals.

b. Plants

(1) Nonpressure pipes entering structures underground, unsupported by original earth for a distance of more than

3 feet shall be supported by Class 3000 concrete, where depth of such support does not exceed 3 feet. All pipes entering buildings or basins below original ground, which are more than 3 feet above structure subgrade and/or have a 3-foot span between wall and original earth, and have cover of more than 24 inches of earth or under roadway, shall be supported by concrete beams under them as shown on the Drawings with columns each 6 feet between structural wall and edge of excavation for the structure in order to prevent breakage from settlement of backfill about the structure. Concrete and reinforcing steel for such support are to be included in the lump sum portion of the Contract and not as extra concrete. Sewers entering structures shall have flexible joint within 16 inches of exterior of structure.

9. Protection of Pipe in Trench

   a. No walking upon the completed pipelines will be permitted until trench has been backfilled to a depth of at least 6 inches over the top of the pipe. The interior of the pipe shall, as the work progresses, be cleaned of all dirt, jointing materials, and superfluous materials of every description. When laying of pipe is stopped for any reason, the exposed end of such pipe shall be closed with a suitable plug fitted into the pipe bell, so as to exclude earth and other material, precautions being taken to prevent flotation of pipe by runoff into trench.

10. Observation of Pipeline

   a. No backfilling (except for securing pipe in place) over pipe will be allowed until the ENGINEER has had an opportunity to observe the joints, alignment and grade, in the section laid, but such observation shall not relieve the CONTRACTOR of further liability in case of defects occurring during or after placement of backfill.

B. Laying Sewer Pipe

1. PVC Pipe

   a. PVC sewer pipe laying shall comply with the requirements of ASTM D 2321 and the additional requirements of these Specifications and standard details of the Contract Drawings.

   b. Article 3.02.A of this Section 330101 shall apply to the installation of PVC sewer pipe. The pipe shall be bedded true to line and grade with uniform and continuous support from a firm base. The bedding material shall conform to that specified in Article 3.02.A of this Section 330101.

c. All PVC sewer pipe shall be installed in a manner to limit deflection of the pipe to 5 percent. A deflection test shall be performed on all flexible pipe. The test shall be conducted after the final backfill has been in place at least 30 days. No pipe shall exceed a deflection of 5 percent. If the deflection test is to be conducted using a rigid ball or mandrel, it shall have a diameter equal to 95 percent of the inside diameter of the pipe. The test shall be performed without mechanical pulling devices.

d. When laser equipment is being used for laying PVC sewer pipe, the CONTRACTOR shall provide adequate ventilation through the pipe to prevent distortion of the beams.

2. Polyethylene (PE) Sewer Pipe

a. PE sewer pipe laying shall comply with the requirements of these Specifications and standard details of the Contract Drawings.

b. Article 3.02.A of this Section 330101 shall apply to the installation of PE sewer pipe. The pipe shall be bedded true to line and grade with uniform and continuous support from a firm base. The bedding material shall conform to that specified in Article 3.02.A of this Section 330101.

c. All PE sewer pipe shall be installed in a manner to limit deflection of the pipe to 5 percent. A deflection test shall be performed on all flexible pipe. The test shall be conducted after the final backfill has been in place at least 30 days. No pipe shall exceed a deflection of 5 percent. If the deflection test is to be run using a rigid ball or mandrel, it shall have a diameter equal to 95 percent of the inside diameter of the pipe. The test shall be performed without mechanical pulling devices.

d. When laser equipment is being used for laying PE sewer pipe, the CONTRACTOR shall provide adequate ventilation through the pipe to prevent distortion of the beams.

e. One additional step in the installation of PE sewer pipe is required as the result of the fusion of the long lengths of pipe on the trench bank which produces a continuous pipeline without an open end where the invert elevation can be confirmed. Thus, it shall be necessary for the CONTRACTOR to carefully check the subgrade for the PE pipe, both for elevation and firmness at 5 foot intervals before installing the pipe in the trench.

f. Because of the high coefficient of expansion of polyethylene, this pipe shall not be sealed into manholes or walls of other structures until at least 48 hours have elapsed after backfilling the pipe to allow adequate time for the pipe temperature to stabilize.

3. Ductile Iron Sewer Pipe

a. Ductile iron sewers shall be laid in compliance with the requirements of these Specifications and standard details of Contract Drawings. Restrictions on depth of cover shall follow ANSI/AWWA C150/A21.50 requirements in Section 02610 for the various classes of ductile iron pipe. Joints shall be made with mechanical, restrained or rubber ring slip joint, according to the manufacturer's specifications and with tools recommended by them. A copy of the manufacturer's instructions shall be available at the site of work at all times when pipe is being laid. Joints shall be thoroughly cleaned and dry before pipes are laid in place.

b. Cutting of pipe may be done using methods as the CONTRACTOR may elect, but the CONTRACTOR will be held responsible for breakage or damage caused by careless cutting or handling.

c. No pipe shall be laid resting on rock, blocking or other unyielding objects, except where laid above ground on piers or in permanent tunnels. Exact lines and grades will be required on exposed pipelines placed on piers. Attachment of pipe to piers shall be as shown on the Standard Detail Drawings.

d. In permanent tunnels pipe shall be laid with bells resting on tunnel liner or on blocks just behind bells. After pipe has been adjusted to proper line and grade, a bedding of Class 3000 concrete shall be poured under pipe to support the entire bottom quadrant. Payment for such bedding shall be included in the unit price for tunnel liner.

3.03 TRENCH BACKFILL-SEWER AND DRAIN PIPE

A. General

1. Excavated materials from trenches and tunnels, in excess of quantity required for trench backfill, shall be disposed of by the CONTRACTOR. It shall be the responsibility of the CONTRACTOR to obtain location or permits for its disposal. Unit prices for furnishing and laying pipe, which includes trench excavation, tunneling, and backfill, shall include the cost of disposition of excess excavated materials, as set forth herein, with no additional compensation being allowed for hauling.

2. No extra charge shall be made for backfilling of any kind, except as herein specified. Backfilling shall be included as a part of the price for furnishing, laying, trenching, and backfilling. No extra charge shall be made for supplying outside materials for backfill except where fills above existing ground are necessary and payment is designated on the Drawings or in the Specifications. If backfilling of the trench or surface restoration is not properly completed, a proportionate part of the unit

price for furnishing, laying, trenching, and backfilling shall be retained from payment estimates.

3. Railroad company and Department of Highways requirements in regard to backfilling will take precedence over the above general Specifications where they are involved.

4. Mechanical tamping, where required by the ENGINEER in locations other than those specifically designated herein, shall be paid for per unit price bid for mechanical tamping.

5. Before completion of the Contract, all backfills shall be reshaped, holes filled, surplus materials hauled away, all permanent walks, street, driveways, highway paving replaced, and all sodding, seeding, and planting work performed.

B. Haunching

1. Upon completion of bedding and laying the sewer or drain pipe, the CONTRACTOR shall place crushed rock, Kentucky Department of Highways Size 9 dependent on size of pipe, or the same material used for pipe bedding on both sides simultaneously to the top of the pipe. This material shall be hand placed using shovel or other satisfactory tool to work the haunching material completely under the bottom quadrant and around the sides of the pipe to assure the maintenance of alignment of the pipe. No compaction of this material is required other than that obtained by the workmen walking on the material during placement.

2. The haunching material is required for all sewer or drain pipe installed in open trenches except where concrete pipe arch is required, in which case the haunching material is required to the bottom of the arch. Where concrete cradle is required, the haunching material shall be placed from top of cradle to top of pipe.

3. The cost of furnishing and placement of the haunching material shall be included in the CONTRACTOR'S bid for furnishing and laying the pipe.

C. Initial Backfill

1. Upon completion of the haunching material to the top of the pipe, initial backfill shall be placed as hereby specified. This material shall serve as protection for the top of pipe reducing the possibility of damage to the pipe during the placement of backfill for the remainder of the trench depth.

2. When sewer or drain pipe is located outside traffic areas, the initial backfill material shall be crushed rock (Kentucky Department of Highways No. 9) placed above the pipe to the level hereinafter stated.

3. When the sewer or drain pipe is located within traffic areas, the initial backfill shall be crushed rock, or the material used for bedding and haunching the pipe, of the same gradation of the pipe bedding material. Other alternate materials may be used only with the specific written permission of the ENGINEER when the work is located inside traffic areas.

4. In the case of steel, cast iron, ductile iron pipe the initial backfill shall be hand placed to a point 6 inches above the barrel of the pipe. In case of plastic pipe, the initial backfill shall be hand placed and evenly spread to a point 12 inches above the pipe barrel for up to 4 feet cover, to a point 18 inches above the barrel for 4 feet to 10 feet cover, and 24 inches for over 10 feet cover.

5. The initial backfill material is required over sewer and drain pipe in all open trenches. The cost of the initial backfill material and placement of same shall be included in the CONTRACTOR'S bid for furnishing, laying, trenching, and backfilling.

D. Final Backfill

1. Outside Traffic Areas

a. After the above specified initial backfill is hand placed, rock may be used in machine placed backfill in pieces no larger than 8 inches in any dimension and to an extent not greater than one-half the volume of the backfill materials required to backfill trench. Larger rock fill will be allowed in wide trenches where side slopes are low enough to prevent rock from dropping over pipe-line. If additional earth is required, it must be obtained and placed by the CONTRACTOR. Filling with rock and earth shall proceed simultaneously, in order that all voids or pockets, created by rock backfill, may be filled with earth. Machine backfilling may be employed with tamping, except as hereinafter restricted, provided caution is used in quantity per dump and in uniformity of level of backfilling. Backfill material must be uniformly ridged over trench, and excess hauled away, with no excavated rock over 1/2-inch diameter or pockets of crushed rock or gravel in top 12 inches of backfill, the top 12 inches reserved for topsoil or material more suited to sustain surface growth. Ridged backfill shall be confined to the width of the trench and not allowed to overlap onto firm original earth, and its height shall not be in excess of that required to provide for settlement of backfill.

2. Inside Traffic Areas

a. Where sewer and drain pipe is located in street, highway, railroad, sidewalk and driveway crossings or within any roadway paving, or about manholes, valve and meter boxes located in such paving, fill

trench to within 6 inches of the surface with Kentucky Department of Highways No. 9 crushed stone, or other gradation acceptable to the ENGINEER. In order to accommodate compacted temporary surfacing it may be necessary to bulkhead or otherwise confine the stone fill at the open end of the trench.

E. Cleanup and Temporary Surfacing

1. General

a. Immediately following the placement of final backfill, all rock and debris, including crushed rock or gravel from construction operations, shall be removed from yards and fields. Streets, drives and walks shall be broomed to remove all earth and loose rock. The cleaning of streets, drives, and walks shall be of such extent to hold dust to a minimum. Loose earth and rock shall in no case be swept or washed into storm sewers or drains as a method of removal, all such material being loaded and hauled away from the site.

b. If acceptable cleanup operations are not completed within an acceptable period of time after the completion of final backfilling, a proportionate part of the price bid for trenching and backfilling shall be retained from partial payment estimates until acceptable cleanup is completed.

2. Temporary Surface Cover - Unpaved Areas

a. Upon completion of acceptable cleanup work, the ground surface shall be prepared for temporary seed, permanent seed or sod per the requirements of Section 329200 of these Specifications.

3. Temporary Surface Replacement - Paved Areas

a. Temporary surfacing of street, highway, railroad, sidewalk and driveway crossings, or within any roadway paving, or about manholes, valve and meter boxes located in such paving, shall consist of 6 inches compacted dense graded aggregate as specified under Section 321123 for temporary walkway or road surfacing, placed and compacted in the trench. Compaction shall be accomplished by methods which shall be sufficient to confine stone to the trench under normal traffic. Backfills shall be maintained easily passable to traffic at original paving level until acceptance of project or replacement of paving or sidewalks. The amount of crushed stone placed shall be paid for at the unit price per ton as shown in Section 330101 herein, titled "BASIS OF PAYMENT." No payment will be made for crushed rock surfacing required as a result of unnecessarily wide trenches, omission of

sheeting and shoring, or damage by the CONTRACTOR'S equipment, or for maintenance of surface level.

b. After the initial placement of the 6-inch depth of temporary surfacing, the CONTRACTOR shall be required to maintain the temporary surfacing to street or road surface level at no additional cost to the OWNER. This requirement shall continue until the replacement of permanent surfacing.

3.04 FIELD QUALITY CONTROL-TESTING SEWERS FOR LEAKS, INFILTRATION, AND DEFLECTION

A. Sewers

1. General

a. All sewers constructed under this Contract shall be tested for leaks and infiltration using methods as hereinafter specified.

b. The cost of all testing of sewer lines and manholes shall be included in the unit price bid for pipe and manholes. The CONTRACTOR shall furnish all materials, equipment and labor required for all types of tests, the ENGINEER being responsible only for directions, recording data and calculating air losses and/or infiltration rates.

2. Sequence

a. Initial Testing

(1) The first manhole to manhole section of sewer laid under this Contract, for each size of pipe and type of joint, shall be given a smoke test prior to the sewer being backfilled and while the sewer trench is dewatered to bottom of the pipe being tested.

(2) Should, based on the results of the test of the first section of pipe laid, the materials being used and the CONTRACTOR'S installation procedures prove to be satisfactory, subsequent smoke testing may, at the discretion of the ENGINEER, be waived. Should, however, based on the results of the test of the first section of pipe laid, the material being used and/or the CONTRACTOR'S installation procedures prove to be unsatisfactory, subsequent smoke testing shall, at the discretion of the ENGINEER, be continued until such time that, in the opinion of the ENGINEER, problems with materials and/or installation procedures have been corrected.

(3) Such subsequent testing shall likewise be done while trenches are dewatered to bottom of pipe to be tested and immediately after completion of either the public sewer lines or laterals, in not more than 2 sections between manholes at a time. All defective work, as so proven by the smoke test, shall be immediately repaired and retested until proven to be satisfactory.

(4) Observation of pipe laying and smoke testing shall in no way relieve the CONTRACTOR of the responsibility of conducting the required low pressure air test, infiltration tests, or correcting poor workmanship.

b. Subsequent Testing

(1) As soon as it is practicable after installing and backfilling sewers, and before putting new sewers into service, low pressure air tests shall be made from manhole to manhole, or up to a maximum of 500 feet of sewer main and 500 feet of sewer laterals at a time, as directed by the ENGINEER. The maximum allowance for air loss during testing shall be determined by tables of minimum holding time for a pressure drop of 1.0 psi and are based on an average loss of 0.0015 cubic feet of air per minute per square foot of internal pipe surface, when tested at an average pressure of 3.0 psi greater than the average back pressure of any groundwater present.

(2) Upon completion of installation and backfilling of all sewers constructed under this Contract, the low pressure air test is required for all sewers so constructed.

c. Additional Testing

(1) Upon completion of the required initial (smoke) testing and required subsequent (low pressure air) testing, and prior to placing the sewer into operation, if ground and/or surface water flow is observed in the completed sewer, the ENGINEER may order infiltration tests be accomplished to determine whether the flow is within acceptable and allowable limits. This additional testing may be required even though the results of the initial smoke testing and subsequent low pressure air testing indicate the sewers are substantially watertight. The infiltration tests shall be conducted, on order of the ENGINEER, as hereinafter specified.

3. Equipment

a. Smoke Testing

(1) The smoke testing blower shall have a capacity of at least 1,200 cfm.

(2) The smoke bombs shall produce a chemical reaction generated, white to gray smoke, leaving no residue, and be nontoxic and nonexplosive. Each bomb shall be capable of producing 25,000 cubic feet of smoke per 3 minutes.

b. Low Pressure Air Testing

(1) The air test equipment used shall meet the following minimum requirements:

(a) Pneumatic plugs shall have a sealing length equal to or greater than the diameter of the pipe to be inspected.

(b) Pneumatic plugs shall resist internal test pressures without requiring internal bracing or blocking.

(c) All air used shall pass through a single control panel.

(d) Three individual hoses shall be used for the following connections:

(i) From control panel to pneumatic plugs for inflation.

(ii) From control panel to sealed line for introducing the low pressure air.

(iii) From sealed line to control panel for continually monitoring the air pressure rise in the sealed line.

4. Procedures

a. Safety Precautions

(1) The air test may be dangerous if a line is improperly prepared. It is extremely important that the various plugs be installed and braced in such a way as to prevent blowouts. Inasmuch as a force of 25 lbs is exerted on an 8-inch plug by expulsion of a poorly installed plug or of a plug that is partially deflated before the pipe pressure is released can be dangerous.

(2) As a safety precaution, pressurizing equipment shall include a regulator set at 10 psi to avoid overpressurizing and damaging an otherwise acceptable line. No one shall be allowed in the manholes during testing.

b. Low Pressure Air Test

(1) All pneumatic plugs shall be seal tested before being used in the actual test installation. One length of pipe shall be laid on the ground and sealed at both ends with the pneumatic plugs to be checked. Air shall be introduced into the plugs to 25 psig. The sealed pipe shall be pressurized to 5 psig. The plugs shall hold against this pressure without bracing and without movement of the plugs out of the pipe.

(2) Clean pipe to be tested by propelling snug fitting inflated rubber ball through the pipe with water.

(3) Plug all pipe outlets with suitable test plugs. Brace each plug securely.

(4) If the pipe to be tested is submerged in groundwater, insert a pipe probe by boring or jetting into the backfill material adjacent to the center of the pipe, and determine the pressure in the probe when the air passes slowly through it. This is the backpressure due to groundwater submergence over the end of the probe. All gauge pressures in the test shall be increased by this amount.

(5) Add air slowly to the portion of the pipe installation under test until the internal air pressure is raised to 4.0 psig.

(6) After an internal pressure of 4.0 psig is obtained, allow at least 2 minutes for air temperature to stabilize, adding only the amount of air required to maintain pressure.

(7) When pressure decreases to 3.5 psig, start stopwatch. Determine the time required for the internal air pressure to reach 2.5 psig. Minimum permissible pressure holding times for runs of single pipe diameter and for systems of 4-inch, 6-inch, or 8-inch laterals in combination with trunklines are indicated in the following table based on air loss calculations per ASTM F-1417.

Pipe Diameter, in.	Minimum Time, min:s	Length for Minimum Time, ft	Time for Longer Length, s	Specification Time for Length (L) shown, min:s							
				100 ft	150 ft	200 ft	250 ft	300 ft	350 ft	400 ft	450 ft
4	3:46	597	0.380 L	3:46	3:46	3:46	3:46	3:46	3:46	3:46	3:46
6	5:40	398	0.854 L	5:40	5:40	5:40	5:40	5:40	5:40	5:42	7:24
8	7:34	298	1.520 L	7:34	7:34	7:34	7:34	7:36	8:42	10:08	11:24
10	9:26	239	2.374 L	9:26	9:26	9:26	9:53	11:52	13:51	15:49	17:48
12	11:20	199	3.418 L	11:20	11:20	11:24	14:15	17:05	19:56	22:47	25:36
15	14:10	159	5.342 L	14:10	14:10	17:48	22:15	26:42	31:09	35:36	40:04
18	17:00	133	7.692 L	17:00	19:13	35:38	32:03	38:27	44:52	51:16	57:41
21	19:50	114	10.470 L	19:50	26:10	34:54	43:37	52:21	61:00	69:48	78:31

36	34:00	66	30.768 L	51:17	76:55	102:34	128:12	153:50	179:29	205:07	230:46

c. Infiltration Test

(1) Before putting new sewer lines into service, weir test shall be made of flow of water in the sewers from manhole to manhole or up to a maximum of 3,000-foot sections at a time, as directed by the ENGINEER. These tests shall be made when, in the ENGINEER'S judgment, groundwater level is equal to the highest groundwater condition in a normal year.

(2) The maximum allowance for all sewer pipe materials shall be 100 gallons per 24 hours per inch diameter per mile of sewer pipe and manholes.

d. Deflection Test

(1) A deflection test shall be performed on all flexible sewer pipe. The test shall be conducted after the final backfill has been in place at least 30 days. No pipe shall exceed a deflection of 5 percent. If the deflection test is to be run using a rigid ball or mandrel, it shall have a diameter equal to 95 percent of the inside diameter of the pipe. The test shall be performed without mechanical pulling devices. Pipe deflection shall be measured and recorded by the CONTRACTOR in the presence of the ENGINEER using appropriate methods approved by the pipe manufacturer and acceptable to the ENGINEER.

5. Repairs and Acceptance

a. If the sewer fails to meet the requirements of the leakage and/or infiltration tests, the CONTRACTOR shall, at his own expense, determine the source of leakage and/or infiltration and make the necessary repairs or replacements.

b. If any sewer fails to meet the requirements of the deflection test, the CONTRACTOR shall, at his own expense, replace all failed pipe as necessary to comply with the deflection requirements. All replacement pipe shall also be tested for deflection.

c. On completion of sewer lines, all sewers and manholes will be inspected for foreign matter, including sand brought in by infiltration, and any such matter shall be removed before final acceptance of the lines. Any visible leakage at manholes or into lines shall be corrected regardless of the results of the required tests.

END OF SECTION

***

SECTION 33 0513

PRECAST CONCRETE SPECIALTIES

PART 1 GENERAL

1.01 SUMMARY

A. All items supplied for use on this project shall be as specified herein.

1.02 RELATED WORK

A. Concrete specifications are included in Section 033010.

B. Castings are specified in Section 055600.

C. Connecting piping is specified in Section 330101.

1.03 REFERENCES

A. Where referenced specifications (ASTM, ACI, PCI, etc.), are mentioned, these standards are deemed to be the minimum standard of quality of materials or methods to apply to this project.

1.04 SUBMITTALS

A. Shop drawings shall be submitted in accordance with Division 01.

1.05 QUALITY ASSURANCE

A. The precast fabricator shall be qualified in accordance with PCI MNL-116, Manual for Quality Control, for plants and production of precast concrete products.

1.06 DELIVERY, STORAGE AND HANDLING

A. Handle precast members in position consistent with their shape and design. Lift and support members only at such designated points.

B. .Provide temporary lateral support during storage as necessary to prevent bowing and warping. Temporary lateral devices shall be clean, non-staining and shall not inhibit uniform curing of exposed surfaces.

C. Protect edges of members from chipping or spalling.

D. Mark units with date of production and final position in structure.

PART 2 PRODUCTS

2.01 MATERIALS

A. Concrete materials including cement, water, sand and coarse aggregate shall conform to ACI 301.

B. Reinforcing steel and prestressing wire and strand shall conform to ACI 301.

C. Initial Drawings shall be sent through the general CONTRACTOR to the ENGINEER in 3 copies for checking and return to the general CONTRACTOR in 2 copies.

D. Final Drawings shall be sent to the ENGINEER through the general CONTRACTOR in 5 copies for conformance and return in 3 copies.

2.02 PRECAST MANHOLES AND ACCESSORIES

A. Precast Reinforced Concrete Manhole Walls and Slabs

1. Precast reinforced concrete manhole walls and cone tops shall be of tongue-and-groove type conforming to ASTM C 478. Cone tops may be of concentric or eccentric configuration. Top slabs for manholes shall conform to details on the Drawings and to ASTM Designation C 478. All precast slabs shall be clearly marked "TRAFFIC" or "NONTRAFFIC" and "TOP" or "BOTTOM." Prior to use of precast reinforced concrete wall sections and top and bottom slabs, shop drawings covering details of construction including accessories shall be submitted to the ENGINEER for review.

2. Precast manholes with "knock-out panels**" for pipe entry are not acceptable**.

B. Manhole Adjustment Rings

1. Manhole frame adjustment rings shall be precast concrete rings for use between the top slab or top of cone and the manhole frame. Maximum allowable adjustment shall be 6 inches.

C. Mortar Materials

1. Portland Cement

a. Any standard brand, conforming to ASTM Specification C 150, Type 1, same as specified for concrete.

2. Sand

   a. First quality, clean, natural Kentucky River or Ohio River sand. When dry, 100 percent shall pass a No. 8 sieve and not more than 35 percent shall pass a No. 50 sieve, and conforming to ASTM Standard Specification C 144.

D. Preformed Elastic Rope Joint Fillers

1. Gasket-type sealant to fill tongue-and-groove joints at top of precast manhole bases and between barrel sections shall be preformed, flexible, watertight, designed for specific joint requirements and meet Federal Specification SS-S-00210 and AASHTO M-198. Sealant shall be Con-Seal manufactured by Concrete Sealants, Inc., New Carlisle, Ohio or Ram-Nek manufactured by K.T. Snyder Co., Inc., Houston, Texas, or equal. Primers, if required by manufacturer, shall be supplied by the sealant manufacturer.

E. Pipe Entry Seal

1. Pipes entering manholes shall be attached by a rubberized entry seal. The seal shall encircle the pipe snugly for the prevention of groundwater leakage into or sewage leakage out of the manhole. The seal shall be of the boot type with stainless steel clamps. The manufacturer of the seal shall certify that the seal material is compatible with the pipe material used on the project.

2. Boot seal shall be flexible of premolded EPDM (ASTM C 923) with stainless steel expanding snap-ring inserted into cored hole of manhole barrel and exterior stainless steel ring to clamp boot around pipe, Kor-N-Seal as manufactured by Trelleborg Engineered Systems, Milford, New Hampshire, or equal.

3. Where manhole is located in soils subject to petroleum or carbon materials, the pipe entry seal shall be of “nitrile” rubber material.

F. Steps

1. Manhole steps shall be cast into the manhole wall at intervals of not more than 15 inches where depths of manholes are greater than 4 feet unless otherwise shown on the Drawings.

G. Waterproofing Admixture

1. A waterproofing admixture such as Xypex Admix C-1000, Kryton KIM HS, or equal, shall be added to the concrete for manholes and wetwells during batching operations to provide waterproofing and improved chemical resistance. The Xypex Admix C-1000 or equal shall be added at 3.5 percent including dye to the required weight of Portland cement or as recommended by the admixture manufacturer. The amount of cement

shall remain the same and shall not be reduced on account of the addition of the waterproofing admixture. The colorant shall be added at the waterproofing manufacturing plant.

PART 3 EXECUTION

3.01 PRECAST MANHOLE CONSTRUCTION

A. General

1. Manhole construction will not be permitted under conditions where there is danger of freezing or when materials are frozen. Manholes shall be protected from freezing weather for a period of at least 48 hours after construction.

B. Excavation

1. Excavation for manholes, control chambers and interceptor structures shall be made of sufficient width to adequately accommodate all work and proper centering. Depth of excavation shall extend sufficiently to accommodate the type of manhole provided. Where a poured concrete base is used, the excavation must be of sufficient depth to allow for a minimum of 3 inches between the bottom of the lower pipe opening and bottom of manhole barrel and an 8 inch thickness for the poured concrete base. Where a precast concrete base is used, whether as a separate unit or integral with the bottom barrel section, the excavation shall be such to allow for a 12 inch depth crushed stone sub-base when in earth or a 9 inch depth crushed stone sub-base when in rock, below the bottom of the precast concrete base.

2. The cost for excavation of these structures is to be included in the linear foot price bid for trenching, backfill and structure unit price. Where the manhole subgrade is located in unstable material, the ENGINEER may order various methods of stabilization such as extra depths of crushed stone, concrete or other means as will prove effective. The CONTRACTOR will be paid for the extra work involved to stabilize the subgrade based on unit prices set up in the Contract unless instability is caused by the CONTRACTOR'S negligence. The limits for extra payment shall be from the elevation the CONTRACTOR would have had to complete based on the type of manhole base provided.

C. Manhole Installation

1. Manhole Base

a. Poured floor slabs of manholes shall be of Class 3500 concrete according to Section 03 3010, and shall be placed ahead of sewer laying to avoid displacement of sewer ends while placing concrete. The part of the concrete slab under the manhole walls shall have a smooth trowel finish. Top of slab shall be 3 inches (or as shown on

manhole details) below the lowest sewer invert grade. In sandy soils, a 6 mil polyethylene film shall be used under manhole slabs to prevent loss of moisture in concrete during placement.

b. Precast concrete base slabs will **be allowed based upon the ENGINEER'S** acceptance of the particular base slab provided. The general requirements for poured slabs shall also apply to precast slabs. Precast base slabs shall be placed on a crushed stone subgrade which has been leveled and compacted to the proper elevation. Crushed stone shall be DGA or Kentucky Department of Highways size 57 and shall be 12 inches in depth when on earth and 9 inches in depth when on solid rock.

c. Precast concrete manhole bottoms with accurately formed channels will be allowed as alternate to standard design, provided smooth surfaces and accurate levels, widths and slopes are obtained. The forms shall be constructed according to the angles and invert elevations obtained from the "stakeout" operation, and variation of forms more than ±2°00' horizontally shall be cause for rejection. Changes in angles or elevations of manhole inverts, caused by relocation of a manhole after the original stakeout, shall be the responsibility of the CONTRACTOR if such relocation is necessitated by conflict with water, gas, drain or other utility lines or obstructions. Placement shall be as detailed for precast slabs above.

2. Manhole Barrel

a. Manhole structure walls shall be constructed of precast concrete as shown on standard detail Drawings and as specified in this Section 330513. Barrels shall be accurately centered on the base slab as staked in the field.

b. When poured or precast concrete base slabs are used, the first barrel section shall be seated in and sealed with cement mortar. Intermediate barrel sections may be seated in and sealed with cement mortar or rope joint filler both as specified in this Section. Where rope joint filler is used, it shall be placed on the outside lip of the tongue and groove barrel section. Where a primer or adhesive is to be used with the rope joint filler, it shall be that specified by the joint filler manufacturer. Precast concrete frame adjustment rings and cast iron frame shall set in a full bed of cement mortar.

c. Precast barrel sections shall have steps cast in place or slots for steps left in place with steps to be located over the manhole outlet sewer pipe. Pipe openings shall be positioned to this arrangement. Likewise, eccentric corbel sections and precast top slabs with

offset entrance shall be positioned on center with the manhole steps over the outlet sewer pipe.

d. CONTRACTOR shall apply grout at all joints, to include joints between the manhole frame and the top of the manhole, in order to provide a smooth finished surface. Grout shall consist of 3 parts sand, 1 part Portland Cement, and sufficient water for hydration and placing.

3. Manhole Inverts

a. Channels through manholes shall be formed of either split tiles, prefabricated forms, or hand finished of the same size as the sewer pipes connected.

b. After the first barrel section has been set, the floor shall be brought up within 1 inch of the top of the sewer channels with crushed stone or broken brick ballast which shall be shaped to provide a slope of at least 3 inches from manhole sides to main sewer channels. One and one-half inches thickness of mortar proportioned by volume, 1 part Portland cement and 2 parts concrete sand in a damp, loose condition (80 pounds per cubic foot dry basis), shall be placed over the ballast. This shall be wood float finished to provide a smooth and well drained floor to the manhole channels.

c. The completed channels shall provide a smooth, steady transition between manhole inlet and outlet pipes. Any roughness or ragged edges within the completed channel shall be corrected prior to acceptance of the manhole.

d. CONTRACTOR shall apply grout around pipe inverts to provide a smooth finished interior surface in the manhole.

4. Manhole Drops

a. For joining sewer lines at different levels, drop manholes shall be provided. The drop inlets shall be as shown on the standard details of the Drawings.

D. Backfill

1. Backfill shall be accomplished per the requirements for sewer backfill as specified in Section 330101.

E. Vacuum Testing

1. General

a. All new manholes installed on this project shall be subjected to a vacuum test to determine the seal of all joints within the manhole. The vacuum test will not be required for existing manholes that are adjusted or partially reconstructed. The following test procedure is required for all new manholes:

(1) Lift holes shall be plugged with an approved nonshrinkable grout prior to testing.

(2) Drop connections shall be installed prior to testing.

(3) The manhole shall be finished and backfilled to design elevation prior to testing.

(4) The vacuum test shall include testing of the seal between the cast iron frame and top slab or cone section, slab, barrel sections, and/or grade rings.

2. Testing Procedure

a. Temporarily plug (and brace) all pipes entering the manhole at least 8 inches into the sewer pipe. The plug shall be inflated at a location beyond the manhole/pipe gasket.

b. The pressure gauge for the test hood shall be liquid filled, having a 3-1/2 inch face with scale reading from 0 to 30 inches of mercury.

c. The test head shall be placed inside the manhole frame and inflated according to the testing equipment manufacturer's recommendations.

d. A vacuum of 10 inches of mercury shall be drawn on the manhole. Upon reaching 10 inches of vacuum, close the valve on the vacuum line to the manhole and disconnect the vacuum line.

e. For the manhole to be considered as having passed the vacuum test, the time for the vacuum reading to drop from 10 inches of mercury to 9 inches of mercury must be equal to or greater than the following values, as referenced in ASTM C 1244:

Minimum Test Times for Various Manhole Diameters

Depth	Diameter, in.								
(ft)	30	33	36	42	48	54	60	66	72
	Time, s								
8	11	12	14	17	20	23	26	29	33
10	14	15	18	21	25	29	33	36	41
12	17	18	21	25	30	35	39	43	49
14	20	21	25	30	35	41	46	51	57
16	22	24	39	34	40	46	52	58	67
18	25	27	32	38	45	52	59	65	73
20	28	30	35	42	50	53	65	72	81
22	31	33	39	46	55	64	72	79	89
24	33	36	42	51	59	64	78	87	97
26	36	39	46	55	64	75	85	94	105
28	39	42	49	59	69	81	91	101	113
30	42	45	53	63	74	87	98	108	121

f. Manholes failing the vacuum test shall be repaired with nonshrink grout or other suitable material and retested per the procedure shown previously.

g. All temporary plugs and braces shall be removed after each test.

h. The CONTRACTOR shall provide all equipment and labor required for vacuum testing of new manholes. The cost for this procedure shall be incorporated into the price bid for the manhole.

END OF SECTION

***

SECTION 33 1100

WATER AND SEWAGE FORCE MAIN PIPE

PART 1 GENERAL

1.01 SUMMARY

A. All pipe, fittings, and jointing materials shall be of one manufacturer unless different types are shown on the Drawings or otherwise accepted by the ENGINEER.

1.02 SUBMITTALS

A. General

1. Prior to the shipment of any water and/or sewage force main piping to the project site, the CONTRACTOR shall submit to the ENGINEER a bill of materials, shop drawings, and descriptive literature for all piping, in the number of copies listed in Division 01 of these Specifications.

B. Plant and Site Piping

1. Submit shop drawings of all interior and exterior piping.

2. Submit testing and certifications for interior and exterior piping.

C. Water Main and Sewage Force Main Projects

1. Submit shop drawings for all piping.

2. Submit descriptive literature for all piping.

3. Submit testing and certifications for all piping.

PART 2 PRODUCTS

2.01 MATERIALS–WATER MAIN AND SEWAGE FORCE MAIN PIPE

A. Ductile Iron Pipe–Mechanical and Rubber Slip Joint Type

1. Pipe

a. General

(1) Ductile iron pipe shall be furnished for all piping 3 inches and over in size designated "DI" on Drawings and shall be designed in accordance with ANSI/AWWA C150/A21.50 and ANSI/AWWA C151/A21.51 specifications and supplements thereto.

b. Design Conditions

(1) Pressure: Minimum 200 to 350 psi operating pressure, plus 100 psi water hammer allowance.

(2) Trench Loading: Laying Condition Type 3, depth of cover as shown on Drawings.

c. Metal Design Strength PSI (Minimum)

Tensile Strength	60,000
Yield Strength	42,000
Percent Elongation	10

d. Minimum Nominal Thickness

(1) Minimum design thicknesses for 200 through 350 psi operating pressures, depths of cover, trench loading and other conditions shall be per ANSI/AWWA C150/ A21.50 specifications.

e. Lengths

(1) Pipe may be furnished in 18 or 20 foot nominal laying lengths.

f. Marking

(1) The net weight, class or nominal thickness, and casting period shall be shown on each pipe. The manufacturer's mark, the year in which the pipe was produced, and the letters "DI" or "DUCTILE" shall be cast or stamped on the pipe.

g. Weighing

(1) Each pipe shall be weighed before application of lining or coating other than standard coating and the weight shown on the outside or inside of the bell or spigot end.

h. Spigot End of Pipe

(1) The spigot end of the pipe shall be free of blemishes and defects which, in the opinion of the ENGINEER, might be responsible for a poor fit with the rubber ring gasket and result in leakage.

2. Fittings

a. General

(1) Ductile iron mechanical joint, restrained joint and fittings shall conform to ANSI/AWWA C110/A21.10 Standard for Gray Iron and Ductile Iron Fittings – 3 inches through 48 inches. Mechanical joints and push on joints shall also conform in all respects to ANSI/AWWA C111/A21.11.

(2) Ductile iron compact fittings, meeting the requirements of ANSI/AWWA C153/A21.53, will also be accepted.

(3) Fittings shall be 350 psi pressure rating for sizes through 24 inches and shall be 250 psi rating for sizes above 24 inches unless a higher operating pressure is shown on the Drawings, and in such cases the fitting pressure rating shall be equal to or above the operating pressure. The pressure rating for all compact fittings shall be 350 psi.

(4) Fittings shall be ductile iron meeting the above requirements and shall be furnished complete with all joint accessories.

b. Lining and Coating

(1) All fittings shall be lined and coated the same as adjacent pipe.

3. Joints

a. General

(1) Pipe joints shall be mechanical joint, rubber ring slip joint or restrained joint as shown on the Drawings.

(2) All items used for jointing pipe shall be furnished with the pipe. The joints shall be made with tools and lubricant in strict conformity with the manufacturer's instructions. Copies of the instructions shall be delivered to the ENGINEER at start of construction in sufficient numbers that will permit the ENGINEER to retain 3 copies.

b. Mechanical Joints

(1) Mechanical joints are to be furnished according to ANSI/ AWWA C111/A21.11. All pipe joints must be furnished complete with all accessories. Mechanical joint bolts and nuts shall be of alloy cast iron or alloy steel (Corten type

such as U.S. Alloy) or equal. Rubber gaskets shall be made of plain first grade rubber, free of imperfections and porosity. Hardness shall be 75 X 5 durometer.

c. Rubber Ring Slip Joint (Push On)

(1) Rubber ring slip joint shall be equal to ANSI/AWWA C111/ A21.11. The joints shall be of the following materials and assembled in the sequence outlined below:

(a) Rubber ring gasket compressed in groove in bell of pipe.

(b) Beveled spigot end of pipe for initial centering into rubber gasket in bell.

d. Restrained Joints

(1) For Pipe

(a) Restrained joint for push-on type bell with rubber O-ring shall meet the applicable requirements of ANSI/AWWA C 111/A21.11. The bell/spigot configuration for the restrained joint shall be such that restraint shall be provided for the joint based on a sustained pressure equal to the pressure class of the pipe.

(b) The restrained joint shall allow the same deflection as standard push-on joint pipe.

(c) Where field welding is required for restrained field cut pipe, the welder shall be properly instructed in the methods and materials for welding on ductile iron pipe.

(2) For Fittings

(a) Where restrained joint fittings are called for, the bell configuration for the fittings shall be the same as for the pipe.

(b) Where fittings with restrained joint bell configuration are not available, restrained materials for use with mechanical joint bell configurations shall be used as follows:

(i) Connect mechanical joint bell assemblies with stainless steel all-thread rods.

(ii) Install restraints glands on each side of the fitting. The restraining glands shall be “Meg-a-Lug,” as manufactured by EBAA Iron Sales, Inc., of Eastland Texas; “Grip Ring,” as manufactured by Romac Industries, Inc., of Seattle, Washington; or equal.

e. Special Gaskets

(1) Where a water main is located within a 200-foot radius of an underground storage tank (UST), special rubber gaskets shall be provided for the water main joints.

(2) These gaskets shall be manufactured of “nitrile rubber” material or other acceptable material possessing superior resistance to deterioration from petroleum based products.

(3) This requirement will apply to the gaskets supplied for mechanical joints, restrained joints, and push-on joints when located within the 200-foot radius of a UST.

(4) The cost of the special gasket shall be incorporated into the cost of the installed pipe.

4. Lining and Coating

a. Water Service

(1) All ductile iron pipe for water service shall have manufacturer's standard outside bituminous or asphaltic base coating and a cement lining and bituminous seal coat on the inside. Cement mortar lining and bituminous seal coat inside shall conform to ANSI/AWWA C104/A21.4.

b. Sewer Force Main Service

(1) All ductile iron pipe for sewer force main service shall be bituminous coated outside and shall be cement lined with seal coat on the inside per the above specifications.

c. Bitumastic Finish Coat

(1) Only a coal tar outside coating, or other compatible coating, shall be applied to pipe which is to receive a bitumastic finish coat.

B. Ductile Iron Pipe-Flanged, Grooved and Special Coupling

1. Pipe

a. Flanged Pipe

(1) Flanged pipe shall be made in accordance with ANSI/AWWA C115/A21.15 Specifications, and shall be thickness Class 53.

(2) Where plain ends of flanged and plain end pipe fit into mechanical joint bells, centrifugally cast pipe shall be used.

b. Grooved Pipe

(1) Where flanged ductile iron pipe is shown on the Drawings, grooved joint piping may be substituted where acceptable to the ENGINEER.

(2) Grooved joint piping shall conform to ANSI/AWWA Specification C 606.

2. Fittings

a. Flanged Pipe

(1) Flanged joint fittings shall conform to ANSI/AWWA C110/ A21.10 Standard for Gray Iron and Ductile Iron Fittings- 3-inch through 48-inch.

(2) Fittings shall be 250 psi pressure rating for all sizes unless a higher operating pressure is shown on the Drawings and in such cases the fitting pressure rating shall be equal to or above the operating pressure.

(3) Fittings shall be ductile iron meeting the above requirements and shall be furnished complete with all joint accessories.

3. Joints

a. General

(1) Pipe joints shall be as shown on the Drawings.

(2) All items used for jointing pipe shall be furnished with the pipe. The joints shall be made with tools and lubricant in strict conformity with the manufacturer's instructions. Copies of the instructions shall be delivered to the

ENGINEER at start of construction in sufficient numbers that will permit the ENGINEER to retain 3 copies.

b. Flanged Pipe

(1) All ductile iron flanged pipe shall have flanges faced and drilled, 125 pound in accordance with ANSI/AWWA C110/ A21.10 unless otherwise specified.

(2) Flanges may be cast integrally with the pipe or they may be screwed on specially designed long hub flanges, refaced across both face of flange and end of pipe.

(3) Flanged joints are to be furnished according to ANSI/AWWA C115/A21.15 and shall be ductile iron only. Flanged joints shall have 1/8-inch rubber full face gaskets made especially for water pipe use. Bolts for ductile iron flanged pipe must be of standard sizes for pipe to be fitted, and must be black steel, machine bolts with heavy hexagon heads and nuts meeting ANSI B18.2.1 and ANSI B18.2.2, respectively. In unheated vaults, submerged and/or damp locations, bolts and nuts for ductile iron flanged pipe shall be stainless steel. Prior to stainless steel nuts being placed on stainless steel bolts, the bolt threads shall be coated with anti-seize.

(4) The American Toruseal Flange Gasket Manufactured by American Cast Iron Pipe Company is an acceptable alternate to the above described gasket.

c. Grooved Pipe

(1) Victaulic Style 31 couplings, or equal, with flush seal gaskets shall be used. Rigid cut grooves shall be used except where flexible couplings are shown on the Drawings. In such case, flexible cut grooves shall be substituted.

d. Special Coupling

(1) Flexible couplings for flanged pipe shall be a mechanical joint cast to a special flanged joint using a neoprene O-ring in place of the usual 1/16-inch rubber ring gasket. The mechanical bell and special flanged joint piece shall be of ductile iron (ANSI/AWWA C110/A21.10) with bolt circle, bolt size and spacing conforming to ANSI/AWWA C110/A21.10 specifications. Mechanical joint follower flange shall be of ductile iron ASTM A 536 or malleable iron ASTM A 47, Grade 35018 or 32510, with high strength/weight ratio design. Bolts shall be fine grained high tensile malleable

iron with malleable iron hexagon nut. Stainless steel bolts and nuts shall be used in vaults and wet wells. Where pressures may exceed 20 psi, anchor studs shall be included with spigots of pipes connected drilled to receive ends of studs.

(2) At locations in flanged pipe where adaptors are not shown on the Drawings, the CONTRACTOR may, at his own cost and for flexibility of installation, use a coupling adapter after acceptance by the ENGINEER. In no event shall unrestrained mechanical joints or dresser type couplings be substituted for flanged joints.

4. Lining and Coating

a. Flanged Pipe

(1) Flanged pipe for water and wastewater service shall be cement lined and bituminous coated the same as written herein for ductile iron pipe, mechanical and rubber slip joint type.

b. Grooved Pipe

(1) Lining and coating shall be as specified for flanged pipe.

C. Polyvinyl Chloride (PVC) Pipe (AWWA)

1. Pipe

a. Distribution Mains

(1) This Specification covers 4-inch through 12-inch PVC pressure pipe made from Class 12454-B material as defined in ASTM D1784 and conforming with the outside diameter dimensions of ductile iron pipe and with wall thicknesses of DR series 14, 18 or 25.

(2) The pipe shall be manufactured to meet the requirements of ANSI/AWWA Specification C900 and these Specifications. It shall be furnished in the size and pressure class as shown on the Drawings, and in 20-foot lengths.

(3) The pipe shall have an integral bell end and gasket seal which is in compliance with the requirements of ASTM D 3139 and F 477.

b. Transmission and Distribution Mains

(1) This Specification covers 14-inch through 48-inch PVC pressure pipe made from Class 12454-B material, as defined in ASTM D1784, and conforming with the outside diameter dimensions of ductile iron pipe. Wall thicknesses shall conform to DR Series 14, 18, 21, 25 or 26 as shown on the Drawings.

(2) The pipe shall be manufactured to meet the requirements of ANSI/AWWA Specification C905 and these specifications. It shall be furnished in 20-foot lengths in the size and pressure class as shown on the Drawings.

(3) The pipe shall have an integral bell end and gasket seal which is in compliance with the requirements of ASTM D3139 and F477.

c. The marking of each piece shall include:

(1) Nominal size and O.D. base.

(2) PVC.

(3) Dimension ratio number.

(4) AWWA pressure class.

(5) AWWA standard designation number.

(6) Manufacturer's name or trademark and production record code.

(7) Seal (mark) of the testing agency that verified the suitability of the pipe material for potable water service.

2. Fittings and Couplings

a. Fittings for use with PVC pipe shall be ductile iron, slip-on or mechanical joint type.

b. If couplings are required, they shall be of the elastomeric-gasket type and shall conform with ANSI/AWWA C900.

D. Polyvinyl Chloride (PVC) Pipe (ASTM)

1. Pipe

a. This Specification covers rigid polyvinyl chloride pipe and fittings, hereinafter called PVC pipe and PVC fittings, for sizes 3/4-inch through 12-inch.

b. PVC pipe shall be extruded from Class 12454-B polyvinyl chloride material with a hydrostatic design stress of 2000 psi for water at 73.4 degrees Fahrenheit, designated as PVC 1120, meeting ASTM Specifications D 1784 for material. Three-fourths inch through 1-1/2 inch water service piping shall be PVC Schedule 40 as specified in ASTM D 1785. Two inch through 12-inch pipe for water and sewage force main service shall be SDR 21 for 200 psi allowable working pressure at 73.4 degrees Fahrenheit and a safety factor of 2.0, as specified in ASTM D 2241.

c. The pipe shall be homogeneous throughout and free from cracks, holes, foreign inclusions or other defects. The pipe shall be as uniform as commercially practical in color.

d. The workmanship, pipe dimensions and tolerances, outside diameters, wall thickness, eccentricity, sustained pressures, burst pressures, flattening, extrusion quality, marking and all other requirements of ASTM D 2241 shall be conformed with in all respects.

e. Pipe shall be furnished in 20-foot lengths. The pipe shall be plain end with bell on one end. Male ends of pipe must be beveled on the outside.

f. Pipe shall have a ring painted around the male end in such a manner as to allow field checking of setting depth of pipe in the socket. This requirement is made to assist construction superintendents and inspectors in visual inspection of pipe installation.

g. Pipe must be delivered to job site by means which will adequately support it, and not subject it to undue stresses. In particular, the load shall be so supported that the bottom rows of pipe are not damaged by crushing. Pipe shall be unloaded carefully and strung or stored as close to the final point of placement as is practical.

h. Pipe must not be exposed to the direct rays of the sun for an extended period of time. If pipe is not to be installed shortly after delivery to the job site, it must be stored in a shaded location.

2. Fittings

a. Ductile Iron

(1) Ductile iron mechanical joint or push-in type fittings with appropriate adapters may be used with exterior PVC pipe. All such fittings shall be approved by the pipe manufacturer, and complete data sent to the ENGINEER, including the manufacturer's approval, for review.

3. Joints

a. Exterior Buried Pipe - Slip Joint Type

(1) Exterior buried pipe shall be jointed with slip-type joints with rubber gaskets.

(2) Pipe with bell end shall have all parts of the bell, including the gasket groove, made from the same extruded piece, integral with the pipe, and shall be thickened to meet standard dimension ratios of wall thickness to outside diameter. The gasket groove shall be constructed such that gasket rollout will not occur. Rubber gasketing shall conform to ASTM D 3139.

b. Interior - Solvent Weld

(1) Interior pipe shall be jointed by solvent welds.

(2) Since PVC welding solvent is engineered and formulated to perform with a given joint design, all solvent must be purchased from the manufacturer of the pipe.

(3) The PVC welding solvent shall be compounded to conform with the socket fit and the weather conditions at the time of installation and be such as to assure minimum installation cost and a weld of maximum strength.

c. Couplings

(1) Couplings shall be of the same material as the pipe and may be of the molded, or extruded type. They shall have a beveled entrance to prevent the wiping off of the lubricant from the male end of the pipe.

(2) PVC couplings shall have a minimum rating of 200 psi for continuous operation at 73.4 degrees Fahrenheit.

(3) The couplings shall have a positive pipe stop that will automatically and accurately position the pipe ends within the couplings. The pipe stop shall also permit the thermal expansion or contraction of the pipe ends.

E. Polyethylene Pipe for Water Mains and Force Mains

1. Pipe

a. General

(1) Polyethylene pipe and fittings shall comply with the requirements of ASTM D 1248, D 1505, D 1693, D 1928, D 2657, D 3035, D 2837 and D 2321.

b. Resins

(1) Only virgin polyethylene resins classified as Type III, Category 5, Grade P34 per ASTM D 3035 with densities of 0.955 p/cc maximum and melt index of 0.15 g/10 minutes maximum shall be used in the process of making the pipe. The resin shall contain antioxidants and be stabilized with carbon black.

c. Design

(1) The pipe shall have a long-term strength rating of 1,600 psi or more and be resistant to environmental stress cracking per procedure C of ASTM D 1928 for not less than 200 hours. The maximum allowable deflection is 5 percent with the pipe installed in accordance with these Specifications, using backfill material at 130 pounds per cubic foot, H-20 live load plus 50 percent impact but no internal pressure. The live load and impact may be disregarded in the calculations for trench conditions with 8 feet or more cover. Operating pressures are shown on the Drawings. Hydrostatic loading shall be considered when the pipe is to be installed below a permanent water table or body of water.

d. Wall Thickness Calculations

(1) The pipe manufacturer shall furnish calculations to support the pipe wall thickness for these various conditions for the ENGINEER'S review/acceptance before the materials are sent to the job site.

e. Quality

(1) No cracks, holes, foreign material, blisters, or other deleterious faults are permitted in the polyethylene pipe. It shall be homogeneous throughout including the heat fused joint. Polyethylene pipe will not be installed containing gouges or cuts that penetrate more than 10 percent of the wall thickness.

f. Water Stops

(1) The pipe manufacturer shall furnish a waterstop assembly for use with the pipe where the pipe passes through a structure wall so as to provide a watertight seal. The assembly shall be attached to the pipe with noncorroding materials.

g. Marking

(1) Each length of polyethylene pipe shall contain the manufacturer's brand name, pipe size and other data to enable an accurate tracing of the raw material source. Polyethylene pipe will not be installed containing gouges or cuts that penetrate more than 10 percent of the wall thickness.

2. Joints

a. Fusion

(1) Polyethylene pipe shall be joined by the heat fusion welding process. Welding equipment may be either gas fired or electric as the CONTRACTOR may select. The welding equipment must be capable of attaining the temperature recommended by the manufacturer for the particular polyethylene extrusion used on the project.

(2) The fusion equipment shall have hydraulic controls and gauges for monitoring fusion pressures. Also, an engine powered facing unit to trim the irregularities of the pipe ends shall be provided. The heated and thermostatically controlled plate shall contain a temperature gauge for monitoring the heat temperature throughout the fusion process.

b. Flange Adapters

(1) Threaded or solvent weld joints and connections are not permitted. Flange adapters as manufactured by the pipe supplier shall be used, butt-fused to the pipe and connected to other pipe material using a rubber gasket for sealing.

2.02 MATERIALS-SERVICE LINE PIPE

A. Copper Pipe and Fittings

1. Inside, Rigid with Solder Joint Connections

a. Small piping inside structures shall consist of standard copper tubing for water; Type "L" for general plumbing purposes. All fittings shall be "solder joint connection" cast or wrought bronze for water service for inside diameter of pipe sizes given. All stops, valves, hose bibbs, and unions shall be made with same joints or threaded iron pipe standard, and be of brass or copper. Use 95-5 tin-antimony solder for "solder joints."

b. Buried Copper Tubing with Compression Joints

(1) Small copper piping for buried service shall be of standard soft copper tubing for water service pipe, ASTM Specifications B 88, Type "K," with bronze fittings, stops, and valves having compression connections for flared copper tubing.

B. Polyethylene Pipe for Water Service

1. Pipe

a. Polyethylene flexible pipe (I.P.O.D. or PVC O.D.) for sizes 1/2-inch through 3-inch water service piping shall be PE 3408, Type III, Grade P34 Class C, DR-9, OD Based for 200 psi working pressure at 73.4 degrees Fahrenheit, meeting ASTM Specification D 1248 for material, D 3350 for cell classification and AWWA C901 Specification for pipe.

b. Polyethylene flexible pipe (copper pipe O.D.) for sizes 1/2-inch through 2-inch water service piping shall be PE 3408, Type III, Grade P34 Class C, DR, OD Based for 200 psi working pressure at 73.4 degrees Fahrenheit, meeting ASTM Specification D 1248 for material, D 3350 for cell classification and AWWA C901 Specification for pipe.

c. Pipe shall meet all applicable provisions of the Commercial Standards and shall bear the National Sanitation Foundation (NSF) seal of approval.

2. Fittings

a. Fittings shall be standard bronze fittings as specified for copper tubing in this Section of these Specifications.

2.03 SERVICE CONNECTIONS

A. General

1. All service connections shall be made by means of tees, factory tapped couplings, or bronze service clamps manufactured specifically for use with the pipe upon which it is to be installed. Whenever possible, corporation stops shall be placed in the service connection prior to conducting hydrostatic tests on the mains.

B. Service Clamps

1. Service clamps for use on ductile iron mains shall be bronze, double strap, Mueller BR 2 B Series, Ford, or equal.

2. Service clamps for use on PVC and polyethylene pipe shall be bronze, wide strap, 2 piece for 2-inch through 8-inch mains, Mueller H-01300 Series, Ford, or equal. For 10-inch and 12-inch mains, use Mueller 3-piece, H-13000 Series, Ford, or equal.

3. The use of Dresser Style 294 plastic saddles will also be permitted for use on PVC or polyethylene mains.

2.04 WALL AND FLOOR SLEEVES WITH RUBBER MECHANICAL SEAL FOR CARRIER PIPE SIZES 2 INCHES THROUGH 48 INCHES

A. General

1. Sleeves shall be required for 2-inch through 48-inch carrier pipes penetrating poured concrete walls and floor slabs. The use of sleeves will require the use of a rubber link, mechanical type seal assembly around the carrier pipe.

2. The CONTRACTOR shall determine the required inside diameter of each individual wall opening or sleeve before ordering, fabricating or installing. The inside diameter of each wall or floor sleeve shall be sized as recommended by the closure assembly manufacturer to fit the carrier pipe, and seal to assure a watertight joint. The CONTRACTOR shall follow the manufacturer's instructions for installing and tightening the seal to provide a watertight pipe penetration.

B. Description

1. The pipe closure assembly shall consist of a heavy wall welded or seamless steel pipe with 4 inches larger than sleeve O.D. continuous water stop plate, modular mechanical type interlocking synthetic rubber links shaped to continuously fill the annular space between the carrier pipe and wall or floor opening sleeve. Links shall be loosely assembled with stainless steel bolts to form a continuous sealing element of EPDM rubber belt around the carrier pipe with glass reinforced nylon plastic pressure plate under each bolt head and nut. Tightening of the bolts shall cause the sealing element to expand and provide absolute watertight seal between the carrier pipe and wall or floor sleeve. The entire closure assembly shall be tagged for location to match the nomenclature on the Drawings.

2. The sleeve shall be factory primed per Paint Specifications, Section 09900.

C. Manufacturers

1. Thunderline Corporation, Link-Seal Century Line Model CS-100, Model LS, FS, and WS. All models used shall be for Type S corrosive service, or equal.

2.05 SOURCE QUALITY CONTROL

A. Ductile Iron Pipe (Mechanical Joint and Rubber Slip Joint Type)

1. Hydrostatic and physical properties acceptance tests shall be in accordance with ANSI/AWWA Specification C151/A21.51 for ductile iron pipe centrifugally cast in metal molds or sand lined molds for water or other liquids.

2. The ENGINEER shall be provided with sufficient copies of each of the tests for each Contract to permit the ENGINEER to retain 3 copies.

3. All items used for jointing pipe shall be tested before shipment.

B. Polyvinyl Chloride (PVC) Pipe (AWWA)

1. The manufacturer shall furnish an affidavit that all delivered materials comply with the requirements of this Specification.

2. Each length of pipe shall be proof tested at four times its rated class pressure.

C. Polyvinyl Chloride (PVC) Pipe (ASTM)

1. Samples of pipe and physical and chemical data sheets shall be submitted to the ENGINEER for review and acceptance before pipe is delivered to job.

2. Samples of solvents and the recommended instruction for their use must be submitted for the ENGINEER'S review and acceptance before delivery of solvent to the job.

D. Polyethylene Pipe for Water Mains and Force Mains

1. Results of tests on the raw materials and the polyethylene pipe in accordance with ASTM standards and the Plastic Pipe Institute shall be furnished along with catalogs and other descriptive literature in the number of copies required by the listing in Section 00700 before the materials are sent to the job site.

PART 3 EXECUTION

3.01 TRENCH EXCAVATION–WATER AND SEWAGE FORCE MAINS

A. General

1. Trenching shall include all clearing and grubbing, including all weeds, briars, trees and stumps encountered in the trenching, regardless of size. The CONTRACTOR shall dispose of any such material by burning, burial or hauling away or as noted on the Drawings, at no extra cost to the OWNER. Ornamental shrubs, hedges, and small trees (3 inches in diameter or less) shall be removed, protected, and replanted, at no extra cost to the OWNER.

2. Trenching also includes such items as railroad, street, road, sidewalk, pipe, and small creek crossings; cutting, moving, or repairing damage to fences, poles or gates and other surface structures, regardless of whether shown on the Drawings. The CONTRACTOR shall protect existing facilities against danger or damage while pipeline is being constructed and backfilled or from damage due to settlement of the backfill.

3. Materials encountered in excavation will be divided into 2 classes only: solid rock excavation and other materials. Solid rock excavation is defined as material requiring the use of specialty equipment for removal, such as “hoe ramming,” or the use of explosive materials for breakage prior to removal. Other materials shall include earth, loose rock, street or road surfacing and base concrete, and boulders less than 1/3 cubic yard in one piece.

4. In case of “unclassified excavation,” as designated in the Drawings and/or Specifications, the price bid shall include earth, solid rock, roots, street or road surfacing and base concrete and boulders.

5. In case of “classified excavation,” as designated in the Drawings and/or Specifications, the CONTRACTOR will be paid an additional cost for the removal of solid rock over that bid for other materials.

6. All excavation shall be open trench, except where the Drawings call for tunneling, boring, or jacking under structures, railroads, sidewalks, roads, or highways.

B. Trees and Shrubs

1. Where pipelines run through wooded terrain, cutting of trees within limits of maximum permissible trench widths, as set forth in this article, will be permitted. However, cutting of additional trees on sides of trench to accommodate operating of trenching machine will not be permitted. The CONTRACTOR shall obtain specific permission of the OWNER before cutting any tree larger than 4 inches in diameter.

C. Highways, Streets and Railroads

1. Construction equipment injurious to paving encountered shall not be used. Curbs, sidewalks, and other structures shall be protected by the CONTRACTOR from damage by his construction equipment.

2. Where trenching is cut through paving which does not crumble on edges, trench edge shall be cut to at least 2 inches deep to straight and neat edges, before excavation is started, and care taken to preserve the edge to facilitate neat repaving.

3. The CONTRACTOR shall so coordinate his work as to produce a minimum of interference with normal traffic on highways and streets. He may, with the approval of the governing agency, close a street to traffic for such length of time considered necessary, provided persons occupying property abutting the street have an alternate route of access to the property which is suitable for their needs during the time of closure. It shall be the responsibility of the CONTRACTOR to give 24 hours advance notice to fire and police departments and to occupants of a street which will be closed, in a manner approved by the governing body.

4. The CONTRACTOR shall maintain road crossings in a passable condition for traffic until the final acceptance of the work, being paid only by unit price for crushed rock used, within limitations as hereinafter specified.

5. The amount of crushed stone placed shall be paid for at the unit price per ton up to the maximum limits of 225 pounds per linear foot of trench over which it is placed for pipe sizes through 16 inches, 300 pounds per

linear foot for pipe sizes 18 inches through 24 inches and 400 pounds per linear foot for sizes 27 inches through 48 inches. The ENGINEER shall have control of thickness and width to be placed and paid for, and may order changes in depth and width as conditions dictate. No payment will be made for crushed rock surfacing required as a result of unnecessarily wide trenches, omission of sheeting and shoring, or damage by the CONTRACTOR'S equipment, or for maintenance of surface level.

6. Railroad and Highway Department requirements in regard to trenching, tunneling, boring and jacking shall take precedence over the foregoing general specifications and the tunneling and boring or jacking specifications, where they are involved. Where work is within railroad right-of-way, Railroad Protective Insurance shall be carried by the CONTRACTOR in the amounts required by the Railroad Company.

7. The insurance policy shall name the railroad as the insured and the original policy shall be delivered to the railroad after submitting same to the OWNER for review. The cost of flagmen required by the railroad and highway departments and railroad inspectors shall be paid by the CONTRACTOR.

8. Uneven surfaces or humps in the ground encountered and high driveways and road crossings shall be dug through to such depth that pipe may be laid to a reasonably even grade and have minimum cover at the low places. Such places requiring extra depths shall be included in the bid and no extra payment will be made for such extra depths required, which are evident from an examination of the ground before bidding, as required for 1 foot cover over valve nuts, or are indicated on the Drawings.

D. Existing Utilities

1. The CONTRACTOR shall determine, as far as possible in advance, the location of all existing sewer, culvert, drain, water, electric, telephone conduits, and gas pipes, and other subsurface structures and avoid disturbing same in opening his trenches. In case of sewer, water and gas services and other facilities easily damaged by machine trenching, same shall be uncovered without damage ahead of trenching machine and left intact or removed without permanent damage ahead of trenching and restored immediately after trenching machine has passed, without extra cost to the OWNER. The CONTRACTOR shall protect such existing facilities, including power and telephone poles and guy wires, against danger or damage while pipeline is being constructed and backfilled, or from damage due to settlement of his backfill. It shall be the responsibility of the CONTRACTOR to inform the customers of utilities of disruption of any utility service as soon as it is known that it has been or will be cut off.

2. The CONTRACTOR shall, at all times during trenching operations, carry a stock of pipe and fittings likely to be needed for replacement of pipelines to facilitate immediate repair.

E. Pipelines in Same Trench

1. Pipelines, force mains, and sewers laid in same trench shall, in all cases, be bedded on original earth, or other specified bedding materials, regardless of divergence in their elevations, unless otherwise specified. They shall never be laid in unsupporting backfill or one above the other. The CONTRACTOR shall receive full trenching and backfilling unit prices for each pipeline, force main, and sewer so laid, the same as if laid in widely separated trenches.

F. Location of Proposed Pipelines

1. The location of pipelines and their appurtenances as shown are those intended for the final construction. However, conditions may present themselves before construction on any line is started that would indicate desirable changes in location. Also, development of property traversed may require location changes. In such cases, the OWNER reserves the right to make reasonable changes in line and structure locations without extra cost, except as may be determined by the application of the unit prices bid to the quantities actually involved. The OWNER is under no obligation to locate pipelines so that they may be excavated by machine.

G. Trench Requirements

1. All trenches must be dug neatly to lines and grades.

2. The opening of more than 500 feet of trench ahead of pipe laying and more than 500 feet of open ditch left behind pipe laying, before backfilling, will not be permitted, except upon written consent of the OWNER. No trench shall be left open or work stopped on same for a considerable length of time. In case of objectionable delay trench shall be refilled according to backfill specifications.

3. Where subgrade of trench has insufficient stability to support the pipeline and hold it to its original grade, the ENGINEER may order stabilization by various means. Exclusive of dewatering normally required for construction and instability caused by neglect of the CONTRACTOR, it shall be paid for at unit prices set up in the Contract, such as extra excavation, crushed rock for pipe bedding, concrete cradle or piling.

4. Excavation for pipe laying must be made of sufficient width to allow for proper jointing and alignment of the pipe, but not greater than the maximums permitted in the following table:

MAXIMUM TRENCH WIDTH AT TOP OF PIPE

Nominal Pipe Size (Ins.)	Trench Width (Ins.)	Nominal Pipe Size (Ins.)	Trench Width (Ins.)
4	28	20	44
6	30	24	48
8	32	30	54
10	34	36	60
12	36	42	66
14	38	48	72
16	40	54	78
18	42		

5. Trenches in earth or rock shall be dug as shown on the Drawings and be sufficiently deep to insure a 30 inch or 36 inch minimum cover over water lines and force mains, as noted on the Drawings. Depths of trenching shall also be adequate for at least 1 foot minimum cover over valve nuts. In order to eliminate the necessity for digging bell holes into the trench subgrade by hand and to insure an earth cushion under the pipe for uniform bearing, trench depth shall be the cover requirement plus outside diameter of barrel of pipe plus the required bedding cushion. The cushion construction requirement shall also apply to tunnels.

6. Wherever it is deemed necessary by the ENGINEER to lay the pipes to an extra depth exceeding the depths required by the Drawings and Specifications and not apparent from unevenness of ground, the CONTRACTOR will be paid for such excavation under extra excavation in earth at the price bid per cubic yard, computed on the basis of maximum trench widths in the preceding table. In unclassified excavation contracts the same width limitations will apply.

7. Trench line stations and locations of accessories will be set ahead of the trenching. These will be set at least each 100 feet of pipeline. Trenches must be dug true to alignment of stakes. Alignment of trenches or pipes in trench must not be changed to pass around obstacles such as poles, fences and other evident obstructions without the permission of the ENGINEER. Lines will be laid out to avoid obstacles as far as possible, contingent with maintenance of alignment necessary to finding pipeline in the future and avoiding obstruction to future utilities.

H. Damage to Existing Structures

1. Hand trenching is required, at no extra payment, where undue damage would be caused to existing structures and facilities by machine trenching.

2. In case of damage to any existing structures, repair and restoration shall be made at once and backfill shall not be replaced until this is done. In all cases, restoration and repair shall be such that the damaged structure will be in as good condition and serve its purpose as completely as before, and such restoration and repair shall be done without extra charge, except as set forth under the applicable provisions of the General and Special Conditions. Where there is the possibility of damage to existing utility lines by trenching machine, the CONTRACTOR shall make hand search excavation ahead of machine trenching, to uncover same, at no extra cost to the OWNER.

I. Excavation Unclassified

1. Excavation for pipelines shall be unclassified and the cost of all excavation of whatever nature and state, including solid rock, shall be included in the CONTRACTOR'S unit price bid for furnishing, trenching, laying and backfilling the pipe.

2. Excavation for structures such as manholes, pump stations, and vaults is likewise unclassified and the cost of all excavation of whatever nature and state, including solid rock, shall be included in the CONTRACTOR'S lump sum or unit price bid, as the case may be.

J. Dewatering of Trenches

1. Dewatering of trenches shall be considered a part of trenching, at no extra cost to the OWNER. Dewatering of trenches shall include groundwater and storm or sanitary sewage. Suitable pumping and other dewatering equipment is to be provided by the CONTRACTOR, to insure the installation of the pipeline structure in a dewatered trench and under the proper conditions. Dewatering shall include all practical means available for prevention of surface runoff into trenches and scouring against newly laid pipe.

2. Piles of excavated materials shall be trenched or temporarily piped to prevent, as far as practical, blockage of drainage ditches and gutters, and water carriage of excavated materials over street and highway surfaces.

3.02 LAYING WATER AND SEWAGE FORCE MAINS

A. General

1. Inspection of Materials

a. All pipe, fittings and accessories shall be subject to an inspection by the OWNER at the job site. Any damaged materials shall be repaired or replaced to the satisfaction of the OWNER. Should repairs to the piping materials be necessary, then same shall be

made in the presence of the ENGINEER using proven methods prescribed by the pipe manufacturer.

b. The OWNER'S inspection of materials shall in no way relieve the CONTRACTOR of his responsibility.

2. Laying Requirements

a. Water and sewage force main pipe shall be laid to lines, cover or grades shown on the Drawings.

b. Pipes must be swabbed out before lowering into trench. In the case of pipelines 4 inch through 20 inch, a swab must also be dragged through the pipe after it is in place. Larger size pipe shall be visually inspected for cleanliness and proper jointing.

c. The points insisted upon in the laying of pipe will be: Proper alignment, evenness of width and depth of joints, perfection in jointing, and care of the pipe in handling.

d. Precautions must be taken to prevent flotation of the pipe should water enter the trench prior to putting the pipeline into operation.

e. In wet, yielding and mucky locations where pipe is in danger of sinking below grade or floating out of grade or alignment, or where the backfill materials are of such a fluid nature that such movements of the pipe might take place during the placing of the backfill, the pipe must be weighted or secured permanently in place by such means as will prove effective. If crushed rock fill beneath the pipe is necessary for stability, it will be paid for at the unit price bid per ton of such material in place except in cases where instability is caused by neglect of the CONTRACTOR.

f. Whenever pipe laying is stopped, the end of the pipe shall be securely plugged with the manufacturer's standard plug held in place by bracing and/or blocking.

g. Elbows, plugs, dead end valves, and tees shall be firmly blocked, as shown on the Drawings, to prevent internal pressure from springing the pipe from the intended alignment, with permanent materials solidly placed without covering pipe joints. Restrained type pipe joints may be substituted for thrust blocks with the ENGINEER'S permission. Pipe shall be free of all structures, other than manholes, vaults, or planned entries into other structures.

h. No pipe shall be laid resting on solid rock, blocking or other unyielding objects. Jointing before placing in the trench and subsequent lowering of more than one section jointed together may be allowed, subject to the ENGINEER'S permission.

i. For PVC and polyethylene pipe, there shall be installed with the pipe #12 AWG insulated wire for the entire length of the pipeline. The wire shall be installed on top of the 12-inch initial backfill and weighted at locations along the wire sufficient to prevent dislodgement during the backfilling process. The wire shall be accessible at valve boxes or at locater stations along the route of the pipeline, as shown on the Drawings.

j. Concrete line markers shall be installed at property lines or at bends in the pipeline. Markers may be long markers or short markers as shown on the Drawings or as called for in these Specifications.

k. Fiberglass line markers shall be installed at valve locations or at locations as shown on the Drawings. Fiberglass markers shall be Carsonite Utility Marker, Style No. 375, or approved equal. Markers shall be equipped with the OWNER'S standard logo.

3. Installing Water Pipe in Cover Pipe

a. Installation of water pipe in cover pipe is covered in Section 31 7119 of these specifications.

B. Laying Ductile Iron Pipe

1. Bedding and Backfilling

a. The laying condition shall be Type 3 specified in ANSI/AWWA C600. The pipe shall be bedded in 4 inches minimum loose soil and the hand placed loose soil backfill lightly consolidated to the top of the pipe. "Loose soil" or "select material" is defined as native soil excavated from the trench, free of rocks, foreign materials, and frozen earth.

b. The selected material shall be hand placed to a point 12 inches above the barrel of the pipe. After the specified backfill is hand placed, rock may be used in machine placed backfill in pieces no larger than 8 inches in any dimension and to an extent not greater than 1/2 the volume of the backfill materials used.

c. The top 12 inches of backfill shall contain no rock over 1-1/2 inches in diameter nor pockets of crushed rock.

d. Larger rock fill will be allowed in wide trenches where side slopes are low enough to prevent rock from dropping over pipeline. If additional earth is required, it must be obtained and placed by the CONTRACTOR. Filling with rock and earth shall proceed simultaneously, in order that all voids be filled with earth.

e. If select material is not available from the trench excavation, or if the CONTRACTOR so desires, he may use crushed stone bedding and backfill to the top of the pipe at no extra cost to the OWNER.

f. Sufficient space, limited to a maximum of 2 feet length, shall be left out of the specified earth or crushed stone bedding to facilitate proper jointing of the pipe.

2. Installation of Pipe

a. Ductile iron pipe shall first be thoroughly cleaned at joints, then joined according to instructions and with tools recommended by the pipe manufacturer. Sufficient copies of the manufacturer's installation instructions shall be furnished the ENGINEER to permit the ENGINEER to retain 3 copies. One copy shall be available at all times at the site of the work.

b. All pipes must be forced and held together or "homed" at the joints before bolting. Pipe must be aligned as each joint is placed, so as to present as nearly true, straight lines and grades as practical, and all curves and changes in grades must be laid in such manner that 1/2 of the maximum allowable deflection shown in the pipe manufacturer's catalog is not exceeded.

c. Concrete blocking of fittings shall be as specified hereinafter in this Specification Section 02610.

d. Cutting of pipe may be done by special pipe cutters as the CONTRACTOR may elect, but the CONTRACTOR will be held responsible for breakage or damage caused by careless cutting or handling. Cut edges of the pipe shall be made smooth and a bevel formed on the exterior of the pipe barrel when using rubber gasket type pipe.

C. Laying Copper Pipe and Fittings

1. Bedding and Backfilling

a. The pipe shall be bedded in 4 inches minimum of loose soil and the hand placed backfill lightly consolidated to a depth of 12 inches above the top of the pipe. "Loose soil" or "select material" is defined as native soil excavated from the trench, free of rocks, foreign materials and frozen earth. The machine placed backfill may contain rock no larger than 8 inches in any dimension and to an extent no greater than half the volume of backfill materials used. The top 12 inches of backfill shall contain no rocks over 1-1/2 inches in diameter nor pockets of crushed rock.

2. Installing Copper Pipe and Fittings

a. Exterior copper pipe shall be laid of type K pipe, with brass compression fittings. Joints shall be neatly reamed and flared and joints drawn up firmly. Pipe shall have at least 30 inch cover. Joints shall be tested and all leakage stopped before backfilling the pipe trench.

b. Interior copper pipe shall be installed of Type L pipe, with sweat joint fittings. Pipe shall be tested and all leaks stopped before the system will be accepted. The pipe shall be free of dents and bends. The sweat joints shall present a neat appearance. All pipe shall be parallel to walls and floors with unions on all runs and branches. The pipe shall be secured to the walls and ceilings by clamps and hangers manufactured for the purpose. Strap hangers are not acceptable. Unions and valves shall be placed on each outlet to facilitate dismantling and shutting off.

c. All copper pipe shall be installed by experienced workmen.

D. Installation of Flanged or Threaded Pipe and Fittings (Interior)

1. Installation - General

a. The CONTRACTOR shall thoroughly clean the pipe and fittings before starting erection. All scale, rust and dirt shall be removed by power brushing and/or solvent cleaning.

b. The erection of piping requires that it progress from the equipment it is connected to, after the equipment has been accurately leveled and aligned, without putting a strain on same. The pipe shall be erected in a workmanlike manner with runs in the true horizontal or vertical plane or as shown on the Drawings.

c. The piping shall be supported by standard pipe hangers or piers rather than by the equipment. The pipe shall be free of all openings in walls and slabs when the final position of the piping is attained and before sealing the annular space about the pipe.

2. Flanged Joint Connection

a. All flanged type connections shall be made using an acceptable gasket and bolts. The bolts shall be tightened evenly to compress the gasket. Care is to be taken not to distort the flanges and/or piping by overtightening the bolts. Final tightening of bolts shall be done with a properly adjusted torque wrench.

3. Threaded Joint Connection

a. All threads shall be full, complete, and made with sharp dies. The ends of the pipe shall be reamed to remove all burrs and all threads must be free of rust and other foreign matter at the time the joint compound is applied. Joint thread compounds must be acceptable to the ENGINEER before use.

b. Pipe threads shall be tapered and in accordance with API Standard 5B. Not more than 3 threads at each joint may be exposed after the connection is made.

c. Unions shall be included to allow for proper assembly and disassembly of each run of pipe. Provide a union on each run of pipe connecting to threaded valves, devices, and equipment.

4. Interface with Other Products

a. When a pipe transitions from ductile iron to pipe of another material, a transition fitting shall be used. The transition material shall be a dielectric material or insulator. For pressure applications above 20 psi the transition fitting shall be a Straub pipe joint, a Dresser type coupling, or equal. For low pressure or gravity applications, the transition fitting shall be a Straub pipe joint, a Dresser type coupling, a Fernco fitting, or equal. All transition couplings shall be approved by the ENGINEER prior to installation.

E. Laying Plastic Pipe

1. Bedding and Backfill - General

a. The pipe shall be bedded in 4 inches minimum depth (for pipe sizes through 16 inches) of crushed rock meeting the requirements of Class I material as specified in ASTM D 2321, except the gradation shall be Kentucky Department of Highways standard size No. 9. For pipe sizes greater than 16 inches in diameter, the pipe bedding shall be a minimum depth of one-fourth the pipe diameter and be of the material and gradation specified previously.

b. Similar material shall be used for haunching up to the spring line of the pipe and it shall be worked under the haunch of the pipe to provide adequate side support. The crushed rock meeting the requirements of Class I (ASTM D 2321) shall then be hand placed to a point 12 inches above the top of the pipe. The remaining backfill, except for the top 12 inches which shall contain no rock over 1-1/2 inch diameter nor pockets of crushed rock, may be excavated material containing no rock over 8 inches in any

dimension. Larger rock will be allowed in wide trenches where side slopes are low enough to prevent rock from dropping over pipeline. If additional earth is required, it must be obtained and placed by the CONTRACTOR. Filling with rock and earth shall proceed simultaneously, in order that all voids may be filled with earth.

c. Sufficient space, limited to a maximum of 2 feet length, shall be left out of the bedding to facilitate proper jointing of the pipe.

d. No pipe shall be laid resting on solid rock, blocking, or other unyielding objects. Jointing before placing in the trench and subsequent lowering of more than one section may be allowed subject to the ENGINEER'S permission.

2. Installation of Polyvinyl Chloride (PVC) Pressure Pipe

a. Prior to laying, all PVC pipe shall be stored in a shaded place for protection from the direct rays of the sun. Pipe shall be distributed from storage as the work progresses as permitted by the ENGINEER.

b. The pipe, fittings, and valves shall be placed in the trench with care. Under no circumstances shall pipe or other materials be dropped or dumped into the trench. The pipe shall not be dragged in a manner which would cause scratching of the pipe surface. An excessive amount of scratching on the surface of the pipe will be considered cause for rejection.

c. Sufficient copies of the pipe manufacturer's instructions for installing the pipe and accessories shall be furnished the ENGINEER by the CONTRACTOR to permit the ENGINEER to retain 3 copies. A copy is to be available at the job site at all times.

d. Concrete blocking of fittings, as hereinafter specified, shall be required for PVC pipe with slip joints and rubber gaskets.

e. All dirt, dust and moisture shall be removed from the bell and spigot ends of pipes to be jointed. Insert gasket in bell. Apply the lubricant to spigot and gasket being careful to keep both ends free of dirt. The joint shall be homed to stop mark on spigot end of pipe. All jointing shall be done in accordance with pipe manufacturer's recommendations.

f. All cutting of the pipe shall be done in a neat and workmanlike manner with the least amount of waste of pipe involved and without damage to existing or new lines. A fine tooth saw, tubing cutter or similar tool can be used to cut the pipe. Cut must be

square and ragged edges removed with a cutting tool and/or file. A bevel or taper on the exterior of each spigot is required.

3. Installation of Polyethylene Pressure Pipe

   a. Polyethylene pipe for water lines or force mains shall be joined using tools and equipment specifically manufactured for use with polyethylene pipe. Heat fusion temperature, heating time and cooling time shall be per the pipe manufacturer's requirements. Pouring of water on completed joints to speed cooling will not be allowed.

   b. The pipe shall be snaked into the trench, employing the natural snaking tendency of the pipe. All short radius bends shall be made with fittings rather than bending the pipe. The pipe will be rejected if it contains kinks and gouges or gouges/cuts penetrating to a depth of 10 percent of the wall thickness.

   c. Sufficient copies of the pipe manufacturer's instructions for installing the pipe and accessories shall be furnished the ENGINEER by the CONTRACTOR to permit the ENGINEER to retain 3 copies. A copy is to be available at the job site at all time.

   d. Because of the high coefficient of expansion of polyethylene, the pipe shall not be attached to rigid structures at the ends until at least 48 hours have elapsed after backfilling and the pipe temperature has had an opportunity to stabilize.

4. Installing Polyethylene Pipe for Water Service

   a. The pipe shall be bedded in 4 inches minimum of loose soil and the hand placed backfill lightly consolidated to a depth of 12 inches above the top of the pipe. "Loose soil" or "select material" is defined as native soil excavated from the trench, free of rocks, foreign materials and frozen earth. The machine placed backfill may contain rock no larger than 8 inches in any dimension and to an extent no greater than half the volume of backfill materials used. The top 12 inches of backfill shall contain no rocks over 1-1/2 inches in diameter nor pockets of crushed rock.

   b. Polyethylene pipe for water services shall have the same outside diameter as copper tubing and shall be compatible for flared compression fittings. The joints to brass fittings shall be made by cutting the pipe with a tube cutter, keeping it clean and square, thence flaring the pipe and completing the joining in accordance with the manufacturer's instructions (a copy of the instructions shall be at the job site at all times). All joints shall be tested and all leakage stopped before backfilling the pipe trench.

c. The pipe shall be snaked into the trench, employing the natural snaking tendency of the pipe. All short radius bends shall be made with fittings rather than with the pipe alone. The pipe shall be bent to a radius of not less than 12 inches.

d. The pipe will be rejected if it contains kinks and gouges.

F. Installation of Water Service Accessories

1. Water Service Meters

a. Water service meters and accessories shall be installed as shown on the Drawings, with meter box centered over the meter.

b. The location of water service connections will be determined in the field, as the work progresses, thereby necessitating the use of pipe saddles and the appropriate tapping equipment. Earth backfill shall be thoroughly tamped around meter boxes to prevent subsequent movement.

2. Air Valves and Corporation Stops

a. The location of air valve assemblies, while being noted on the Drawings, could possibly be shifted in actual construction. For this reason, the same statements relative to the methods of installation of meters and water service connections apply to the installation of air valve assemblies. Air valve assembly boxes shall be installed in the same manner as water meter boxes except that the box will be located slightly off center of the air valve, in order to give better access to the stopcock between the valve and water main.

b. Corporation stops, as shown on the Drawings, are required between the water main and the meter, and between the main and the air valve assembly.

G. Installation of Fire Hydrants

1. Fire hydrants shall be installed in the general location as shown on the Drawings. Exact location shall be determined in the field. Hydrants shall be set such that the lowest nozzle shall be high enough above the ground to allow the uninhibited 360 degree swing of a 15-inch hydrant wrench.

2. Hydrant drainage pits shall be excavated below the hydrant to the depth shown on the Drawings. Crushed stone drainage media shall be of the size shown on the Drawings. Hydrant shall be set vertical and anchored as hereinafter specified.

3. Hydrants installed on this project shall be anchored to prevent the hydrant from blowing off the feeder line when suddenly opened or closed. Likewise, the hydrant pilot valve shall be anchored to prevent blowoff when the hydrant is removed. The CONTRACTOR shall anchor the hydrant and pilot valve utilizing one of the following procedures:

    a. Where the hydrant is located immediately adjacent to the water main, install all thread rods from the main line branch tee to the valve inlet and from the valve outlet to the mechanical joint of the hydrant inlet piece.

    b. Provide locked mechanical joint and/or restrained joint piping from the main to the hydrant including the main line tee.

    c. Use method a or b from the water main to the pilot valve and provide a concrete thrust block on the hydrant.

    d. Method b may not be used when the hydrant feed line is PVC pipe.

4. The additional cost of providing all-thread rods, locked mechanical joint pipe and fittings, restrained joint pipe and fittings, and/or the concrete thrust block at the hydrant shall be included in the CONTRACTOR'S unit price bid for the hydrant.

H. Blocking of Pipe at Bends and Ends

1. Horizontal Bends

    a. Concrete backing and/or blocking required at bends in the horizontal plane shall be accomplished per detail on the Drawings. The square footage of blocking area shall be obtained from Tables "A" and "B" through the following procedure:

        Step No. 1 - From Table "A," select type soil and bearing area factor for particular fitting to be blocked.

        Step No. 2 - From Table "B," select multiplier to be used for the size pipe being blocked and its test pressure.

        Step No. 3 - Calculate actual bearing area required by multiplying bearing area factor from Table "A" by multiplier from Table "B" (e.g. - 16 inch tee with 250 psi test pressure in sandy clay - 9.42 x 1.78 = 16.7 S.F. of bearing area required). Bearing area shall in no case be less than the minimum shown in Table "B."

TABLE "A"

Type Soil	Soil Bearing Pressure (PSF)	Bearing Area Factor for Degree of Bend (Square Feet) 90˚ Plug/Tee	45˚	22 1/2˚	11 1/4˚
Sandy Clay	3,000	13.33	9.42	7.21	3.68	1.85
Hard Clay	6,000	6.66	4.71	3.61	1.84	0.92
Shale	12,000	3.33	2.36	1.80	0.92	0.46
Solid Rock	16,000	2.50	1.77	1.35	0.69	0.35

TABLE "B"

Pipe Dia. (In.)	Min. Bearing Area (S.F.)	Multiplier for Pipe Test Pressure (TP) (TP) 350 psi	(TP) 300 psi	(TP) 250 psi	(TP) 200 psi	(TP) 150 psi	(TP) 100 psi	(TP) 50 psi
4	1.0	0.16	0.13	0.11	0.09	0.07	0.04	0.02
6	1.0	0.35	0.30	0.25	0.20	0.15	0.10	0.05
8	1.0	0.62	0.53	0.44	0.36	0.27	0.18	0.09
10	1.0	0.97	0.83	0.69	0.56	0.42	0.28	0.14
12	1.3	1.40	1.20	1.00	0.80	0.60	0.40	0.20
14	1.5	1.91	1.63	1.36	1.09	0.82	0.54	0.27
16	1.8	2.49	2.13	1.78	1.42	1.07	0.71	0.36
18	2.3	3.15	2.70	2.25	1.80	1.35	0.90	0.45
20	2.5	3.89	3.33	2.78	2.22	1.67	1.11	0.56
24	3.6	5.60	4.80	4.00	3.20	2.40	1.60	0.80
30	5.2	8.75	7.50	6.25	5.00	3.75	2.50	1.25
36	7.0	12.60	10.80	9.00	7.20	5.40	3.60	1.80
42	9.1	17.15	14.70	12.25	9.80	7.35	4.90	2.45
48	11.4	22.40	19.20	16.00	12.80	9.60	6.40	3.20
54	13.5	28.35	24.30	20.25	16.20	12.15	8.10	4.05
60	16.0	35.00	30.00	25.00	20.00	15.00	10.00	5.00

b. Consideration will be given to the use of restrained type mechanical joint pipe and fittings in lieu of concrete blocking. Use of the restrained joint pipe and fittings is subject to review and acceptance by the ENGINEER of the locking-method and adequacy of design for pressures involved.

2. Vertical Bends

a. The use of vertical bends in lieu of extra depth trenching shall be subject to permission by the ENGINEER.

b. Where the CONTRACTOR elects to use vertical bends, or where vertical bends are called for on the Drawings, the CONTRACTOR shall submit the blocking design, including calculations, to the ENGINEER for review and acceptance. Anchorages shall be designed to resist thrusts caused by the internal test pressure in the pipe. Protection against corrosion shall be inherent in the design.

I. Supplemental Backfilling Information

1. General

a. Excavated materials from trenches, tunnels, and structure excavation in excess of quantity required for trench backfill or site regrade, shall be disposed of by the CONTRACTOR. It shall be the responsibility of the CONTRACTOR to obtain location or permits for its disposal. The price bid for trench excavation and backfill, or site excavation and regrade, shall include the cost of disposition of excess excavated materials, as set forth herein, with no additional compensation being allowed for hauling.

b. For water line and sewage force main contracts where sod is destroyed in areas maintained equivalent to residence yards, it shall be replaced on slightly ridged backfill on trench, and where destroyed in areas adjacent to the trench, it shall be replaced by the CONTRACTOR with fresh sod, all of which will be paid for at a unit price bid per foot of pipeline. The timing of resodding shall be controlled by the ENGINEER. Ground shall be prepared and fertilized as herewith specified for seeded areas. In small patches, supplying of 3 inches of topsoil and raking may be substituted for disking.

c. For plant or site based contracts, sodding shall be placed to the extent shown on the Drawings. Refer to Section 32 9200 of these Specifications for detailed instructions for the placement of sod. The cost for sodding of site based areas shall be included in the lump sum bid for the project.

d. Where pastures, thin grass or cover crops are destroyed by trenching, laying, backfilling, or tunneling operations, surface shall be prepared by disking, fertilizing, and seeding, as specified in Section 32 9200. Seeding and fertilizing shall be included in the price for trenching and backfilling. The timing of this operation

shall be controlled by the ENGINEER. Requirements of the Department of Highways for reseeding shall take precedence over these Specifications where they are involved.

e. No extra charge shall be made for backfilling of any kind, except as specified. Backfilling shall be included as a part of the price for trenching. No extra charge shall be made for supplying outside materials for backfill except where fills above existing ground are necessary and payment is designated on Drawings or in Specifications. If backfilling of the trench or surface restoration is not properly completed, a proportionate part of the unit price for trenching shall be retained from payment estimates.

f. Before completion of the Contract, all backfills shall be reshaped, holes filled, and surplus materials hauled away and all permanent walks, street, driveways, and highway paving and sod replacement (if such surface replacement items are included in the Contract) and reseeding performed.

g. Backfill material must be uniformly ridged over trench, and excess hauled away. Ridged backfill shall be confined to the width of the trench and not allowed to overlap onto firm original earth, and its height shall not be in excess of needs for replacement of settlement of backfill.

h. All rock, including crushed rock or gravel from construction, must be removed from yards and fields. Streets and walks shall be broomed to remove all earth and loose rock immediately following backfilling.

2. Special Requirements

a. In case of street, highway, railroad, sidewalk, and driveway crossings or within any roadway paving, or about manholes, valve and meter boxes located in such paving, the following backfill material and procedure is required.

b. The pipe shall be bedded in 4 inches minimum depth (for pipe sizes through 16 inches) of crushed rock meeting the requirements of the Kentucky Department of Highways standard size No. 9. For pipe sizes greater than 16 inches in diameter, the pipe bedding shall be a minimum depth of 1/4 the pipe diameter and be of the material and gradation specified previously.

c. Similar material shall be used for haunching up to the spring line of the pipe, and it shall be worked under the haunch of the pipe to provide adequate side support. The crushed rock shall then be hand placed to a point 12 inches above the top of the pipe.

d. After the above bedding and selected backfill have been placed, fill trench to within 6 inches of the surface with Kentucky Department of Highways No. 57 crushed stone, uniformly distributed, or other gradation acceptable to the ENGINEER. In order to accommodate compacted temporary surfacing it may be necessary to bulkhead or otherwise confine the stone fill at the open end of the trench.

e. Temporary surfacing of street, highway, railroad, sidewalk, and driveway crossings, or within any roadway paving, or about manholes, valve and meter boxes located in such paving, shall consist of 6 inches compacted dense graded aggregate as specified under Section 32 1123 for temporary walkway or road surfacing, placed and compacted in the trench. Compaction shall be accomplished by methods which shall be sufficient to confine stone to the trench under normal traffic. Backfills shall be maintained easily passable to traffic at original paving level until acceptance of project or replacement of paving or sidewalks.

f. Railroad Company and Department of Highways requirements in regard to backfilling will take precedence over the above general specifications where they are involved.

J. Cut-Ins, Tie-Ins, and Cutting and Plugging

1. The OWNER shall not be responsible for extra costs of cut-ins, tie-ins, cutting and plugging, due to water not being entirely cut off by the existing water main valves.

2. A cut-in is defined as the removal of one section of existing pipeline (2 cuts of pipe) and insertion of one or more new pipeline connections therein.

3. A tie-in is defined as the removal of an existing plug or cap and the connecting of the new pipeline into the existing pipeline or fitting or valve at the joint opened by such removal.

4. A cutting and plugging is defined as the cutting and installation of a plug in an existing line.

3.03 FIELD QUALITY CONTROL

A. Testing Polyvinyl Chloride (PVC) Pressure Pipe During Construction Period

1. Prior to pressure testing the pipe shall be center loaded with backfill to prevent arching and whipping under pressure. Center loading shall be done carefully so that joints will be completely exposed for examination during testing unless conditions warrant complete backfill before testing.

2. During the general construction period the following pressure testing procedure shall be followed (on sections that can be separately isolated):

    a. After the PVC pipe is assembled in the trench a test of not more than 30 percent above the system's anticipated working pressure shall be applied with either air or water. After 2 consecutive tests have been performed without any failure, the CONTRACTOR at his option and with the ENGINEER'S permission may discontinue testing until the system is completed. Testing shall then be performed as outlined herein in this Section.

B. Testing Water and Sewage Force Main Piping for Leakage

1. The CONTRACTOR will be required to test all pipelines and appurtenances with water. The maximum test pressure, measured at the lowest elevation of the pipeline being tested, shall be the pressure class of the pipe unless a specific test pressure is shown on the Drawings.

2. Prior to testing, the line shall be filled with water and any entrapped air in the line removed. This may be accomplished at a service tap for water service or air release valve. In any case, the CONTRACTOR shall be responsible for removal of air from the system at no additional cost to the OWNER.

3. When the line or section being tested is pumped up to the required pressure, it shall be valved off from the pump and a pressure gauge placed in the line. The pressure drop in the line, if any, shall be noted. If no pressure drop is noted in 4 hours, the ENGINEER, at his discretion, may accept the line or section as being tested, or he may require the test run the full 24 hours.

4. At the end of the 24 hour test period, the pressure shall be recorded. If there is a drop in pressure, the CONTRACTOR will be required to pump the section being tested up to initial test pressure and maintain that pressure for 24 hours, measuring the amount of water required to accomplish this. The line will not be accepted until the leakage shall prove to be less than 10 gallons per inch diameter per mile of pipe per 24 hours. The 24 hour test shall be charted by timed pressure recorder.

5. Should there be leakage over the allowable amount, the CONTRACTOR will be required to locate and repair the leaks and retest the section.

6. If the leakage of a section of pipeline being tested is below the allowable amount, but a leak is obvious, in the opinion of the ENGINEER, due to water at the surface of the ground, or any other means of determining a leak, the CONTRACTOR will be required to repair those leaks.

7. The CONTRACTOR shall furnish meter and suction tank, pipe test plugs, and bypass piping, and make all connections for conducting the above tests. The pumping equipment used shall be centrifugal pump, or other pumping equipment which will not place shock pressures on the pipeline. Power plunger or positive displacement pumps will not be permitted for use on closed pipe system for any purpose.

8. Inspection of pipe laying shall in no way relieve the CONTRACTOR of the responsibility for passing tests or correcting poor workmanship.

C. Disinfection (Water Mains and Services)

1. Upon completion of the work and cleaning up, and prior to final acceptance, the CONTRACTOR shall disinfect all water lines constructed which are to carry treated water.

2. Prior to starting disinfection, all water mains must be thoroughly flushed to remove mud, rocks, etc. Disinfection will then be accomplished by the adding of a chlorine solution while filling the main to obtain the initial 50 ppm of chlorine. The CONTRACTOR shall supply all equipment, labor, etc., necessary for flushing and disinfecting the mains. The CONTRACTOR shall submit, in writing, to the ENGINEER, the method he proposes to use for adding the chlorine.

3. The calcium hypochlorite granule or tablet method shall not be used. The placement of small amounts of disinfectant material in the main during construction will not be allowed.

4. Disinfection shall be accomplished by filling the new and/or repaired portions of the system with water having a chlorine content of at least 50 parts per million and at the end of a 24 hour contact time a residual of at least 25 parts per million shall remain. At the end of the 24 hour contact period, all the sterilized surfaces and areas shall be thoroughly flushed from the water system. Chlorinated water shall be disposed of in accordance with 401 KAR 5:031 and 8:020, which state that the allowable in stream concentration of chlorine is 10 ug/l, which is equal to 0.01 mg/l. The CONTRACTOR shall submit, in writing to the ENGINEER, the method he proposes for dechlorinating. Recommended chemicals, as given in AWWA C651, are sulfur dioxide, sodium bisulfate, sodium sulfite, and sodium thiosulfate.

5. For tie-ins to an existing system such as tapping valves or direct cut-in, disinfection shall, at the ENGINEER'S discretion, consist of thoroughly cleaning the new part(s) with a solution containing not less than 200 mg/l (ppm) chlorine.

6. After initial disinfection and flushing, the OWNER will collect water samples for bacteriological testing. A core zone, which includes up to the

first 1/2 mile, shall be established. Two samples shall be taken from the core zone. Additionally, 1 sample taken from each mile of new distribution main shall be taken for analysis. A new or routine replacement main shall not be placed in service until negative laboratory results are obtained on the bacteriological analyses. Sample bottles shall be clearly identified as "special" construction tests. If any of the samples are found to be positive or contain confluent growth, the CONTRACTOR shall repeat the disinfection procedure until the required numbers of negative samples are obtained.

7. The new water main(s) shall not be accepted by the OWNER for operation until the above sterilization procedures have been completed. The cost of sterilization/dechlorination procedures shall be incorporated into the CONTRACTOR'S unit price and/or lump sum bid, as the case may be.

3.04 BASIS OF PAYMENT

A. Excavation and Backfilling

1. Trenching, Laying, and Backfilling Pipelines

a. Unit Price Contracts

(1) Payment for trenching and backfilling for pressure lines shall be included in the unit price bid for furnishing and installing the pipe, measured by the linear feet installed, including fittings and accessories length.

b. Lump Sum Contracts

(1) The CONTRACTOR'S lump sum bid shall include all costs for trenching, laying and backfilling pipelines.

2. Solid Rock Excavation

a. Classified Excavation

(1) Rock excavation shall be paid for at an extra unit price per cubic yard for extra cost of its excavation over that for excavating earth. Therefore, its quantity will not be subtracted from earth excavation quantities.

b. Unclassified Excavation

(1) Excavation shall be unclassified and the cost of all excavation of whatever nature and state, including solid rock, shall be included in the CONTRACTOR'S unit price bid for each item of construction requiring excavation or included in the lump sum bid for such type contracts.

3. Search and Extra Depth Trench Excavation

   a. "Search" trench excavation shall be the actual measured excavation within limits as acceptable to the ENGINEER.

   b. "Extra Depth" trench excavation shall be the calculated yardage below the lowest point of excavation which would normally have been required for construction.

   c. Trench width limitations for either condition shall be as listed in the following table:

For 6" Pipe 2'-6"	For 16" Pipe 2'-11"	For 36" Pipe 5'-6"
For 8" Pipe 2'-9"	For 18" Pipe 3'-2"	For 42" Pipe 6'-0"
For 10" Pipe 2'-9"	For 20" Pipe 3'-5"	For 48" Pipe 6'-6"
For 12" Pipe 2'-9"	For 24" Pipe 3'-8"	For 54" Pipe 7'-0"
For 14" Pipe 2'-9"	For 30" Pipe 4'-4"	

   d. The work of uncovering and backfilling required for locating existing sewers, water lines and other existing facilities for avoidance in location of proposed pipelines where such uncovering and backfilling is not within trench for improvements, shall be paid for at a price per cubic yard for such excavation actually removed and backfilled under item for “Search or Extra Depth Trench Excavation.” Such payment does not include uncovering existing utility lines for their protection during or after trenching operations for the proposed pipeline.

   e. Where pipelines, force mains and sewers are laid in the same trench, the CONTRACTOR shall receive full trenching and backfill unit prices for each pipeline, force main and sewer so laid, the same as if laid in widely separated trenches.

4. Mechanical Tamping

   a. Mechanical tamping is defined as backfill placed and compacted by power driven mechanical equipment to a greater density than can be achieved by natural settlement or hand tamping methods. Mechanical tamping will be required when ordered by the ENGINEER with payment by the cubic yard so compacted. Measurement, but not actual extent of the mechanical tamping, shall be limited by the numerical maximum allowable trench width (for each size pipe) as shown in the table listed under "Search and Extra Depth Trench." Payment for mechanical tamping shall not

include the specified bedding, haunching, or initial backfill required above and below the top of pipe.

B. Tunneling, Boring or Jacking

1. Permanent Tunnels

a. The payment for permanent tunnels shall be the length measured along its centerline from the entrance face on one side to the exit face on the other side of the tunnel. Payment per linear foot for each size tunnel shall include excavation, tunnel liner, pressure grouting, tunnel subgrade, closure plates and backfilling, complete.

2. Temporary Tunnels

a. Payment for temporary tunnels shall be made per linear foot based on the measured distance along the centerline of tunnel from the inlet face on one side to the outlet face on the other side of the tunnel. Payment shall include all excavation, backfilling and all sheeting and shoring of tunnel, regardless of whether removed.

3. Boring or Jacking

a. In unit price Contracts, usable holes either bored or jacked shall be paid for per linear foot of hole actually bored or jacked, according to the diameter of the hole required, measured along the centerline from the point of entrance on one side to the point of exit on the other side. When cover pipe is installed inside the bore, boring or jacking and cover pipe shall be paid per linear foot based on the length of the cover pipe installed, according to the diameter of the cover pipe required.

C. Trench and Pipe Stabilization

1. Extra Excavation

a. Extra excavation required for trench or pipe stabilization shall be paid by the cubic yard so excavated under the item "Search and/or Extra Depth Trench Excavation" based on the limitations for that item.

2. Crushed Stone for Trench Stabilization

a. Crushed stone ordered by the ENGINEER for trench stabilization shall be as specified in Section 32 1123 of these Specifications and paid by the ton so placed.

3. Crushed Stone for Pipe Bedding

a. Additional crushed stone bedding ordered by the ENGINEER for pipe stabilization shall be as specified in Section 32 1123 of these Specifications and paid by the ton so placed.

4. Plain or Reinforced Concrete Arch

a. Plain or reinforced concrete arch called for on the Drawings and/or ordered by the ENGINEER shall be paid for by the linear foot of pipeline upon which it is placed. The Form of Proposal will indicate which method is to be used.

5. Plain or Reinforced Concrete Cradle

a. Plain or reinforced concrete cradle called for on the Drawings and/or ordered by the ENGINEER shall be paid for by the linear foot so placed.

D. Water Lines or Sewage Force Mains

1. Unit Price Contracts

a. Water Lines or Sewage Force Mains

(1) Payment for furnishing, trenching, bedding, laying, and backfilling water lines or force mains shall be included in the unit price bid per linear foot of pipe laid, including length of fittings and valves, unless same are included in lump sum portions or assemblies noted on the Drawings. However, payments will not be made for branch lengths of fittings within 2.5 feet of edge of main trench. The extra cost of trenching in difficult locations, such as stream, railroad, and highway crossings, if not covered in other contract unit prices, shall be included in unit price for furnishing, trenching, bedding, laying, and backfilling the pipe.

(2) All blowoff or vent branches will be measured as pipe from center of connecting tee to end of pipe.

(3) In the case of unit price contracts, ductile iron fittings, laid outside lump sum assemblies, will be included in the unit price bid per linear foot of pipe laid, including the length of fittings and valves, for the pipe in which the fitting is installed. If stated otherwise in the Special Conditions, ductile iron fittings, laid outside lump sum assemblies, will be paid for by the pound of body castings, without joint accessories, at the weights listed in ANSI/AWWA

C110/A21.10 or ANSI/AWWA C1534/A21.53 in the case of ductile iron compact fittings.

2. Lump Sum Contracts

a. All work shall be included in the CONTRACTOR'S lump sum bid.

E. Excess Materials

1. The unit prices for trench excavation, tunneling and backfill shall include the cost of disposition of excess excavated materials.

F. Valves

1. The unit price bid for the installation of valves shall include valve boxes, the cost of the concrete collar required around the valve boxes and extension stems if required.

G. Testing and Purging

1. The unit price bid for installing pressure lines shall include cleaning, purging, and testing the line.

H. Blocking of Bends and End of Pipe

1. The payment for blocking of bends and ends of pipes shall be included in the price bid for furnishing and laying the pipe.

I. Disinfection and Dechlorination

1. The required disinfection of pipelines followed by disposal of the chlorinated water used in the disinfection process shall be included in the price bid for furnishing and laying the pipe.

J. Tracing Wire or Tape

1. The cost of tracing wire or tape installed with nonmetallic pipe shall be included in the price bid for furnishing and installing the pipe.

END OF SECTION

***

SECTION 33 4213

STORM SEWER

PART 1 GENERAL

1.01 SUMMARY

A. The work covered by this section shall consist of furnishing, laying, jointing storm sewer pipe and fittings, and furnishing and installation of manholes, catch basins, area drains, and other structures incidental to the construction of storm sewers.

1.02 RELATED SECTIONS

A. Section 31 2000–Moving

B. Section 03 3000–Cast-in-Place Concrete (Minor Structures)

PART 2 PRODUCTS

2.01 GENERAL

A. The diameter of pipe culverts and storm drains shown on the project drawings and bid schedule are based on Manning's formula for pipe flowing full, and the slopes shown on the drawings and profiles. Any alternative materials and types of pipe culverts and storm drains will be indicated on project drawings or shall be approved by ENGINEER during the bid phase of project by written addendum.

B. Storm drains shall have a Manning’s roughness coefficient (n-value) not greater than 0.013.

2.02 STORM PIPE MATERIALS

A. All piping materials shall have a Manning’s roughness coefficient (“n”) no greater than 0.013.

B. Reinforced Concrete Pipe (RCP): All concrete pipe shall be Class III (unless otherwise noted on plans) reinforced concrete pipe conforming to ASTM C76. Horizontal elliptical shall conform to C-507 Class HE-III.

C. High Density Polyethylene Pipe (HDPE), smaller than 12 inches in diameter: Pipe and appurtenances shall be high density polyethylene conforming to the requirements of AASHTO M294, Type S, or ASTM F 2306 as applicable. The pipe shall have a smooth interior and annular-corrugated exterior or profile wall pipe smooth interior for large diameter pipe. Polyethylene pipe materials shall be high-density polyethylene meeting ASTM D 3350 minimum cell classification 435400C. The use of reground materials is not allowed.

D. Polyvinylchloride (PVC) Pipe: PVC storm pipe, less than 12-inch interior diameter, shall meet the requirements of ASTM D 3034, SDR 35, with bell-and-spigot ends for gasketed joints.

E. The CONTRACTOR shall require the manufacturer or supplier furnish a certification that all materials furnished meet the above listed standards and materials specifications. A copy of this certification shall be provided to the ENGINEER.

2.03 STORM PIPE ACCESSORIES

A. Joint Materials

1. Butyl Mastic Joints or Rubber Gasket for RCP: “Soil-Tight” joints for RCP may be accomplished by using a butyl mastic sealant or a rubber gasket in the joint. The butyl mastic joint material shall meet the requirements of AASHTO M 198 (Type B). The rubber gasket joint material shall meet the physical property requirements set forth in ASTM 443.

2. Rubber “O” Ring or Profile Gasket Joints for RCP: The bell and spigot or the tongue and groove of the pipe shall be specially manufactured and prepared for the type of joint selected. The rubber gaskets shall meet the requirements of ASTM C443. Rubber gasket joints per ASTM C 443 will only be required in installations that require a watertight joint. RCP will be used on all watertight systems.

3. O-Ring Rubber Gasket Joints for HDPE: Joints shall consist of a bell and spigot type joint with an O-ring rubber gasket meeting the requirements of ASTM F477. All HDPE installations will require a rubber gasket meeting the above requirements.

4. Rubber O-Ring Gasket Joints for PVC: Joints shall consists of a bell and spigot type joint with an O-Ring rubber gasket meeting the requirements of ASTM F477.

2.04 STRUCTURES AND APPURTENANCES

A. Catch basins, manholes, and area drains shall be precast or cast-in-place concrete as shown on the Plans or as otherwise directed by the ENGINEER. Round Precast concrete structures shall meet the applicable requirements of ASTM C478 with a minimum f’c= 4,000 psi. Square and or Rectangular precast concrete structures shall meet ASTM C 913. Cast-in-place structures shall be minimum f’c=4,000 psi.

B. Grates, Frames, And Curb Castings: Conforming to the requirements of ASTM A-48, Class 30. Machining of contact surfaces will be required so that covers and grates rest securely on the frames.

C. Ladder Bars: Shall be made of aluminum alloy conforming to Federal Specification QQ-A-200/8.

D. Steps for Storm Manholes and Catch Basins: Steps shall conform to ASTM C 478 and shall be steel reinforced copolymer polypropylene with the materials conforming to the following:

1. The deformed steel reinforcing bar shall be 1/2-inch conforming to ASTM A-615 Grade 60.

2. The copolymer polypropylene shall conform to ASTM D4101 PP0344B33534Z02.

E. Mortar: Shall be composed of one part Portland cement and 2 parts sand (volumetric measure). Mortar that has been mixed for more than 30 minutes which has been retempered or which has "set" shall not be used in the work.

F. Headwalls and End Sections: Shall be precast concrete as shown on the Plans or as otherwise directed by the ENGINEER.

G. Radius Slotted Pipe Drains: Shall be galvanized steel slotted pipe, 8-inch diameter with median duty galvanized frame and galvanized steel grate meeting ADA requirements. Radius slotted pipe drain shall be as manufactured by Dura Trench or approved equal.

PART 3 EXECUTION

3.01 PIPELINE CONSTRUCTION

A. Carefully protect all existing sewers, water lines, gas lines, sidewalks, curbs, gutters, pavements, electric lines, or other utilities or structures in the vicinity of the work from damage at all times. Wherever it is necessary for the proper accomplishment of the work to repair, remove, and/or replace any utility or structure, do so in accordance with the provisions set forth in the General and Supplementary Conditions and in Division 1, General Requirements.

B. Before constructing or placing joints, demonstrate to the ENGINEER, by completing at least one sample joint, that the methods employed conform to the specifications and will provide a watertight joint if a watertight system is specified on the plans, and further that the workmen intended for use on this phase of the work are thoroughly familiar and experienced with the type of joint proposed.

C. Before placing sewer pipe in position in the trench, carefully prepare the bottom and sides of the trench, and install any necessary bracing and sheeting as provided in Section 31 2000, Earthwork.

D. Tightly stretch a mason's line or wire above the ground level, parallel to and directly above the axis of the pipe to be installed; this line is to be supported at intervals of no more than 50 feet on sewers being laid on a grade of 2 percent or more and not exceeding 25 feet for grades of less than 2 percent. Determine the exact line and grade for each section of pipe by measuring down from this line to the invert of the pipe in place. Accurately place each pipe to the exact

line and grade called for on the drawings. Furnish all labor and materials necessary for erecting batter boards. The use of laser beams will be allowed.

E. Do not allow water to run or stand in the trench while pipe laying is in progress, before the joint has completely set, or before the trench has been backfilled. Do not at any time open up more trench than the available pumping facilities are able to dewater.

F. Correct trench bottoms found to be unsuitable for foundations after pipe laying operations have been started, and bring them to exact line and grade with compacted earth as necessary.

G. Carefully inspect each piece of pipe and special fitting before it is placed, and lay no defective pipe in the trench. Pipe laying shall proceed upgrade, starting at the lower end of the grade and with the bells or grooves upgrade.

H. When bell and spigot pipe is utilized bell holes shall be excavated and be large enough to allow ample room for the pipe joints to be properly made. Cut bell holes out not more than 10 joints ahead of the pipe laying. Carefully grade the bottom of the trench between bell holes so that each pipe barrel will rest on a solid foundation for its entire length. Lay each pipe joint so as to form a close concentric joint with adjoining pipe and to avoid sudden offsets or inequalities in the flow line.

I. Jointing operations shall follow pipe laying very closely; failure to comply with this provision will result in the ENGINEER stopping all pipe laying operations until jointing operations catch up.

J. (For watertight installations only) After the joints have been completed, they shall be inspected, tested, and accepted by the ENGINEER before they can be covered. The CONTRACTOR shall immediately repair any leaks or defects discovered at any time after completion of the work. Take up any pipe that has been disturbed after joints were formed; clean and remake the joints; and relay the pipe at the CONTRACTOR'S expense. Carefully protect all pipe in place from damage until backfill operations are completed.

K. Required trench widths, bedding materials, structural backfill materials, and compaction requirements for trench backfill and structural backfill for the various piping products called for in the plan documents are set forth on the project drawing detail sheet or are included and attached at the end of this section of specifications.

L. Do not begin the backfilling of trenches until the pipe in place has been inspected and approved by the ENGINEER.

M. As the work progresses, thoroughly clean the interior of all pipe in place. On small pipe, keep a swab or drag in the pipeline, and pull forward past each joint immediately after it has been made. After laying each line of pipe, carefully inspect it, and remove all earth, trash, rags, and other foreign matter from its interior.

3.02 JOINT CONSTRUCTION

A. Butyl Mastic Joints: Apply butyl mastic material on spigot or tongue of pipe section installed prior to homing bell or groove end of next pipe section.

B. Rubber “O” Ring and Profile Joints (for Watertight Installations with RCP): Rubber gaskets and the method of joint construction shall form a flexible watertight seal and shall be in strict compliance with the manufacturer's directions and requirements. Adequately lubricate the gaskets with lubricant provided for this purpose. Pipe joints shall be adequately and thoroughly homed until gasket has seated.

C. O-Ring Rubber Gasket Joints for HDPE: O-ring rubber gasket joints shall be placed on the spigot end at least two corrugations of the spigot must insert into the bell end.

D. Rubber O-Ring Gasket Joints for PVC: O-Ring rubber gaskets installed according to ASTM D 3034 for elastomeric gasket joints.

3.03 CONNECTIONS

A. Make connections to all existing sewer lines as shown on the Plans or as directed by the ENGINEER. Make connections either by removing a section of the sewer from the existing line and inserting in the space a wye branch of the proper size or by constructing a manhole, junction box, regulator chamber, or other structure as shown on the Plans.

B. Make connections to existing manholes or inlets by cutting a hole in the wall of the existing structure, inserting a length of pipe into the hole, filling around the pipe with concrete or mortar, and troweling the inside and outside surfaces of the joint to a neat finish, without excessive projection of pipe which may impair hydraulic performance. Shape or reshape the bottoms of manholes as necessary to fit the invert of the sewer pipe.

3.04 PIPE PROTECTION

A. If pipe sewer has less than 1 foot of cover when completed, provide concrete protection as shown on the drawings or required by the ENGINEER. Place the protection in accordance with the Plans. PVC and HDPE installations must meet minimum cover as specified in Trench Details.

3.05 INSTALLATION OF STRUCTURES AND APPURTENANCES

A. Construct inlets to the sizes, shapes, and dimensions shown on the drawings or as directed by the ENGINEER to meet special conditions. Excavate for structures in accordance with the applicable provisions of Section 31 2000, Earth Moving.

B. Where inlets are to be constructed in existing pavements and/or curbs and gutters, cut such pavements and/or curbs and gutters to a neat line with an air hammer or other suitable equipment, removing no more pavement and/or curb and gutter than is essential.

C. Protect inlet foundations from damage by water and/or other causes. Place no concrete until the trench has been freed from water and/or mud, and maintain the trench in a reasonably dry condition during the progress of construction on structures.

D. When the foundation has been prepared and is approved by the ENGINEER, construct the bottom to the required line and grade. After the bottom has been allowed to set for a period of no less than 24 hours, construct the inlet thereon, taking care to form the pipe or pipes into the walls at the required elevations.

E. Set all castings accurately to line and grade in full cement mortar beds. Unless otherwise shown on the Plans and/or directed by the ENGINEER, set all grate frames no less than 1 inch below the normal grade of surrounding pavement and no less than 3 inches below the normal surface of unpaved areas; then slope the surrounding area to the grates on an approximate slope of 12:1. Mount frame in grout, secured to the top cone section to the elevation as indicated on the Plans.

F. After the frames have time to set, but in no case less than 24 hours, the space around the drainage structure shall be backfilled and compacted to the required grade and as specified in Section 31 2000, Earth Moving.

G. Install headwalls and/or end sections as shown on the Plans and in accordance with the manufacturer's specifications.

H. Install radius slotted pipe drains per manufacturer's recommendations.

1. Slotted pipe shall discharge at the end through 8-inch SDR 35 PVC pipe into drainage structure.

2. Minimum slotted pipe slope shall be 0.5 percent.

3. Slotted pipe drain shall follow the radius of the adjacent face of curb.

3.06 SUBMITTALS AND FIELD QUALITY CONTROL

A. The CONTRACTOR shall submit to the ENGINEER certification and test data to assure all pipes supplied will meet the following criteria:

B. Pipe Materials: Manufacturer shall provide certification that all materials meet or exceed Part 2 Products**,** Article 2.02 Sewer Pipe Materials. Test data regarding pipe materials and or pipe strength may be requested by the ENGINEER or OWNER.

C. Installation Deflection Requirements for HDPE

1. After the backfilling and the embankment are complete and no sooner than 7 days after the embankment is complete an independent testing firm shall be employed by the contractor to perform deflection and alignment tests on each line of pipe. For pipes 24-inch diameter and smaller this test shall be preformed using a nine-vane mandrel with a diameter that is 5 percent less than the nominal inside diameter. The mandrel vanes shall be equally spaced around the center core. The CONTRACTOR at his own expense shall replace any line of pipe, through which the mandrel does not freely pass.

2. A mandrel test as prescribed above will also be required no earlier than 30 days prior to expiration of project warranty period, release of any performance bonds, or final acceptance by the OWNER. Any line of pipe, through which the mandrel does not freely pass, shall be replaced at the CONTRACTOR's expense.

3. Pipes larger than 30-inch diameter may be tested by a mandrel as described above or they may have their deflection and alignment checked by field measurements under the supervision of the engineer. If diameter measurements are taken in lieu of pulling a mandrel through the line, then each pipe shall be measured at the joint and at a distance of 1/3 the length from each end. The CONTRACTOR at his own expense shall replace any pipe. Large diameter pipes will be checked and approved 7 days after embankment is complete and no earlier than 30 days prior to final acceptance by OWNER, expiration of warranty period, or release of any performance bond.

3.07 CLEANUP

A. After completing each section of sewer line, remove all debris and construction materials and equipment from the site of the work, grade and smooth over the surface on both sides of the line, and leave the entire right-of-way in a clean, neat, and serviceable condition.

B. The interior of catch basins, area drains, and manholes shall be cleaned of debris and excess material, the grating or cover placed, and all unused material, equipment, tools, and debris removed from the area.

SECTION 33 4922

STORM SEWER UNDERGROUND DETENTION SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. The work covered by this section shall consist of furnishing and installing a complete storm sewer underground detention system including storage chambers, connecting manifolds, inlet and discharge connections, storm water quality units and other structures, materials, and fittings incidental to the construction of storm sewer underground detention systems.

1.02 RELATED SECTIONS

A. Section 05 5600–Castings

B. Section 31 2000–Earth Moving

C. Section 32 1123–Crushed Stone and Dense Graded Aggregate (DGA)

D. Section 31 0519–Geotextiles

E. Section 31 2513–Erosion Prevention and Sediment Control

F. Section 33 4213–Storm Sewer

G. Section 03 3010–Cast-in-Place Concrete (Minor Structures)

1.03 PERFORMANCE CRITERIA

A. Provide a complete storm sewer underground detention system complying with the following:

1. Required Storage

   0.75 acre-feet for detention, elevation 984.0 to 990.0
   0.25 acre-feet for water quality, elevation 981.0 to 984.0
   0.12 acre-feet for water quality by manufactured unit

2. Storage Vertical and Horizontal Constraints

   a. Adjustments to the proposed site drainage system (storm piping connecting curb inlets to underground detention system) are allowed to accommodate the proposed detention system subject to approval by the Project Engineer. Any adjustments to the proposed site drainage system will be at no cost to the OWNER. See Item 3 below for additional constraints.

3. Traffic loading: H-20. Allow minimum 18 inches from top of storage limits to final surface elevations. Stone backfill over storage chambers shall allow for stable subgrade.

4. Storage chambers shall have positive slope to drain to the discharge locations.

5. Water quality components shall remove 80 percent TSS for the 1.45 acres of new impervious area and 10.55 acres of existing impervious area.

6. Underground detention systems shall be designed and installed to include sufficient personnel access points to allow for visual inspection and maintenance of the entire system and also comply with all applicable laws and regulations (including OSHA) regarding confined space access and occupation.

1.04 DESIGN RESPONSIBILITIES

A. The proposed underground detention system shall be designed by an engineer licensed in the Commonwealth of Kentucky based on the criteria listed above, these contract documents and applicable local, state, and federal regulations. In these specifications, the underground detention system design engineer shall be noted as “system engineer.”

B. Drawings and details for the proposed underground detention system shall be stamped by the system engineer and submitted for review. Drawings and details shall include, but are not limited to, layout and dimensions, elevations, placement and connections details, installation and backfill requirements, materials used and compatibility with its various components and the proposed storm sewer system.

PART 2 PRODUCTS

2.01 GENERAL

A. Selection of products for the storm sewer underground detention system shall be selected from manufacturer’s available products and materials based on the underground detention system design requirements and these documents.

B. Products shall be demonstrated to be compatible either by being part of a manufacturer’s comprehensive system or through the system design and drawings.

C. Products shall comply with manufacturer’s standards and recommendations and as included in this section.

D. Storage chambers and storage pipes shall be a minimum of 36 inches measured in the vertical dimension. Access shall be through standard (24 inches minimum diameter) frame and lid and access structure shall be a minimum of 48 inches interior diameter. Provide access steps.

2.02 STORAGE CHAMBER MATERIALS

A. High-Density Polyethylene (HDPE) Corrugated Wall Stormwater Collection Chambers: Chambers and appurtenances shall be approved by IAPMO Research and testing as accredited by ANSI, and be manufactured in an ISO 9001:2008 certified facility.

B. Polypropylene (PP) Corrugated Wall Stormwater Collection Chambers: Chambers and appurtenances shall comply with ASTM F 2418 and ASTM F 2787.

C. The CONTRACTOR shall require the manufacturer or supplier to furnish a certification that all materials furnished meet the above listed standards and materials specifications.

2.03 STORAGE CHAMBER ACCESSORIES

A. Joint materials listed below are for water-tight joints. If the proposed system utilizes perforated pipe or the stone backfill for storage volume, water-tight joints are not required.

1. O-Ring Rubber Gasket Joints for HDPE: Joints shall consist of a bell and spigot type joint with an O-ring rubber gasket meeting the requirements of ASTM F477. All HDPE installations will require a rubber gasket meeting the above requirements.

2. Joint materials for polypropylene (PP) corrugated wall stormwater collection chambers shall comply with manufacturer’s recommendations.

2.04 STRUCTURES AND APPURTENANCES

A. Access Lids and Frames: Conforming to the requirements of ASTM A-48, Class 30. Machining of contact surfaces will be required so that covers and grates rest securely on the frames.

B. Ladder Bars and or Steps: Shall be made of aluminum alloy conforming to Federal Specification QQ-A-200/8.

2.05 STORM WATER QUALITY UNITS

A. Provide storm water quality units compatible with system selections and of materials complying with those used for storage chambers. Units shall have necessary access points to allow for ease of maintenance, cleaning and monitoring.

B. Storm water quality units shall have documented results in meeting the Total Suspended Solids removal requirements. Supplier shall document suitability for the proposed use and ability to meet water quality removal requirements.

2.06 MISCELLANEOUS MATERIALS

A. Stone Backfill and Bedding: Provide stone backfill and bedding as recommend by the manufacturer and system engineer. If stone backfill is used for storage volume, provide washed, open graded stone to provide void requirements for the system.

B. Geotextile Filter Fabric: Where open graded stone is used for backfill, install geotextile filter fabric at stone/soil interface and around perforated piping. See Specification Section 31 0519 for geotextile requirements for woven and nonwoven materials.

PART 3 EXECUTION

3.01 GENERAL

A. Storm sewer underground detention system shall be installed per manufacturer's recommendations, the drawings and details prepared by the system engineer and the approved shop drawings. Installation of said system shall be carefully coordinated with the grading and drainage activities of the surrounding work.

B. Coordinate locations and elevations of connections to the site drainage system prior to installation of the underground detention system. Report any conflicts to the project Engineer.

C. No sediment laden storm water runoff will be allowed to discharge to the underground detention system. CONTRACTOR shall maintain erosion and sediment control measures in the contributing drainage watershed until all areas have been stabilized with vegetation or asphalt pavement.

D. The underground detention system and storm water quality units will not be accepted as completed until all areas of new construction contributing storm water runoff to the system is complete and stabilized, the non-paved areas have established vegetation, all paved areas completed and the underground storage chambers and storm water quality unit have been cleaned of all sediment and debris to as-new condition.

3.02 INSTALLATION

A. Install system according to approved system drawings and specifications.

B. Excavate and fill area to provide proper elevations and slopes to comply with approved system drawings. Removal, placement, and compaction of material to comply with Section 31 2000, Earth and Rock Work.

C. Stage grading work to prevent intrusion of sediment laden storm water runoff from entering underground detention system.

D. Install geotextile filter fabric at interface of open-graded stone and soil.

3.03 CONNECTION TO SITE DRAINAGE SYSTEM

A. Use joint materials compatible with underground detention system and site drainage system for connecting the system pipes and structures.

B. Connect proposed site drainage system only after measures are in place to prevent sediment laden storm water from discharging into the underground detention system.

3.04 SYSTEM PROTECTION

A. Provide adequate cover and project of installed materials and products. Add stone cover if required to accommodate construction traffic. Damage products and/or materials will be replaced. Replacement of damaged materials is the sole responsibility of the contractor.

3.05 SUBMITTALS AND FIELD QUALITY CONTROL

A. The CONTRACTOR shall submit to the ENGINEER certification and test data to assure all pipes supplied will meet the following criteria:

1. Storage Chamber Materials: Manufacturer shall provide certification that all materials meet or exceed Part 2 Products section 2.02 Storage Chamber Materials. Test data regarding pipe materials and or pipe strength may be requested by the ENGINEER or OWNER.

2. Installation: CONTRACTOR shall submit to the ENGINEER a certification from the system engineer that the system has been installed in compliance with the approved system design.

3.06 CLEANUP

A. After completion of system, remove all debris and construction materials from the area.

B. The interior of storage chambers and storm water quality units shall be cleaned for all sediment, trash, and other materials. Filtering medium used in the storm water quality units will be replaced or installed initially after construction in the contributing watershed has been completed.
