INVITATION FOR BIDS

UK-2563.30-8-25
Cancer Treatment Center
BAS Controls
ADDENDUM #1
10/02/2024

IMPORTANT: BID AND ADDENDUM MUST BE RECEIVED BY: 10/10/2024 @ 3:00 P.M. LEXINGTON, KY TIME

Bidder must acknowledge receipt of this and any addendum as stated in the Invitation for Bids.

ITEM #1: Questions & Answers and Modifications and Clarifications to the Bid Documents:

- Bidders are instructed to review and incorporate into their offers the attached addendum#1 from Walsh Construction Group and associated files.
- The "Group 3 drawing set" is posted in the UK Plan Room and is not included in this document as the file(s) are too large.

OFFICIAL APPROVAL
UNIVERSITY OF KENTUCKY

Addendum #01

Client	University of Kentucky Healthcare	Date	09/30/2024
Project	Cancer Treatment Center BAS Controls	UK Project #	2563.3
Solicitation #	UK-2563.30-8-25	Champlin Project #	514-6926

This addendum provides information to clarify or adjust construction items which may affect any or all trade contractors. The original documents for the referenced project are amended as noted in this addendum and made part of said documents and shall govern the work covered by the Form of Proposal. All work to be in strict accordance with the terms, stipulations and conditions of contract documents.

CLARIFICATION:
Drawings with revision clouds have changes as described below.

SUMMARY OF ATTACHMENTS

PART A - DRAWINGS:

IC100 – MECHANICAL CONTROLS – LEVEL 00

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*
2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC101 – MECHANICAL CONTROLS – LEVEL 01

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*
2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC102 – MECHANICAL CONTROLS – LEVEL 02

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE*

PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."

2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*
3. *Revise note IC29 to read "MEDICAL GAS MANIFOLD SCALES TO BE INTEGRATED AND MONITORED BY THE BAS VIA BACNET OVER MSTP CONNECTION. IF LOW WEIGHT IS DETECTED AN ALARM SHALL BE SIGNALED TO THE BAS."*

IC103 – MECHANICAL CONTROLS – LEVEL 03

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*
2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC104 – MECHANICAL CONTROLS – LEVEL 04

1. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC105 – MECHANICAL CONTROLS – LEVEL 05

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*
2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC106 – MECHANICAL CONTROLS – LEVEL 06

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*

2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC107 – MECHANICAL CONTROLS – LEVEL 07

1. *Revise note IC17 to read "REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER."*
2. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS."*

IC108 – MECHANICAL CONTROLS – LEVEL 08

1. *Revise note IC26 to read "ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK"*

IC208 – MECHANICAL CONTROLS

1. *Refer to bubbled changes on sheet.*

IC209 – MECHANICAL CONTROLS

1. *Refer to bubbled changes on sheet.*

IC210 – MECHANICAL CONTROLS

1. *Refer to bubbled changes on sheet.*

IC212 – MECHANICAL CONTROLS

1. *Refer to bubbled changes on sheet.*

IC300 – MECHANICAL CONTROLS - SCHEDULES

1. *Refer to bubbled changes on sheet*

PART B - SPECIFICATIONS:

Revised Table of Contents

Section 232923 – Variable Frequency Motor Controls

1. *New Section.*

Section 250200 – Instrumentation and Control for HVAC – UK Standards

1. *New Section.*

Section 250300 – Energy Meters

1. *New Section.*

PART C – RESPONSES TO BIDDER QUESTIONS:

See project team responses to bidder questions.

PART D – EXHIBITS

None.

Part E – SKETCHES

See BP-7 Group 3 To Bid Drawings and Combined Specs for Coordination and Reference.

PART F – UPDATED BID FORMS

None.

End of Addendum

Controls RFP Question and Response Log Respones As Of: 10/2/2024 @ 8:00 AM Through RFI # 86				
#	Question	Responder	Response	Release
1	Note I26 on multiple drawings calls for the controls contractor to provide and install building lighting controls panel. But in the RFP and on IC210 there is mention of a "lighting control vendor". Would the lighting control vendor not provide the lighting control panel and the controls contractor just integrate to that panel? Is the lighting control panel not going to be integrated via BACnet IP? Aren't BACnet IP integrations handled directly by UK's controls group?	AEI	Lighting Control Panels will be provided by the Electrical Contractor. The control panels will require integration with the BAS system for timeclock controls (provided by Controls Contractor)	
2	Is this intended to be bid like Health Education Building where it is one bid for the controls for the whole building, core & shell and Fit-Out? Or is this just intended to be a Core & Shell bid?	Walsh	This is for the entire building, not including the parking garage. The parking garage is a separate project.	
3	There appears to be IC drawings pages 441-465. But these are labeled as "C&S 100% DD Review" and I do not see any IC drawings for the Fit-Out.	CMTA	The C&S 100% DD Review is in the previously issued section. That was the first time the controls IC drawings were included in a set. However, there is no different core and shell set vs fitout set. This bid is to include all work on both bid packages. Note that the IC drawings contain all of the fitout.	
4	if this is just a bid on the Core and Shell controls, what's with all the drawings provided that seem to be for the Fit-Out? These start on page 3357. There does not appear to be any additional drawings to go along with the Core and Shell control drawings (mechanical, plumbing, electrical, architectural, etc).	Walsh	See response to question 3 above and note all of the fitout information included in the IC drawing set. In Progress Fit Out Drawing Set was provided for reference to subcontractors as they are assembling their proposal.	
5	1. The stairwell pressurization fans require the related controls to be UL864. Is there a JACE/JACE panel that can meet UL864 compliance? Does UK have an example of this anywhere else on campus for reference?		Yes there is a UL 864 jace on the market from Distech or this could be tied into any approved tier 2 device that is UL 864 listed.	
6	2. Would a Johnson Controls SNE Tier 1 panel that is UL864 compliant be allowed to be furnished in order to meet UL864 compliance for the stairwell pressurization? All tier 1 devices that do not need UL864 compliance can remain JACEs.		No, provide panel from list of approved products per the specifications.	
7	3. Is the BAS contractor responsible for furnishing a fire fighters panel for stairwell pressurization? Or will this be provided by others?		Yes, BAS contractor to provide as shown on the drawings.	
8	4. Can we move the fire fighter panel, UL864 controls, and stairwell pressurization control under the fire alarm contract and the BAS contractor monitor only these controls?		no	

9	Can we move the fire fighter panel, UL864 controls, and stairwell pressurization control under the fire alarm contract and the BAS contractor monitor only these controls?		no	
10	1. On page 232 of the RFP under 7. Scope Clarifications-Scope Specific: Item 20. States that the BAS contractor shall complete the graphics package, in the form of a formal submittal, within four weeks of contract award. Can you please clarify or give more detail as to what this graphics package is? Typically UK does all their own graphics for the BAS. Is this project different?	Walsh	No, UK is providing graphics as is typical for all UK projects. This line item will be corrected prior to issuance of subcontract to successful firm.	
11	2. On page 233 of the RFP under 7. Scope Clarifications-Scope Specific: Item 31 mentions that the BAS contract shall furnish and install thermometers and pressure gauges. Typically actual local read out thermometers and local readout pressure gauges are not provided by the BAS contractor. Temperature sensors and pressure sensors reporting to the BAS are. Please confirm if it is actually intended for the BAS contractor to furnish local read out thermometers and local readout pressure gauges.	Walsh	Correct, gauges are by division 23 contractor and sensors are by the BAS contractor. This line item will be corrected prior to issuance of subcontract to successful firm.	
12	3. On page 233 of the RFP under 7. Scope Clarifications-Scope Specific: Item 31 mentions that the BAS contractor shall install temperature sensor ports, testing ports, controls valves etc required for monitoring or providing alarms per contract documents and sequence of operations. Typically temperature sensor ports/wells and control valves are to be installed by the mechanical contractor. Please confirm that these items are the mechanical contractors responsibility.	Walsh	Confirmed, mechanical contractor will be responsible for installation of ports and welding to pipework for BAS controllers use for placement of sensors.	
13	4. The stairwell pressurization fans require the related controls to be UL864. Is there a JACE/JACE panel that can meet UL864 compliance? Does UK have an example of this anywhere else on campus for reference?	CMTA	There is a UL 864 jace on the market from Distech or this could be tied into any approved tier 2 device that is UL 864 listed.	
14	5. Would a Johnson Controls SNE Tier 1 panel that is UL864 compliant be allowed to be furnished in order to meet UL864 compliance for the stairwell pressurization? All tier 1 devices that do not need UL864 compliance can remain JACEs.	CMTA	No, provide panel from list of approved products per the specifications.	
15	6. Is the BAS contractor responsible for furnishing a fire fighters panel for stairwell pressurization? Or will this be provided by others?	CMTA	Yes, BAS contractor to provide as shown on the drawings.	
16	7. Is the BAS contractor responsible for furnishing the “Water Meter associated with the irrigation water loop for both exterior and interior?” This is on page 235 of the RFP under 7. Scope Clarifications-Scope Specific: Item 55.	CMTA	Yes, the BAS contractor is responsible for this.	
17	8. Regarding the window shade control:		in progress	
18	a. How many control points need to be accounted for?		in progress	
19	b. How many window shade zones are there going to be?		in progress	
20	c. Will this be associated with daylight harvesting? If so, how?		in progress	
21	d. What is the sequence of operation associated with the window shade control?		in progress	

22	9. The documents state that their will be a networked elevator controls/monitoring system provided. Will this be an IP integration? If it is an IP integration aren't all IP integrations carried out by UK UEM and therefore the BAS contractor would not perform this portion of the scope of work?	CMTA	elevation integration shall be BACnet over IP.	
23	10. On page 237 of the RFP under 7. Scope Clarifications-Scope Specific: Item 68 mentions that the BAS contractor shall furnish and install all VAV Venturi valves, controls, 24 vac power, rpms, room humidity monitors, DAT sensors, etc.	CMTA	Venturi valves to be supplied by the BAS contractor installed by division 23. VAV boxes are not purchased or installed in this package. The rest of that list is to be provided and installed by BAS contractor as stated.	
24	a. Please confirm that the BAS contractor is responsible for furnishing the venturi valves.	CMTA	confirmed	
25	b. The BAS contractor should not be responsible for installing the venturi valves. Please confirm this is the responsibility of the mechanical contractor. This is also mentioned on item 69.	CMTA	This will be clarified. The BAS contractor should provide but not install the venturi valves.	
26	11. Is the BAS contractor also responsible for furnishing any reheat coils associated with the venturi valves?	CMTA	no, this is by division 23	
27	12. For the medical refrigerator/freezer monitoring. The sequence says that these medical refrigerators/freezers will be provided with an integral temperature sensing sweet.	CMTA	this will be clarified. The BAS contractor will need to provide a temp sensor capable of integrating into the BAS. Refrigerators and freezers will have a port through which the temp probe connects to.	
28	a. Is this an integration? If so, what is the communication protocol? BACnet MSTP?		in progress	
29	b. Is this just points to wire to the inputs and outputs of a controller?		in progress	
30	c. How many points are required per refrigerator/freezer?		in progress	
31	13. Note IC17 calls out the refrigerator/freezers. How do we indicate which refrigerator/freezer on the drawings is considered a "medical refrigerator/freezer" and which notes are referring to Walk-In cooler/freezers?	CMTA	They are tagged and labeled on the IC drawings	
32	14. Note IC29 mentions that the medical gas manifold scales are to be integrated and monitored by the BAS. Will this be a BACnet MSTP integration? Will this be a BACnet IP integration and if so, will UK UEM integrate this?		in progress	
33	15. Are the CRAC units going to be provided with MSTP controls for integration by the BAS contractor or BACnet IP controls to be integrated by UK UEM?	CMTA	Crac units will be provided with a factory mounted controller capable of integrating via BACnet over MSTP.	
34	16. Who is responsible for furnishing and installing the door switch associated with the air curtain controls?	CMTA	The door switch is to be provided by the air curtain manufacturer.	
35	17. Can you confirm if the BAS contractor is supposed to provide the ability to command the electric unit heaters? The sequence states for these units to operate under their own controls, but then later states that the DDC system shall have the capability to start and stop these units. The points list does not indicate command or status.	CMTA	this will be clarified. Points list will have a command and status.	
36	18. There are several points list that are titled AHU-9 points. Please clarify that these other points list have nothing to do with AHU 9. The Generator and Exhaust Fans.	CMTA	Correct, the AHU-9 designation is a typo. The points on the list are correct.	
37	19. The glycol water system controls points list is titled with baseboard heating water system. Please confirm this is a typo.	CMTA	confirmed typo	

38	20. Regarding the Fan Coil Units, will these be provided with (1) step down transformers to give power to the controller, (2) will the controls contractor have to provide a transformer, or (3) does power for the controller for the FCU's need to be provided independently of power provided to the FCU?	CMTA	fan coil units will be provided with a field mounted controller. Controls contractor shall be responsible for all low voltage power and wiring neccessary for controls integration.	
39	21. Who is responsible for 120V power to power supplies for low voltage power distribution to terminal unit controllers (VAVs and PHX valves)?	CMTA	These should all be low voltage and power supplied by BAS contractor	
40	22. Who is responsible for 120V power to BAS contractor control panels?	CMTA	There are some shown on the division 26 drawings and the division 26 contractor has those included in his scope. Any additional power needed for control panels is to be included by the BAS contractor.	
41	23. Is the BAS contractor responsible for furnishing smoke and combination fire/smoke dampers?	Walsh	no	
42	24. Is the BAS contractor responsible for providing power to smoke and combination fire/smoke dampers?	Walsh	no	
43	25. Is the BAS contractor responsible for controlling or monitoring status of smoke and combination fire/smoke dampers?	CMTA	monitoring only	
44	Please provide details as to what information is required for the 'Technical Proposal'.	Walsh	Refer to Section 4.0 of the RFP Proposal Format and Content for requirements for the Technical Proposal	
45	It is our assumption, from reading the RFP, that there are 3 separate envelopes to be submitted. (1) Financial Proposal - containing only 'Criteria 3 Financial Proposal', (1) Technical Proposal - pending confirmation of details (question No.1 submitted), and (1) RFP Response / Qualifications - containing the remaining sections: signed authentication of proposal and statement of non-collusion and non-conflict of interest form, transmittal letter, executive summary and proposal overview, criteria 1 offeror qualifications, criteria 2 services defined, criteria 4 evidence of successful performance and implementation schedule, criteria 5 other additional information. Please confirm.	Walsh	There should be 2 separate Submissions: Financial Proposal and Technical Proposal. All items that are not a direct response to Section 8.0 Financial Offer Summary, shall be included in the Technical Proposal.	
46	Note I26 on multiple drawings calls for the controls contractor to provide and install building lighting controls panel. But in the RFP and on IC210 there is mention of a "lighting control vendor". Would the lighting control vendor not provide the lighting control panel and the controls contractor just integrate to that panel? Is the lighting control panel not going to be integrated via BACnet IP? Aren't BACnet IP integrations handled directly by UK's controls group?	Walsh	Correct. The lighting controls will be bid under division 26 and BAS contractor will integrate these controls into the BAS	
47	In the bid form cost breakdown there is a line item for core and shell systems. What documents are we supposed to reference to delineate the core and shell from the fitout? Can a list of systems be provided for what is considered to be the core and shell?	Walsh	Core and shell systems are considered the major equipment located in dedicated mechanical or electrical rooms.	
Received by project team after RFI Deadline				

48	What is the fee associated with participating in the TEXTURA payment management system? Is this a flat dollar amount for contracts above a certain amount or a % of our entire contract?	Walsh	From Ex B.1 CM Unified General Conditions 8.8: Subcontractors are required to use Textura Payment Management System in accordance with Exhibit N for monthly pay applications. Subcontractor to reference Prompt Payment for Construction Contracts. Subcontractor includes in their Bid the Subcontractor Usage Fee which is equal to .22% of their contract value up to a maximum of $5,000	
49	Please clarify expectations and level of design as it relates to BIM for the Controls Bid Package		in progress	
50	Please confirm that the Controls Contractor is responsible for Design Assist Engineering		in progress	
51	Please confirm Pressure Reducing Valve will be provided by the Mechanical Contractor.		in progress	
52	Please provide mechanical schedules for VAVs.		in progress	
53	Please confirm VAV Boxes are included in Controls Contractor's Bid Package.	Walsh	VAV boxes are to be provided by Div 23 Contractor.	
54	Please provide Piping information for AHU Hot and Chilled water valves.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
55	Please provide Piping information for Humidifier control valves.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
56	Please provide Electrical Floor plan drawings.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
57	Please provide Plumbing Floor Plans drawings.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
58	Please clarify Note IC26 on IC-100. Please indicate whether the controls contractor is to furnish the lighting control panel.	Walsh	See previous answer above	
59	Please clarify Note IC27 on IC-100. Please indicate whether the controls contractor is to furnish the fire control panel.		in progress	
60	Please clarify Note IC20 on IC-100. Please indicate whether the controls contractor to install Boiler Control Panel.		in progress	
61	Please indicate which contractor is to furnish Fire/Smoke Dampers & Fire Dampers	Walsh	Dampers to be provided by Div 23 contractor	
62	Clarify which Contractor is responsible for furnishing Venturi Valves, Venturi Controls, and the Venturi Controls Wiring/Installation.	Walsh	Venturi valves to be furnished by Controls Contractor and installed by Div 23 Contractor. All controls and wiring by controls contractor.	
63	Please provide Floor area drawings locating Steam Pressure Reducing Valve System.			

64	Please provide Floor area drawings locating Lab Air Compressors.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
65	Please provide Floor area drawings locating Lab Emergency Showers.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
66	Please provide Floor area drawings locating Medical Vacuum Pump.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
67	Please provide Floor area drawings locating Gas meters.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
68	Please provide Floor area drawings locating Building Natural Gas meters.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
69	Please provide Floor area drawings Power meters.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
70	Please provide Floor area drawings locating Elevator Sump pumps.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
71	Please provide Floor area drawings locating Elevator Control system.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
72	Please provide Floor area drawings locating Fuel Oil pump.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
73	Please provide Floor area drawings locating Fire pump.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
74	Please provide Floor area drawings Domestic Water Booster pump.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
75	Please provide Floor area drawings Linear Accelerator Cooling control.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
76	Please provide Floor area drawings locating Fan Filter unit.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	

77	Please provide Floor area drawings locating Medical Gas and Medical Gas manifolds.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
78	Please provide Floor area drawings locating Refrigerators and Freezers.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
79	Please provide Floor area drawings locating Automatic Transfer Switch.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
80	Please provide Floor area drawings locating Parallel Switchgear.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
81	Please provide Floor area drawings locating 480V Switchgear.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
82	Please provide Floor area drawings locating Essential Electrical Switchgear.	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
83	Please provide Floor area drawings locating Emergency Generators	Walsh	Fit Out Interior Drawings have been provided for Reference with the original RFP documents. Core and Shell Documents to be made available, for coordination and reference, as part of an addendum.	
84	Please indicate which Contractor is responsible for 120V power to Control Panels	Walsh	Div 26 Subcontractor to provide 120V power.	
85	Please indicate which Contractor is responsible for 120V power to power supplies for low voltage power distribution to Terminal Unit Controllers	Walsh	Div 26 Subcontractor to provide 120V power.	
86	Please indicate which Contractor is responsible for network drops for Tier 1 Controllers	Walsh	Div 27 Subcontractor to provide data ports.	

TABLE OF CONTENTS

DIVISION 20 - MECHANICAL

DIVISION 21 – FIRE SUPPRESSION

DIVISION 22 – PLUMBING

DIVISION 23 – HEATING VENTILATING AND AIR CONDITIONING

END OF TABLE OF CONTENTS

SECTION 232923 – VARIABLE FREQUENCY MOTOR CONTROLS

PART 1 - SUMMARY

1.1 GENERAL

A. Section includes separately enclosed, pre-assembled, combination VFDs, rated 600 V and less, for speed control of three-phase, squirrel-cage induction motors.

1.2 DEFINITIONS

A. BAS: Building automation system.

B. CE: Conformite Europeene (European Compliance).

C. CPT: Control power transformer.

D. EMI: Electromagnetic interference.

E. IEEE: Institute of Electrical and Electronics Engineers

F. IGBT: Insulated-gate bipolar transistor.

G. LAN: Local area network.

H. LED: Light-emitting diode.

I. MCP: Motor-circuit protector.

J. NC: Normally closed.

K. NO: Normally open.

L. NRTL: National Recognized Testing Laboratory

M. OCPD: Overcurrent protective device.

N. PCC: Point of common coupling.

O. PID: Control action, proportional plus integral plus derivative.

P. PWM: Pulse-width modulated.

Q. RFI: Radio-frequency interference.

R. TDD: Total demand (harmonic current) distortion.

S. THD(V): Total harmonic distortion (voltage).

T. VFC: Variable-frequency motor controller.

1.3 ACTION SUBMITTALS

A. Product Data: For each type and rating of VFC indicated. Include features, performance, electrical ratings, operating characteristics, shipping and operating weights, and furnished specialties and accessories.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout, required working clearances, and required area above and around VFCs. Show VFC layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

B. Harmonic Analysis Study and Report: Comply with IEEE 519-2014 and NETA Acceptance Testing Specification; identify the effects of nonlinear loads and their associated harmonic contributions on the voltages and currents throughout the electrical system. Analyze possible operating scenarios, including recommendations for VFC input filtering to limit TDD and THD(V) at each VFC to specified levels. VFD manufacturer shall provide all means of mitigation of harmonic contributions, including but not limited to, harmonic filters, in order to ensure that voltage and current distortion limits are within the required ranges as indicated in Tables 1 and 2 of IEEE-519-2014. Analysis shall indicate point of common coupling.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

1.6 DELIVERY, STORAGE, AND HANDLING

A. If stored in space that is not permanently enclosed and air conditioned, remove loose packing and flammable materials from inside controllers and install temporary electric heating, with at least 250 W per controller.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation, capable of driving full load without de-rating, under the following conditions unless otherwise indicated:
   1. Ambient Temperature: Not less than 14 deg F and not exceeding 104 deg F.
   2. Ambient Storage Temperature: Not less than minus 4 deg F and not exceeding 140 deg F
   3. Humidity: Less than 95 percent (non-condensing).
   4. Altitude: Not exceeding 3300 feet.

B. Interruption of Existing Electrical Systems: Do not interrupt electrical systems in facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
   1. Notify Owner no fewer than five days in advance of proposed interruption of electrical systems.
   2. Indicate method of providing temporary electrical service.
   3. Do not proceed with interruption of electrical systems without Owner’s permission.
   4. Comply with NFPA 70E.

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for VFCs, including clearances between VFCs, and adjacent surfaces and other items.

1.8 COORDINATION

A. Coordinate features of motors, load characteristics, installed units, and accessory devices to be compatible with the following:
   1. Torque, speed, and horsepower requirements of the load.
   2. Ratings and characteristics of supply circuit and required control sequence.
   3. Ambient and environmental conditions of installation location.

B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases.

C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace VFCs that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 2 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURED UNITS

A. Manufacturers: Subject to compliance with requirements, provide product by one of the following:
   1. ABB.
   2. Allen Bradley.
   3. Yaskawa Electric America, Inc; Drives Division.

B. General Requirements for VFCs: Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 508C.

C. Application: variable torque.

D. VFC Description: Variable-frequency power converter (rectifier, dc bus, and IGBT, PWM inverter) factory packaged in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.
   1. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
   2. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to authorities having jurisdiction.

E. Design and Rating: Match load type, such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.

F. Output Rating: Three-phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range; maximum voltage equals input voltage.

G. Unit Operating Requirements:
   1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFC input voltage rating.
   2. Input AC Voltage Unbalance: Not exceeding 3 percent.
   3. Input Frequency Tolerance: Plus or minus 3 percent of VFC frequency rating.
   4. Minimum Efficiency: 97 percent at 60 Hz, full load.
   5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
   6. Minimum Short-Circuit Current (Withstand) Rating: 100 kA.
   7. Ambient Temperature Rating: Not less than 14 deg F and not exceeding 104 deg F.
   8. Ambient Storage Temperature Rating: Not less than minus 4 deg F and not exceeding 140 deg F
   9. Humidity Rating: Less than 95 percent (non-condensing).
   10. Altitude Rating: Not exceeding 3300 feet.
   11. Vibration Withstand: Comply with IEC 60068-2-6.
   12. Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
   13. Starting Torque: Minimum 100 percent of rated torque from 3 to 60 Hz.
   14. Speed Regulation: Plus or minus 5 percent.
   15. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.

16. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.

H. Inverter Logic: Microprocessor based, 32 bit, isolated from all power circuits.

I. Isolated Control Interface: Allows VFCs to follow remote-control signal over a minimum 40:1 speed range.
   1. Signal: Electrical.
   2. Signal: Pneumatic.

J. Internal Adjustability Capabilities:
   1. Minimum Speed: 5 to 25 percent of maximum rpm.
   2. Maximum Speed: 80 to 100 percent of maximum rpm.
   3. Acceleration: 0.1 to 999.9 seconds.
   4. Deceleration: 0.1 to 999.9 seconds.
   5. Current Limit: 30 to minimum of 150 percent of maximum rating.

K. Self-Protection and Reliability Features:
   1. Input transient protection by means of surge suppressors to provide three-phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.
   2. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
   3. Under- and overvoltage trips.
   4. Inverter overcurrent trips.
   5. VFC and Motor Overload/Overtemperature Protection: Microprocessor-based thermal protection system for monitoring VFCs and motor thermal characteristics, and for providing VFC overtemperature and motor overload alarm and trip; settings selectable via the keypad; NRTL approved.
   6. Critical frequency rejection, with selectable, adjustable deadbands.
   7. Instantaneous line-to-line and line-to-ground overcurrent trips.
   8. Loss-of-phase protection.
   9. Reverse-phase protection.
   10. Short-circuit protection.
   11. Motor overtemperature fault.

L. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.

M. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped, unless "Bidirectional Autospeed Search" feature is available and engaged.

N. Bidirectional Autospeed Search: Capable of starting VFC into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.

O. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.

P. Integral Input Disconnecting Means and OCPD: NEMA KS 1, non-fusible switch, with power fuse block and current-limiting fuses with pad-lockable, door-mounted handle mechanism.

   1. Disconnect Rating: Not less than 115 percent of VFC input current rating.
   2. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFC input current rating, whichever is larger.
   3. Auxiliary Contacts: NO/NC, arranged to activate before switch blades open.
   4. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.
   5. NC alarm contact that operates only when circuit breaker has tripped.

2.2 CONTROLS AND INDICATION

A. Status Lights: Door-mounted LED indicators displaying the following conditions:
   1. Power on.
   2. Run.
   3. Overvoltage.
   4. Line fault.
   5. Overcurrent.
   6. External fault.

B. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.
   1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
   2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
      a. Control Authority: Supports at least four conditions: Off, local manual control at VFC, local automatic control at VFC, and automatic control through a remote source.

C. Historical Logging Information and Displays:
   1. Real-time clock with current time and date.
   2. Running log of total power versus time.
   3. Total run time.
   4. Fault log, maintaining last four faults with time and date stamp for each.

D. Indicating Devices: Digital displayand additional readout devices as required, mounted flush in VFC door and connected to display VFC parameters including, but not limited to:
   1. Output frequency (Hz).
   2. Motor speed (rpm).
   3. Motor status (running, stop, fault).
   4. Motor current (amperes).
   5. Motor torque (percent).
   6. Fault or alarming status (code).
   7. PID feedback signal (percent).
   8. DC-link voltage (V dc).
   9. Set point frequency (Hz).
   10. Motor output voltage (V ac).

E. BAS Interface: Factory-installed hardware and software to enable the BAS to monitor, control, and display VFC status and alarms. Allows VFC to be used with an external system within a multi-drop LAN configuration; settings retained within VFC's nonvolatile memory.
   1. Network Communications Ports: Ethernet.
   2. Embedded BAS Protocols for Network Communications: ASHRAE 135 BACnet ; protocols accessible via the communications ports.

2.3 LINE CONDITIONING AND FILTERING

A. Input Line Conditioning: provide 3% input filtering, to limit TDD and THD(V) at the defined PCC per IEEE 519.

B. EMI/RFI Filtering: CE marked; certify compliance with IEC 61800-3 for Category C2.

2.4 ENCLOSURES

A. VFC Enclosures: NEMA 250, to comply with environmental conditions at installed location.
   1. Dry and Clean Indoor Locations: Type 1 .

B. Plenum Rating: UL 1995; NRTL certification label on enclosure, clearly identifying VFC as "Plenum Rated."

C. Where redundant VFD's are specified, the redundant VFD's and all associated equipment shall reside in a single enclosure.

2.5 ACCESSORIES

A. General Requirements for Control-Circuit and Pilot Devices: NEMA ICS 5; factory installed in VFC enclosure cover unless otherwise indicated.
   1. Push Buttons, Pilot Lights, and Selector Switches: Standard-duty, type.
      a. Push Buttons: Unguarded types; maintained.
      b. Pilot Lights: LED types; ; push to test.
      c. Selector Switches: Rotary type.
      d. Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.

B. Control Relays: Auxiliary and adjustable solid-state time-delay relays.

C. Fusible Disconnect Switch interlock: provide interlock such that when disconnect switch is open, VFD stops sending power to load.

D. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.
   1. Current Transformers: Continuous current rating, basic impulse insulating level (BIL) rating, burden, and accuracy class suitable for connected circuitry. Comply with IEEE C57.13.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, surfaces, and substrates to receive VFCs, with Installer present, for compliance with requirements for installation tolerances, and other conditions affecting performance.

B. Examine VFC before installation. Reject VFCs that are wet, moisture damaged, or mold damaged.

C. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFC installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 HARMONIC ANALYSIS STUDY

A. Perform a harmonic analysis study to identify the effects of nonlinear loads and their associated harmonic contributions on the voltages and currents throughout the electrical system. Analyze operating scenarios, including recommendations for VFC input filtering to limit TDD and THD(V) to specified levels.

B. Prepare a harmonic analysis study and report complying with IEEE 519-2014 and NETA Acceptance Testing Specification.

C. Provide all necessary appurtenances to mitigate harmonic distortion of building electrical system.

3.3 INSTALLATION

A. Coordinate layout and installation of VFCs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Wall-Mounting Controllers: Install VFCs on walls with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished floor unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not on walls, provide freestanding racks.

C. Floor-Mounting Controllers: Install VFCs on 4-inch nominal thickness concrete base.
   1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
   2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   4. Install anchor bolts to elevations required for proper attachment to supported equipment.

D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

E. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.

F. Comply with NECA 1.

3.4 IDENTIFICATION

A. Identify VFCs, components, and control wiring. Comply with requirements for identification specified in Section 232400 "Identification, Tags, Charts, Etc."
   1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
   2. Label each VFC with engraved nameplate.
   3. Label each enclosure-mounted control and pilot device.

B. Operating Instructions: Frame printed operating instructions for VFCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFC units.

3.5 CONTROL WIRING INSTALLATION

A. Install wiring between VFDs and remote devices and facility's central-control system. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables." All control wiring shall be in separate conduit from power wiring.

B. Bundle, train, and support wiring in enclosures.

C. Connect selector switches and other automatic control devices where applicable.
   1. Connect selector switches to bypass only those manual- and automatic control devices that have no safety functions when switches are in manual-control position.
   2. Connect selector switches with control circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Acceptance Testing Preparation:
   1. Test insulation resistance for each VFC element, bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

C. Tests and Inspections:
   1. Inspect VFC, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
   2. Test insulation resistance for each VFC element, component, connecting motor supply, feeder, and control circuits.
   3. Test continuity of each circuit.
   4. Verify that voltages at VFC locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Architect before starting the motor(s).
   5. Test each motor for proper phase rotation.
   6. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:
      a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each VFC. Remove front panels so joints and connections are accessible to portable scanner.
      b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each VFC 11 months after date of Substantial Completion.
      c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
   7. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

D. VFCs will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies the VFC and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.7 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

3.8 ADJUSTING

A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.

B. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.

C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable, instantaneous trip elements. Initially adjust to six times the motor nameplate full-load amperes and attempt to start motors several times, allowing for motor cool-down between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Architect before increasing settings.

D. Set the taps on reduced-voltage autotransformer controllers.

E. Set field-adjustable circuit-breaker trip ranges.

F. Set field-adjustable pressure switches.

3.9 PROTECTION

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until controllers are ready to be energized and placed into service.

B. Replace VFCs whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.10 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain VFCs.

END OF SECTION 232923

SECTION 250200 – INSTRUMENTATION AND CONTROL FOR HVAC – UK STANDARDS

INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

RELATED DOCUMENTS:

Drawings and general provisions of the Contract, including General and Supplementary Conditions, General Mechanical Provisions and General Requirements, Division 1 Specification Sections apply to the work specified in this section.

DESCRIPTION OF WORK:

Furnish a BACnet system compatible with existing University systems. All building controllers, application controllers, and all input/output devices shall communicate using the protocols and network standards as defined by ANSI/ASHRAE Standard 135-2001, BACnet. This system shall communicate with the University of Kentucky Facility Management's existing BACnet head-end software using BACnet/IP at the tier 1 level and BACnet/MSTP at the tier 2 level. No gateways shall be used for communication to controllers installed under section. BACnet/MSTP or BACnet/IP shall be used for all other tiers of communication. No servers shall be used for communication to controllers installed under this section. If servers are required, all hardware and operating systems must be approved by the Facilities Management Controls Engineering Manager and/or the Facilities Management Information Technology Manager.

All Building Automation Devices should be located behind the University firewall, but outside of the Medical Center Firewall and on the environmental VLAN.

Provide all necessary hardware and software to meet the system's functional specifications. Provide Protocol Implementation Conformance Statement (PICS) for Windows-based control software and every controller in system, including unitary controllers. These must be in compliance with Front End systems PICS and BIBBS and attached Tridium PICS and BIBBS. Provide all hardware and software to backup, restore, troubleshoot and install system. Software, backups, unitary, and ASC files shall be delivered to UEM (Utilities & Energy Management) for archiving purposes.

When providing a JACE or equivalent tier-1 controller, the licenses for ALL available points must be purchased by the installing contractor. It will not be acceptable for an installing contractor to install a JACE in a manner in which only part of the licenses for the available capacity have been purchased. Any contractor who is required to utilize an existing JACE to accomplish his final Tie-in to Tridium, must include the cost to accommodate his additional points BOTH at the local JACE level as well as the head-end Tridium level.

Prepare individual hardware layouts, interconnection drawings and software configuration from project design data.

Design, provide, and install all equipment cabinets, panels, data communication network cables needed, and all associated hardware.

Provide and install all interconnecting cables between supplied cabinets, application controllers, and input/output devices.

Provide complete manufacturer's specifications for all items that are supplied. Include vendor name of every item supplied.

Provide supervisory specialists and technicians at the job site to assist in all phases of system installation, startup, and commissioning.

Provide a comprehensive operator, administrator and technician training program as described herein.

Provide as-built documentation, programming software for use site wide, electronic copies of all diagrams, and all other associated project operational documentation (such as technical manuals on approved media, the sum total of which accurately represents the final system.

Furnish, install, and fit-up in complete working order, with all accessories required, the automatic temperature control and monitoring systems shown on the Drawings and specified herein. The systems shall be properly connected, piped and wired in a manner conforming to the laws, ordinances and codes now in force in the Commonwealth of Kentucky.

The controls and all listed I/O points from this project shall communicate with the University of Kentucky Facilities Management's existing BACnet software head-end station using BACnet/IP. All BACnet points shall be exposed to the University of Kentucky Facilities Management's head-end station. Graphics will be installed by UEM on the head-end system. All point and device names shall comply with the University Facilities Management standards and shall be approved before and included in the shop drawings submittal. Cooperate with the Owner (UEM) to ensure that all specified points and alarms communicate and operate on the head-end system. All point and device names shall comply with the University Facilities Management standards (format listed below, consult Utilities and Energy Management (UEM) for the correct abbreviations) and shall be included in the shop drawings submittal for review and approval. Point naming conventions and formats are listed further in this specification in the Direct Digital Controls Equipment section. Refer to University Standard 230553S02 for the AHU Naming Convention.

Related to the alarms, the contractor is to set up the alarm parameters specified by the system sequences of operations without enabling the alarms. Contractor is to provide a list of points containing alarm extensions to Owner (UEM). UEM will be responsible for doing the alarm names, alarm texts and enabling the alarm points provided on the list.

All work must be coordinated and scheduled with the UEM Controls group prior to any work being done on site.

Thermostats: Each terminal unit requires a thermostat for operation, unless specifically indicated on the Drawings to be slaved to another unit. Slaved terminal units shall be controlled to match the CFM and discharge air temperature of the master unit. Thermostat locations have been identified on the Drawings to the extent possible, but all such locations may not be shown. Provide the required thermostats whether or not shown on the Drawings. For those thermostats not shown on the Drawings, work out an acceptable location with the Architect/Engineer. Thermostats are to be provided with no doors.

Provide DDC controls for the air terminal units. Provide electronic operators controlled and monitored by direct digital control systems which shall include, but not be limited to, air handling systems, pumps, terminal units, etc.

The control equipment shall be complete and shall include, but not be limited to, all necessary valves, damper operators, pipe, fittings, etc.

Electronic Control System installer must physically demonstrate to Owner and Owner's representatives (UEM) via software simulations that the proposed building automation system and control sequences will function as outlined in the contract documents prior to field implementation.

Provide VFD's as specified in other sections.

The control and monitoring system for this project shall be made up using standard materials, equipment and components regularly manufactured for systems of this type. The system shall be complete in every respect and shall be a functioning system.

Electrical power wiring and interlock wiring for all controls, signal devices, equipment, alarms, etc., shall be in accordance with diagrams and instructions from the supplier of the systems. All power and control wiring, conduit and wiring connections required for the complete installation, including wiring to smoke dampers and combination fire/smoke dampers and their motors, shall be provided by this Contractor in accordance with Electrical specification requirements. Controls shall be on emergency power.

Refer to other Mechanical Division sections for installation of instrument wells, valve bodies, and dampers in mechanical systems; not work of this section.

QUALITY ASSURANCE:

Manufacturer: Subject to compliance with requirements, manufacturers offering controls that may be incorporated into the work at Tier 1 BACnet/IP include the following:

Vykon Jace 8000
Johnson Controls Facility Explorer line of Niagara Powered Products
Alerton
Honeywell CIPer IP Series
Phoenix PCI Jace (for laboratory controls only)

Subject to compliance with requirements, manufacturers offering controls that may be incorporated into the work at Tier 2 BACnet/MSTP include the following:

Honeywell WEB Series
Johnson Controls Extended Architecture Line
Alerton
Distech ECB

Acceptable controls manufacturers shall include any controls manufacturers which utilize a BACnet protocol in accordance with the specification. If the bidding manufacturer is not listed above, documentation for approval as an equal must be submitted 10 days prior to the bid opening date to allow for evaluation by the university.

Installing Contractor: Installing controls contractors must comply with the following requirements:

The installing systems integration contractor has been in the business of installing BACnet controls for the last 5 years minimum. In addition, the installing systems integration contractor needs to demonstrate with documentation that they have provided the controls in a minimum of (3) hospital or university renovation projects of similar size and scope where they utilized a BACnet system.

The systems integration contractor must have on staff the following number of key personnel as a minimum, each with a minimum of 5 years of related BACnet controls installation experience: Project Manager - 2, Controls Applications Engineer - 2, Programmer - 2, Installation Supervisor - 2, Controls Technician - 5.

Prefer contractor staff to include Niagara Tridium AX/N4 certified technicians.

Contractor to have experience with successful integrations of controls with Niagara Tridium systems.

Contractor to have a minimum of 3 years of installation history with the brand of controls being bid.

Contractor must have a help desk operation or staff available for phone contact 24/7 for providing technical

support to university staff. Call forward and emergency service numbers are not acceptable during normal business hours.

Codes and Standards:

Electrical Standards: Provide electrical components of pneumatic control systems which have been UL-listed and labeled, and comply with NEMA standards.

NFPA Compliance: Comply with NFPA 90A "Standard for the installation of Air Conditioning and Ventilating Systems" where applicable for controls and control sequences.

Kentucky Building Code: Comply with requirements where applicable for controls.

Provide products of the temperature control system with the following agency approvals:

UL-916; Energy Management Systems
UL-873; Temperature Indication and Regulating Equipment
UL-864; Subcategories UUKL, OUXX, UDTZ; Fire Signaling and Smoke Control Systems
CSA; Canadian Standards Association
FCC, Part 15, Subpart J., Class A Computing Devices

All products shall be labeled with the appropriate approval markings. System installation shall comply with NFPA, NEMA, NEC, Local and National Codes.

SUBMITTALS:

Product Data: Submit manufacturer's technical product data for each control device furnished, indicating dimensions, capacities, performance and electrical characteristics, and material finishes, also include installation and start-up instructions.

A. Shop Drawings, Product Data, and Samples

1. Each submittal shall have a cover sheet with the following information provided: submittal ID number; date; project name, address, and title; BAS Contractor name, address and phone number; BAS Contractor project manager, quality control manager, and project engineer names and phone numbers.
2. Each submittal shall include the following information.
    a. BAS riser diagram showing all DDC controllers, network repeaters, and network wiring.
    b. One-line schematics and system flow diagrams showing the location of all control devices.
    c. Points list for each DDC controller, including: Tag, Point Type, System Name, Object Name, Expanded ID, Display Units, Controller Type, Address, Cable Destination, Module Type, Terminal ID, Panel, Slot Number, Reference Drawing, and Cable Number. The initial shop drawing submittal for review needs to include all point names meeting the naming convention outlined in this specification for UEM approval at the shop drawing phase prior to the contractor beginning any programming.
    d. Vendor’s own written description for each sequence of operations, to include the following:

- Sequences shall reference input/output and software parameters by name and description.
- The sequences of operations provided in the submittal by the BAS Contractor shall represent the detailed analysis needed to create actual programming code from the design documents.
- Points shall be referenced by name, including all software points such as programmable setpoints, range limits, time delays, and so forth.
- The sequence of operations shall cover normal operation and operation under the various alarm conditions applicable to that system.

e. Detailed Bill of Material list for each panel, identifying: quantity, part number, description, and associated options.

f. Control Damper Schedules. This spreadsheet type schedule shall include a separate line for each damper and a column for each of the damper attributes, including: Code Number, Fail Position, Damper Type, Damper Operator, Blade Type, Bearing Type, Seals, Duct Size, Damper Size, Mounting, and Actuator Type.

g. Control Valve Schedules. This spreadsheet type schedule shall include a separate line for each valve and a column for each of the valve attributes, including: Code Number, Configuration, Fail Position, Pipe Size, Valve Size, Body Configuration, Close off Pressure, Capacity, Valve CV, Calc CV, Design Pressure, Actual Pressure, and Actuator Type.

h. Cataloged cut sheets of all equipment used. This includes, but is not limited to, the following: DDC panels, peripherals, sensors, actuators, dampers, and so forth.

i. Range and scale information for all transmitters and sensors. This sheet shall clearly indicate one device and any applicable options. Where more than one device to be used is on a single sheet, submit two sheets, individually marked.

j. Hardware data sheets for all local access panels.

k. Software manuals for all applications programs to be provided as a part of the programming devices, and so forth for evaluation for compliance with the performance requirements of this Specification.

l. The controls contractor shall include their BACnet PICS and BIBB statements (as described in ASHRAE 135-2001) for each device.

3. BAS Contractor shall not order material or begin fabrication or field installation until receiving authorization to proceed in the form of an approved submittal. BAS Contractor shall be solely responsible for the removal and replacement of any item not approved by submittal at no cost to the Owner.

4. Submittal shall have approved point names.

Maintenance Data: Submit maintenance instructions and spare parts lists for each type of control device. Include that type data, product and shop drawings in maintenance manual.

Operation and Maintenance Instructions:

This contractor shall prepare an electronic Operations Manual entitled "Automatic Temperature Control and Monitoring Systems Operation and Maintenance Data." Manual shall be PDF files with separate PDFs for each of the items noted below.

Each manual shall contain the following information:

Name and address of Consulting Engineer, Contractor, and index of equipment, including vendor (name and address).

Complete brochures, descriptive data and parts list, etc., on each piece of equipment, including all approved shop drawings.

Complete maintenance and operating instructions, prepared by the manufacturer, on each major piece of equipment, including preventative maintenance instructions.

Complete shop drawing submittal on temperature and monitoring controls including control diagrams updated to reflect "as-built" conditions.

All wiring and component schematics necessary for Owner (UEM) to troubleshoot, repair and expand the system.

All manuals shall be submitted to the Engineer prior to final inspection of the building.

Provide a laminated copy mounted in a sleeve on the outside of the panels for the controls sequences pertinent to equipment supplied by that specific controls panel.

Controls Program Backup: At the end of the project, the contractor is to supply digital back-up copies of all final complete operating controls programs. These shall be delivered to UEM for archiving purposes.

DELIVERY, STORAGE AND HANDLING:

Provide factory shipping cartons for each piece of equipment and control device. Maintain cartons while shipping, storage and handling as required to prevent equipment damage and to eliminate dirt and moisture from equipment. Store equipment and materials inside and protect from weather.

PART 2 - PRODUCTS

DIRECT DIGITAL CONTROL SYSTEM

General: This specification defines the minimum hardware and performance requirements for a computer-based building automation system to be furnished and installed.

SCOPE OF WORK:

System Requirements:

Contractor shall provide all equipment, engineering and technical specialist time to check the installation required for a complete and functioning system. The contractor shall furnish and install all interconnecting system components. Components to include, but not be limited to: power line conditioners, field panels, sensors, motor starter interfaces, and any other hardware items not mentioned above but required to provide the Owner with a complete workable system.

Any feature or item necessary for complete operation, trouble-shooting, and maintenance of the system in accordance with the requirements of this specification shall be incorporated, even though that feature or item may not be specifically described herein. This shall include hardware and software.

All materials and equipment used shall be standard components, regularly manufactured for this and/or other systems and not custom designed especially for this project. All systems and components shall be thoroughly tested and proven in actual use.

Input/Output Summary:

The system as specified shall monitor, control and calculate all of the points and functions as listed in the Input/Output Summary.

System Start-Up and Acceptance:

Upon completion of the installation, the BAS Contractor shall start-up the system and perform all necessary testing and debugging operations. An acceptance test in the presence of the Owner's representative shall be performed. The vendor shall check all sensors that exhibit any problems or faulty reading. When the system performance is deemed satisfactory in whole by UEM, the system parts will be accepted for beneficial use and placed under warranty. The BAS Contractor is to be available for system commissioning at the end of the installation when requested by the Engineer and/or Owner. The contractor is to also be available for seasonal commissioning for the other seasons beyond the initial commissioning.

This Contractor shall work with the Owner (UEM), who is developing the graphics, to ensure that all points report, function and alarm as required on the BACnet head-end system. The Contractor will also work with the Project Manager or CNS/MCIS to obtain all necessary IP’s and Ethernet drops needed for BACnet panel. The Owner (UEM) will assign all BACnet/IP instance numbers and all BACnet/MSTP network numbers for use by the Contractor. All BACnet/IP devices will report directly to the head-end system.

UEM will be performing their own complete point by point evaluation as part of this project, independently of the commissioning activity. This will occur during the warranty period of the project.

Facilities Management’s Instruction:

The BAS Contractor shall provide two copies of an electronic version of the operator's manual describing all operating and routine procedures to be used with the system. This user's manual should contain subjects such as: standard operation, error message explanations, software usage, commands, system troubleshooting, etc. The Contractor shall also provide wiring schematics for all system components.

The BAS Contractor shall instruct the Owner's designated representatives in these procedures during the start-up and test period. The duration of the instruction period shall be no less than four (4) hours during two 2 hour sessions. (Number of hours may be adjusted to a max of 40 dependent upon the size and scope of project. For larger projects, training vouchers for instructional training at the manufacturer’s facilities may be requested in lieu of on-site training.) These instructions are to be conducted during normal working hours at the Owner's convenience and are to be prearranged with the Owner. The owner can request this training any time within the one year warranty period and may request any number of classes adding up to the total number of hours. The contractor shall provide an hourly unit price for additional on-site training.

The instructions shall consist of both hands-on at the job site and classroom training at a classroom location on the University of Kentucky campus coordinated with the Project Manager and UEM.

Upon completion, the attendees shall be able to operate the system and implement system changes including start-up, boot load, add point to the data base, enter messages, and down line load field units.

Prior to the scheduling of the sessions, an agenda outlining the training topics must be submitted for approval. Agenda items shall include, but not be limited to, the following topics:

1) Explanation of control sequences. Include which sensors are used and how output device operates.
2) Explanation of control drawings and manuals, including symbols, abbreviations, and overall organization.
3) Walk-through of project to identify controller locations and general routing of network cabling.
4) Review of operation and maintenance of hardware devices including air compressor, air dryers, controllers, instruments, and sensors. Include schedule for routine maintenance.
5) Programming Application Specific Controllers
   (a) Backing up and Restoring Application Specific Programming
   (b) Adding/Deleting/Editing points on Application Specific controllers
   (c) Troubleshooting Application Specific controllers (inputs/outputs/logic/master – slave relationships/bus issues)
6) Programming Building Specific Controllers
   (a) Backing up and Restoring Building Specific Controllers Programming
   (b) Adding/Deleting/Editing points on Building Specific Controllers controllers
   (c) Troubleshooting Building Specific Controllers controllers (inputs/outputs/logic/network issues)
7) How to use tools and cables

Warranty:

The system including all hardware and software components shall be warranted for a period of one year when the system performance is deemed satisfactory in whole by UEM. The system parts will be accepted for beneficial use and placed under warranty at that time. A Certificate of Occupancy does not initiate the control system warranty. Any defects in materials and workmanship arising during this warranty period shall be corrected without cost to the Owner.

All applicable software as detailed in this specification shall be updated by the BAS Contractor free of charge during the warranty period. This will ensure that all system software will be the most up-to-date software available from the BAS Contractor.

DIRECT DIGITAL CONTROL (DDC) EQUIPMENT

System Software

All software required for monitoring, modifying, configuring and backup for the system shall be embedded in the controller and accessible via VT terminal, hyper-terminal or the web. This software shall allow any computer with access (and security) to the University's network to perform the work described above using a web browser or provided software. No software upgrades should be required unless provided at no additional cost to the customer. The software version used for installation of any new devices must either be at the current software version used on the University Facilities Management campus at the current JAVA version or the new software at the most current JAVA version must be installed on all devices and the current system prior to the installation of the new devices. All software is to also operate on the latest version of Microsoft Windows operating system. All configuration and programming tools required for the upgraded version must be provided at the time of installation.

Provide a USB, standard RS-232 9 pin female, Bluetooth, RJ11, RJ12 or RJ45 connection for on-site access.

BACnet Conformance

Building Controller shall as a minimum support MS/TP and Ethernet BACnet LAN types. It shall communicate directly via these BACnet LANs as a BACnet device and shall support simultaneous routing functions between all supported LAN types. Global controller shall be a BACnet conformance class 3 device and support all BACnet services necessary to provide the following BACnet functional groups:

1. Clock Functional Group
2. Files Functional Group
3. Reinitialize Functional Group
4. Device Communications Functional Group
5. Event Initiation Functional Group

Please refer to end of this section for a complete list of the services that must be directly supported to provide each of the functional groups listed above. All proprietary services, if used in the system, shall be thoroughly documented and provided as part of the submittal data.

Standard BACnet object types supported shall include as a minimum: Analog Value, Binary Value, Calendar, Device, File, Group, Notification Class, Program and Schedule object types. Alarms should also be setup on this system with limits. All proprietary object types, if used in the system, shall be thoroughly documented and provided as part of the submittal data.

The Building Controller shall comply with Annex J of the BACnet specification for IP connections. This device shall use Ethernet to connect to the IP internetwork. It must support interoperability on the campus area network and function as a BACnet Broadcast Management Device (BBMD) and/or a BACnet router.

Building Controller (B-BC)

General

Building Controller (B-BC) shall be minimum 16 bit microcomputer based, utilizing a multi-tasking, multi-user operating system.

The B-BC controllers shall permit the simultaneous operation of all control, communication facilities management and operator interface software, as programmed by the Contractor or User. Modification of the on-board B-BC controller database shall be performed on-line using the built-in software. Systems which require the B-BC to be removed from service while DDC control sequences are modified shall not be acceptable.

B-BC controllers shall utilize true floating point arithmetic capabilities.

All B-BC controllers shall have open licensing to connect to existing UK UEM Tridium BACnet BAS.

Databases and Memory Back-Up

All programming defining the functions to be performed by the B-BC, including but not limited to application programs and point database within each B-BC, shall be protected from loss due to power failure for a minimum of 72 hours. All database and backup shall be provided to the UK UEM Controls group.

Service Ports

B-BC controllers shall be equipped with a minimum of one operator service port for the connection of a laptop computer. The service port shall be either a built-in standard RS-232 data terminal port, USB port, CAT5 cable or RJ11/12 connection.

Connection of a service device, to a service port, shall not cause the B-BC controller to lose communications with its peers or other networked device controllers.

Display and Readout Capability

The B-BC controller shall additionally provide diagnostic LED indication of device transmit and receive data communications for all communication port and peripheral ports, normal operation, abnormal operation and control relay operation indication.

Manual/Auto Control and Notification

The B-BC controller shall provide commanded override capability from the built-in operator interface. Such overrides shall be annunciated to the head-end station. Such overrides shall be valid as long as power is applied to the controller.

Adjustments

Every control panel shall provide adjustments for the functions specified. In general, adjustments shall be provided for all setpoints used by controllers within each control panel. In addition, adjustments shall be provided for throttling ranges, mixed air damper minimum positions, or other items as specified. Adjustments shall be integral to each individual B-BC. The built-in operator interfaces shall allow the easy execution of the adjustment through named identifiers within the B-BC. From a single B-BC user interface, any other B-BC shall be accessible and full adjustment capabilities shall be provided.

B-BC Naming Convention

B-BC devices shall be named using the following naming convention:

> *B-BC devices shall be named using the following format:*
> *BuildingName_BuildingNumber_Floor_RoomNumber_B-BC Device Type* OR
> *BuidlingNumber_BuildingName_Floor_RoomNumber_B-BC Device Type*
>
> *All B-AAC points shall be named using the following format:*
> *Building_Floor_RoomNumber_Device Type_Equipment ShortName_Function*

Examples:

A B-BC device located in the Pavilion HA mechanical room HA4001 would be named as follows:

PAVHA_0293_04_HA4001_JACE

An exhaust fan status point for a fan in Pavilion HA mechanical room HA3001 fed directly from the above

panel would be named as follows:

PAVHA_03_HA3001_HVA_EF1_STAT

For function short names and building short names and numbers, contact the University Controls Engineering Department.

Advanced Application Controller (B-AAC)

General

Controls shall be microprocessor based, Advanced Application Controllers (B-AAC's). B-AAC's shall be provided for Air Handling Units, packaged Rooftops, primary and secondary pumping loop systems and other applications as shown on the drawings. B-AAC's shall be based on a minimum 16 bit microprocessor working from software program memory which is physically located in the B-AAC. The application control program shall be resident within the same enclosure as the input/output circuitry which translates the sensor signals. All input/output signal conversion shall be performed through a minimum of a 10 bit A to D converter. All input points shall be universal in nature allowing their individual function definition to be assigned through the application software. All unused input points must be available as universally definable at the discretion of the owner. If the input points are not fully universal in nature, unused points must be equal in quantity between Analog Inputs and Digital Inputs.

All B-AAC controllers shall have open licensing to connect to existing UK UEM Tridium BACnet BAS.

Contractor shall provide a minimum of one B-AAC controller per air handling or mechanical system as shown on the drawings.

The BAS contractor shall provide and field install all B-AAC's specified under this section. Mechanical equipment manufacturers desiring to provide B-AAC' type controls as factory mounted equipment, shall provide a separate bid for their products less all controls, actuators, valve assemblies and sensors, which are specified to be provided by the BAS/Temperature control contractor.

All input/output signals shall be directly hardwired to the B-AAC. Troubleshooting of input/output signals shall be easily executed with a volt-ohm meter (VOM). As a result of this intent, it is specified that power line carrier systems, or other systems which command multiple outputs over a single pair of wires, shall not be utilized.

B-AAC's shall be in continuous direct communication with the network which forms the facility wide Building Automation System. The B-AAC's shall communicate with the B-BC at a minimum baud rate of 9,600 baud.

Non-Volatile Memory

All control sequences programmed into the B-BC shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained. Power failures shall not cause the GDC memory to be lost, nor shall there be any need for batteries to be recharged or replaced to maintain the integrity of the controller database. The B-BC shall allow for the creation of unique application control sequences. Systems that only allow selection of sequences from a library or table are not acceptable.

All control sequences shall be fully programmable at the B-AAC, allowing for the creation and editing of an application control sequence, while at the unit.

The B-AAC shall be provided with an interface port (standard RS232 data terminal port or USB port) for a laptop computer. The interface port shall allow the laptop to have full functionality as described above. From the interface port or *network terminal, the laptop shall be able to directly access any B-AAC or B-ASC in the* network.

The B-AAC shall provide an input/output point trending utility that is capable of accumulating 48 analog point samples and 10 digital point samples, per Input/Output point. Each sample shall be taken on a user defined interval, ranging from 1 second to 255 hours per sample. The digital readings shall be on a change of state occurrence for the digital points. All samples shall be recorded with the engineering units for the value, along with a time and date identifier for each sample taken. The samples shall be protected against loss due to power interruptions through a battery or capacitor backup method for a minimum of 30 days.

Systems unable to provide the above capability shall provide for the individual Input/Output point trending at the B-BC. Specifics as to how each B-AAC point will be trended, at the B-BC, shall be provided in the submittal documents. Included in the explanation shall be the sample intervals, the memory allocation in the B-BC and the number of B-AAC's per B-BC that can be expected.

The B-AAC shall provide LED indication of transmit/receive communications performance, as well as for the proper/improper operation of the controller itself.

The B-AAC shall be provided with a battery backed time clock that is capable of maintaining the time of day and calendar for up to thirty days, upon loss of power to the B-AAC, without loss of setting. The battery for the time clock shall be replaceable by the customer. The B-AAC shall be provided with integral time schedules; as a minimum, two seven day schedules with eight on/off periods per day shall be provided. Holiday override of weekly schedules shall be provided for pre-scheduling of holidays, for the year in advance.

Controller Location

To simplify controls and mechanical service troubleshooting, the B-AAC shall be capable of being mounted directly in or on the controls compartment of the air handling system. The B-AAC shall be housed in a NEMA 1 enclosure to accommodate direct mounting on the equipment to be controlled. The B-AAC shall be constructed in a modular orientation such that service of the failed components can be done quickly and easily. The modular construction should limit the quantities of printed circuit boards to a maximum of two. All logic, control system, power supply and input/output circuitry shall be contained on a single plug-in circuit board. When required to replace a printed circuit board, it shall not be necessary to disconnect any field wiring. This shall allow all controls maintenance and troubleshooting to be made while at the air handling unit. The B-AAC shall be directly wired to sensory devices, staging relays or modulating valves for heating and cooling.

Every controller and control panel shall be labeled with a lamacoid plate permanently secured to the device. Sticky tape or glued labels are not acceptable. The labeling shall describe the device and include related information such as MAC address, IP address, BACnet Instance numbers, etc.

All power feeds shall be clearly identified and shall include panel number, breaker and electrical panel location if not in the same room.

For compatibility to the environment of the air handling unit, B-AAC's shall have wide ambient ratings. B-AAC's shall be rated for service from -40 DegF (Degrees Fahrenheit) to 140 DegF.

Contractor shall submit description of location of B-AAC's on all mechanical and air handling equipment.

B-AAC Naming Convention

B-AAC devices shall be named using the following naming convention:

B-AAC devices shall be named using the following format:
Building_Floor_RoomNumber_B-AAC Device Type_Equipment Short Name

All B-AAC points shall be named using the following format:

Function

Examples:

An Air Handler controller in the Pavilion HA mechanical room HA4001 for AHU7 would be named as follows:

PAVHA_04_HA4001_HVA_AHU7

The mixed air temperature point for the above system would be named as follows:

MAT

Therefore, when this point is learned, the entire point name will be:

PAVHA_04_HA4001_HVA_AHU7_MAT

For function short names and building short names and numbers, contact the University Controls Engineering Department.

Application Specific Controller (B-ASC)

General

Controls shall be microprocessor based Application Specific Controller (B-ASC). B-ASC's shall be provided for Unit Ventilators, Fan Coils, Heat Pumps and other applications as shown on the drawings. B-ASC's shall be based on a minimum 16 bit microprocessor working from software program memory which is physically located in the B-ASC. The application control program shall be resident within the same enclosure as the input/output circuitry which translates the sensor signals. All input/output signal conversion shall be performed through a minimum of a 10 bit A to D converter.

Contractor shall provide a minimum of one B-ASC controller per unitary system as shown on the drawings.

The BAS contractor shall provide and install all B-ASC's specified under this section.

All input/output signals shall be directly hardwired to the B-ASC. Troubleshooting of input/output signals shall be easily executed with a volt-ohm meter (VOM). As a result of this intent, it is specified that power line carrier systems, or other systems which command multiple outputs over a single pair of wires, shall not be utilized.

B-ASC's shall be in continuous, direct communication with the network which forms the facility wide building automation system. The B-ASC's shall communicate with the B-BC at a baud rate of no less than 38,400 baud.

Non-Volatile Memory

All control sequences programmed into the B-ASC shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained. Power failures shall not cause the B-ASC memory to be lost, nor shall there be any need for batteries to be recharged or replaced to maintain the integrity of the controller database. The B-ASC shall allow for the creation of unique application control sequences.

The B-ASC shall be provided with the ability to interface with a laptop computer. The interface port shall be provided at the wall sensor or within the unitary equipment. Connection to the wall sensor must be a standard RJ-45 or USB port.

The B-ASC shall provide an input/output point trending utility that is capable of accumulating 48 analog point samples and 10 digital point samples per Input/Output point. Each sample shall be taken on a user defined interval, ranging from 1 second to 255 hours per sample. The digital readings shall be on a change of state occurrence for the digital points. All samples shall be recorded with the engineering units for the value, along with a time and date identifier for each sample taken.

Systems unable to provide the above capability shall provide for the individual input/output point trending at the B-BC. Specifics as to how each B-ASC point will be trended, at the B-BC, shall be provided in the submittal documents. Included in the explanation shall be the sample intervals, the memory allocation in the B-BC and the number of B-ASC's per B-BC that can be expected.

Controller Location

To simplify controls and mechanical service troubleshooting, the B-ASC shall be mounted directly in the controls compartment of the unitary system. The B-ASC shall be provided with a sheet metal or polymeric enclosure that is constructed of material allowing for the direct mounting within the primary air stream, as defined by UL-465. The direct mounting shall allow all controls maintenance and troubleshooting to be made while at the unitary equipment. The B-ASC shall be directly wired to sensory devices, staging relays or modulating valves for heating and cooling.

For compatibility to the environment of the unitary equipment, B-ASC shall have wide ambient ratings. B-ASC's shall be rated for service from 32 DegF (Degrees Fahrenheit) to 140 DegF.

Contractor shall submit description of location of B-ASC's on all mechanical and unitary equipment.

B-ASC Naming Convention

B-ASC devices shall be named using the following naming convention:

B-ASC devices shall be named using the following format:
Building_Floor_RoomNumber_B-ASC Device Type

All B-ASC points shall be named using the following format:
Function

Examples:

A VAV controller in the Pavilion HA room HA498 would be named as follows:

PAVHA_04_HA498_VAV

The discharge air temperature point for the above room would be named as follows:

DAT

Therefore, when this point is learned, the entire point name will be:

PAVHA_04_HA498_VAV_DAT

For function short names and building short names and numbers, contact the University Controls Engineering Department.

CONTROL PANELS

Panelboard shall contain all instruments and accessories. Provide each item of equipment with an engraved nameplate. Panelboard shall be wall-mounted or stand-mounted and shall be completely enclosed.

As far as is practical, the control components for each system shall be grouped. Provide each group of components with identification.

The entire panelboard shall be pre-wired and brought to a main terminal strip. All relays, switches, etc., shall be installed, furnished and wired on panelboard. Clearly mark each terminal strip as to which wire from which component is to be connected.

Fabricate panels of 0.06-inch- (1.5-mm-) thick, furniture-quality steel or extruded-aluminum alloy, totally enclosed, with hinged doors and keyed lock, with manufacturer's standard shop-painted finish and color.

Panel-Mounted Equipment: Temperature and humidity controllers, relays, and automatic switches; except safety devices. Mount devices with adjustments accessible through front of panel.

Door-Mounted Equipment: Flush-mount (on hinged door) manual switches, including damper-positioning switches, changeover switches, thermometers, and gages.

Graphics: Color-coded graphic, laminated-plastic displays on doors, schematically showing system being controlled, with protective, clear plastic sheet bonded to entire door.

SENSORS

Electronic Sensors used in air ducts or liquid lines shall utilize non-adjustable RTD or thermostat sensing elements with + or -0.36^{o}F, accuracy and stability of at least + or -0.05^{o}F per year. All sensors used in liquid line shall be provided with separable stainless steel immersion wells. Averaging sensors shall be a minimum of five (5) feet in length, and shall be installed in such a manner so as to sense representative sample of the medium being controlled.

Equipment Operation Sensors: As follows:

Status Inputs for Fans: Differential-pressure switch with adjustable range set to 175 percent of rated fan static pressure. A hawkeye sensor should also be provided so that the owner knows if belts are lost or fans are running backwards.

Status Inputs for Electric Motors: Current-sensing relay with current transformers, adjustable and set to 175 percent of rated motor current.

Digital-to-Pneumatic Transducers: Convert plus or minus 12-V dc pulse-width-modulation outputs (preference is 4-20mA or 0-10 Volts), or continuous proportional current or voltage to 0 to 20 psi (0 to 138 kPa).

Damper Position Indication: Potentiometer mounted in enclosure with adjustable crank-arm assembly connected to damper to transmit 0 to 100 percent damper travel.

SENSOR INPUT AND OUTPUT DEVICES:

The following sensors and devices, or their equivalents, shall be considered acceptable. Other sensors and devices required for this specification are outlined in their respective subsystem.

Analog sensing elements for remote indication shall be independent of local pneumatic sensors used for local control loops.

System Accuracy: The system shall maintain an end-to-end accuracy for one year from sensor to operator's console display for the application specified.

STANDARD	Temperature Sensors
TYPE	Electronic
APPLICATION	BAS, HVAC, BTU, Boiler Control
STANDARD	100 or 1000 ohm platinum wire wound RTD element Standard J (3 wire) configuration European curve, Alpha = .00385 Ohms/Ohm/deg.C., meets DIN SID 43760 Wire in conduit
MECHANICAL	1/4" stainless steel sheath
SPACE TEMPERATURE	Sensor housing to be similar in appearance to existing thermostats except that thermometers are not required. Similarity to be Owner's decision. Locate on an outside wall if possible.
DUCT TEMPERATURE	Standard lengths -- 5.5", 11.5" and 17.5" Other lengths with owner's written approval. Locate in central area of airstream at minimum of 18" from reheat coil. 1/2" NPT mounting thread and flange and conduit connection. Glass encapsulated element unless otherwise approved.
THERMOWELL	Drilled brass or stainless steel or brass fitting with stainless steel sheath built-up well with Owner approval. Glass encapsulated element unless otherwise approved. 3/4" process connection with drilled wells. 1/2" NPT process connection on built-up wells. Insertion into measured medium - 1" + 1/2" diameter of pipe. Cast iron connector head - 1/2" NPT process connection and conduit connection. Rated thermowell pressure = 250 psi.

ELEMENT ACCURACY must meet .1% DIN and the DIN 43760 standard.

OVERALL ACCURACY	+ 1 deg.F. General duct, space and thermowell temperatures. + .75 deg.F. for thermowell ele. on 4" or larger pipes. + .5 deg.F. for thermowell ele. on 8" or larger pipes.

OVERALL RANGE -20% to l20% of possible operating conditions.

GENERAL NOTE If wires from RTD probe to DGP are to be more than 200 feet long, provide extra large cast iron connector head (nominal size 2-11/16 x 1/4) or junction box to accommodate a resistance to 4-20 mA convertor transmitter.

STANDARD Pressure Sensor

TYPE Electronic with LVDT element.

APPLICATION
4-20 mA Output (2 wire)
Wire in conduit
Input voltage 10-35 volts DC
Loop resistance greater than or equal to 500 ohms

MECHANICAL
Linear variable differential transformer (LVDT) element
Allowable Standard Ranges 0- 30 PSI
0-100 PSI
0-200 PSI
Other ranges with Owner written approval
1/2" NPT input thread and conduit connection.
Provide differential inputs unless otherwise approved.
Provide an air filter on unused differential ports.
Provide with a NEMA 4 watertight enclosure unless otherwise approved.
Min. rate pressure - l50% FS proof and 450 PSI static.

OVERALL ACCURACY + 0.5% F.S. including Linearity, hysteresis and repeatability.

ACCURACY NOTE: If pressure transducer is used to calculate flow with a pilot tube, then the accuracy of the pressure sensor should be dictated by the overall accuracy requirement of the system and would probably require a high accuracy sensor.

This section covers all new transducers provided. All new transducers provided shall be of the following type:

	INPUT	OUTPUT
l.	Temperature (deg.F.)	4-20 mA, 2 wire
	Temperature (deg.F.)	100 ohm platinum wire RTD
2.	Pressure	4-20 mA, 2 wire
3.	Flow Instantaneous	4-20 mA, 2 wire
4.	Flow Integrated	Pulse 10 PPS Max A25 msec open (min.) 40 msec closed (min.)
5.	KW Instantaneous	4-20 mA, 2 wire
6.	KWH - Integrated	Pulse – 10 PPS Max A25 msec open (min.) 40 msec

closed (min.)

Digital inputs from devices with isolated, dry type contacts (no grounds, no voltage) of either normally open (N.O.) or normally closed (N.C.) configuration. Live contact inputs, those that have voltage present, shall be provided with isolating devices to meet dry contact requirement.

THERMOSTATS:

Room Thermostats: Provide room thermostats that work in conjunction with the B-AAC and B-ASC terminal unit controllers. Thermostats shall have visible thermometers, setpoint indication and exposed setpoint adjustment in all areas except public spaces. Thermostats are to have push buttons on the front face for adjusting the temperature setpoints. Thermostats are to have no doors.

In cases where a single room sensor is to be shared by multiple controllers the slave box reheat control valves and dampers shall be individually controlled to track the discharge temperature of the master unit. The Master shall be identified locally and on the FMS.

An RJ-11 type connection to serial port shall allow a local portable operator or programmer’s terminal to access all program blocks and attributes for complete programmability.

Room Thermostat Accessories: As follows:

Insulating Bases: For all thermostat installations.

Thermostat Guards: Locking transparent-plastic mounted on separate base.

Adjusting Key: As required for device.

Aspirating Boxes: Where indicated for thermostats requiring flush installation.

DAMPERS:

Provide automatic control dampers as indicated, with damper frames not less than 13-gage galvanized steel. Provide mounting holes for enclosed duct mounting. Provide damper blades not less than formed 16-gage galvanized steel, with maximum blade width of 8".

Secure blades to 1/2" diameter zinc-plated axles using zinc-plated hardware. Seal off against spring stainless steel blade bearings. Provide blade bearings of nylon and provide thrust bearings at each end of every blade. Construct blade linkage hardware of zinc-plated steel and brass. Submit leakage and flow characteristics plus size schedule for controlled dampers.

Do not exceed maximum 48"x48" damper size. For sizes larger then this maximum in either dimension, use multiple dampers with a separate operator for each damper. Do not link separate dampers together.

Operating Temperature Range: From -20 degrees to 200 degrees F. (-29 degrees to 93 degrees C.). The occupant shall have an operation local range of 68 degrees and 74 degrees on rooms with Occupancy sensors.

For standard applications as indicated, provide parallel or opposed blade design (as selected by manufacturer's sizing techniques) with inflatable steel blade edging, or replaceable rubber seals, rated for leakage less than 10 CFM/sq.ft. of damper area, at differential pressure of 4" w.g. when damper is being held by torque of 50 inch-pounds.

Smoke Dampers: Provide smoke and combination fire/smoke dampers in accordance with applicable requirements of Specification Section "Ductwork Accessories".

ACTUATORS:

Electric Valve and Damper Motors: Size each motor to operate dampers or valves with sufficient reserve power to provide smooth modulating action or 2-position action as specified.

For chilled water and preheat heating water coils at all air handling units, provide Belimo Energy Valves (or equivalent). Energy Valve shall have BACNet/MSTP interface for integration into controls system. Integrate all available control points to the BAS.

For reheat coils in branch ductwork and heating coils for air terminal units and fan terminal units, provide pressure-independent characterized control valves (PICCV) with non-spring return, fully proportional, floating valve actuators.

For all other applications, provide permanent split-capacitor or shaded pole type motors with gear trains completely oil-immersed and sealed. Equip spring-return motors, with integral spiral-spring mechanism. Furnish entire spring mechanism in housings designed for easy removal for service or adjustment of limit switches, auxiliary switches, or feedback potentiometer.

Equip motors for outdoor locations and for outside air intakes with "O ring" gaskets designed to make motors completely weatherproof, and equip with internal heaters to permit normal operation at -40 degrees F. (-40 degrees C.)

Provide separate motor for each outside air, return air and exhaust air damper. Do not link dampers with different functions together on one damper motor.

Provide separate motor for each damper when overall damper size exceeds 48" in either dimension. Do not link different dampers together on one damper motor.

Binary backed-up motors are not acceptable.

MISCELLANEOUS:

Wells for Pipe Mounted Sensor: Wells shall have minimum working pressure of 150 WOG psig. Wells shall be brass or stainless steel.

Lightning Protection: All electric/electronic equipment supplied must be internally or externally lightning/transient surge voltage protected on all external power feeder and input/output connections which are subject to surge voltage transients. Provide high speed clamping elements which meet IEEE. STD. 472 (SWC) on all digital or analog date channels.

Pressure Instruments:

Differential Pressure and Pressure Sensors: Sensors shall have 4-20 mA output proportional signal with provisions for field checking. Sensors shall withstand up to 150% of rated pressure, without damaging device. Accuracy shall be within 2% of full scale.

Pressure Switches: Pressure switches shall have repetitive accuracy of +2% of range and withstand up to 150% of rated pressure. Sensors shall be diaphragm or bourdon tube design. Switch operation shall be adjustable over operating pressure range. Switch shall have application rated Form C, snap-acting, self-wiping contact of platinum alloy, silver alloy or gold plating.

Current Sensing Relays: Relays shall monitor status of motor loads. Switch shall have self-wiping, snap-acting Form C contacts rated for application. Setpoint of contact operation shall be field adjustable.

Low Voltage Wiring: Control wiring for analog functions shall be 18 AWG minimum with 600 volt insulation, twisted and shielded, 2 or 3 wire to match analog function hardware.

Low Voltage Wiring: Wiring for electric or electronic circuits less than 25 volts shall be cabling manufactured for express use in air plenums. The plenum cable shall be 24 gauge or larger as required, tinned copper, Teflon insulated, twisted pairs, shielded or unshielded, as required, a color coded, overall tape wrap, with transparent Teflon jacket, 150V., NEC725, Class 2 classified for use in air plenum non-conduit signaling application.

Manual Override Switches: In case of failure of the DDC system, provide override switches to operate fans, pumps, air handling units, cooling tower, heat exchangers, etc., manually in local interface control panel. Also for temperature and pressure control provide switches to allow supply temperatures, water temperatures, supply air pressure and fans to be manually regulated. All switches shall be located in locked panel to prevent unauthorized use of the manual override switches.

PART 3 - EXECUTION

INSPECTION:

Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

INSTALLATION OF AUTOMATIC TEMPERATURE CONTROLS

General: Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details shown on the Drawings.

CONTROL WIRING:

Contact the project manager for all required Ethernet connections for this project.

Install control wiring, without splices between terminal points, color-coded. Install in neat workmanlike manner, securely fastened. Install in accordance with National Electrical Code. Install wiring in electrical conduit in all areas. All controls conduit shall be green in color.

Conceal conduit, except in mechanical rooms and areas where other conduit and piping are exposed.

Install all control wiring with color-coded wire in ¾” minimum size conduit. Wire gauge to be in accordance with National Electrical Code.

Connect electrical components to wiring systems and to ground as indicated and instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals according to tightening requirements specified in UL 486A.

POWER WIRING:

Provide power wiring and conduit to air terminal units (if required) and to smoke dampers and combination fire/smoke dampers and their damper motors.

Furnish and install power cabling and conduit for temperature controls panels and equipment from emergency power panels. Each temperature control panel shall be connected to a separate circuit. Conduits shall connect to panels at the locations directed by the Contractor under Division 26. Final connection in the power panels shall be by Temperature Control Contractor in coordination with Division 26 Contractor.

MISCELLANEOUS:

Software Programming: All software programs shall be programmed by this Contractor.

Installation of Mechanical Devices: Refer to Mechanical Division sections for installation of valve bodies, control wells and dampers; not work of this section.

ADJUSTMENT AND SERVICE:

After completion of the installation, the automatic temperature control manufacturer shall regulate and adjust all thermostats, control valves, motors, and other equipment provided under his contract and shall place them in complete operating condition, subject to approval by the Engineer and Owner.

This shall include but not be limited to “tuning” of all control systems. Systems shall be tuned for decaying wave response and minimal overshoot of setpoint. Contractor is to not leave any system in an Auto Tune mode.

Room temperature controls shall have one temperature setpoint with less than a 0.5˚F between calculated heating and cooling temperatures.

This Contractor shall work with Balancing Contractor to provide verification of CFM reading from the DDC terminal unit controllers.

Final adjustment shall be performed by specially trained personnel in direct employ of manufacturer of primary temperature control system.

After completion of installation, perform the following:

Installation.

Check proper installation and connection of each control device.
Verify electric power.
Verify each sensor and actuator connection to field computer.

Field Computer Operation.

Point Test.
- check of wiring of each sensor and actuator end-to-end
- verify calibration of each sensor.
- verify manual operation of each actuator.

Local loop control.
- bring each local loop under control.
- check response to upset, change in setpoint.
- check full and partial load operation.

Supervisory functions.
- verify time clock schedules.
- verify reset control.

Verify communication with each field device.

- perform end-to-end sensor and actuator checks.
- verify that the database is correct.

Test other software.
Trend Logging.
Report Generation.
Remote Access.
System Documentation.

Verify proper operation of every control point in the presence of the Engineer. Include point-by-point checkout.

The control manufacturer shall provide a period of free service extending through one complete heating season and one complete cooling season, after acceptance of the control system, and shall report the condition of the control equipment to the Owner and the Architect.

PART 4 - SEQUENCE OF OPERATION:

(The consultant is responsible for providing the appropriate Sequences of Operation required by the project. Following are some guidelines for use in the development of the drawings and specifications as they relate to University projects.)

AIR HANDLING UNITS (AHU)

For all AHUs, the following is a minimum points list that is required for each unit:
Supply discharge temperature
Return temperature
Mixed Air temperature
Preheat temperature
OA temperature
Damper positions – OA, RA, MA
Pressures – Discharge Static, 2/3 Static, Return Static
Fan Commands & Statuses of all fans – Supply, Return and Exhaust
Heating & Cooling Coil Valve Commands
All VFD information – Fans and Pumps
Pump Commands and Status
CFM readings – Discharge, Return, Outside Air
Humidifier Commands and Humidity points
Setpoints for temperature and pressures
Filter pressure differentials

Related to freezestat operation for all AHUs, the following sequence needs to be added to each sequence: *Upon tripping of the freezestat, the heating control valve is to modulate to maintain a heating plenum space temperature of 3 degrees F (adj) less than the specific unit DAT setpoint. Example: For unit with 55 DAT setpoint, plenum temperature is to control to 52 degrees.*

All AHUs shall be programmed to restart on their own without any software lockout reset required.

Reference University Standard 230553S02 for the AHU naming convention.

CHILLED WATER SYSTEMS

For buildings and installations that require a chilled water system decoupled loop, refer to University Standard 236000S01.

ROOM TERMINAL HVAC

For all rooms, provide the following points as a minimum:
VAV supply and/or return damper position
Heating valve position
CFM reading
Room DAT
Room temperature
Room temperature setpoint
Radiant Heat valve position (if applicable)

For any space that may be unoccupied during periods of operation, consideration needs to be given in the design of the space to the University Energy Guidelines.

HYDRONIC WATER SYSTEMS

All hydronic water systems shall be developed using an outside air temperature reset schedule developed for each particular building.

BACnet Protocol Implementation Conformance Statement:
The controls contractor shall include their BACnet PICS and BIBB statements (as described in ASHRAE 135-2001) for their BACnet Interface with their shop drawings. The interface shall comply with the following as a minimum.

Vendor Name: Tridium, Inc.
Product Family: Niagara Framework, including N4 Web Supervisor, JACE 6XX at Release 3.8, JACE 8xxx at release 4.6 or greater using the most current version of JAVA or HTML 5. All control work associated with this project must be fully compatible with this version of Tridium such that all alarms, points, etc. communicate and clear alarms seamlessly with the existing system.
Description: This product family provides bi-directional communication between the Tridium Niagara Framework and a BACnet system operating at BACnet Conformance Class 3, over Ethernet media.

BACnet Protocols are documented in Appendices A, B & C.

REQUIRED SUBMITTALS:

The following chart is supplied for the benefit of the Owner, Architect, Engineer and contractor to assure a complete submission of required information. It is a reference listing of documents required by the Specifications under this Section. Refer to Specifications Section - General Provisions for the general requirements of submittals.

ITEM	SHOP DRAWING	M&O MANUAL	PARTS LIST	WRITTEN DESCRIPTION
Control equipment	x	x	x	
Control systems	x			
Control sequence				x
“As-builts” drawings	x	x	x	
Frequency drives	x	x	x	
Air terminal units	x	x	x	
I/O Summary Charts	x			

Print and Save Excel I/O Summary Sheet in Spec Directory; Refer to drawings for points lists

VARIABLE FREQUENCY DRIVES (VFDs):

The work includes all labor, materials, and related items to completely furnish and install, start up and test, and place into service the Variable Frequency Drives indicated and scheduled on the Drawings and described in the Specifications.

Variable Frequency Drives shall be Pulse Width Modulation adjustable frequency AC drives as manufactured by ABB, Yaskawa or Eaton. The drives shall be 6 pulse drives at a minimum, with 3% impedance. The drive unit shall be UL listed as a complete assembly.

Each drive shall include the following features:

Factory mounted fused disconnect for overcurrent protection.

Human interface module (HIM) keypad factory mounted (not hand held). Panel mounted Hand/Off/Auto switch to allow manually switching between hand (manual control via HIM); off (drive off, motor off; and automatic (control via temperature control signal).

A mechanical interlock between the bypass and drive contactors.

A control transformer.

UL/CSA/CE labeled.

The rectifier stage shall convert fixed voltage, fixed frequency, AC line power to fixed DC voltage. The input power section shall utilize a full wave bridge design incorporating diode rectifiers. The rectifier shall be insensitive to phase rotation of the AC line. The DC voltage shall be filtered. The DC bus shall have external connections for standby battery back-up or for linking multiple AC drive buses. The inverter shall change fixed DC voltage to variable frequency AC. The inverter shall utilize IGBT's as required by the current rating of the motor.

The drives shall operate a variable torque load. The speed range shall be from a minimum of 0.5 Hz @ 100% breakaway torque to a maximum speed of 250 Hz.

The drives shall have UL Type 1 listed enclosures that allow operation in a Pollution Degree 3 environment and shall meet NEMA Type 1/1P30 or NEMA Open/P20. The drives shall meet IEC 664-1 and NEMA ICS 1-111A Part 3 standards.

The drives shall be designed to operate in an ambient temperature of 0 degrees C to 40 degrees C.

The drives shall meet IEC 68-2-6 vibration specification.

Drives 75 HP and smaller shall be designed and constructed for finger safe operation with the enclosure open to operator access according to IP20 standards.

The drives shall be designed to operate from an input voltage ranging from 380+/- 10% to 480 +/- 10%; and from an input frequency form 48 to 63 Hz.

The displacement power factor shall not be less than 0.98 lagging under any speed or condition.

The efficiency of the AC drive at 100% speed and load shall not be less than 97%.

Variable torque overtorque capacity of 110% for 1minute.

The output carrier frequency of the drive shall be randomly modulated and selectable at 4 kHz, or 8 kHz.

The output frequency shall be from 0.1 to 400 Hz for AC drives up to 75 HP. At horsepowers above 75 HP, the maximum output frequency shall be 200 Hz.

Upon power-up, the drives shall automatically test for valid operation of memory, option module, loss of analog reference input, loss of communications, dynamic brake failure, DC to DC power supply, control power, and the pre-charge circuit.

The drives shall be protected against short circuits between output phases; between output phases and ground; on the outputs, on the internal supplies, and on the logic and analog inputs.

For a fault condition other than a ground fault, short circuit, or internal fault, an auto restart function will provide a minimum of 5 programmable time delays before restart attempts; trial time will range from 1 second to 180 seconds.

The deceleration mode of the AC drive shall be programmable for normal and fault conditions. The stop modes shall include ramp to stop, free-wheel stop, fast stop, and DC injection braking.

A synchronized restart shall be provided that will catch a spinning motor by sensing the motor frequency and rotational direction and synchronize the AC output prior to restarting.

The drive shall be able to receive the control inputs for the smoke detection system to shut the fans down.

The manufacturer shall offer 24 hour product and application response via a nationwide network of factory certified technical support personnel.

A parts and labor warranty of 2 years from the date of substantial completion shall be included. Warranty shall include travel time and expenses.

Factory-authorized startup for each drive is mandatory. Provide a written record of the startup of each unit.

Auxiliary contacts for connection to local disconnect to shut down drive when disconnect is off.

INSTALLATION: Install all equipment in accordance with the manufacturers' recommendations. Drives are to be wall mounted.

Start up and programming by a factory-authorized technician.

MAINTENANCE AND OPERATING INSTRUCTIONS: Provide one (1) hard copy and (1) electronic copy of maintenance and operating instructions for each piece of equipment furnished. The (1) hard copy shall be in a 3-ring binder, and both hard copy and electronic copy shall contain a copy of the approved shop drawings or catalog cuts of all equipment, as well as maintenance and operating instructions from the equipment manufacturers.

Instruct Owner's personnel in the operation of the equipment. Refer to 15900-6 4.6.

ADJUSTMENT AND SERVICE

After completion of the installation, the automatic temperature control manufacturer shall regulate and adjust all thermostats, control valves, motors, and other equipment provided under his contract and shall place them in complete operating condition, subject to approval by the Architect and

Owner.

This shall include but not be limited to “tuning” of all control systems. Systems shall be tuned for decaying wave response and minimal overshoot of setpoint.

Room temperature controls shall have one temperature setpoint with less than a 0.25°F between calculated heating and cooling temperatures.

This Contractor shall work with the Balancing Contractor to provide verification of CFM reading from the DDC terminal unit controllers.

Final adjustment shall be performed by specially trained personnel in direct employ of manufacturer of primary temperature control system.

After completion of installation, perform the following:

Installation:

Check proper installation and connection of each control device.

Verify electric power.

Verify each sensor and actuator connection to field computer.

Field Computer Operation.

Point Test

Check of wiring of each sensor and actuator end-to-end

Verify calibration of each sensor.

Verify manual operation of each acturator.

Local Loop Control

Bring each local loop under control.

Check response to upset, change in setpoint.

Check full and partial load operation.

Supervisory function

Verify time clock schedules.

Verify reset control.

Verify Host Computer Operation.

Verify communication with each field device.

Perform end-to-end sensor and actuator checks.

Verify that the database is correct.

Test other Software.

Trend Logging.

Report Generation.

Remote Access.

System Documentation.

Verify proper operation of every control point in the presence of the Engineer. Include point-by-point checkout.

The control manufacturer shall provide a period of free service extending through one complete heating season and one complete cooling season after acceptance of the control system, and shall report the condition of the control equipment to the Owner and the Architect.

Appendix A – Vykon Niagara Compatibility Statement (NiCS)

VYKON Niagara^{AX} Compatibility Statement (NiCS) Includes all VYKON branded JACE and Software Products

VYKON Niagara^{AX} Compatibility Statement (NiCS)

Includes all VYKON branded JACE and Software Products

The following information describes Tridium's VYKON branded Niagara^{AX} product licensing.

Tridium's VYKON AX branded products utilizes an open access licensing procedure. VYKON AX branded products can be connected to and managed by any Niagara based tools or systems without the need to modify the license. This means the end user does not have to authorize changes to a VYKON AX license for another systems integrator to gain access to the system. The end user does need to have the necessary user names and passwords installed by the original system integrator so they can be used by another Niagara trained system integrator.

The following is an explanation of the VYKON licensing scheme.

BrandID

Every licensed station and tool has a Brand Identifier (BrandID). This field holds a text descriptor that the OEM chooses as the identifier for its product line. Each station or tool can have only one BrandID entry.

Tridium's VYKON products have the following:

BrandID – VYKON

Station Compatibility In

This field is a list of brands that this local station will allow Niagara AX data to come in from. Simply stated from the point of view of a JACE, "this is the list of brands that can I can accept data from". Tridium's VYKON products contain:

Station Compatibility In – All (In the actual license ALL is define by an *)

Note: The compatibility fields can contain; a single brand "ABC", a list of multiple brands "ABC, XYZ", no brand

"None" or all brands "All".

Station Compatibility Out

This field is a list of brands that this local station will allow Niagara AX data to be shared with. Simply stated, "This is the list of brands that I can share data with". Tridium's VYKON products contain:

Station Compatibility Out – All

Tool Compatibility In

This field is a list of brands that this station will allow to be connected to it for engineering of its application. Simply stated, "This is the list of brands that can engineer me". Tridium's VYKON products contain:

Tool Compatibility In – All

Tool Compatibility Out

This field is a list of brands that this tool is allowed to connect to and engineer. Simply stated, "This is the list of brands that I can engineer". Tridium's VYKON products contain:

Tool Compatibility Out – All

As long as VYKON branded products are purchased by the end user any Tridium Certified (TCP) system integrator can provide support for the end user without the need for the owner to be involved in the licensing process. For more information on Niagara Connectivity and Security visit our website library at: http://www.vykon.com/cs/library/white_papers

TRIDIUM NIAGARA AX 3.8
BACnet PICS

BACnet Protocol Implementation Conformance Statement

Date: August 31, 2016
Vendor Name: Tridium
Product Name: Niagara AX BACnet Integration
Product Model Number: Tridium JACE models
Application Software Version: 3.8.112 or higher
Firmware Revision: 3.8.112.1 or higher
BACnet Protocol Revision: 7

Product Description:
Niagara AX provides the ability to view, monitor, and control BACnet devices over IP, raw Ethernet, or MS/TP media. Devices, points, schedules, alarms, and logs can be learned and managed from Niagara AX. In addition, Niagara points, schedules, histories, and alarming can be exposed to BACnet for monitor and control by foreign BACnet clients.

BACnet Standardized Device Profile (Annex L):

☐ **BACnet Advanced Operator Workstation (B-AWS)**
☐ **BACnet Operator Workstation (B-OWS)**
☐ **BACnet Operator Display (B-OD)**
☒ **BACnet Building Controller (B-BC)**
☐ **BACnet Advanced Application Controller (B-AAC)**
☐ **BACnet Application Specific Controller (B-ASC)**
☐ **BACnet Smart Sensor (B-SS)**
☐ **BACnet Smart Actuator (B-SA)**

Segmentation Capability:

Feature	Supported	Window size
Transmit Segmented Messages	yes	10
Receive Segmented Messages	yes	any

Standard Object Types Supported:

- The CreateObject and DeleteObject services are not supported, so no objects are dynamically creatable or deletable through BACnet service requests, although these objects are dynamically creatable and deletable through Niagara.
- No general range restrictions exist; however, certain specific applications may have specific range restrictions.
- All potentially available properties are listed for each object type.
- Optional properties are listed in *italics*. Not all instances support all optional properties.
- Writable properties are listed in **bold**. Any range limitations are expressed in parentheses following the property name.

Notes from Table

1. The File_Size property of File objects is only writable if the underlying system file is changeable.
2. The Setpoint property of Loop objects is writable only if the setpoint is not linked from within Niagara.
3. The Recipient_List property of the Notification Class object will maintain entries that are internally configured within Niagara.
4. The List_Of_Object_Property_References property of the Schedule object will maintain entries that are internally configured within Niagara.
5. The Priority_For_Writing property of Schedule objects is not important for internal Niagara operation, as the priority at which a point is commanded is determined by the input to which the Schedule output is linked.
6. These Trend Log object properties are not writable if the backing history for the exported Trend Log is a Niagara-generated history. If the history is created as a BACnet Trend Log, then they are writable.
7. Trend Logs in Niagara use internal triggering and are either COV or Interval. So the Log_Interval property cannot be written from BACnet.

Powered by Niagara AX FRAMEWORK®

Data Link Layer Options:

☒ BACnet IP, (Annex J)
☒ BACnet IP, (Annex J), Foreign Device
☒ ISO 8802-3, Ethernet (Clause 7)
☐ ANSI/ATA 878.1, 2.5 Mb. ARCNET (Clause 8)
☐ ANSI/ATA 878.1, RS-485 ARCNET (Clause 8), baud rate(s) _____
☒ MS/TP master (Clause 9), baud rate(s): 9600, 19200, 38400, 76800
☐ MS/TP slave (Clause 9), baud rate(s): _____
☐ Point-To-Point, EIA 232 (Clause 10), baud rate(s):_____
☐ Point-To-Point, modem, (Clause 10), baud rate(s): _____
☐ LonTalk, (Clause 11), medium: _____
☐ Other:

Device Address Binding:

Is static device binding supported? (This is currently necessary for two-way communication with MS/TP slaves and certain other devices.) ☒Yes ☐ No

Networking Options:

☒ Router, Clause 6 – Routing configurations: Ethernet-IP, Ethernet-MS/TP, IP-MS/TP
☐ Annex H, BACnet Tunneling Router over IP
☒ BACnet/IP Broadcast Management Device (BBMD)
Does the BBMD support registrations by Foreign Devices? ☒ Yes ☐ No

Character Sets Supported:

Indicating support for multiple character sets does not imply that they can all be supported simultaneously.

☒ ANSI X3.4	☐ IBM™/Microsoft™ DBCS	☒ ISO 8859-1
☒ ISO 10646 (UCS-2)	☐ ISO 10646 (UCS-4)	☐ JIS C 6226

If this product is a communication gateway, describe the types of non-BACnet equipment/networks(s) that the gateway supports:
This product supports communications between BACnet and any third-party system to which Niagara can connect. Contact Tridium for a list of supported protocols.

Appendix C – BACnet Testing Laboratories Product Listing

BACnet Testing Laboratories Product Listing

This product has been tested at a qualified BACnet Testing Laboratory and found to comply with all the necessary interoperability requirements in place on the published test date. This listing represents the tested capability of the Listed Product. For information on additional functionality that was not covered in the test process, refer to the Manufacturer's PICS statement on the BI website.

Listing Information

Vendor		Listing Status
Tridium, Inc. 3951 Westerre Parkway, Suite 350 Richmond, VA 23233 USA		Listed Product
Test Requirements	BACnet Protocol Revision	Date Tested
Requirements as of July 2009	Revision 7 (135-2008)	July 2011

Product Name	Model Number(s)	Software Version
Niagara AX Supervisor with BACnet B-AWS	S-AX-AWS	3.6.35

END OF SECTION 250200

SECTION 250300 - ENERGY METERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes thermal and electric power energy meters that connect to DDC systems.

B. Related Requirements:

1. Section 250200 "Direct-Digital Control System for HVAC" for control equipment and software, relays, electrical power devices, uninterruptible power supply units, wire, and cable.

1.3 DEFINITIONS

A. DDC: Direct-digital control.

B. Ethernet: Local area network based on IEEE 802.3.1 standards.

C. Firmware: Software (programs or data) that has been written onto read-only memory (ROM). Firmware is a combination of software and hardware. Storage media with ROMs that have data or programs recorded on them are firmware.

D. I/O: Input/output.

E. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle.

F. RS-232: A TIA standard for asynchronous serial data communications between terminal devices.

G. RS-485: A TIA standard for multipoint communications using two twisted pairs.

H. RTD: Resistance temperature detector.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics, electrical characteristics, and furnished accessories indicating electrical power requirements.

3. Product description with complete technical data, performance curves, and product specification sheets.

B. Shop Drawings:

1. Include plans, elevations, sections, and mounting details.
2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each product requiring a certificate.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For energy meters to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 UTILITY ENERGY METERS

A. Manufacturers: The required energy meters for the energy sources listed below shall be as follows:
1. Natural gas - ONICON F-5500
2. Domestic cold water - ONICON F-4600
3. Steam Condensate – ONICON F-4600
4. AC Condensate – ONICON FT-3000
5. Chilled Water – ONICON F-3500
6. Electrical Power - Schneider METSEPM5560 and METSEPM5563RD

B. For insertion type meters, temperature ranges for the specified meters shall be chosen to match the application.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for instruments installed in piping to verify actual locations of connections before installation.

C. Examine roughing-in for instruments installed in duct systems to verify actual locations of connections before installation.

D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install products level, plumb, parallel, and perpendicular with building construction.

B. Support instruments, tubing, piping wiring, and conduit to comply with requirements indicated.

C. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

3.3 ELECTRIC POWER

A. Furnish and install electrical power to products requiring electrical connections.

B. Furnish and install circuit breakers. Comply with requirements in Section 262816 "Enclosed Switches and Circuit Breakers."

C. Furnish and install power wiring. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

D. Furnish and install raceways. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems."

3.4 MAINTENANCE SERVICE

A. Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by manufacturer's authorized service representative. Include semiannual preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper meter operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain instrumentation and control devices.

B. Coordinate video with operation and maintenance manuals and classroom instruction for use by Owner in operating, maintaining, and troubleshooting.

C. Record videos on DVD disks.

D. Owner shall have right to make additional copies of video for internal use without paying royalties.

END OF SECTION 230923.13

TAGGED NOTES

IC1	PROVIDE AND INSTALL NEW TIER 1 DDC CONTROL PANEL AND CABINET.
IC3	ALL CONTROLS POINTS IN THE OUTLINED AREA TO REPORT TO BACP-LL-A REFER TO BP-08 FIT-OUT DRAWINGS FOR EQUIPMENT SCHEDULES AND SPECIFICATIONS IN THE OUTLINED AREA.
IC4	ALL CONTROLS POINTS IN THE OUTLINED AREA TO REPORT TO BACP-LL-B REFER TO BP-08 FIT-OUT DRAWINGS FOR EQUIPMENT SCHEDULES AND SPECIFICATIONS IN THE OUTLINED AREA.
IC17	REFRIGERATOR/FREEZER TO BE MONITORED BY DDC, CONTROLS CONTRACTOR TO PROVIDE AND INSTALL REFRIGERATOR/FREEZER TEMPERATURE MONITORS. MEDICAL REFRIGERATORS/FREEZERS SHALL BE PROVIDED WITH PORT TO INTEGRATE TEMEPRATURE SENSOR, COORDINATE WITH MEDICAL EQUIPMENT PACKAGE. PROVIDE HIGH TEMPERATURE ALARM. FIELD VERIFY LOCATION AND CONFIRM WITH MEDICAL EQUIPMENT PROVIDER.
IC26	CONTROLS CONTRACTOR TO INSTALL BOILER CONTROL PANEL AND ALL NECESSARY INTEGRATION. BOILER CONTROL PANEL PROVIDED BY THE BOILER MANUFACTURE.
IC27	ELECTRICAL CONTRACTOR TO PROVIDE AND INSTALL BUILDING LIGHTING CONTROLS PANEL. CONTROLS CONTRACTOR TO INTEGRATE BUILDING LIGHTING CONTROLS PANEL INTO BAS SYSTEM FOR TIMECLOCK CONTROLS.
IC28	CONTROLS CONTRACTOR TO PROVIDE AND INSTALL FIRE CONTROL PANEL AND INTEGRATE INTO BAS.
IC30	FIRE PUMP CONTROLLER TO BE INTEGRATED AND MONITORED BY THE BAS.
IC31	2 ENERGY METERS, CONTROLS CONTRACTOR TO INTEGRATE INTO BAS. COORDINATE WITH ELECTRICAL CONTRACTOR.
IC32	3 ENERGY METERS, CONTROLS CONTRACTOR TO INTEGRATE INTO BAS. COORDINATE WITH ELECTRICAL CONTRACTOR.
IC33	4 ENERGY METERS, CONTROLS CONTRACTOR TO INTEGRATE INTO BAS. COORDINATE WITH ELECTRICAL CONTRACTOR.
IC44	5 ENERGY METERS, CONTROLS CONTRACTOR TO INTEGRATE INTO BAS. COORDINATE WITH ELECTRICAL CONTRACTOR.
	THERMOSTAT SHALL BE NON-METALLIC, MRI SAFE DEVICE.

HUMIDIFIER SCHEMATIC

1. HUMIDIFIER

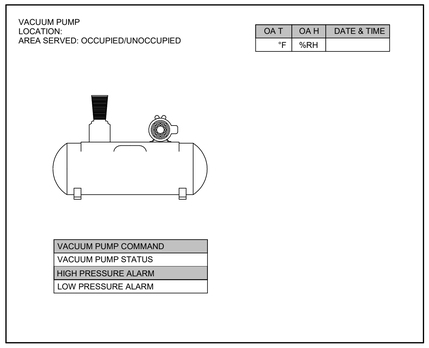
1.1. AHU1_DT_0S, AHU3_LAB_12N, AHU6_SUR_2S, AHU8_CLIN_34N, AHU12_DT_5S and AHU14_SUR_2N shall be provided a with an adiabatic humidifier. This shall be provided with a BACnet over MSTP communication and all points shall be available to the DDC system. The humidifier shall operate under its own controls to maintain 35% relative humidity in its associated space. The humidifier shall be enabled from the DDC system. When enabled from the DDC, the humidifier shall control the steam control valve. The valve shall be provided by the DDC contractor.

1.2 The humidifier shall be provided with a dedicated reverse-osmosis (RO) water treatment system. The RO system shall be provided with a monitoring system with BACnet over MSTP communication and all points shall be available to the DDC system.

1.3 Humidifier shall control humidity setpoint.

HUMIDIFIER SCHEMATIC

Point Description	Object Name	DI	DO	AI	AO	Override
Humidifier Command	HUM_C		X			X
Humidifier Status	HUM_S	X				
Humidifier Valve % Open	HUM_VLV_P			X		



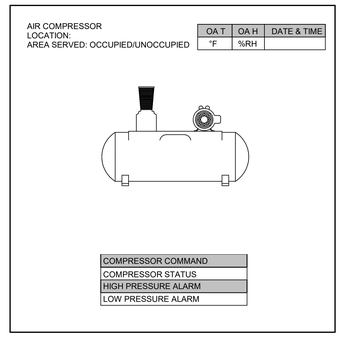
1. MEDICAL VACUUM PUMP

1.1. The meical vacuum pump (VAC-1) shall operate in a lead lag schedule. The DDC shall monitor both pumps.

1.2. The DDC system shall monitor the system pressure down stream of the dryer and provide a high and low pressure alarm.

MEDICAL VACUUM PUMP POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Vacuum Pump Command	VAC_C		X			X
Vacuum Pump Status	VAC_S	X				
High Pressure Alarm	VAC_HP_A	X				
Low Pressure Alarm	OA_F	X				



1. AIR COMPRESSOR

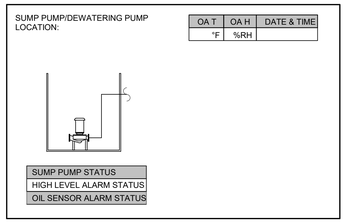
1.1. The medical air comressor (MAC-1) is a duplex air compressor and shall operate in a lead lag schedule. The air compressor shall have BACNET interface. The DDC system shall monitor both compressors. The compressor will alternate via the mechanical altenuator provided with the compressor.

1.2. The instrument air comressor (IAC-1) is a duplex air compressor and shall operate in a lead lag schedule. The air compressor shall have BACNET interface. The DDC system shall monitor both compressors. The compressor will alternate via the mechanical altenuator provided with the compressor.

1.3. The DDC system shall monitor the system pressure downstream of the dryer and shall provide a high or low pressure alarm.

MEDICAL VACUUM PUMP POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
MAC-1 Command	MAC_C		X			X
MAC-1 Status	MAC_S	X				
MAC-1 High Pressure Alarm	MAC_HP_A	X				
MAC-1 Low Pressure Alarm	MAC_LP_A	X				
IAC-1 Command	IAC_C		X			X
IAC-1 Status	IAC_S	X				
IAC-1 High Pressure Alarm	IAC_HP_A	X				
IAC-1 Low Pressure Alarm	IAC_LP_A	X				



1. ELEVATOR SUMP PUMP

1.1. The DDC system shall monitor each building sump pump through the sump pump control panel. Provide all necessary equipment and labor to integrate the sump pump control panel into the BAS. Provide an alarm if the pump control panel is in an alarm status.

1.2. If high liquid levels are detected an alarm shall be signaled to the BAS.

1.3. If oil sensor is indicated an alrm shall be signaled to the BAS.

ELEVATOR SUMP PUMP POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Sump Pump Status	SP_X_S	X				
High Level Alarm	SP_XHL_A	X				
Oil Sensor Alarm	MAC_XO_A	X

RA Damper Status	RA_D_S	X				
Space Temp Set Point	SP_T_SP				X	X
Space Temp Actual	SP_T_A			X		

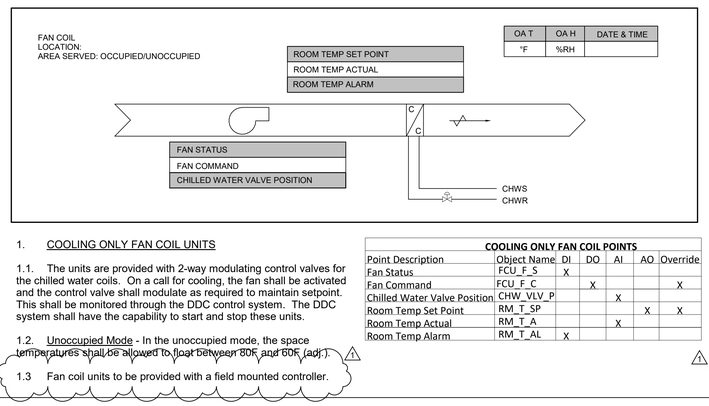
1. EMERGENCY GENERATOR

1.1. This building is equipped with 3 emergency generators.

1.1. The DDC shall monitor the status of each generator as well as low fuel level in the generator and is located on the loading dock. The (3) automatic transfer switches shall have their status monitored as well. The emergency generator shall be able to communicate to the DDC system via BACnet over MSTP and all points shall be available to the DDC system.

1.2. The Generator Equipment room shall be provided with two motorized damper fast open outside air intake damper on each outside air intake louver. The controls contractor shall provide the fast-open acutator, along with all required wiring and equipment. This dampers shall be normally closed and fail open. Upon initiation of any of the three generators, the DDC system shall open the intake dampers instantaneously to provide proper intake air to cool the generator.

1.3. Each generator shall be provided with a heat rejection duct routed to the building exterior. The heat rejection duct shall be provided with a branch duct and motorized damper that supplies directly into the space. This damper shall be normally closed and fail open. When the room temperature drops below 35 F (adj.) the motorized damper shall modulate open to bypass warm generator heat rejection air into the space to provide space heating. When the room temperature is above 35 F (adj.) this damper shall be closed.



1. COOLING ONLY FAN COIL UNITS

1.1. The units are provided with 2-way modulating control valves for the chilled water coils. On a call for cooling, the fan shall be activated and the control valve shall modulate as required to maintain setpoint. This shall be monitored through the DDC control system. The DDC system shall have the capability to start and stop these units.

1.2. Unoccupied Mode - In the unoccupied mode, the space temperatures shall be allowed to float between 80F and 60F (adj.).

1.3 Fan coil units to be provided with a field mounted controller.

COOLING ONLY FAN COIL POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Fan Status	FCU_F_S	X				
Fan Command	FCU_F_C		X			X

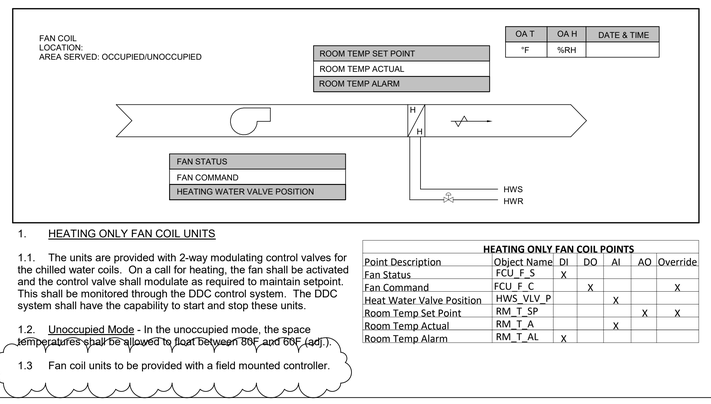
Room Temp Alarm	RM_T_AL	X				



1. HEATING ONLY FAN COIL UNITS

1.1. The units are provided with 2-way modulating control valves for the chilled water coils. On a call for heating, the fan shall be activated and the control valve shall modulate as required to maintain setpoint. This shall be monitored through the DDC control system. The DDC system shall have the capability to start and stop these units.

1.2. Unoccupied Mode - In the unoccupied mode, the space temperatures shall be allowed to float between 80F and 60F (adj.).

1.3 Fan coil units to be provided with a field mounted controller.

HEATING ONLY FAN COIL POINTS

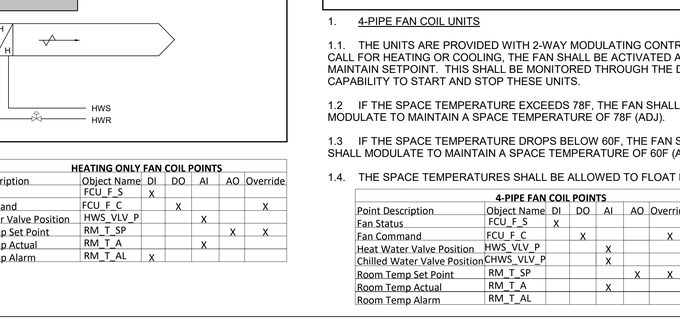
Room Temp Actual	RM_T_A			X		
Room Temp Alarm	RM_T_AL	X				



1. DOMESTIC WATER BOOSTER PUMP

1.1. The domestic water booster pump shall operate under its own controls to maintain appropriate system pressure in the occupied mode. In the unoccupied mode, the system shall be off. The DDC system shall monitor pump status and provide an alarm if the pump is not operating in the occupied mode. The DDC system shall monitor the pressure set point and corresponding system pressure.

DOMESTIC WATER BOOSTER PUMP POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
DBP-1A Command	DBP_1A_C		X			X
DBP-1A Status	DBP_1A_S	X				
DBP-1A Speed	DBP_1A_SPD			X		
DBP-1B Command	DBP_1A_C		X			X

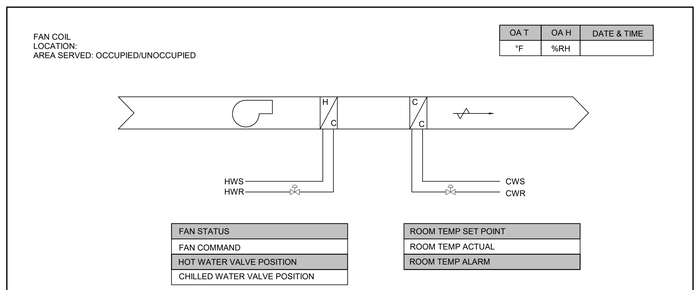
DBP-1B Speed	DBP_1B_SPD			X		
Pressure Set Point	DCW_P_SP				X	X
Pressure Actual	DCW_P_A			X		

1. BUILDING FIRE PUMP

1.1. The DDC system shall monitor the building fire pump. Provide an alarm if the pump is in operation.

FIRE PUMP POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Fire Pump Status	FP_S	X				



1. 4-PIPE FAN COIL UNITS

1.1. THE UNITS ARE PROVIDED WITH 2-WAY MODULATING CONTROL VALVES FOR THE CHILLED AND HOT WATER COILS. ON A CALL FOR HEATING OR COOLING, THE FAN SHALL BE ACTIVATED AND THE CONTROL VALVE SHALL MODULATE AS REQUIRED TO MAINTAIN SETPOINT. THIS SHALL BE MONITORED THROUGH THE DDC CONTROL SYSTEM. THE DDC SYSTEM SHALL HAVE THE CAPABILITY TO START AND STOP THESE UNITS.

1.2 IF THE SPACE TEMPERATURE EXCEEDS 78F, THE FAN SHALL ACTIVATE AND THE CHILLED WATER CONTROL VALVE SHALL MODULATE TO MAINTAIN A SPACE TEMPERATURE OF 78F (ADJ.).

1.3 IF THE SPACE TEMPERATURE DROPS BELOW 60F, THE FAN SHALL ACTIVATE AND THE HEATING WATER CONTROL VALVE SHALL MODULATE TO MAINTAIN A SPACE TEMPERATURE OF 60F (ADJ.).

1.4. THE SPACE TEMPERATURES SHALL BE ALLOWED TO FLOAT BETWEEN 78F AND 60F (ADJ.).

4-PIPE FAN COIL POINTS

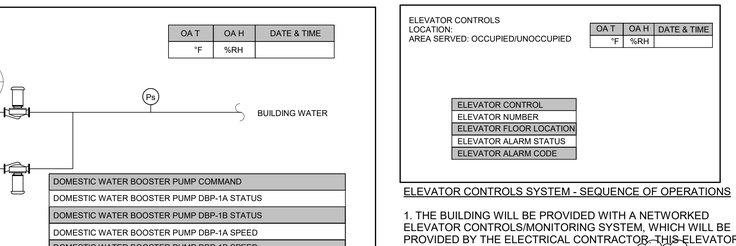
Room Temp Set Point	RM_T_SP				X	X
Room Temp Actual	RM_T_A			X		
Room Temp Alarm	RM_T_AL					



ELEVATOR CONTROLS SYSTEM - SEQUENCE OF OPERATIONS

1. THE BUILDING WILL BE PROVIDED WITH A NETWORKED ELEVATOR CONTROLS/MONITORING SYSTEM, WHICH WILL BE PROVIDED BY THE ELECTRICAL CONTRACTOR. THIS ELEVATOR CONTROLS SYSTEM SHALL BE EQUIPPED WITH A BACNET INTERFACE FOR INTEGRATION INTO THE BAS VIA IP.

2. PROVIDE A FULL GRAPHIC MAP OF THE BUILDING INDICATING ELEVATOR LOCATIONS AND ALARM STATUS, INCLUDING THE CENTRAL ENERGY PLANT. THE ELEVATOR FLOOR LOCATION SHALL BE INDICATED GRAPHICALLY ON THE MAP. IF AN ELEVATOR IS IN ALARM STATUS, THIS ELEVATOR SHALL BE HIGHLIGHTED IN RED ON THE MAP.

3. ALL POINTS AVAILABLE FROM THE ELEVATOR CONTROL SYSTEM SHALL BE MADE AVAILABLE TO THE BAS.

ELEVATOR POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Elevator Control	ELEV_C		X			X
Elevator Number	ELEV_N			X		
Elevator Floor Location	ELEV_FL			X		
Elevator Alarm Status	ELEV_A	X				
Elevator Alarm Code	ELEV_AC	X

1. MISCELLANEOUS EXHAUST FANS

1.1. EF2_HTE_05S and EF5_HTE_1N serves hot labs throughout the building. EF2_HTE_05S shall be provided with an ECM speed controller provided by the fan manufacturer. EF5_HTE_1N shall be provided with a VFD, VFD's shall be provided by the controls contractor. These fans shall operate 24/7 at a constant volume.

1.3. EF4_GEN_0N serves general exhaust spaces throughout the building. This fan shall be provided with a VFD, VFD's shall be provided by the controls contractor. This fan shall operate whenever AHU4_AUX_012N is in operation.

1.4. EF6_GE_0123S and EF8_GE_2345N serves general exhaust spaces throughout the building. These fans shall be provided with a VFD, VFD's shall be provided by the controls contractor. These fans shall operate 24/7 at a constant volume.

1.5. EF7_GE_4567S serves general exhaust spaces throughout the building. This fan shall be provided with a VFD, VFD's shall be provided by the controls contractor. This fan shall operate whenever AHU11_CLIN_6S is in operation.

1.6. EF9_GE_678N serves general exhaust spaces throughout the building. This fan shall be provided with a VFD. VFD's shall be provided by the controls contractor. This fan shall operate whenever AHU5_CLIN_567N is in operation.

1.7. EF13_ISO_1S and EF24_ISO_2N serve airborn infection isolation rooms. These fans shall be provided with an ECM speed controller provided by the fan manufacturer. These fans shall operate 24/7 at a constant volume.

1.8. EF14_RAD_0N serves the radioactive waste room on the lower level. This fan shall be provided with a VFD. VFD's shall be provided by the controls contractor. This fan shall operate 24/7 at a constant volume.

1.9. EF15_LAB_5N serves the stem cell lab. This fan shall be provided with an ECM speed controller provided by the fan manufacturer. This fan shall operate in response to a low oxygen signal reported to the BAS via oxygen depletion sensors located in the space. The controls contractor shall be responsible for providing and installing the oxygen depletion sensors. Refer to IC105 for oxygen depletion sensor locations.

1.10. EF16_MRI_1N, EF17_MRI_1N, EF18_MRI_1N and EF19_MRI_1N serve as emergency exhast fans for the MRI exam rooms on the first floor. These fans shall be provided with an ECM speed controller provided by the fan manufacturer. These fans shall be interlocked with there respective MRI and shall activate during a quench event at the associated MRI. Provide push button activation control for each fan in the locations indicated on the drawings. Activation of these fans shall generate an alarm at the DDC.

1.11. EF20_SUR_2S served the central sterile located on the second floor. This fan shall be provided with a VFD. VFD's shall be provided by the controls contractor. This fan shall operate 24/7 at a constant volume.

1.12. EF3_MED_0N, EF21_MED_2S and EF25_MED_2N serve medical gas storage rooms. EF21_MED_2S and EF25_MED_2N shall be provided with an ECM speed controller provided by the fan manufacturer. EF3_MED_0N shall be provided with a VFD, VFD's shall be provided by the controls contractor. These fans shall operate 24/7 at a constant volume.

1.13. EF22_LAB_0S serves an exhaust hood located in "A007B MOLD/BLOCK FABRICATION". This fan shall be provided with an ECM speed controller provided by the fan manufacturer. This fan shall operate 24/7 at a constant volume.

2.0. The DDC shall monitor the status of each of these fans listed via a current sensor. If the command does not match the fan status, then an alarm shall be generated to the BAS.

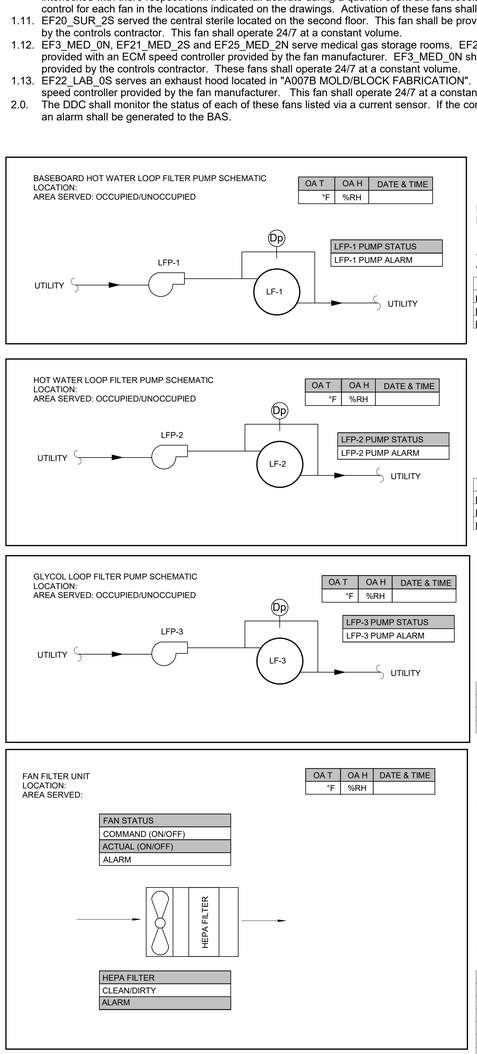
ELECTRIC HUMIDIFIER

1. ELECTRIC HUMIDIFIER

1.1. MRI VAV boxes shall be provided with a remote electric humidifiers (located in MRI equipment rooms) w/ duct mount dispersion. This shall be provided with a BACnet over MSTP communication and all points shall be available to the DDC system. The humidifier shall operate units its own controls to maintain appropriate humidity levels in the space served. The humidifiers shall be enabled from the DDC system. When enabled from the DDC, the humidifiers shall operate units its own controls sequence to maintain a minimum of 50% RH in the space.

ELECTRIC HUMIDIFIER POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
Humidifier Command	HUM_C		X			X
Humidifier Status	HUM_S	X				
Humidifier Valve % Open	HUM_VLV_P			X		



1. BASEBOARD HOT WATER LOOP FILTER PUMP (LFP-1)

1.1. The Loop Filter Pump shall operate when the baseboard hot water pumps are in operation. LFP-1 shall be off when the baseboard hot water pumps are off.

1.2. The DDC shall monitor pumps status and sound an alarm if the pump is not operating at the same time as the baseboard hot water pumps.

LFP-1 POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
LFP-1 Pump Status	LFP_1P_S	X				
LFP-1 Pump Alarm	LFP_1P_A	X				

1. HOT WATER LOOP FILTER PUMP (LFP-2)

1.1. The Loop Filter Pump shall operate when the secondary hot water pumps are in operation. LFP-2 shall be off when the secondary hot water pumps are off.

1.2. The DDC shall monitor pumps status and sound an alarm if the pump is not operating at the same time as the secondary hot water pumps.

LFP-2 POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
LFP-2 Pump Status	LFP_1P_S	X				
LFP-2 Pump Alarm	LFP_1P_A	X				

1. GLYCOL LOOP FILTER PUMP (LFP-3)

1.1. The Loop Filter Pump shall operate when the secondary hot water pumps are in operation. LFP-3 shall be off when the secondary hot water pumps are off.

1.2. The DDC shall monitor pumps status and sound an alarm if the pump is not operating at the same time as the secondary hot water pumps.

LFP-3 POINTS

Point Description	Object Name	DI	DO	AI	AO	Override
LFP-3 Pump Status	LFP_1P_S	X				
LFP-3 Pump Alarm	LFP_1P_A	X				

1. FAN FILTER UNITS (FFU)

1.1. REFER TO DRAWINGS FOR LOCATIONS OF FAN FILTER UNITS. FAN FILTER UNITS SHALL BE CONSTANT VOLUME.

1.2. FAN FILTER UNITS SHALL OPERATE 100% OF THE TIME. THE BAS SHALL MONITOR THE STATUS OF THE FAN. IF THE FAN IS OFF AT ANY TIME, THE BAS SHALL GENERATE AN ALARM.

1.3 THE BAS SHALL MONITOR THE STATUS OF THE HEPA FILTER THROUGH THE FFU CONTROLS INTERFACE. THE BAS SHALL DISPLAY THE CLEAN/DIRTY STATUS OF THE HEPA FILTER. IF THE FFU OUTPUTS A DIRTY FILTER SIGNAL TO THE BAS, THEN THE BAS SHALL GENERATE AN ALARM.

FAN FILTER POINTS

Point Description	Object Name	DI	DO	AI	AO	Override

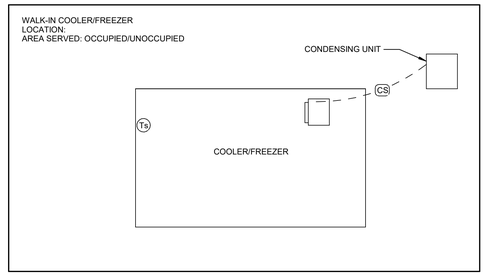
MEDICAL REFRIGERATOR/FREEZER - SEQUENCE OF OPERATIONS

1. The medical refrigerator/freezers included in the medical equipment drawings shall be provided with an integral temperature sensing suite. The controls contractor shall provide all equipment and wiring necessary to integrate this system into the BAS.

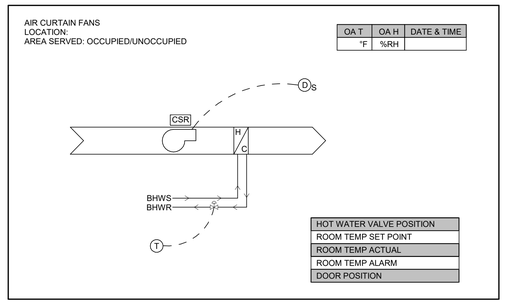
2. If the temperatures exceed a pre-designated setpoint (adj.), an alarm shall be generated to the BAS.



WALK-IN COOLER/FREEZER - SEQUENCE OF OPERATIONS

1. The controls contractor shall provide and install a wall-mounted temperature sensor inside each walk-in cooler/freezer and shall integrate into the BAS.

2. If the temperatures exceed a pre-designated setpoint (adj.), an alarm shall be generated to the BAS.



1. AIR CURTAIN FAN CONTROLS SEQUENCE

1.1. Air curtain fans shall be installed where indicated on the drawings.

1.2. When the door being served by the air curtain is closed, the air curtain shall remain off and the hot water control valve shall remain closed. When the door opens, the fan shall run and the hot water control valve shall open.

1.3. The air curtain heating coil shall be connected to the baseboard heating water system. The controls contractor shall provide a two-way two-position control valve installed on the baseboard heating water return pipe. The control valve shall be controlled by the same space thermostat as the VAV box serivng the space.

1.4. If no VAV box serves the space where the air curtain is installed, the temperature controls contractor shall provide a wall-mounted thermostat to control this valve.

1.5. When the space is in a call for heating, the control valve shall open fully to provide full coil flow for the air curtain fan heating coil. The air curtain supply fan shall be connected to a door switch and shall operate when the door is opened. The control valve position shall be monitored by the DDC system.

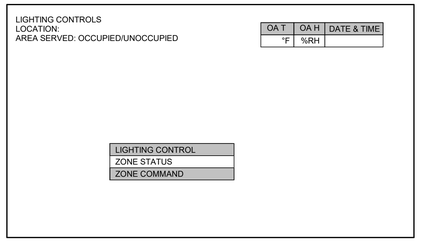
Exterior Zone 5 Flow	EZ_5_F			X		
Interior Zone 1 Flow	IZ_1_F			X		

1. WATER SYSTEM METERING

1.1. Provide a water meter for the buildings irrigation water loop which serves the yard hydrants and a separate loop which serves interior landscape areas. This shall be connected to the DDC system and provide a total GPM per month of water usage.



LIGHTING SYSTEM METERING POINTS

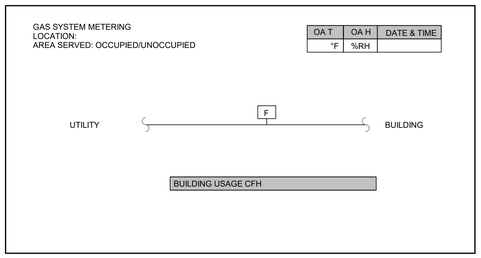
Point Description	Object Name	DI	DO	AI	AO	Override
Zone Status	LZ_X_S	X				
Zone Command	LZ_X_C		X			X

1. LIGHTING CONTROL SYSTEM

1.1. The DDC shall monitor the lighting control system both the interior and exterior lighting zones and shall have a visual indication on the graphics screen of the building if the lights are on or off for each room/area. The DDC system shall have the availability to turn on and off the lights and control all schedules at each of the following zones.

1.1. Number of control zones -

1.2. Provide all required relays, panels, controllers, etc. as required to control this system. Coordinate all requirements with lighting control vendor. Refer to electrical specifications for additional information.



1. BUILDING NATURAL GAS METERING - SEQUENCE OF OPERATIONS

1.1. The controls contractor shall provide and install his digital gas meter in the main gas service entering the building. Coordinate size/requirements with the plumbing drawings. This meter shall be integrated into the BAS. All points available from the meter shall be made available to the BAS.

1.2. All controls wiring from the meter to the BAS shall be provided and installed by the TCC.

1.3. The provided meter shall have the capabilities of providing instanataneous consumption readings, as well as calculating consumption over a period of time, as indicated on the energy metering points list.

1. DOMESTIC HOT WATER SYSTEM

1.1. The domestic hot water system shall run 24/7

1.2. The domestic hot water return pump RP-1 and RP-2 shall run constantly with one pump in standby. The lead pump shall regurarly cycle between RP-1 and RP-2

1.3. The deomestic hot water heaters WH-1, WH-2 and WH-3 shall run in a N+1 configuration with two water heaters operating in normal operation and one on standby. The water heaters shall control themselves through there own sequence to 125F water.

1.4 The DDC shall monitor the DHW supply and return temperature at each floor and report to the BAS.

OPERATING ROOM TEMPERATURE CONTROL SCHEMATIC

NTS

SEQUENCE OF OPERATION- OPERATING ROOM TEMPERATURE AND PRESSURE CONTROL - PHOENIX CONTROL SYSTEM

THE FOLLOWING DESCRIBES THE SEQUENCE OF OPERATION FOR A TYPICAL OPERATING ROOM WITH VARIABLE AIR VOLUME VENTURI VALVES.

FLOW CONTROL

1. SUPPLY, RETURN AND EXHAUST VALVES SHALL PROVIDE PRESSURE INDEPENDENT CONTROL WHILE MAINTAINING THEIR FLOW SET POINTS TO (+-)5% ACCURACY.
2. A POSITIVE VOLUMETRIC OFF SET (ROOM DIFFERENTIAL) SHALL BE MAINTAINED BETWEEN THE OPERATING ROOM AND ADJOINING SPACES AT ALL TIMES. THE ROOM SHALL MAINTAIN AN OVERALL POSITIVE VOLUMETRIC OFFSET OF 500 CFM (ADJ.) IN OCCUPIED AND UNOCCUPIED MODES.

CLIMATE CONTROL

1. THE SUPPLY AIR VALVE SHALL OPERATE AT A CONSTANT VOLUME WHILE SPACE IS OCCUPIED. UPON A CALL FOR HEATING THE HOT WATER CONTROL VALVE SHALL MODULATES TO MAINTAIN SPACE SET POINT.
2. PROVIDE HUMIDITY MONITORING PERCENT RH FOR PROCEDURE.
3. THE CONTROL SYSTEM MONITORS DUCT DISCHARGE TEMPERATURE, ZONE TEMPERATURE, HOT WATER CONTROL VALVE, SUPPLY AND RETURN AIRFLOW RATES, OCCUPIED/UNOCCUPIED STATUS, AND RELATIVE HUMIDITY (RH ONLY AT LOCATIONS INDICATED). THESE VALUES SHALL BE DISPLAYED ON THE VANTAGE TOUCH SCREEN CONTROLLER INTERFACE.
4. ZONE SET POINTS ARE CAPABLE OF LOCAL OR REMOTE ADJUSTMENTS WITH THE CAPABILITY TO LOCKOUT LOCAL ADJUSTMENT.

OCCUPANCY

THE SYSTEM OPERATES THE AIR VALVES AND HEATING CONTROL VALVE IN AN OCCUPIED OR UNOCCUPIED MODE ACCORDING TO THE SPACE MOUNTED OCCUPANCY SENSORS, AND INCLUDES AN OVERRIDE AT THE ZONE THERMOSTAT OR AS DESCRIBED BELOW. THE CONTROLS CONTRACTOR SHALL PROVIDE AND INSTALL TWO CEILING-MOUNTED DUAL-TECHNOLOGY OCCUPANCY SENSORS. THE SYSTEM SHALL BE PLACED INTO UNOCCUPIED MODE WHEN THE SPACE HAS BEEN UNOCCUPIED FOR A PERIOD OF 30 MINUTES (ADJ.). THE SPACE SHOULD RETURN TO OCCUPIED MODE IMMEDIATELY WHEN OCCUPANCY IS SENSED.

- OCCUPIED MODE - THE SUPPLY AND RETURN AIR VALVES SHALL MAINTAIN THE OCCUPIED AIR VOLUME SHOWN IN THE SUPPLY AIR VALVE AND RETURN AIR VALVE SCHEDULES. UPON A CALL FOR HEATING, THE HOT WATER CONTROL VALVE SHALL MODULATE TO MAINTAIN SPACE SET POINT.
- UNOCCUPIED/SETBACK MODE - THE SYSTEM SHALL MODULATE THE SUPPLY AND RETURN AIR VALVES FROM MAXIMUM TO MINIMUM POSITIONS INDICATED ON THE SUPPLY AIR VALVE AND RETURN AIR VALVE SCHEDULES TO MAINTAIN THE OVERALL ROOM VOLUMETRIC OFFSET DESCRIBED HEREIN. THE HOT WATER CONTROL VALVE SHALL MODULATE AS NECESSARY TO MAINTAIN THE TEMPERATURE SETPOINT, AS DETERMINED BY THE OWNER.
- IN UNOCCUPIED MODE, THE OCCUPANCY SENSORS SHALL OVERRIDE THE SYSTEM INTO OCCUPIED MODE UPON NOTIFICATION OF OCCUPANCY FROM THESE SENSORS. PROVIDE A 30 MINUTE DELAY AFTER OCCUPANCY IS LAST REPORTED BY THE SENSORS BEFORE RETURNING THE SYSTEM INTO UNOCCUPIED MODE.

COMPUTER ROOM AC UNIT (CRAC) CONTROLS SCHEMATICS

1. COMPUTER ROOM AC UNIT CONTROLS SEQUENCE

1.1. These units shall be provided with factory controls capable of integrating into the BAS via BACnet over MSTP. The DDC system shall monitor space temperature and provide a high temperature alarm. Provide all necessary wiring conduit, etc. as required to interlock the DDC thermostat with unit and condensing unit. Units shall control to maintain all spaces served at a minimum of 72°F (adj.).

1.2. CRAC-1 and CRAC-2 is provided with an integral humidifier. The DDC system shall monitor space humidity and provide a low humidity alarm (<40% RH) and a high humidity alarm (>75% RH).

1.3. The DDC system shall have the ability to start and stop the split system. These shall be provided with a BACnet over MSTP communication and all points shall be available to the DDC system.

1.1. Upon an alarm activation signal from the fire alarm control panel, the stairwell pressurization fan shall enable and run constinuosly. If the command signal does not match the status and alarm shall be enuciated at the front end.

1.2. There shall be HOA switches located in the lower level fire command room to manually allow the starting of the stairwell pressurization fans.

1.3 All controls related to the stairwell pressuirization fans shall be UL864 listed. Provide all monitoring wiring from fans to fire fighter control panel located in the fire comman room on the lower level.

REMARKS:

1. AT MINIMUM, VFD SHALL INCLUDE 5% IMEDANCE VIA 5% AC LINE REACTOR OR DUAL DC BUS CHOKES SIZED TO 5% EQUIVALENT IMPENDANCE. VFD INPUT AMPS SHALL NOT EXCEED VFD OUTPUT AMPS.
2. PROVIDE UL1449 SURGE SUPPRESSION DEVICE.
3. VFD SHALL INCLUDE ALPHA-NUMERIC KEYPAD INERFACE, WITH DISPLAY IN PLAIN ENGLISH. (DISPLAYS RELYING SOLELY ON CODES ARE NOT ACCEPTABLE).
4. PROVIDE INTERNAL EMI/RFI FILTER PER IEC 61800-3.
5. VFD SHALL BE BTL LISTED FOR BACNET MS/TP, AND ALSO INCLUDE MODBUS AND N2.
6. VFD SHALL INCLUDE REAL TIME CLOCK WITH BATTERY BUCKUP (INLUDE 10 YEAR BATTERY).
7. PHASE LOSS PROTECTION & BROKEN BELT (LOSS OF LOAD) INDICATION WHILE IN BYPASS.
8. BYPASS CONTRACTORS SHALL BE POWERED BY SWITCH MODE POWER SUPPLY, ALLOWING +30% TO -30% INPUT VOLTAGE TOLERANCE. (120V CPT NOT ALLOWED).
9. VFD AND BYPASS SHALL BOTH INCLUDE BACNET MS/TP, DAMPER CONTROL AND FIREMAN'S OVERRIDE FUNCTIONALITY.
10. BYPASS OPERATION TO AUTO-RESET AFTER A BROWN OUT CONDITION.
11. INCLUDE FACST ACTION DRIVE ISOLATION FUSES.
12. BYPASS SHALL BE FULLY FUNCTIONAL IN THE EVENT OF A VFD FAILURE. BYPASS SHALL NOT RELAY ON THE VFD OR THE VFD'S CONTROL BOARD/RELAYS.
13. ABILITY FOR LOCAL OR REMOTE ALTERNATION. CONFIGURABLE FOR AUTOMATIC OR MANUAL TRANSFER UPON VFD FAULT.
14. BOTH VFDS MOUNTED IN COMMON ENCLOSURE. SINGLE MAIN DISCONNECTION MEANS. DRIVE ISOLATION FUSS FOR BOTH DRIVES.
15 INCLUDE A VFD1/ALTERNATION/VD2 SWITCH.
16. SINGLE POINT CONNECTION FOR RUN STATUS, FAULT STATUS, AND FOR DAMPER CONTROL AND FIREMAN'S OVERRIDE FUNCTIONALITY.
17. OUTPUT ISOLATION CONTRACTOR AFTER EACH VFD.
18. SYSTEM TO MEET IEEE 519-2014 BASE ON THE HARMONIC MITIGATION METHOD(S) IDENTIFIED IN THE ABOVE SCHEDULE.
19. VFD SELECTIONS ARE BASED ON MOTOR AMPERAGE NOT EXCLUSIVELY HORSE POWER.
20. VFDS'S ARE SHOWN FOR REFERENCE ONLY. VFD'S TO BE PROVIDED BY THE CONTROLS CONTRACTOR AS PART OF A FUTURE BID PACKAGE.

REMARKS:

1. CONTRACTOR TO PROVIDE LOW PRESSURE VALVE.
2. VALVE ACTUATOR TO BE FAST ACTING.
3. VALVE ACTUATOR TO BE STANDARD ACTING.
4. VALVE TO BE POSITIVE SHUT-OFF VALVE.
5. CONTROLS CONTRACTOR TO PROVIDE VENTURI VALVE, MECHANICAL CONTRACTOR TO INSTALL.

SECTION 019113 - BUILDING SYSTEMS COMMISSIONING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Specific Building Systems (MEP) Commissioning requirements are given in this specification. The following specification sections are related to the Commissioning work specified in this section:

1. Building Enclosure Commissioning requirements: refer to Section 019115.
2. Fire Suppression System requirements: refer to Division 21.
3. Plumbing System requirements: refer to Division 22.
4. Mechanical System requirements: refer to Division 20.
5. Test and Balance (TAB) requirements: refer to Section 203100.
6. HVAC System requirements: refer to Division 23.
7. Facility Management System (FMS) / Direct Digital Control (DDC) System requirements: refer to Division 25.
8. Electrical System Requirements: refer to Division 26.
9. Access Control and Video Surveillance System requirements: refer to Division 28.
10. Fire Alarm System requirements: Refer to Division 28.

1.2 SECTION INCLUDES

A. Section includes the Commissioning (Cx) requirements for the Building Fire Suppression, Mechanical, Plumbing, Heating Ventilating and Air Conditioning (HVAC), Electrical, and Electronic Safety and Security systems.

1. The Building Systems Commissioning requirements are separate from, and in addition to, the Building Enclosure Commissioning requirements in Section 019115. The Construction Manager and Subcontractors are required to participate in each of the Commissioning processes.
2. The 019113 Commissioning Agent (CxA) and 019115 Building Enclosure Commissioning Agent (BECxA) will provide separate documentation for each Commissioning process.

1.3 DESCRIPTION

A. Commissioning is a systematic process of ensuring all building systems perform interactively according to design intent and Owner’s operational needs. Commissioning will encompass and coordinate traditionally separate functions of system documentation, installation checkout, equipment Start-Up, control system calibration and point-to-point checkout, testing and balancing, and Functional Performance Testing. Commissioning is intended to achieve the following specific objectives according to the Contract Documents:

1. Verify and document proper installation and performance of equipment and systems.

2. Provide Owner with functional buildings and/or systems with minimal operational problems at time of move-in.

B. Commissioning does not take away from or reduce responsibility of the Construction Manager or installing Contractors and Subcontractors to provide a finished and fully functioning product.

C. This section shall in no way diminish the responsibility of the Construction Manager, Contractors, Subcontractors and Suppliers in performing all aspects of work and testing as outlined in the contract documents. The Commissioning requirements in this specification are separate from and in addition to any other Equipment/Systems Testing, Demonstration or Commissioning requirements specified in other Sections of the Project Manual.

1.4 ABBREVIATIONS

A. The following are common abbreviations used in the Specifications (definitions are found further in this Section):

1. A/E - Architect and Design Engineers.
2. BECxA – Building Enclosure Commissioning Agent – refer to Section 01 91 15.
3. CM – Construction Manager.
4. Cx – Commissioning.
5. CxA - Commissioning Agent.
6. Cx Database – Commissioning Database.
7. Cx Plan - Commissioning Plan.
8. CxT - Commissioning Team.
9. DDC – Direct Digital Control.
10. FMS – Facility Management System / Direct Digital Control (DDC) System.
11. FMSC – Facility Management System Contractor
12. FPT - Functional Performance Test.
13. O&M - Operations & Maintenance.
14. OR - Owner’s Representative.
15. PFC - Pre-Functional Checklist.
16. RFI - Request for Information.
17. TAB - Test, Adjust and Balance.

1.5 DEFINITIONS

A. Acceptance Phase: Phase of construction after Start-Up and initial checkout when Functional Performance Tests, O&M documentation review and training occur.

B. Approval: Acceptance that a piece of equipment or system has been properly installed and is functioning in tested modes according to the Contract Documents.

C. Architect/Engineer (A/E): Prime consultant (architect) and sub-consultants who comprise the design team, generally HVAC Mechanical Designer/Engineer and Electrical Designer/Engineer.

D. Basis of Design (BOD): Documentation of primary thought processes and assumptions behind design decisions made to meet design intent. Describes systems, components, conditions and methods chosen to meet intent.

E. Building Enclosure Commissioning Agent (BECxA): Contracted to Owner. BECxA directs and coordinates day-to-day Building Enclosure Commissioning activities independently from CxA.

Refer to Section 019115 for Building Enclosure Commissioning Requirements. BECxA reports directly to Owner.

F. Commissioning Agent (CxA): Contracted to Owner. CxA directs and coordinates day-to-day Commissioning activities. CxA reports directly to Owner.

G. Commissioning (Cx) Database - A “cloud-based” process management platform provided by the CxA utilized to execute the Commissioning process.

H. Commissioning (Cx) Plan: Overall plan developed after bidding that provides structure, schedule and coordination planning for Commissioning process.

I. Contract Documents: Documents binding on parties involved in construction of this project (drawings, specifications, change orders, amendments, contracts, etc.).

J. Construction Manager: Contracted directly to Owner. Entity under contract to construct the project. May also be referred to as Contractor or General Contractor in other sections of the Project Manual.

K. Control System: System and components associated with Facility Management System (FMS) and/or Direct Digital Control (DDC) System. Refer to Division 25.

L. Commissioning (Cx) Database - A “cloud-based” process management platform provided by the CxA utilized to execute the Commissioning process.

M. Deferred Functional Tests: Functional tests performed after substantial completion due to partial occupancy, equipment, seasonal requirements, design or other site conditions that disallow test from being performed.

N. Deficiency: Condition of a component, piece of equipment or system that is not in compliance with Contract Documents (that is, does not perform properly or is not complying with design intent).

O. Functional Performance Test Procedures: Commissioning protocols and detailed test procedures and instructions that fully describe system configuration and steps required to determine if the system is performing and functioning properly. These procedures shall be used to document Functional Performance Tests.

P. Functional Performance Test (FPT): Test of dynamic function and operation of equipment and systems. Systems are tested under various modes, such as during low cooling or heating loads, high loads, component failures, unoccupied, varying outside air temperatures, life safety conditions, power failure, etc. Systems are run through all specified sequences of operation. Components are verified to be responding in accordance with contract documents. Functional Performance Tests are executed after Pre-Functional Checklists and Start-Ups are complete.

Q. Monitoring: Recording of parameters (flow, current, status, pressure, etc.) of equipment operation using data loggers or trending capabilities of Facility Management Systems.

R. Overridden Value: Writing over a sensor value in DDC system to see response of a system (e.g., changing outside air temperature value from 52^{o}F to 72^{o}F to verify economizer operation). See also “Simulated Signal”.

S. Pre-Functional Checklist (PFC): A list of static inspections and elementary component tests that verify proper installation of equipment (e.g., belt tension, oil levels, labels affixed, gages in place, sensors calibrated, etc.).

T. Seasonal Performance Tests: Functional Performance Tests deferred until system(s) ambient conditions are closer to design conditions.

U. Simulated Condition: Condition created for testing component or system (e.g., applying heat to space temperature sensor to monitor response of VAV box).

V. Simulated Signal: Disconnecting sensor and using signal generator to send amperage, resistance or pressure to transducer and/or DDC system to simulate value to FMS.

W. Specifications: Construction specifications of Contract Documents.

X. Start-up: The activities where systems or equipment are initially tested and operated. Start-up is completed prior to Functional Performance Testing.

Y. Subcontractor: Contractors and their Subcontractors who provide and install building components and systems.

Z. Test Procedures: Step-by-step process, which must be executed to fulfill test requirements.

AA. Test Requirements: Requirements specifying what modes and functions, etc. will be tested. Test requirements are not detailed test procedures. Test requirements are specified in the Cx Plan.

BB. Trending: Monitoring using Facility Management System.

CC. Vendor: Supplier of equipment.

DD. Warranty Period: Warranty period for entire project, including equipment components.

1.6 COORDINATION

A. Commissioning Team: Members of the Commissioning Team (CxT) will consist of:

1. Commissioning Agent (CxA).
2. Owner’s Representative(s) (OR).
3. Representatives of the Facility User and Operation and Maintenance Personnel.
4. Architect and Design Engineers (A/E).
5. Construction Manager
6. The Contractors and Subcontractors who provide, install, or integrate with the equipment to be commissioned (e.g., Fire Alarm System Contractor integration with the HVAC equipment, etc.).
7. Test and Balance Contractor (TAB Contractor).
8. Facility Management System Contractor (FMSC).
9. Equipment Suppliers and Vendors.

B. Management: Owner will contract services of the CxA. The CxA directs and coordinates Commissioning activities and reports to OR. All members of the CxT shall cooperate to fulfill contracted responsibilities and objectives of the Contract Documents.

C. Kick-Off Meeting: CxA will plan, schedule and conduct a Commissioning Kick-Off Meeting. Membership and responsibilities of the CxT will be clarified at this meeting. Cx Kick-Off Meeting shall be conducted no later than 30 days prior to initial installation of any commissioned equipment on-site (i.e., equipment set on site). CxA will distribute meeting minutes to all parties.

D. Scheduling:

1. CxA will work with Commissioning Team (CxT) to establish required Commissioning activities to incorporate in preliminary Commissioning schedule. The Construction Manager will integrate Commissioning activities into master construction schedule. Representatives of the CxT will address scheduling problems. Necessary notifications are to be made in a timely manner in order to expedite Commissioning.
2. The CxA will provide initial outline schedule of primary Commissioning events at Commissioning Kick-Off Meeting. As construction progresses, more detailed schedules are developed by the CxT.

E. Commissioning and Project Phasing:

1. Phased completion of the project construction is anticipated. The commissioning processes described herein will be completed for each phase of work.
2. All Commissioning work must be completed successfully with no remaining installation or operating deficiencies prior to Owner move-in/occupancy with the exception of the following:

a. Compilation and delivery of Final Commissioning Report.
b. Completion of Online Templates for project LEED Certification.
c. Compilation of LEED Current Facilities Requirements and Operations & Maintenance Plan (CFR and O&M Plan).
d. Compilation of LEED Systems Manual.
e. Compilation of LEED Ongoing Commissioning Plan.
f. Opposed Season Testing.
g. End of Warranty Review Meeting.

PART 2 - PRODUCTS / COMMISSIONING DOCUMENTATION

2.1 COMMISSIONING (CX) DATABASE

A. The Commissioning process will be executed utilizing a “cloud-based” Commissioning (Cx) Database provided by the CxA. The Cx Database is accessed by authorized users using any device running an HTML-5 internet browser (e.g., PC, laptop, tablet, phone) or by an operating system specific (e.g., iOS) application downloaded from corresponding app store.

B. CxA will provide the Construction Manager and Subcontractors with web access to the Cx Database during the Commissioning process to allow the Construction Manager and Subcontractors to complete the scoped Commissioning tasks indicated in other sections of this specification (e.g., completion of Commissioning activities such as notification of deficiency item corrections, readiness for Functional Performance Testing, etc.).

2.2 COMMISSIONING (CX) PLAN

A. CxA will develop overall plan for execution of the Commissioning Process. CxA will provide a single overall Commissioning Plan for all phases of work.

B. The Cx Plan will contain:

1. Executive Summary of overall commissioning process.
2. List of CxT members and roles and responsibilities.
3. Master Equipment List (list of commissioned equipment and systems).
4. Pre-Functional Checklists (PFCs) for commissioned equipment. The PFCs will be developed in the Cx Database.
5. Functional Performance Test Procedures for each commissioned equipment/system including integrated systems testing. The FPTs will be developed in the Cx Database. The initial Cx Plan will not include the FPTs; these will be developed once the FMS/DDC Submittal is approved by the A/E.
6. Sample Master Issues List (used to track issues/deficiencies throughout the commissioning process). The MIL will be developed in the Cx Database.
7. Operation and Maintenance (O&M) and Warranty Data Matrix documenting the O&M/Warranty Documentation requirements for commissioned equipment/systems.
8. Owner Training Matrix documenting the Owner Training requirements for commissioned equipment/systems.
9. Opposed Season Testing Matrix documenting the Opposed Season Testing requirements for commissioned equipment/systems.

C. The Cx Plan will be delivered to the CxT in electronic format (Adobe PDF file searchable from the Table of Contents).

2.3 COMMISSIONED EQUIPMENT/SYSTEMS SUBMITTALS AND O&M DATA

A. Construction Manager shall provide CxA with documentation required for Commissioning work. At minimum, documentation shall include: Requirements as described in Section 013300, detailed Start-Up procedures, full sequences of operation, O&M data, performance data, any performance test procedures, duct pressure testing procedures and results, piping pressure testing and flushing procedures and results, FMS/DDC drawings, details of Owner contracted tests, Warranty Documentation, and Owner Training Documentation. In addition, installation and checkout materials actually shipped inside equipment and actual field checkout sheet forms used by factory or field technicians shall be submitted to CxA.

B. Construction Manager shall submit submittals for all commissioned equipment to CxA for review concurrently with A/E as required for LEED project certification.

C. Construction Manager shall submit one copy of the final A/E approved submittal data to the CxA for record purposes.

D. Construction Manager shall submit one copy of the final A/E approved O&M data for all commissioned equipment/systems to the CxA for record purposes.

E. Construction Manager shall submit one copy of as-built shop drawings of all FMS/DDC system including control sequences, control panels and components, master points list, etc., incorporating all field modifications made prior to Owner acceptance.

2.4 EQUIPMENT NAMEPLATE DOCUMENTATION

A. CM/Subcontractors shall submit photo documentation of the equipment nameplate information for all commissioned equipment (.jpg, .jpeg, .png, .tif, .tiff, format). Filenames shall be tagged by equipment identification from the Schedule drawings. The information shall be provided to the CxA prior to equipment installation.

B. CM/Subcontractors shall submit the following information to the CxA for each item of commissioned equipment. The information will be input by Construction Manager/Subcontractor into the Cx Master Equipment List spreadsheet (Microsoft Excel - .xls format) provided by the CxA. The information shall be provided to the CxA prior to equipment installation.

1. Equipment Manufacturer.
2. Equipment Model Number.
3. Equipment Serial Number.

2.5 SITE VISIT REPORTS

A. CxA will make periodic site visits to complete scoped commissioning work. CxA will provide a report for each site visit to members of the CxT.

B. CxA Site Visit Report will include the following:

1. Attendees and purpose of site visit.
2. Observations regarding commissioned systems and results of completed commissioning work.
3. “Next Steps” section documenting Cx process status and upcoming Cx work / site visits.
4. Current Master Issues List (MIL).
5. Status Report of Cx Process work completion.
6. Picture Report (where applicable).

2.6 PRE-FUNCTIONAL CHECKLISTS (PFC)

A. The objective of the Pre-Functional Checklist is to verify and document that the equipment/systems are provided and installed according to documented design intent and Contract Documents.

B. CxA will develop the Pre-Functional Checklists from the Contract Documents and A/E approved Equipment Submittals. The Pre-Functional Checklists will be included in the Cx Plan developed in the Cx Database. The Pre-Functional Checklists will be completed during construction in the Cx Database by the CxA.

C. Sample Pre-Functional Checklists are included at the end of this specification. The samples are provided to give the Construction Manager and Subcontractors a general idea of the detailed installation items that will be checked for proper installation. The Pre-Functional Checklists included are prototypical, and do not reflect specific requirements of this project’s plans or specifications. Specific Pre-Functional Checklist items may be added, modified or deleted in the Construction Phase Cx Plan delivered to the CxT in order to reflect the final construction document requirements. Construction Manager and Subcontractors shall review final construction documentation for applicable details and specifications related to equipment to be commissioned in order to fully ascertain all of the Pre-Functional Checklist requirements.

2.7 START-UP PLAN

A. Construction Manager and Subcontractors responsible for purchase, installation and Start-Up of commissioned equipment shall compile all testing and equipment Start-Up documentation into an overall Start-Up Plan document.

B. Start-Up Plan shall include the following documentation:

1. Testing documentation and recording forms for all testing required by Division 20, 21, 22, 23, 26, and 28 specifications (e.g., duct pressure testing, duct cleaning, pipe pressure testing, piping flushing and cleaning plans, electrical testing, etc.). Testing documentation shall include:

    a. A written description of the required testing and the procedures required to complete the testing.
    b. All instrumentation utilized for the testing.
    c. Checklist with boxes or lines for recording and documenting the completion of the testing activity and results.

2. Equipment Start-Up Documentation including detailed Start-Up procedures from equipment manufacturer and checkout procedures with normally used field checkout sheets. Start-up documentation shall include checklists and procedures with specific boxes or lines for recording and documenting inspections of each piece of equipment.
3. Facility Management System Start-Up and initial check-out documentation and recording forms including but not limited to point-to-point verifications, control sensor calibrations, and control valve/damper actuator calibrations for inclusion in the Start-Up Plan. Facility Management System Start-up documentation shall include checklists and procedures with specific boxes or lines for recording and documenting inspections of each control system point, sensor or device.
4. Test and Balance (TAB) Execution Plan outlining the TAB procedures and proposed sequencing and scheduling of required TAB work.
5. Equipment Maintenance Log including a listing all maintenance tasks (including frequency of execution) required to be performed on equipment started to ensure equipment warranties are not voided. Start-Up Plan documentation shall include a log for each required maintenance task for Subcontractor/Vendor to document execution of the required maintenance tasks from Start-Up through Final Application for Payment.

C. Start-Up Plan documentation shall be provided in “searchable” electronic PDF format as follows:

1. Provide a separate Start-Up Plan PDF file for each Division of work (e.g., Division 20 Start-Up Plan Division 21 Start-Up Plan, Division 22 Start-Up Plan, Division 23 Start-Up Plan, etc.)
2. Each Start-Up Plan PDF file will have a Cover Sheet with Project Information and Document Title.
3. Each Start-Up Plan PDF file will have a Table of Contents. The Table of Contents shall be “bookmarked” for hyperlink navigation directly to each section and item/document noted below.

    a. Proposed Schedule/Sequencing Plan of Testing and Start-Up activities.
    b. Completed Testing documentation (e.g., duct pressure testing, duct cleaning, piping pressure testing, piping flushing and cleaning, electrical testing, etc.) organized by specification section.
    c. Executed Start-Up Checklists for each item of equipment organized by specification section.

d. Completed Facility Management System Start-Up activities completed by the Facility Management System Contractor including but not limited to all point-to-point verifications, control sensor calibrations and control actuator calibrations.
e. TAB Execution Plan.
f. Warranty Maintenance Log for each item of equipment organized by specification section.

2.8 OWNER TRAINING

A. Construction Manager with assistance from responsible Subcontractors and Equipment Vendors will provide Owner training in Start-Up, Operation and Maintenance of all commissioned systems/equipment under contract per Project Manual specifications.

2.9 FACILITY MANGEMENT SYSTEM (FMS) TREND DATA

A. Building Systems operation will be monitored and analyzed by the CxA utilizing trend data provided from the FMS.

B. The Facility Management System Contractor (FMSC) for this project shall provide trend data for all commissioned equipment/systems monitored or controlled by the FMS. The complete cost for the FMSC to set up all required trending and reporting shall be included in the project contract cost.

C. Examples of FMS trended points by system type utilized for commissioning are included in a Table at the end of this specification. The CxA will conduct an FMS Cx Trend Data Planning Meeting with the FMSC as a part of the Cx FPT Scheduling Meeting. The FMS Cx Trend Data Planning Meeting will coordinate and finalize:

1. System points to be monitored.
2. Frequency/interval of monitoring for each point.
3. Trend data output file format, presentation, and data-transfer requirements.
4. Equipment/systems adjustments required for “forced” peak load trending (e.g., adjusting equipment space temperature sensor setpoints to simulate peak cooling/heating loads, utilizing AHU preheat coil to simulate peak cooling load, etc.).

D. Prior to the FMS Cx Trend Data Planning Meeting; the FMSC will provide CxA with a Master Point Summary Table, organized by equipment type, listing all FMS points for each item of equipment controlled or monitored by the FMS. The Master Point Summary Table shall list the following information:

1. Building Designator.
2. Building Name.
3. System Description or Equipment Name. Equipment Names shall match drawing Schedule information.
4. Point ID.
5. Point Type.
6. Full point name.
7. English language point description. The point description shall be an easily understandable English-language description of the point.
8. Node address (Domain, Subnet, Node).
9. Node/Device ID.
10. Device MAC Address, where applicable.

11. Object ID [object type, instance number] (BACnet Systems).
12. Engineering units.
13. Alarm limits, if any.

E. General Trend Report Requirements

1. Each trend report is generated in a Microsoft Excel-readable file format (e.g., .xlsx, .csv, or .txt).
2. Equipment/System Trend Reports shall be compiled in separate Workbooks for each equipment type or system.
3. Each Workbook shall be titled by specific equipment/system type (e.g., Air Handling Unit, VAV Box, Exhaust Fan, Chilled Water System, Heating Hot Water System, etc.). Max Workbook file size is 10MB. Provide multiple Workbook files (e.g., Air Handling Unit 1, Air Handling Unit 2, etc.) if required to meet file size limitations.
4. Each Workbook will contain separate Trend Data worksheets for each piece of equipment. Each worksheet will be tabbed by project specific equipment name per project schedule drawings.
5. Refer to Sample Trend Report at the end of this specification for required Worksheet Trend Report format/layout.
6. Cx FMS Trend Reports shall remain in place through the project one year warranty period (to allow CxA to utilize FMS Trend Reports for Opposed Season Testing and Warranty Review).

F. Trend Point Configuration

1. All data point names must be unique from other points in the same project.
2. Each trend data point shall record the instantaneous value of the corresponding control data point being trended at 5-minute, 15-minute, or change-of-value intervals. The trend sampling interval for each data point must be consistent (e.g., data cannot start at a 5-minute interval and then change to a 15-minute interval).
3. All utility consumption data (kWh, ton-hr., btu, etc.) trends shall report the accumulated consumption across the interval period (e.g., electrical consumption, kWh, total for the 15-minute period) and shall not report total accumulating consumption.
4. All utility demand data (kW, ton, btu/hr., etc.) trends shall report the instantaneous demand at a 15-minute interval period unless otherwise specified by the CxA and shall not report total accumulating demand.
5. Input a custom data point naming convention utilized for trend reports that shall comply with the Owner’s established point naming convention.

2.10 FUNCTIONAL PERFORMANCE TEST (FPT)

A. CxA will develop the Functional Performance Test (FPT) procedures from the Contract Documents and A/E approved FMS Control Submittal. The FPT procedures will be included in the Cx Plan developed in the Cx Database. The FPTs will be executed by the Construction Manager and Subcontractors. The CxA will witness the FPT and document the results in the Cx Database.

B. Development of Test Procedures:

1. The purpose of any given specific test is to verify and document compliance with stated criteria of acceptance given on test form. CxA shall develop specific test procedures and forms to verify and document proper operation of each piece of equipment and system. Contractors will provide limited assistance to CxA in developing procedure (i.e.,

answering questions about equipment, operation, sequences, etc.). Prior to execution, CxA shall provide a copy of test procedures to CxT for review. Construction Manager and Subcontractors will review tests for feasibility, safety and equipment warranty protection.

2. Test procedure forms developed by the CxA will include (but not be limited to) the following information:

   a. System and equipment or component name(s).
   b. Equipment location and ID number.
   c. Date.
   d. Project name.
   e. Participating parties.
   f. Specific sequence of operation or other specified parameters being verified.
   g. Instructions for setting up test.
   h. Specific step-by-step procedures to execute test, in a clear, sequential and repeatable format.
   i. A Yes/No checkbox to allow for clearly marking whether or not proper performance of each part of test was achieved.
   j. Section for comments

3. Sample Functional Performance Test (FPT) forms are included at the end of this specification. The samples are provided to give the Construction Manager and Subcontractors a general idea of the work required to complete the FPT. The FPT checklists included are prototypical, and do not reflect specific requirements of this project's plans or specification. Specific FPT items may be added, modified or deleted in the Cx plan delivered to the CxT in order to reflect the final construction document requirements. Construction Manager and Subcontractors shall review final construction documentation for applicable details and specifications related to equipment to be commissioned in order to fully ascertain all of the FPT requirements.

2.11 CXA MASTER ISSUES LIST (MIL)

A. Any issues noted by CxA are tracked in a Master Issues List (MIL) accessed from the Commissioning (Cx) Database.

2.12 TEST EQUIPMENT

A. Construction Manager and Subcontractors shall provide all specialized tools, test equipment and instruments required to execute Start-Up, checkout and Functional Performance Testing of equipment under their contract.

B. Test equipment shall be of sufficient quality and accuracy to test and/or measure system performance with tolerances specified. A testing laboratory shall have calibrated test equipment within the previous 12 months. Calibration shall be NIST traceable. Equipment shall be calibrated according to manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates readily available.

C. Construction Manager/Electrical Subcontractor shall provide full capacity Load Banks for Emergency Power System Testing. Full capacity Load Banks may be required during separate testing periods (three or more) depending on construction completion and equipment readiness for testing. Provide Load Banks for one week testing period for each system test to allow for potential weather events.

2.13 SYSTEMS MANUAL DOCUMENTATION

A. Construction Manager will provide the following documentation for each item of commissioned equipment and each commissioned system to the CxA for preparation of various electronic Systems Manuals. This documentation is in addition to any documentation required in other specification sections of the Project Manual:

1. Final Owner's Project Requirements Document (from Owner).
2. Final Basis of Design Document (from A/E).
3. Construction Record Drawings and Specifications.
4. As-Built Drawings.
5. A/E approved equipment submittals.
6. A/E approved Operations and Maintenance (O&M) Data including:

    a. Operating instructions for all equipment.
    b. Preventive maintenance plan for building equipment including recommended schedule and frequency for equipment preventative maintenance.

7. As-Built FMS/DDC Drawings/Schematics and Sequences of Operation including the following information for each commissioned system:

    a. Building Occupancy Schedule.
    b. Operating instructions for associated integrated building systems.
    c. Instructions for Energy Saving Operations and descriptions of Energy Savings Strategies in use in the facility.
    d. Seasonal Start-Up and shut down procedures, manual and restart operations procedures, recommendations regarding seasonal operational issues that affect energy use.
    e. A list of equipment run-time and time of day schedules (occupied/unoccupied) and a schedule frequency to review them for relevance and efficiency.
    f. Setpoints for all systems.

        1) Changes in schedules or setpoints for different seasons, days of the week, and times of day.
        2) A table of all user adjustable set points and reset schedules with a brief discussion of the purpose of each and the range of reasonable adjustments with energy implications. Include a schedule of frequency to review the various set points and reset schedules to ensure they are at current relevant and efficient values.

    g. Any ongoing system optimization procedures.
    h. A table of all sensors and actuators including a recommendation for recalibration frequency of each sensor and actuator by type and use.

8. Owner Training Documentation.

B. Documentation shall be provided in "searchable" "bookmarked" electronic Adobe PDF format organized as follows:

1. Separate Adobe PDF file for:

    a. Final Owner's Project Requirement Document
    b. Final Basis of Design Document.

c. Construction Record Drawings and Specifications bookmarked by drawing number and specification Section/Title.
d. As-Built Drawings bookmarked by drawing number.
e. Equipment Submittals bookmarked by specification Section/Title.
f. Equipment O&M Data bookmarked by equipment specification Section/Title.
g. As Built FMS/DDC drawings bookmarked by system.
h. Owner Training Documentation bookmarked by specification Section/Title.

2. Table of Contents for each PDF document organized by contract document specification Section and specific contract document identification tag. The Table of Contents shall by hyperlinked to allow direct access from each Section to each individual equipment item and each specific information item for the equipment.

2.14 FINAL COMMISSIONING REPORT

A. The Final Commissioning Report will include:

1. Executive Summary including:

a. List of Commissioned Equipment/Systems.
b. List of participants and roles.
c. Overview of Commissioning and testing scope and general description of testing and verification methods.
d. Evaluation regarding disposition of equipment, systems and documentation in the following areas:

1) Conformance to specifications and design intent.
2) Equipment installation.
3) Functional performance.
4) Recommendations for improvement to equipment or operations, future actions, etc. will also be listed.

2. Master Issues List.
3. Executed Pre-Functional Checklists.
4. Executed Functional Performance Tests.
5. Site Visit Reports.
6. Design Phase Cx Documentation.
7. Executed Matrices documenting Cx verification of O&M, Warranty and Owner Training for commissioned equipment/systems.
8. Sections will be provided for the following information to be inserted at a later date:

a. Opposed Season Testing.
b. End of Warranty Review Meeting Minutes.

PART 3 - EXECUTION

3.1 COMMISSIONING OVERVIEW

A. The following provides a brief overview of typical Commissioning tasks during construction and general order in which they occur:

1. CxA develops project specific Commissioning Plan in the Cx Database including specific Pre-Functional Checklists and equipment and system Functional Performance Test procedures. CxT members are provided web access to the Cx Database for review of the Cx Plan prior to Cx Kick-Off meeting.
2. Commissioning during construction begins with a Kick-Off Meeting conducted by CxA where membership of CxT is established, and responsibilities reviewed. The Commissioning Plan is reviewed during this meeting.
3. CxA schedules subsequent meetings as necessary to plan, coordinate and schedule Commissioning activities. Deficiencies and problem resolution will also be discussed at these meetings.
4. Construction Manager submits copies of submittals for all equipment to be commissioned to CxA for review concurrently with A/E review. CxA reviews equipment submittals and forwards review comments to A/E and OR.
5. Construction Manager submits copies of final A/E approved submittals for all equipment to be commissioned to CxA for record purposes. CxA revises Cx Plan if required.
6. Construction Manager develops initial outline Owner Training Program and submits to CxT for review.
7. Subcontractors install commissioned equipment/systems. CxA makes periodic site visits to review commissioned equipment installations and execute Pre-Functional Checklists. CM/Subcontractors provide the necessary personnel to assist CxA (e.g., provide room access, provide ladders, remove A/C unit covers, open electrical panel covers, etc.) with sample PFC verifications.
8. Any issues noted by CxA are tracked in a Master Issues List (Cx MIL) in the Cx Database. Subcontractors correct issues noted by CxA and update Cx MIL in Cx Database for CxA verification of issue corrections.
9. CM develops Start-Up Plans. CM/Subcontractors coordinate overall schedule of equipment/systems Testing and Start-Up and submit schedule to CxA so that CxA may witness Testing and Start-Up activities as required.
10. Subcontractors complete testing (e.g., duct and piping pressure testing, piping flushing, etc.) as required by Division 20, 21, 22, 23, 26, and 28 specifications. Subcontractors compile completed testing documentation in the Start-Up Plan. CM/Subcontractors submit Start-Up Plan to CxA for verification of completion of testing activities prior to Functional Performance Tests.
11. CxA conducts a Commissioning Functional Testing Schedule Meeting with the CxT to establish a coordinated approach to the integration of the Functional Performance Testing activities within the Master Construction Schedule. CxA conducts Cx FMS Trend Data Planning meeting as a part of this meeting.
12. Subcontractors and Equipment Vendors/Suppliers perform Start-Up and Initial Checkout per the Start-Up Plan documentation and checklists. CM/Subcontractors compile completed Start-Up and Initial Checkout documentation in the Start-Up Plan. CM/Subcontractors submit Start-Up Plan to CxA for verification of completion of Start-Up activities prior to Functional Performance Tests.
13. Facility Management System Contractor sets up required FMS System trending and reporting for CxA review to assess readiness for Functional Performance Tests.
14. CM submits Systems Manual documentation to CxA.
15. Functional Performance Tests are executed by CM and Subcontractors, under supervision of and documented by CxA.
16. Items of non-compliance in material, installation or set-up will be corrected at CM expense and system shall be retested.
17. CM executes Owner Training exercises per Owner Training Plan.
18. CxA issues Final Commissioning Report.
19. CxA completes LEED Online documentation for project certification.
20. Opposed Season Functional Performance Tests are scheduled by the CM. Opposed Season Functional Performance Tests are executed by CM and Subcontractors, under

supervision of and documented by CxA. Subcontractors correct any issues noted from Opposed Season Functional Performance Tests.

21. CxT participates in End of Warranty Review Meeting with facility maintenance staff to review systems performance. An updated Warranty Phase Issue Log shall be generated, and the CM shall resolve all issues determined by the CxT to be subject to project Warranty requirements.
22. CxA issues Opposed Season Functional Performance Test Report and Warranty Review Meeting Minutes for insertion in Final Commissioning Report.

3.2 SYSTEMS TO BE COMMISSIONED

A. GENERAL:

1. CxA PFC and FPT for 100% of equipment listed below with the following exceptions:

    a. Parking Garage is excluded from CxA scope.
    b. Equipment/systems the Level 4 Shelled areas are excluded from CxA scope with the exception of the HVAC terminal equipment (heaters, air terminal boxes, split systems, etc.) installed to provide tempering to shelled spaces for extended periods prior to fit-outs.
    c. Terminal Devices (e.g., VAV Boxes, Venturi Valves, Fan Coil Units, Lighting Control Occupancy Sensors, Door Access Controls, Fire Alarm Device verifications, etc.) on Levels 5, 6, and 7 will be commissioned (PFC and FPT) at a 25% sampling rate.

B. FIRE SUPPRESSION:

1. Fire Pump and Jockey Pump.
2. Any Facility Management System (FMS) integration or monitoring of commissioned Fire Suppression systems and alarms.
3. FMS System trending data for 100% of the Fire Suppression systems and alarms monitored or controlled by the FMS.

C. PLUMBING:

1. Domestic Water Booster Pumps
2. Domestic Hot Water System. Domestic Hot Water System FPT will include sample verification of HW Delivery to most remote fixtures on each level.
3. Safety Plumbing Fixtures (Emergency Eyewashes, Showers).
4. Water Softener System.
5. RO/DI System.
6. Vacuum Systems.
7. Compressed Air Systems.
8. Fuel Oil Storage and Distribution System.
9. Any Facility Management System (FMS) integration or monitoring of commissioned Plumbing systems and alarms.
10. FMS System trending data for 100% of the Plumbing systems and alarms monitored or controlled by the FMS.

D. MECHANICAL / HEATING, VENTILATING AND AIR CONDITIONING (HVAC):

1. Heat Recovery Chillers.
2. Condensing Boilers.

3. Heat Exchangers.
4. Steam PRVs.
5. Hydronic Pumps.
6. Fans.
7. Air Handling Units.
8. Fan Coil Units.
9. CRAC Units.
10. VAV Boxes and Venturi Valves:

    a. Testing will include 8-hour FMS trending in normal operation prior to CxA FPT. Trending data must indicate operation with no deficiencies prior to scheduling CxA FPT.
    b. Testing will include 4-hour FMS “forced” trending in each operational mode (peak cooling, peak heating, any special sequences like CO2, DCV or dehumidification, any special alarms, etc.) prior to CxA FPT. Trending data must indicate operation with no deficiencies prior to scheduling CxA FPT.

11. Baseboard Heaters.
12. Hydronic Coils.
13. Unit Heaters.
14. Variable Frequency Drives.
15. Humidifiers.
16. Critical Space Pressure Monitors/Alarm Systems.
17. Fuel Oil Storage and Distribution System.
18. Facility Management Systems (FMS) for all commissioned equipment including integration into UK Campus “Tridium” System. CxA FPT of FMS will include sample verification (40 hrs.) of FMS Contractor control device calibrations and BAS point-to-point verifications.
19. FMS trending data for 100% of the HVAC equipment monitored or controlled by the FMS.

E. ELECTRICAL:

1. The Variable Frequency Drives (VFD), Motor Control Panels/Motor Starters for all commissioned equipment.
2. Lighting Control Systems including Scheduled Event control, Occupancy Sensor control and Daylight Harvesting controls.
3. The Emergency Power System including Generators, Paralleling Gear, Transfer Switches, Load Banks and remote annunciation, etc.
4. Power Monitoring and Control System.
5. Normal Power Distribution Equipment monitored by the Power Monitoring and Control System, or any equipment monitored for the purpose of Energy Monitoring for ASHRAE 90.1.
6. Coordination of Breakers in commissioned Electrical Equipment including reviewing the Protective Device Coordination Study and confirming installed settings in the field.
7. Confirming Arc Flash Labeling per Arc Flash Study for commissioned Electrical Equipment.
8. Comprehensive Black Site Test (BST) encompassing the verification of all commissioned systems and Emergency Lighting (interior and exterior) functional performance while under emergency power (loss of normal power – transfer to emergency power – restoration of normal power).
9. Any Facility Management System (FMS) integration or monitoring of commissioned Electrical equipment/systems.
10. FMS System trending data for 100% of the Electrical equipment monitored or controlled by the FMS.

F. ELECTRONIC SAFETY AND SECURITY:

1. Security Systems including Access Control and Video Surveillance.
2. The Fire Alarm System including interface with other systems such as Emergency Power, Fire Suppression, HVAC Systems, Elevators, Stairwell Pressurization, etc. Fire Alarm System Functional Testing will include testing each prototypical alarm sequence in each Fire Alarm Zone and verification of Fire Alarm devices to ensure correct alarm notification, labeling of device, activation of general alarm, etc. CxA Fire Alarm System FPT will be conducted separately from and prior to any required Fire Marshal, Code Official or Authority Having Jurisdiction (AHJ) testing.

G. OTHER SYSTEMS:

1. Elevators (FPT only). Elevator interface operation with Fire Alarm and Emergency Power System only.
2. Renewable Energy Systems (if any).

3.3 RESPONSIBILITIES OF COMMISSIONING TEAM MEMBERS

A. Architect/Engineer (A/E):

1. Document design intent of systems. Respond to any issues developed during the commissioning process that may require clarification of design intent.
2. Provide final copy of Basis of Design Document (BOD) for inclusion in Systems Manual.
3. Provide PDF files of design documents required for Systems Manual.

B. Commissioning Agent (CxA):

1. Facilitate cooperation of CxT in Commissioning work.
2. Provide periodic progress reports of Commissioning status.
3. Review, track and coordinate resolution of non-compliance and deficiencies identified by CxT. Maintain Master Issues List (MIL), Resolution List, & Testing Records. Maintain records of all issues submitted by CxT.
4. Identify Commissioning activities and durations for inclusion into the project schedule by the Construction Manager. Review schedule periodically with CxT to ensure commissioning activities are properly reflected. Participate in the “Reverse Phase Scheduling Meeting” with the CxT to verify construction schedule has allowed sufficient time for completion of commissioning activities.
5. Attend and chair CxT meetings as required.
6. Develop Construction Phase Commissioning Plan including project specific Pre-Functional Checklists and Functional Performance Test procedures.
7. Conduct initial Commissioning Kick-Off Meeting to review Cx Plan and responsibilities of each member of the CxT.
8. Review shop drawings for equipment to be commissioned concurrent with the A/E. Provide submittal review comments to OR and A/E for inclusion in the submittal comments returned to the Construction Manager.
9. Review final A/E approved shop drawings for equipment to be commissioned and modify Cx Plan if required.
10. Review A/E approved control submittal sequences of operation and update Commissioning Plan Functional Performance Tests (FPTs) if required. Work with Construction Manager, FMS Contractor, and AE until sufficient clarity has been obtained, in writing, to update Commissioning Plan FPTs.
11. Review initial outline Owner Training Program developed by Construction Manager.

12. Make periodic site visits to review commissioned equipment installations and execute Pre-Functional Checklists (PFC) in Cx Database. Provide a summary Site Visit Report following each site visit.
13. Attend construction meetings as necessary. Typically, periodic site visits will be scheduled to allow attendance at regularly scheduled contractor progress meetings.
14. Prior to equipment Start-Up, conduct a Commissioning Functional Testing Schedule Workshop (Web Meeting) with the CxT in order to establish a coordinated approach to the integration of the Cx FPT activities within the Master Construction Schedule.
15. As a part of the Commissioning FPT Schedule Workshop:

    a. Coordinate scheduling and CxA participation in witnessing FMS Start-Up activities (control device calibrations, point-to-point verifications) with FMSC.
    b. Conduct Cx FMS Trend-Logging Plan Meeting with FMSC to coordinate FMS trending requirements for Cx.

16. Make periodic site visits to witness Subcontractor Testing and Start-Up activities (major equipment/systems).
17. Make periodic site visits to witness FMSC Start-Up activities (40 hrs. total).
18. Review final executed Start-Up Plan systems testing and equipment Start-Up documentation completed by Subcontractors and Vendors prior to Functional Performance Testing to verify systems readiness for CxA testing.
19. Review O&M documentation submitted by Construction Manager for compliance with the project specifications.
20. Review the final Test and Balance report prior to Functional Performance Testing to verify systems readiness for CxA testing. Report any comments to CxT.
21. Provide benchtop testing of BAS system programming (review programming and conduct “dry run” test for each distinct sequence with the FMSC.
22. Review FMS Trend Data prior to Functional Performance Testing to verify systems readiness for testing.
23. Witness FPTs. Document test results and recommend system for acceptance.
24. As a part of the FPTs, verify accuracy of Final TAB Report by witnessing TAB Contractor Verification readings.
25. Monitor the completion of the Owner Training exercises by:

    a. Attending a sampling of the Owner Training exercises.
    b. Digitally videotaping O&M staff training sessions.
    c. Reviewing the final executed Owner Training Program documentation submitted by the CM/Subcontractors at the completion of the Owner Training exercises.

26. Provide Final Commissioning Report, summarizing final disposition of building systems after Functional Performance Testing.
27. Complete LEEDv4 Fundamental Cx and Enhanced Cx Online templates required for project certification.
28. Witness Opposed Season Functional Performance Testing and document results.
29. Conduct End of Warranty Review with CxT and Facilities Staff and document findings for commissioned systems.
30. Append Final Commissioning Report as required for Opposed Season Functional Performance Testing and End of Warranty Review Meeting Minutes.

C. Construction Manager:

1. The Construction Manager leads the commissioning process for the construction team and facilitates cooperation of Subcontractors in executing and completing the commissioning work. In addition to the specific Construction Manager commissioning roles and responsibilities specified herein, the Construction Manager is ultimately

responsible for ensuring that the Subcontractor commissioning roles and responsibilities of this specification are executed and completed as specified.

2. Ensures resolution of non-compliance and deficiencies of construction related items identified by CxA. Ensures Cx Database Master Issues List (MIL) is updated by Subcontractors to reflect deficiency item corrections for CxA verification. Updates to Cx Database regarding corrections of deficiencies shall be made within two working days of completion of deficiency correction work.
3. Notifies CxA of completion of Commissioning Activities (e.g., Cx MIL deficiency issue corrections, Start-Up completion, readiness for Functional Performance Testing, etc.) via Cx Database. Updates to Cx Database regarding status of Commissioning activities shall be made within two working days of activity completion.
4. Review Commissioning Plan, Pre-Functional Checklists, and FPT procedures.
5. Attend Commissioning Kick-Off Meeting, and other CxT Meetings.
6. Attend Commissioning Scheduling Meetings to coordinate the integration of the Cx activities in the Master Construction Schedule. Update the Master Construction Schedule to include all Cx activities.
7. Periodically update Commissioning activities in the construction schedule and provide construction schedule updates to CxT. Attend and participate in the “Reverse Phase Scheduling Meeting” with the CxT to verify construction schedule has allowed sufficient time for completion of commissioning activities.
8. Submit copies of submittal data for commissioned equipment, with manufacturer Start-Up criteria, Subcontractor/Vendor Start-Up checklists, and Operating and Maintenance criteria to CxA for review simultaneous with A/E review.
9. Submit copies of final A/E approved submittal data for all commissioned equipment to CxA for record purposes.
10. Provide necessary personnel to assist CxA with execution of the PFCs during periodic CxA site visits (e.g., provide site and space access, provide ladders, etc.).
11. Develop, with cooperation of Subcontractors/Vendors, detailed Owner Training Program. Submit initial outline Owner Training Program to CxT for review within 60 days of completion of submittal process (i.e., all equipment/systems approved by A/E). Revise Owner Training Program as required based on CxA review comments.
12. Oversee development of equipment Start-Up Plan by and execution of equipment Start-Up checks by Subcontractor/Vendors.

    a. Ensure equipment Start-Up Plan is developed and contains forms for all required Testing and Start-Up activities.
    b. With Subcontractors, develop overall schedule of Testing and Start-Up activities. Submit final Testing and Start-Up schedule to CxA 30 days prior to start of any such activities to allow CxA to schedule site visit trips to witness activities as required.
    c. Ensure final executed Start-Up Plan is submitted to CxA prior to start of Functional Performance Testing. Ensure final executed Start-Up plan is organized and contains all documentation required by this specification before submitting to CxA.

13. Attend the Cx FPT Schedule Workshop (Web Meeting) conducted by CxA with the CxT in order to establish a coordinated approach to the integration of the Cx FPT activities within the Master Construction Schedule. Update the Master Construction Schedule to include all Cx FPT activities. Attend Trend-Logging Plan Meeting with CxA and FMSC.
14. Assures CxA that equipment and systems are ready for FPTs. Verifies that the following activities are completed, and documentation submitted to CxA as a prerequisite for FPTs:

    a. All deficiency items noted by CxA prior to Functional Performance Testing are corrected by Contractors and MIL is updated accordingly.
    b. Executed Start-Up Plan electronic PDF files submitted to CxA including:

1) All equipment/systems testing documents completed by Subcontractors.
2) All equipment/systems Start-Up documents completed by Subcontractors/Vendors.
3) All FMS Start-Up documentation completed by FMSC. FMS point-to-point and control device calibration documentation included.
4) Maintenance logs of all interim maintenance tasks performed by Subcontractors/Vendors on all equipment from initial Start-Up through final Owner acceptance, so warranties are not void.

c. Verify Subcontractors and FMSC have confirmed equipment control integration (LonTalk, BACnet, MODBUS, etc.) into FMS.
d. Attend and verify completion of CxA/FMSC benchtop testing of BAS system programming ("dry run" test for each distinct control sequence).
e. Final Test and Balance Report is submitted to CxA for review.
f. O&M documentation submitted to CxT for review.
g. FMS Trend Data is submitted to CxA for review.
h. Systems Manual documentation submitted to CxA.
i. Final schedule for Owner Training exercises submitted to CxA.

15. Schedule, coordinate and assist CxT in FPTs. Attend and participate in Cx FPTs as required to ensure Subcontractor and Equipment Vendor participation and completion of scheduled FPT activities. At a minimum, the Construction Manager should be present at start and completion of daily FPT activities to ensure Subcontractor/Equipment Vendor participation and completion of Functional Testing work.
16. Verify Subcontractors correct deficiencies identified during FPTs. Schedule, coordinate and attend any retesting required to verify FPT deficiency corrections.
17. Coordinate training sessions and execute training per Owner Training Program through the Subcontractors/Vendors.
18. Submit maintenance logs of all interim maintenance tasks performed by Subcontractors/Vendors on all equipment from initial Start-Up through final Owner acceptance so warranties are not void.
19. Schedule, coordinate and assist CxT in Opposed Season FPTs. Verify Subcontractors correct deficiencies identified during Opposed Season FPTs. Schedule, coordinate and attend any retesting required to verify Opposed Season FPT deficiency corrections.
20. Schedule, coordinate, and lead the End of Warranty Review Meeting to review system/equipment performance. Correct any deficiency issues noted during Warranty Period per the Project Warranty Process.

D. Subcontractors and Equipment Vendors:

1. Review Commissioning Plan, Pre-Functional Checklists, and FPT procedures.
2. Attend Commissioning Kick-Off Meeting and other CxT Meetings.
3. Assist CxT with developing a comprehensive Commissioning schedule. Attend Commissioning Scheduling Meetings to coordinate the integration of the Cx activities in the Master Construction Schedule. With Construction Manager, update the Master Construction Schedule to include all Cx activities. Attend and participate in the "Reverse Phase Scheduling Meeting" with the CxT to verify construction schedule has allowed sufficient time for completion of commissioning activities.
4. Notify CxA of completion of Commissioning Activities (e.g., deficiency corrections, Start-Up completion, readiness for Functional Performance Testing, etc.) via Cx Database. Updates to Cx Database regarding status of Commissioning activities shall be made within two working days of activity completion.
5. Provide necessary personnel to assist CxA with execution of the PFCs during periodic CxA site visits (e.g., provide equipment model/serial number list, provide ladders, remove A/C unit covers, open electrical panel covers, etc.).

6. Correct deficiencies of construction related items identified by CxA. Update Cx Database to reflect deficiency item corrections for CxA verification. Updates to Cx Database regarding corrections of deficiencies shall be made within two working days of completion of deficiency correction work.
7. Develop Start-Up Plan with Construction Manager.
8. Prepare Owner Training Program with Construction Manager.
9. Execute all required equipment and systems testing as required by project specifications (e.g., duct pressure testing, piping pressure testing, piping flushing, electrical acceptance testing, etc.). Provide schedule of testing activities to CxA 30 days prior to start of any testing so that CxA may witness a sampling of the testing. Submit completed testing documentation in final executed Start-Up Plan electronic PDF files to CxA for review prior to start of Functional Performance Testing.
10. Attend the Cx FPT Schedule Workshop (Web Meeting) conducted by CxA with the CxT in order to establish a coordinated approach to the integration of the Cx FPT activities within the Master Construction Schedule. With Construction Manager, update the Master Construction Schedule to include all Cx FPT activities. Attend Cx FMS Trend-Logging Plan Meeting with CxA, Construction Manager, and FMSC.
11. Execute equipment Start-Up per Start-Up Plan. Provide schedule of equipment Start-Up activities to CxA 30 days prior to beginning any equipment Start-Up so that CxA may witness a sampling of the equipment Start-Up activities. Submit completed Start-Up documentation in final executed Start-Up Plan electronic PDF files to CxA prior to start of Functional Performance Testing.
12. Execute all periodic maintenance required on started equipment from initial Start-Up of equipment to final acceptance by Owner to prevent equipment warranties from being voided. Document execution of periodic maintenance by signing and dating maintenance logs for each item of equipment. Submit maintenance log documentation in final executed Start-Up Plan electronic PDF files to CxA prior to start of Functional Performance Testing.
13. Ensure installation work is complete, is in compliance with Contract Documents and is ready for Functional Performance Testing.

    a. Verify all deficiency items noted by CxA prior to Functional Performance Testing are corrected and MIL is updated in Cx Database. Deficiency item status updates should be made within two days of completion of corrective work.
    b. Verify Start-Up Plan electronic PDF files are forwarded to Construction Manager/CxA.
    c. Confirm equipment control integration (LonTalk, BACnet, MODBUS, etc.) into FMS.
    d. With Construction Manager, compile O&M documentation and submit to CxT for review.
    e. With Construction Manager, compile Systems Manual documentation and submit to CxA.
    f. Attend and participate in CxA/FMSC benchtop testing of BAS system programming (“dry run” test for each distinct control sequence) as required (for equipment/systems integrated with FMS).
    g. Notify CxT that equipment and systems are ready for Functional Performance Testing.

14. Provide certified and calibrated instrumentation required to take measurements of system and equipment performance during FPTs.

    a. Electrical Subcontractor shall provide full capacity Load Banks for Emergency Power System Testing. Full capacity Load Banks may be required during separate testing periods (three or more) depending on construction completion and

equipment readiness for testing. Provide Load Banks for one week testing period for each system test to allow for potential weather events.

15. Execute FPTs developed by CxA as described in contract documents and Commissioning Plan. FPT test results will be documented by CxA.

    a. Electrical Subcontractor and Lighting Control System Vendor/Authorized Manufacturer Representative shall demonstrate complete operation of Lighting Control Systems during CxA FPT separate from and in addition to any other required Owner Demonstrations or Owner Training (i.e., Lighting Control System Vendor/Authorized Manufacturer Representative shall include separate site visit trip(s) for Commissioning Lighting Control System Functional Performance Testing).

16. Correct deficiencies identified during FPT. Conduct any retesting required to verify FPT deficiency corrections.
17. Execute training per Owner Training Program.
18. Execute Opposed Season FPTs. Correct deficiencies identified during Opposed Season FPTs. Conduct any retesting required to verify Opposed Season FPT deficiency corrections.
19. Subcontractors shall ensure Equipment Provider Technician and/or Authorized Manufacturer's Representative on-site participation in FPT and Opposed Season FPT as required; along with FMSC, to demonstrate commissioned equipment/system operation.

    a. Equipment Provider Technician and/or Authorized Manufacturer's Representative shall be skilled in software programming and hardware operation to exercise sequences of operation and to correct control deficiencies identified during FPTs and Opposed Season FPTs.
    b. Equipment Provider Technician and/or Authorized Manufacturer's Representative shall provide instrumentation, computer, software, and communication resources necessary to demonstrate total operation of commissioned equipment during FPTs and Opposed Season FPTs.

20. Attend and participate in the End of Warranty Review Meeting to review system/equipment performance. Correct any deficiency issues noted during warranty period per the Project Warranty Process.

E. Facility Management System Contractor (FMSC):

1. Review Commissioning Plan, Pre-Functional Checklists, and FPT procedures.
2. Attend Commissioning Kick-Off Meeting and other CxT Meetings.
3. Assist CxT with developing a comprehensive Commissioning schedule. Attend Commissioning Scheduling Meeting to coordinate the integration of the Cx activities in the Master Construction Schedule. Update the Master Construction Schedule to include all Cx activities. Attend and participate in the "Reverse Phase Scheduling Meeting" with the CxT to verify construction schedule has allowed sufficient time for completion of commissioning activities.
4. Notify CxA of completion of Commissioning Activities (e.g., deficiency corrections, Start-Up completion, readiness for Functional Performance Testing, etc.) via Cx Database. Updates to Cx Database regarding status of Commissioning activities shall be made within two working days of activity completion.
5. Provide necessary personnel to assist CxA with sample verification of the Pre-Functional Checklists for Facility Management System as required during periodic CxA site visits

(e.g., provide equipment model/serial number list, provide ladders, remove/open control panel covers, etc.)

6. Correct deficiencies of construction related items identified by CxA. Update Cx Database MIL to reflect deficiency item corrections for CxA verification. Updates to Cx Database MIL regarding corrections of deficiencies shall be made within two working days of completion of deficiency correction work.
7. Prepare Owner Training Program with Construction Manager.
8. Following A/E approval of FMS submittal (and prior to FMS Start-Up), provide the following documentation to CxA:

    a. Master List of FMS Points (see Part 2 FMS Trend Data requirements for Master List Point documentation required).
    b. Master List of DDC Control Devices (e.g., valves, dampers, actuators, sensors, flow measuring devices, etc.).
    c. FMS Point-to-Point Verification Checklists to be executed during FMS Start-Up.
    d. FMS Control Device Checklists to be executed during FMS Start-Up.

9. Completely install and thoroughly inspect Start-Up, test, adjust, calibrate and document systems and equipment under FMS Contract.
10. Provide laptop computer, software and training to accommodate TAB Contractor in system balancing.
11. Maintain database of FMS/DDC parameters submitted by TAB Contractor subsequent to field adjustments and measurements.
12. Submit schedule of FMS Start-Up activities to CxA 30 days prior to beginning any Start-Up work to allow CxA to witness FMS Start-Up activities. Coordinate and scheduled site visits for CxA to witness FMS Start-Up activities (40 hrs.). Provide on-site technician skilled in software programming and hardware operation to assist CxA during CxA verifications of DDC Control Device calibrations and point-to-point checks required during Start-Up.
13. Maintain comprehensive records of all FMS Start-Up records including but not limited to system calibration checkout records and point-to-point checklists. Submit completed Start-Up documentation in final executed Start-Up Plan electronic PDF files to CxA prior to start of FPT.
14. Attend the Cx FPT Schedule Workshop (Web Meeting) conducted by CxA with the CxT in order to establish a coordinated approach to the integration of the Cx FPT activities within the Master Construction Schedule. With Construction Manager, update the Master Construction Schedule to include all Cx FPT activities.
15. As a part of the Cx FPT Scheduling Workshop (Web Meeting), attend Cx FMS Trend-Logging Plan Meeting with Construction Manager prior to FPT to coordinate FMS trending requirements.
16. Conduct benchtop testing of BAS system programming (review programming and conduct “dry run” test for each distinct sequence) with CxA and other members of the CxT.
17. Ensure installation work is complete, is in compliance with Contract Documents and is ready for Functional Performance Testing.

    a. Verify all deficiency items noted by CxA prior to Functional Performance Testing are corrected and MIL is updated in Cx Database. Deficiency item status updates should be made within two days of completion of corrective work.
    b. Verify Start-Up Plan electronic PDF files are forwarded to /CxA.
    c. Confirm equipment control integration (LonTalk, BACnet, MODBUS, etc.) into FMS.
    d. With Construction Manager, compile O&M documentation and submit to CxT for review.

e. With Construction Manager, compile Systems Manual documentation and submit to CxA.
f. Complete benchtop testing of BAS system programming (review programming and conduct “dry run” test for each distinct sequence) with CxA and other members of the CxT.
g. Submit one week of operating FMS trend data (either automatically or manually) to CxA for review to assess the readiness of the specific system to begin on-site FPT. Submit FMS trend data to CxA for review a minimum of seven (7) days prior to scheduled FPT.
h. Submit Systems Manual documentation to CxA.
i. Notify CxT that equipment and systems are ready for Functional Performance Testing.

18. Provide instrumentation, computer, software, and communication resources necessary to demonstrate total operation of building systems and control system equipment during FPTs.
19. Provide on-site technician skilled in software programming and hardware operation to exercise sequences of operation and to correct control deficiencies identified during FPTs. Conduct any retesting required to verify FPT deficiency corrections.
20. Execute training per Owner Training Program.
21. Provide instrumentation, computer, software, and communication resources necessary to demonstrate total operation of building systems and control system equipment during Opposed Season FPTs.
22. Provide on-site technician skilled in software programming and hardware operation to exercise sequences of operation and to correct control deficiencies identified during Opposed Season FPTs. Conduct any retesting required to verify Opposed Season FPT deficiency corrections.
23. Attend and participate in the End of Warranty Review Meeting to review system/equipment performance. Correct any deficiency issues noted during warranty period per the Project Warranty Process.

F. Test, Adjust and Balance (TAB) Contractor:

1. Review Commissioning Plan, Pre-Functional Checklists, and FPT procedures.
2. Attend Commissioning Kick-Off Meeting and other CxT Meetings.
3. Assist CxT with developing a comprehensive Commissioning schedule. Attend Commissioning Scheduling Meetings to coordinate the integration of the Cx activities in the Master Construction Schedule. Update the Master Construction Schedule to include all Cx activities. Attend and participate in the “Reverse Phase Scheduling Meeting” with the CxT to verify construction schedule has allowed sufficient time for completion of commissioning activities.
4. Correct deficiencies of construction related items identified by CxA. Update Cx Database MIL to reflect deficiency item corrections for CxA verification. Updates to Cx Database MIL regarding corrections of deficiencies shall be made within two working days of completion of deficiency correction work.
5. Notify CxA of completion of Commissioning Activities (e.g., deficiency corrections, Start-Up completion, readiness for Functional Performance Testing, etc.) via Cx Database. Updates to Cx Database regarding status of Commissioning activities shall be made within two working days of activity completion.
6. Prepare Owner Training Program with Construction Manager.
7. Submit TAB Plan and forms describing methodology for execution of test and balance procedures specific to this project to CxT for review.
8. Cooperate with FMSC with execution of required work.

9. Coordinate schedule for all TAB activities with CxA. Provide CxA with final schedule for all TAB activities 30 days prior to starting TAB work to allow CxA to schedule site visits to witness TAB work and readings.
10. Attend the Cx FPT Schedule Workshop (Web Meeting) conducted by CxA with the CxT in order to establish a coordinated approach to the integration of the Cx FPT activities within the Master Construction Schedule. With Construction Manager, update the Master Construction Schedule to include all TAB and Cx FPT activities.
11. Submit copy of Final TAB report to CxA for review prior to start of Functional Performance Testing.
12. Submit Systems Manual documentation to CxA.
13. Provide on-site technician and equipment, as necessary, skilled in TAB procedures to provide verification of equipment and system performance and to correct any TAB deficiencies identified during FPTs. Conduct any retesting required to verify FPT deficiency corrections.
14. Provide on-site technician and equipment, as necessary, skilled in TAB procedures to provide verification of Final TAB Report air and water readings to CxA.

    a. Final TAB Report Verification Readings are separate from and in addition to TAB Contractor equipment performance verifications during CxA Functional Performance Testing.
    b. Allow 80 hours for Final TAB Report Verification Readings.

15. Execute training per Owner Training Program.
16. Provide on-site technician and equipment, as necessary, skilled in TAB procedures to provide verification of equipment and system performance and to correct any TAB deficiencies identified during Opposed Season Functional Performance Testing. Conduct any retesting required to verify Opposed Season FPT deficiency corrections.
17. Attend and participate in the End of Warranty Review Meeting to review system/equipment performance and operations. Correct any deficiency issues noted during warranty period per the Project Warranty Process.

3.4 COMMISSIONING TEAM (CxT) MEETINGS

A. CxT meetings will be held periodically as determined by CxA with frequency increasing as construction advances and systems become operational. Attendance is mandatory. CxA will record minutes and attendance. CxA will chair CxT Meetings.

B. Discussions held in CxT meetings shall include, but not be limited to PFC completion, system/equipment Start-Up, progress, scheduling, testing, documentation, deficiencies and problem resolution.

3.5 REPORTING

A. CxA will provide regular status reports to Construction Manager and Owner, with increasing frequency as construction and Commissioning progresses.

B. CxA will regularly communicate with members of CxT, keeping them apprised of Commissioning progress.

C. CxA shall submit non-compliance and deficiency reports to Owner and Construction Manager.

D. CxA shall provide a Final Commissioning Report to Owner.

3.6 SUBMITTAL REVIEWS.

A. CxA shall review submittals for commissioned equipment concurrently with A/E. CxA shall review submittals:

1. For conformance as it relates to commissioning. Review is primarily intended to aid in development of Functional Testing procedures and only secondarily to verify compliance with equipment specifications.
2. To ensure maintenance and operation requirements are addressed.
3. To verify compliance with the Basis of Design and Owner's Project Requirement information provided by the A/E.

B. CxA submittal review comments will be submitted to the A/E and OR for review. A/E shall review CxA submittal review comments to determine if the comment should be included in the formal A/E submittal review comments returned to the Construction Manager.

C. Construction Manager shall submit one copy of the final A/E approved submittal data to the CxA for record purposes.

D. CxA will update Cx Plan PFCs and FPTs if required based on final A/E approved submittals.

3.7 PRE-FUNCTIONAL CHECKLISTS (PFC)

A. CxA will complete the Pre-Functional Checklists in the Cx Database.

B. Any deficiency issues noted will be included and tracked in the Master Issues List in the Cx Database.

3.8 MASTER ISSUES LIST (MIL)

A. Commissioning Issues will be tracked from initial notice by CxA through correction via the Cx Database as follows:

1. Open Issue:

a. Issues noted by the CxA during periodic site visits will be included in the Cx Database Master Issues List (MIL).

2. Recheck Issue:

a. The Subcontractors shall correct the deficiency items and notify the CxA when the items are corrected and ready for CxA verification by updating the deficiency item status from "Open" to "Recheck" in the Cx Database. CxA does not recheck issues until they have been noted ready for "Recheck" in the Cx MIL by the Subcontractor that corrected the issue.

3. Closed Issue:

a. The CxA will verify the correction and update the item status from "Recheck" to "Closed" in the Cx Database.

B. Costs for CxA to reverify any Issue marked by the Subcontractor for CxA recheck and found to be incomplete will be considered Additional Services (see paragraphs below for CxA costs).

3.9 START-UP AND INITIAL CHECKOUT

A. Construction Manager shall schedule all required Systems Testing and Equipment Start-Up with CxT. Subcontractors and Equipment Vendors shall execute Systems Testing and Equipment/Systems Start-Up per the Start-Up Plan.

B. Construction Manager shall submit final schedule of Testing and Start-Up activities to CxA 30 days prior to any testing or Start-Up activity to allow CxA to witness as required.

C. Subcontractors shall execute equipment/systems Testing and Start-Up per Start-Up Plan, document results and compile/organize all Start-Up Plan documentation into electronic PDF files (searchable from Table of Contents to each documentation item).

D. Construction Manager shall forward copy of completed Start-Up Plan PDF files to CxA for review to verify completion of Start-Up activities. Executed Start-Up Plan PDF files must be submitted to CxA prior to start of Functional Testing.

E. Construction Manager shall clearly list outstanding items or Testing/Start-Up activities that are not completed successfully. Updates to Cx Database regarding corrections of any Testing and Start-Up deficiency issues shall be made within two working days of completion of retesting work.

F. Construction Manager shall submit an updated Start-Up report and Statement of Correction on any incomplete or non-compliance report.

G. Any Testing or Start-Up activity marked as completed which is later found to be incomplete and causes re-verification work by CxA, delays during Functional Performance Testing, or retesting will be considered Additional Services (see paragraphs below for CxA costs).

3.10 FUNCTIONAL PERFORMANCE TESTING

A. Objectives and Scope:

1. The objective of Functional Performance Testing is to demonstrate each system is operating according to documented design intent and Contract Documents. Functional Performance Testing facilitates bringing systems from a state of substantial completion to full dynamic operation. Additionally, during Functional Performance Testing, areas of deficient performance are identified and corrected, improving operation and functioning of systems.
2. Each system shall be operated through all modes of operation (occupied, unoccupied, warm-up, cool-down, etc.) where there is a specified system response. Verifying each sequence in the sequences of operation is required.
3. Functional Performance Testing is separate from, and in addition to, any other Start-Up, Testing, Demonstration or Commissioning required in other Sections of the Project Manual.
4. The CxA will document the Functional Performance Testing utilizing the Cx Database.

B. Initial Facility Management Systems (FMS) Checkout:

1. The FMS must be verified for correct operation by the FMSC prior to the CxA witnessing and documenting the FPTs. The Cx FPTs are intended to document completion of the FMS and proper operation of the Commissioned Systems. The Cx FPTs are not intended to serve as a "Quality Control" measure or "Punch List" for the Construction Manager, Facility Management System Contractor or other Subcontractor. The CxA FPTs are not intended to serve as "Beta" testing for the FMS.
2. Prior to CxA FPT, FMSC will complete benchtop testing of BAS system programming (review programming and conduct "dry run" test for each distinct sequence) with CxA and other members of the CxT.
3. The intent of this process is for the FMSC to physically check and verify proper equipment and integrated systems operation for all operational sequences prior to the CxA witnessing and documenting the actual FPT.

C. Coordination and Scheduling:

1. Prior to equipment Start-Up, CxA will conduct a FPT Scheduling Meeting with the CxT in order to integrate the FPT activities into the Master Construction Schedule. The Construction Manager will update the Master Construction Schedule to include all Cx activities.
2. Construction Manager will provide sufficient notice to CxA regarding completion schedule for equipment and systems. Construction Manager will schedule FPTs with CxT. CxA shall witness and document functional testing of equipment and systems. Contractors shall execute tests under direction of CxA.
3. Construction Manager must allow sufficient time in the Construction Schedule to complete the FPT prior to Owner move-in/occupancy. This includes completing the commissioned systems installations, Testing, Start-Up, and all prerequisites required for Functional Performance Testing. CxT will participate in Attend and participate in a "Reverse Phase Scheduling Meeting" to verify construction schedule has allowed sufficient time for completion of commissioning activities. Time and expenses for CxA to complete Functional Performance Testing during Owner move-in or after Owner occupancy will be considered Additional Services (see paragraphs below for CxA costs).
4. FPTs are Integrated Systems Tests. For example, the Fire Alarm System must be complete and ready for operation in order to test the AHU Fire Alarm shutdown sequence. All equipment and systems associated with a FPT must be complete and ready for testing.
5. In general, the Functional Performance Testing will be organized/scheduled based on the following hierarchy:

    a. Project completion. Some areas of the building may be complete before other areas. Priority will be given to these area systems assuming they can be grouped together for Integrated Systems Testing.
    b. Integrated Systems. The testing will be organized into groups of Integrated Systems from larger systems down to smaller systems (e.g., Chilled Water System, Air Handling System, Terminal Units, etc.).
    c. Systems with limited integration and "stand alone" systems (e.g., Unit Heater or Fan only being monitored by the FMS).

6. FPTs will be grouped together to allow testing to be conducted over weekly testing periods to maximize testing efficiencies. Single systems testing spread out over multiple testing weeks will not be allowed. In general, the testing will begin on Monday and end on Friday afternoon. The actual testing hours will be coordinated with the Construction Manager based on the amount of testing work to be completed during that week. Construction Manager and Subcontractors should be prepared to work from 8:00AM to 5:00PM each day to complete the testing for that weekly period.

7. Some systems may require testing after normal working hours (e.g., Lighting Controls, Fire Alarm System integration, etc.) to avoid conflicts with ongoing work or adjacent building operations. This testing will be scheduled for evenings (Monday – Thursday) or early mornings (Tuesday – Friday). Weekend testing will only be allowed if agreed upon by CxT in advance.

D. Prerequisites for Functional Performance Testing:

1. All MIL Issues noted prior to Functional Testing must be corrected and updated in the Cx Database.
2. Construction Manager must submit the fully executed Start-Up Plan electronic PDF files including all equipment and systems testing documentation (e.g., duct and piping pressure testing, cleaning/flushing documentation, etc.), and all executed start up and initial check-out documentation.
3. TAB Contractor shall complete all test and balance work and submit Final Test and Balance Report for review by A/E and CxA. A/E shall review Final Test and Balance Report for acceptance. CxA review of Final TAB Report is cursory (not for acceptance) and is primarily intended to ensure that the equipment and systems are ready to be functionally tested.
4. FMSC must submit all FMS Start-Up and initial checkout documentation (including point-to-point verifications, etc.) in the Start-Up Plan.
5. Commissioned equipment control integration (e.g., LonTalk, BACnet, MODBUS, etc.) to the Control System must be complete and verified by the Equipment Provider and FMSC.
6. FMSC must complete benchtop testing of BAS system programming (review programming and conduct “dry run” test for each distinct sequence) with CxA and other members of the CxT.
7. FMSC must complete FMS system trending data set-up and reporting and submit one week of operating data (either automatically or manually) for CxA review to assess the readiness of the specific system to begin on-site Functional Testing. Operating data must be submitted at least seven (7) days prior to anticipated start of FPT.
8. FMS network and front end must be complete and operational. FMS graphics must be complete.
9. O&M documentation must be submitted to CxA for review.
10. Final schedule of Owner Training exercises must be submitted to CxA prior to scheduling Functional Performance Tests.
11. Systems Manual documentation must be submitted to CxA.

E. Final Test and Balance (TAB) Report Verification:

1. TAB Contractor will allow for 80 hours of Final TAB Report verification readings (both air and water readings). Final TAB Report Verification readings to be focused on critical areas (starting with those equipped with pressure monitors).
2. TAB Contractor will re-read devices with the same equipment used in the TAB process in the presence of the CxA. The devices will be selected at random by the CxA and the CxA will record the TAB Verification readings. All Verification readings must be within ±10% of final TAB report readings.
3. Readings outside of the ±10% tolerance in more than 10% of the TAB Verification readings will indicate failure of the TAB Verification testing and require re-testing. TAB Subcontractor will correct all deficient readings and schedule TAB Verification re-testing with CxA. The CxA will randomly select a different sample of the TAB final report readings for the Verification re-testing.
4. Readings outside of the ±10% tolerance in more than 10% of the TAB Verification re-testing readings will indicate failure of the Verification re-test and will require a second re-testing. TAB Subcontractor will correct all deficient readings and schedule second TAB Verification re-testing with CxA. The TAB Verification re-testing procedures will be

repeated a second time again utilizing a different sample of the final TAB report readings selected at random by the CxA.

5. Readings outside of the ±10% tolerance in more than 10% of the second TAB Verification re-testing readings will require TAB Verification retesting for all the TAB final report readings.
6. All TAB verification retesting will be completed at no additional cost to the Owner. See paragraphs below for CxA costs for retesting.

3.11 DOCUMENTATION, NON-CONFORMANCE AND APPROVAL OF TESTS

A. Documentation:

1. CxA will witness and document results of FPT utilizing Cx Database. FPTs are made available to the CxT in the Cx Database for review and approval prior to testing. CxA will include the executed FPTs in the Final Commissioning Report.

B. Non-Conformance:

1. CxA will record results of FPT. Deficiency or Non-Conformance Issues will be noted and reported to Construction Manager and Owner in the Cx Master Issues List (Cx MIL).
2. Corrections of minor deficiencies identified may be made during tests at discretion of CxA. In such cases, deficiency and resolution will be documented in the FPT.
3. Every effort will be made to expedite testing and minimize unnecessary delays, while not compromising integrity of tests. CxA shall not overlook deficient work or loosen acceptance criteria to satisfy scheduling or cost issues unless directed to do so by the Owner.
4. Deficiency and Non-Conformance Issues are handled in the following manner:

    a. When there is no dispute on Deficiency Issue and Construction Manager accepts responsibility for remedial action:

        1) CxA documents Deficiency Issue and Subcontractors response and intentions in the Cx MIL and they go on to another test or sequence.
        2) All issues are made available to CxT via the Cx MIL and written Cx Site Visit Reports.
        3) Subcontractor corrects deficiency and updates Issue status to “Recheck” in the Cx MIL.
        4) Construction Manager reschedules test with Subcontractor.
        5) CxA witnesses retesting and documents results. Corrected issues will be updated in the Cx MIL to “Closed”.
        6) See paragraphs below for CxA costs for retesting and reverification work.

    b. When there is a dispute about a Deficiency Issue, regarding whether it is a deficiency or who is responsible:

        1) CxA documents Deficiency Issue and Subcontractors response and intentions in the Cx MIL and they go on to another test or sequence.
        2) All issues are made available to CxT via the Cx MIL and written Cx Site Visit Reports.
        3) Construction Manager facilitates resolution of deficiency. Other parties are brought into discussions as needed. Final interpretive authority is with A/E. Final acceptance authority is with the Owner.
        4) Construction Manager documents resolution process.

5) Once interpretation and resolution have been decided, appropriate Subcontractor corrects deficiency and updates Issue status to “Recheck” in the Cx MIL.
6) Construction Manager reschedules test and test is repeated until satisfactory performance is achieved.
7) CxA witnesses retesting and documents results. Corrected issues will be updated in the Cx MIL to “Closed”.
8) See paragraphs below for CxA costs for retesting and reverification work.

C. Costs for CxA MIL Verifications and Retesting:

1. Cost for Subcontractor to correct and retest any PFC or FPT deficiency item, if they are responsible for deficiency, will be theirs. If Subcontractor is not responsible, cost recovery for retesting will be negotiated with CM.
2. CxA has included a seventy (70) hour allowance for delays, reverifications and retesting work to be used over the duration of the Cx process. CxA will provide status of retesting allowance to CxT in periodic site visit reports. CxA labor and expenses for any of the following work beyond the 70 hour allowance will be considered Additional Services to be negotiated with the Owner. CxA Additional Service costs must be approved by the Owner for CxA to schedule retesting site visits.

a. Excessive Deficiency Issue Verifications (for excessive/repeated issues).
b. Any reverification of a Deficiency Issue when the Issue is marked as corrected by the CM/Subcontractor and found to remain deficient by CxA on verification.
c. Delays during Functional Performance Testing caused by excessive or repeated testing failures.
d. Any Functional Performance Testing or Opposed Season Functional Performance Testing MIL Issue Verifications or Retesting (for any reason).

D. Costs for Functional Performance Test Additional Services:

1. Cost for CM/Subcontractor to complete Functional Performance Testing Additional Services will be theirs.
2. Additional Services for CxA to complete any Functional Performance Testing during Owner move-in or after Owner occupancy (regardless of whether the testing was attempted prior to that point or not) will be considered Additional Services to be negotiated with the Owner. CxA Additional Service costs must be approved by the Owner for CxA to schedule testing site visits during Owner move-in or after Owner occupancy.

E. Approval:

1. CxA notes each satisfactorily demonstrated function on test form. CxA, A/E and Owner provide formal approval of FPT. CxA recommends acceptance of each test to Owner. The Owner gives final approval, providing a signature to Construction Manager.

3.12 TRAINING OF OWNER PERSONNEL

A. CM/Subcontractors/Vendors will provide complete training in start-up, operation and maintenance of all equipment under contract.

B. Construction Manager and Subcontractors will be responsible for

1. Developing Owner Training Program.
2. Scheduling of Owner Training with Owner and Contractors. Owner Training Schedule will be provided to CxA to allow CxA to schedule site visits to attend training sessions.
3. Execution of Owner Training.
4. Documentation of completed Owner Training.

C. CxA will monitor the completion of the Owner Training as follows:

1. CxA will review Owner Training Program submitted by Construction Manager.
2. CxA will attend a sampling of the Owner Training Sessions.
3. CxA will digitally videotape O&M staff training sessions for commissioned equipment/systems.
4. CxA will review the final executed Owner Training Program documentation.

D. General sequencing of the development of the Owner Training Program and completion of the Owner training is as follows:

1. CxA will review the Owner training requirements (including preparation of Owner Training Program) with the Construction Manager and Subcontractors at the Commissioning Kick-Off meeting.
2. Construction Manager will prepare an outline of the Owner Training Program within 30 days of completion of submittal process (i.e., all equipment/systems approved by A/E). Submit Owner Training Program outline to CxT for review.
3. Schedule for Owner Training sessions will be reviewed and updated as required throughout the project construction by CxT at Construction Manager Progress Meetings (attended by CxA during periodic site visits). Construction Manager will submit final Owner Training Schedule to CxT 30 days prior to start of training exercises to allow CxA to witness the Owner training exercises.
4. Subcontractors and Equipment Vendors will execute training exercises per Training Program including any required comprehension testing and continuing Owner Training exercises.
5. Construction Manager will submit a copy of the following Owner Training documentation to CxA on completion of Owner Training exercises (CxA copy is in addition to any copies required by other specifications for Owner use):

    a. Final executed Owner Training Program and Owner Training Manuals including all training documentation (sign-in sheets, handouts, comprehension tests, etc.). Copy shall be in “searchable” PDF format.

3.13 OPPOSED SEASON FUNCTIONAL PERFORMANCE TESTING

A. During Warranty Period, seasonal testing (tests delayed until weather conditions are closer to system’s design) will be completed as part of this contract. Construction Manager will coordinate this activity.

B. One Opposed Season Test will be conducted (during peak conditions opposite initial Functional Performance Testing). Only seasonally impacted sequences and capacities will be retested during the opposed season test (e.g., safeties and fire alarm interlocks will not be retested during the Opposed Season Tests).

C. Tests will be executed, documented and deficiencies corrected by appropriate contractor(s), with facilities staff and CxA witnessing.

D. CxA will incorporate final updates to the Final Cx Report as necessary.

3.14 END OF WARRANTY REVIEW MEETING

A. CxA will participate in an End of Warranty Review with the Owner and O&M staff to review the facility and commissioned systems performance. End of Warranty Review will be completed 10-11 months into the one-year warranty period.

B. The End of Warranty Review shall address the following (for commissioned systems only):

1. Any outstanding construction deficiencies.
2. Any outstanding warranty period deficiencies identified by the CxA during Opposed Season Testing.
3. Any deficiencies that were noted by the Operations Staff during the warranty period.
4. Any problems noted by the Operations Staff related to operating the facility as originally intended.

C. Any issues covered under a warranty or under the original Contract Documents will be assigned to the Construction Manager for correction per the project warranty process. CM/Subcontractor will correct the issue and notify the Owner of correction. Subcontractor shall provide any retesting or photo documentation required by Owner to verify issue corrections.

D. CxT will determine a process for resolution, including the party responsible for resolution (e.g., A/E, Facility Staff, etc.), for all other non-warranty issues.

E. CxA will document resolution process for all issues in meeting minutes and distribute to the CxT.

3.15 SAMPLE COMMISSIONING DOCUMENTATION

A. Sample Pre-Functional Checklist (PFC), Functional Performance Test (FPT) and Cx BMS Trend Data/Report are included on the following pages.

SSRCx FACILITIES COMMISSIONING

Sample HVAC Pre-Functional Checklist

PROJECT:
LOCATION:

SYSTEM/UNIT: HVAC Equipment/ AHU

Tested By:
Date:

Model Verification - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Specified Manufacturer				
2	Installed Manufacturer				
3	Specified Model #				
4	Installed Model #				
5	Serial #				
6	Specified Airflow				
7	Specified Static Pressure				

General - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Inspection and Access doors are operable				
2	Casing Undamaged				
3	Equipment has been cleaned and finish touched up if necessary.				
4	Manufacturer's required maintenance clearance provided for service.		23 05 [illegible]0 1.8 E		
5	Specified unit mounting requirements		Sch[illegible]ule Note 10		
6	Verify unit is mounted per plans and specs		Schedule Note 10		
7	Specified access doors		Schedule Note 4		
8	Verify access doors are provided per plans and specs		Schedule Note 4		
9	Access doors are installed s[illegible] air leaks through door				
10	Access doors open against air pressure				
11	Specified lights are provided per plans and specs		Schedule Note 5		
12	Verify lights are installed in locations per plans and specs		Schedule Note 5		
13	4" housekeeping pad is provided under all floor mounted equipment		23 05 48 3.4 G		
14	Flexible pipe connectors are installed on all equipment supported by vibration isolation		23 05 48 3.4 L		

Accessories - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Specified accessories are provided (1)		Schedule Note 12		
2	Verify accessories are provided (1)		Schedule Note 12		
3	Specified accessories are provided (2)		Schedule Note 11		
4	Verify accessories are provided (2)		Schedule Note 11		
5	UV lights are factory installed downstream of cooling coils		Schedule Note 16

Tested By:
Date:

Ductwork - HVAC Equipment - AHU

	Verification	Response	Notes	By	Date/Time
1	Ductwork is connected to unit with flexible connections		Schedule Note 19		
2	Duct installation is complete				
3	Access doors installed and labeled at fire / smoke dampers, fire dampers, and smoke detectors		23 31 13 3.1 E		

Controls - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Return duct smoke detector is installed in return duct		Schedule Note 19		
2	Supply duct smoke detector is installed after supply fan		Schedule Note 19		
3	Specified return air sensors are installed per the controls schematic		M06-02 Detail C3		
4	Verify return air sensors are installed per the controls schematic		M06-02 Detail C3		
5	Specified mixed air sensors are installed per the controls schematic		M06-02 Detail C3		
6	Verify mixed air sensors are installed per the controls schematic		M06-02 Detail C3		
7	Specified discharge air sensors are installed per the controls schematic		M06-02 Detail C3		
8	Verify discharge air sensors are installed per the controls schematic		M06-02 Detail C3		
9	Specified automatic dampers are installed per the controls schematic		M06-02 Detail C3		
10	Verify automatic dampers are installed per the controls schematic				

Labeling - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Permanently fasten labels are on each major item of mechanical equipment. Labels are located in accessible and visible areas.		23 05 53 2.3 A		
2	Duct is labeled with contents and flow direction		23 05 53 2.3 C		

Insulation - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Specified Air Duct Insulation requirements:		23 07 13 4.1 - EXPOSED: 2" Rigid Fiberglass Board; CONCEALED: 2" Flexible Fiberglass with Vapor Barrier		
2	Verify Air Duct Insulation requirements:		23 07 13 4.1		

Startup Mechanical - HVAC Equipment/ AHU

	Verification	Response	Notes	By	Date/Time
1	Contractor's executed startup procedures haves been submitted for review				

Sample Electrical Pre-Functional Checklist

LOCATION:
PROJECT #:

SYSTEM/UNIT: Emergency Equipment/GEN 1
AREA: Exterior

Documentation - Emergency Equipment/GEN 1

	Verification	Response	Notes	By	Date/Time
1	Manufacturer - Specified				
2	Manufacturer - Installed				
3	Capacity / Power Factor - Specified				
4	Capacity / Power Factor - Installed				
5	Voltage - Specified				
6	Voltage - Installed				
7	Engine Model				
8	Engine Serial #				
9	Generator Model				
10	Generator Serial #				

Installation - Emergency Equipment/GEN 1

	Verification	Response	Notes	By	Date/Time
1	Generator installation is clean and clear of debris				
2	Generator is secured to concrete housekeeping pad				
3	Generator installed on steel base				
4	Generator mounted on spring isolators				
5	Provided with flex connection between radiator and exhaust plenum				
6	Flexible fuel lines provided for connection to generator				
7	Provided with flex connection exhaust silencer				
8	All conduit connections consist of flex conduit				
9	Generator installed to provide access for periodic maintenance				
10	Provided with electrically powered, thermostatically controlled jacket water heater(s) to maintain a minimum specified water jacket temperature under ambient temperatures				
11	Critical grade exhaust silencer provided and installed per design				
12	Provided with gas proof, stainless steel, flexible exhaust bellows with threaded NPT or flanged connections				
13	Silencer provided w/ condensate drain				
14	Rain cap and bird screen provided for exhaust pipe				
15	A lube oil drain is extended beyond the skid base

2.01 Unit - On - HVAC Equipment/AHU

	Verfication	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Unit is commanded on via building BMS				
2	EXPECTED RESPONSE: Fire/Smoke Dampers are fully opened				
3	EXPECTED RESPONSE: Supply fan is energized and runs continuously during unit operation				
4	EXPECTED RESPONSE: Interlocked Exhaust Fan(s) is energized and runs continuously during unit operation				
5	EXPECTED RESPONSE: VFD(s) modulates to maintain constant flow as filters get loaded				
6	EXPECTED RESPONSE: OA damper opens to minimum airflow position				
7	EXPECTED RESPONSE: RA damper opens fully				
8	EXPECTED RESPONSE: OA damper modulates to maintain OA flow setpoint				
9	EXPECTED RESPONSE: Cooling coil valve modulates to maintain LAT setpoint (50°F, adj.)				
10	VERIFY: Supply fan minimum runtime is programmed				

2.02 Cooling Coil Control HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate OA temp > 45°F				
2	EXPECTED RESPONSE: Cooling Coil is enabled				
3	EXPECTED RESPONSE: Cooling coil control valve modulates to maintain LAT setpoint of 50°F (adj.)

2.03 Supply Air Reset - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate return air temperature > return air high limit				
2	EXPECTED RESPONSE: Supply air temperature setpoint is reset downward				
3	RECORD: RA Temperature High Limit Setpoint	°F			
4	RECORD: Supply Air Temperature Setpoint/Actual	°F			
5	TEST PROCEDURE: Simulate return air temperature < return air low limit				
6	EXPECTED RESPONSE: Supply air temperature setpoint is reset upward				
7	RECORD: RA Temperature Low Limit Setpoint	°F			
8	RECORD: Supply Air Temperature Setpoint/Actual	°F			

2.04 Unit - Off - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Unit is commanded to shut down via building BMS				
2	EXPECTED RESPONSE: OA damper closes				
3	EXPECTED RESPONSE: CHW Coil opens				
4	EXPECTED RESPONSE: Supply fan deenergizes				
5	EXPECTED RESPONSE: Interlocked exhaust fan(s) deenergizes				

3.01 High Space Temperature Alarm - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate space temperature greater than the cooling setpoint by a "user defined amount"				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

3.02 Low Space Temperature Alarm - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate space temperature lower than the cooling setpoint by a "user defined amount"				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

Sample HVAC Functional Performance Test

PROJECT:

3.03 High Return Air Humidity - AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate RA humidity > 70% (adj.)				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

3.04 Low Return Air Humidity - AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate RA humidity < 35% (adj.)				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

3.05 Supply Fan Failure - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate supply fan status does not match command				
2	VERIFY: Remaining supply fan(s) ramp up to maintain supply airflow setpoint				
3	EXPECTED RESPONSE: Alarm is sent to BMS				
4	TEST PROCEDURE: Simulate supply fan runtime exceeded				
5	EXPECTED RESPONSE: Alarm is sent to BMS				
6	RECORD: Runtime Alarm Setpoint				

3.06 Pre Filter DP Alarm - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate DP across pre filter > pre filter DP setpoint				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

3.07 Final Filter DP Alarm - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate DP across final filter > final filter DP setpoint				
2	EXPECTED RESPONSE: Alarm is sent to BMS				

3.08 Smoke/Fire Detection Alarm - HVAC Equipment/AHU

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate smoke detected/emergency shutdown signal				
2	EXPECTED RESPONSE: Unit shuts down according to shutdown sequence				
3	EXPECTED RESPONSE: Alarm is sent to BMS				

Sample Plumbing Systems Functional Performance Test

PROJECT:
LOCATION:

SYSTEM/UNIT: Domestic Hot Water System

1.00 Sample FPT - Domestic Hot Water System

	Verification	Response	Notes	By	Date/Time
1	Sample FPT				

1.02 Pre-test Setpoints & Conditions - Domestic Hot Water System

	Verification	Response	Notes	By	Date/Time
1	RECORD: WH-A Status				
2	RECORD: WH-B Status				
3	RECORD: Recirculation Pump A Status				
4	RECORD: Recirculation Pump B Status				
5	RECORD: DHWR Temperature				
6	RECORD: DHWS Leaving WH-A Temperature Setpoint/Actual				
7	RECORD: DHWS Leaving WH-B Temperature Setpoint/Actual				
8	RECORD: WH-A Circulation Pump Status				
9	RECORD: WH-B Circulation Pump Status				
10	RECORD: WH-A Temperature Control Valve Position (If available)				
11	RECORD: WH-B Temperature Control Valve Position (If available)				
12	RECORD: HW Temperature to HX				
13	RECORD: HW Temperature Leaving HX				
14	RECORD: Mixing Valve Setpoint/Actual Leaving Water Temperature				

Sample Plumbing Systems Functional Performance Test

PROJECT:
LOCATION:

SYSTEM/UNIT: Domestic Hot Water System

2.01 System Enabled - Domestic Hot Water System

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Domestic Water System is enabled				
2	EXPECTED RESPONSE: Domestic Water Recirculation Pumps are energized manually				
3	EXPECTED RESPONSE: Active Water Heater's circulation pump is energized				
4	EXPECTED RESPONSE: Water Heaters Temperature Control Valve modulates to maintain the LWT Setpoint				
5	EXPECTED RESPONSE: Mixing Valve maintains setpoint				
6	TEST PROCEDURE: Water Heater LWT is above or below setpoint				
7	EXPECTED RESPONSE: Water Heaters Temperature Control Valve modulates to maintain the LWT Setpoint				
8	RECORD: DHWS Leaving WH-A Temperature Setpoint/Actual				
9	RECORD: DHWS Leaving WH-B Temperature Setpoint/Actual				
10	EXPECTED RESPONSE: Mixing Valve maintains setpoint				

2.02 System Disabled - Domestic Hot Water System

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Domestic Water System is disabled				
2	EXPECTED RESPONSE: Domestic Water Recirculation Pumps are de-energized manually				
3	EXPECTED RESPONSE: Water Heater's circulation pumps are de-energized				
4	EXPECTED RESPONSE: Water Heaters Temperature Control Valves open to bypass				

3.01 System Alarm - Domestic Hot Water System

	Verification	Response	Notes	By	Date/Time
1	TEST PROCEDURE: Simulate an alarm from the system				
2	EXPECTED RESPONSE: Alarm is sent to BAS				

Sample Electrical Functional Performance Test

PROJECT:
LOCATION:

SYSTEM/UNIT: Lighting Controls

1.0 Test Procedure: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	VERIFY A minimum of 20% of occupancy sensors are to be functionally tested. Document room tested and results of device tested.				
2	VERIFY by visual response that:				
3	PROCEDURE Device senses space is occupied and turns lights ON.				
4	PROCEDURE Device senses space is un-occupied.				
5	PROCEDURE Device turns lights off after preset time delay. (10-30 minutes)				
6	PROCEDURE Local switch operates properly, if applicable.				
7	PROCEDURE Device location during time of functional testing is indicated below:				

1.1 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	RECORD Devices installed in the following areas were demonstrated to operate, with any issues noted on the MIL. See 'Comments' section for device location.				
2	Level 1				

1.2 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	Level 2				

1.3 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	Level 3				

1.4 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	Level 4				

1.5 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	Level 5				

1.6 Device Location: Occupancy Sensor

	Verification	Response	Notes	By	Date/Time
1	Level 6				

Sample Electrical Functional Performance Test

PROJECT:
LOCATION:

SYSTEM/UNIT: Lighting Controls

	Verification	Response	Notes	By	Date/Time
1	VERIFY the following features are provided:				
2	3.5 inch touch screen				
3	On/Off buttons for each group of fixtures				
4	Dimmer for each group of fixtures				
5					

2.1 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	RECORD Device(s) installed in the following areas were demonstrated to operate, with any issues noted on the MIL. See 'Comments' section for additional device location.				
2	Level 1				

2.2 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	Level 2				

2.3 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	Level 3				

2.4 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	Level 4				

2.5 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	Level 5				

2.6 Device Location: Graphic Wall Pod

	Verification	Response	Notes	By	Date/Time
1	Level 6				

FACILITIES COMMISSIONING

Sample Electrical Functional Performance Test

PROJECT:
LOCATION:
PROJECT #:

SYSTEM/UNIT: Emergency Power System/G1

1.0 Load Testing - Emergency Power System/G1

	Verification	Response	Notes	By	Date/Time
1	VERIFY Transfer switches are complete, testing coordinated concurrently with generator testing.				
2	VERIFY Load bank provided is fully rated 0.8PF device.				
3	PROCEDURE: From "cold start", disconnect primary power to all ATS's.				
4	RECORD: Time delay on start.				
5	RECORD: Time taken to reach operating speed.				
6	RECORD: Voltage and frequency overshoot.				
7	RECORD: Time taken to achieve steady state condition.				
8	PROCEDURE: 100% full load test allowed to run for 2 hours. (Intent of NFPA 110 is to use building loads).				
9	RECORD: Voltage, frequency, load current, fuel pressure, oil pressure, and coolant temperature recorded at first load acceptance and in 15 minute intervals thereafter.				
10	PROCEDURE: Restore primary power to each ATS.				
11	RECORD: Generator cooldown and shutdown period.				
12	PROCEDURE: Generator allowed to cool for 5 minutes.				
13	PROCEDURE: Generator started individually and closed to 100% nameplate KW.				
14	RECORD: Cranking time until the prime mover starts and runs.				
15	RECORD: Time taken to reach operating speed.				
16	RECORD: Voltage and frequency overshoot.				
17	RECORD: Time taken to achieve steady state condition.				
18	PROCEDURE: 2-hour 100% load test performed.				
19	RECORD: Voltage, frequency, load current, fuel pressure, oil pressure, and coolant temperature recorded at first load acceptance and in 15 minute intervals thereafter.				

Sample Electrical Functional Performance Test

PROJECT:
LOCATION:
PROJECT #:

SYSTEM/UNIT: Emergency Power System/G1

2.0 Crank Cycle Test - Emergency Power System/G1

	Verification	Response	Notes	By	Date/Time
1	PROCEDURE: Utilize any method recommended by manufacturer to prevent the prime mover from running.				
2	PROCEDURE: Put the control switch into "run" to cause the prime mover to crank.				
3	VERIFY: Starting battery pack is capable of maintaining cranking speed for 75 second cycle per NFPA 110 (15 sec crank, 15 sec rest, 15 sec crank, 15 sec rest, 15 sec crank).				
4	RECORD: Battery voltage at conclusion of test.				

3.0 Generator Control Panel - Emergency Power System/G

	Verification	Response	Notes	By	Date/Time
1	VERIFY the proper operation of each function:				
2	3-position selector switch (run/off/auto)				
3	Local emergency stop button				
4	Push-button reset switch				
5	Voltage adjustment potentiometer				
6	Self-diagnostic capabilities with a readout on a digital display pa				
7	Lamp test switch				
8	Panel illumination lights with switch				
9	Contacts for local and remote common alarm				
10	Verify activation of alarm horn and indicating LED for each alarm and shutdown.				
11	VERIFY the proper operation of each shutdown, alarm, and pre-alarm:				
12	Overcrank shutdown - red				
13	Low coolant temperature alarm - red				
14	High water temperature pre-alarm - amber				
15	High water temperature shutdown - red				
16	Low oil pressure pre-alarm - amber				
17	Low oil pressure shutdown - red				
18	Overspeed shutdown - red				
19	Low fuel main tank				
20	Low coolant level				
21	EPS supplying load				

FACILITIES COMMISSIONING

Sample Electrical Functional Performance Test

PROJECT:
LOCATION:
PROJECT #:

SYSTEM/UNIT: Emergency Power System/G1

3.0 Generator Control Panel - Emergency Power System/G1

	Verification	Response	Notes	By	Date/Time
22	Controls not in auto				
23	High battery voltage				
24	Low cranking voltage				
25	Low battery voltage				
26	Battery charger failure alarm				
27	Ground fault alarm				
28	VERIFY proper operation of each meter and gauge:				
29	Voltmeter				
30	Ammeter				
31	Frequency meter				
32	Power factor				
33	KVAR				
34	KWH				
35	Battery charging voltmeter				
36	Coolant temperature gauge				
37	Oil pressure gauge				
38	Running time meter				
39	Engine RPM				

4.0 Remote Annunciator Panel - Emergency Power System/G1

	Verification	Response	Notes	By	Date/Time
1	VERIFY activation of alarm horn and indicating LED for each al and shutdown:				
2	Overcrank shutdown				
3	Low coolant temperature alarm				
4	High water temperature pre-alarm				
5	High water temperature shutdown				
6	Low oil pressure pre-alarm				
7	Low oil pressure shutdown				
8	Overspeed shutdown				
9	Low fuel main tank				
10	Low coolant level				
11	Controls not in auto				
12	Batt charger AC failure				
13	Ground fault alarm				
14	Lamp test switch				
15	PROCEDURE: Activate remote emergency stop pushbutton				
16	VERIFY: Generator shuts down immediately.

SAMPLE TREND REPORT FORMAT FOR Cx

Sample Trend Report is for a typical VAV Box "Forced Trend" of max heating / max cooling over 4-hr period
Trended Points are examples for Report formatting only. Equipment points to be trended will be determined during Cx FPT Scheduling Meeting.

Date / Time	Zone Setpoint (deg F)	Zone Temp (deg F)	Supply Airflow Setpoint (cfm)	Supply Airflow (cfm)	Discharge Air Velocity Pressure (in)	Supply Air Damper Output	Heating Output	Discharge Air Temperature

END OF SECTION 019113

SECTION 019115 - BUILDING ENCLOSURE COMMISSIONING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Section includes the Commissioning (Cx) requirements for Building Enclosure systems.

1. The Building Enclosure Commissioning requirements are separate from, and in addition to, the Building Systems Commissioning requirements in Section 019113. The Construction Manager and Subcontractors are required to participate in each of the Commissioning processes.
2. The 019115 Building Enclosure Commissioning Agent (BECxA) and 019113 Commissioning Agent (CxA) will provide separate documentation for each Commissioning process.

1.2 RELATED DOCUMENTS

A. The work under this section is subject to requirements of the Contract Documents, including the Owner's General Conditions and articles of the Construction Manager's General Conditions.

B. This section includes the commissioning requirements for the Building Enclosure systems.

1. Refer to Section 019117 for Building Enclosure Functional Performance Testing.
2. The commissioning requirements for the building enclosure systems given in this section are entirely separate from, and in addition to, the Building Systems Commissioning specified in specification section 019113.
3. The Construction Manager, Contractors, Sub-contractors and Suppliers are required to participate in both commissioning processes as required by sections 019113 General Commissioning Requirements and 019115 Building Enclosure Commissioning.
4. The 019113 Commissioning Agent (CxA) and 019115 Building Enclosure Commissioning Agent (BECxA) will provide separate documentation for each commissioning process.

C. Specific building enclosure commissioning requirements are given in this specification. The following specification sections are related to the commissioning work specified in this section:

1. Integrated Exterior Mockups: Refer to 014339
2. Building Systems Commissioning: Refer to 019113
3. Building Enclosure Functional Performance Testing: Refer to 019117
4. Basic Concrete Requirements: Refer to Division 03
5. Basic Masonry Requirements: Refer to Division 04
6. Basic Waterproofing, Roofing, Cladding, Air Barrier, Insulation Requirements: Refer to Division 07
7. Basic Fenestration Systems Requirements: Refer to Division 08

D. Reference standards to be included as part of the building enclosure commissioning process include the following:

1. National Institute of Building Sciences 'Building Enclosure Commissioning Process BECx', Guideline 3-2012.

2. ASTM E2813-18, 'Standard Practice for Building Enclosure Commissioning'
3. ASTM E2947-21a, 'Standard Guide for Building Enclosure Commissioning'

1.3 GENERAL DESCRIPTION

A. Building Enclosure Commissioning is a systematic process of validating and verifying all building enclosure systems responsible for environmental separation perform interactively according to the Owner's Project Requirements. The Building Enclosure Commissioning process is intended to achieve the following specific objectives according to the Contract Documents:

1. Verify and document installation and performance of building enclosure materials and systems.
2. Endeavor to provide the Owner with functional Building Enclosure systems that meet the Project Requirements.

B. Commissioning does not take away from or reduce responsibility of system designers or installing contractors to provide a finished and fully functioning product per the contract documents.

C. This section shall in no way diminish the responsibility of Division 03, 04, 05, 07, and 08 Contractors, Subcontractors, and Suppliers in performing all aspects of work and testing as outlined in the Contract Documents. Any requirements outlined in this section are in addition to requirements outlined in Division 03, 04, 05, 07, and 08.

1.4 ABBREVIATIONS

A. The following are common abbreviations used in this Section (definitions are found further in this Section):

1. A/E – Architect and Design Engineers
2. BECx – Building Enclosure Commissioning
3. BECxA – Building Enclosure Commissioning Agent
4. BECT – Building Enclosure Commissioning Team
5. BETA – Building Enclosure Testing Agency
6. BECx Plan – Building Enclosure Commissioning Plan
7. FPT – Functional Performance Test
8. CM – Construction Manager
9. CT – Commissioning Team
10. CxA – Commissioning Agent for Building Systems - Refer to Section 019113
11. O&M – Operations & Maintenance

1.5 DEFINITIONS

A. Approval: Acceptance that a material or system has been properly installed and is functioning in tested modes according to the Contract Documents.

B. Architect/Engineer (A/E): Prime consultant (architect) and sub-consultants who comprise the design team, generally the Architect of Record and any Design Sub-consultants.

C. Basis of Design (BOD): Documentation of primary thought processes and assumptions behind design decisions made to meet design intent. Describes systems, components, conditions, and methods chosen to meet intent.

D. Building Enclosure Commissioning Agent (BECxA): Contracted to Owner through the CxA. BECxA directs and coordinates day-to-day Building Enclosure Commissioning activities independently from CxA.

E. Building Enclosure Commissioning Plan (BECx Plan): Overall plan developed after bidding that provides structure, schedule, and coordination planning for the Building Enclosure commissioning process.

F. Building Enclosure Commissioning Team (BECT): See 1.7 A.

G. Building Enclosure Testing Agency (BETA): BETA will be represented by or contracted to the BECxA and is responsible for executing building enclosure functional performance testing under the direction of the BECxA.

H. Building Enclosure Functional Performance Test (FPT): Test of performance of building enclosure materials and systems. Systems are tested under various simulated environmental conditions, such as air or water leakage under pressure differential. Refer to Section 019117.

I. Commissioning (Cx) Database - A “cloud-based” process management platform provided by the CxA utilized to execute the Commissioning process.

J. Commissioning Agent (CxA): Commissioning Agent for Building Systems; refer to Section 019113. Contracted to Owner. CxA directs and coordinates day-to-day Building Systems Commissioning activities independently from BECx activities. CxA reports directly to Owner.

K. Commissioning Observation: Any condition identified by the BECxA that adversely affects the commissionability, operability, maintainability or functionality of a system, equipment or component. Any condition that is in conflict with the project OPR, Contract Documents, performance requirements, manufacturer requirements, and/or accepted industry standard practices of the installed systems and components. (See also – Deficiency, Master Issues Log)

L. Commissioning Plan: Overall plan developed after bidding that provides structure, schedule and coordination planning for Commissioning process.

M. Contract Documents: Contract documents include design and construction contracts, price agreements and procedure agreements. Contract Documents also include all final and complete drawings, specifications and all applicable contract modifications or supplements.

N. Contractor: Contractor or Subcontractors responsible for furnishing and installation of building components and systems.

O. Deficiency: Condition of a component, piece of equipment or system that is not in compliance with Contract Documents (that is, does not perform properly or is not complying with design intent).

P. Functional Performance Test (FPT): Test of function and operation of components and systems. Systems are physically tested to verify various performance requirements are met (resistance to water penetration, air leakage rate, adhesive strength, etc.). Refer to 019117 Building Enclosure Functional Performance Testing and testing requirements in related specifications.

Q. Master Issues Log (MIL): On-going list tracking commissioning observations and BECT responses and resolution.

R. Mockup: On-building structure which includes representative portions of building enclosure systems, assemblies, and components. Mockups shall be constructed, tested, and reviewed prior to commencement of building enclosure construction. Refer to specification 014339 Integrated Exterior Mockups.

S. Owner's Project Requirements (OPR): A written document that details the project requirements and the expectations of how the building and its systems will be used and operated. These include project goals, measurable performance criteria, cost considerations, benchmarks, success criteria, and supporting information.

T. Specifications: Construction specifications of Contract Documents.

U. Sub-contractor: Contractors of CM, and their Sub-contractors, who provide and install building enclosure components and systems.

V. Warranty Period: Warranty period for entire project, including equipment components.

1.6 RELATED WORK

A. Specific building enclosure commissioning requirements are given in this specification. The following specification sections are related to the commissioning work specified in this section:

1. Building Systems Commissioning: Refer to 019113
2. Building Enclosure Functional Performance Testing: Refer to 019117
3. Basic Concrete Requirements: Refer to Division 03
4. Basic Masonry Requirements: Refer to Division 04
5. Basic Waterproofing, Roofing, Air Barrier, Insulation Requirements: Refer to Division 07
6. Basic Fenestration Systems Requirements: Refer to Division 08

1.7 COORDINATION

A. Building Enclosure Commissioning Team: Members of the Building Enclosure Commissioning Team (BECT) will consist of:

1. Architect and Design Engineers (A/E)
2. Building Enclosure Commissioning Agent (BECxA)
3. Building Enclosure Testing Agent (BETA)
4. Division 03, 04, 07, 08 Contractors who provide and install the systems to be commissioned.
5. Any other Contractors or Subcontractors who provide and install the systems to be commissioned.
6. Commissioning Agent (CxA)
7. Construction Manager (CM)
8. Owner(s) (OR)
9. Representatives of the Facility User and Operation and Maintenance Personnel.
10. Systems Suppliers and Vendors.

B. Management: Owner will contract services of the CxA. The BECxA will direct and coordinate building enclosure commissioning activities and report to the CxA and OR. All members of the

Building Enclosure Commissioning Team shall cooperate to fulfill contracted responsibilities and objectives of the Contract Documents.

C. Kick-Off Meeting: BECxA will plan, schedule and conduct a Building Enclosure Commissioning Kick-Off Meeting. Membership and responsibilities of the BECT will be clarified at this meeting. BECx Kick-Off Meeting will be conducted no later than 30 days prior to initial installation of any commissioned systems on-site. CxA will distribute meeting minutes to all parties.

D. Scheduling: BECxA will work with the BECT to establish required commissioning activities to incorporate in preliminary commissioning schedule. The CM will integrate commissioning activities into a master construction schedule. Necessary notifications are to be made in a timely manner in order to expedite the commissioning process.

E. Project Phasing and Project Substantial Completion:

1. Phased completion of the project construction is anticipated. The commissioning processes described herein will be completed for each phase of work.
2. All BECxA work with the exception of the following must be completed for each project phase prior to Owner move-in/occupancy.

a. The following BECx work will be completed after Owner move-in/occupancy:

1) Compilation and delivery of Final Commissioning Report.
2) End of Warranty Review Meeting

PART 2 - PRODUCTS / COMMISSIONING DOCUMENTATION

2.1 COMMISSIONING (Cx) DATABASE

A. The BECx process will be executed utilizing a “cloud-based” process management Cx Database provided by the CxA. Cx Database is accessed by authorized users using any device running an HTML-5 internet browser (e.g., PC, laptop, tablet, phone) or by an operating system specific (e.g., iOS) application downloaded from corresponding app store.

B. Cx Database platform will be autonomous from any other database or web-based information platform utilized by the Construction Team throughout project construction.

C. CxA will provide the Commissioning Team with web access to the Cx Database during the Commissioning process. The CM/Contractors will complete the scoped Commissioning tasks indicated in other Sections of this specification in the Cx Database (e.g., completion of Commissioning activities, such as providing documentation of BECx Master Issues Log deficiency item corrections).

2.2 BUILDING ENCLOSURE COMMISSIONING PLAN

A. BECxA will develop overall plan for execution of the BECx Process.

B. The BECx Plan will contain:

1. Overview of the commissioning process.

2. Listing of major Commissioning milestones for coordination and inclusion in the master construction schedule.
3. List of BECT members and roles and responsibilities.
4. Description of management and communication for the commissioning process.
5. Master Systems List (list of commissioned component and systems).
6. Functional Performance Test Plan with test procedures and requirements for each commissioned system. The initial Cx Plan will not include the FPTs. Final FPTs will be developed in the Cx Database after related submittals are approved by the A/E.
7. Operation & Maintenance Data Matrix.
8. Warranty Matrix.
9. Owner Training Matrix.

C. The BECx Plan will be delivered to the BECT in electronic format (Adobe PDF file searchable from the Table of Contents).

2.3 MASTER ISSUES LOG (MIL)

A. Any issues noted by BECxA are tracked in a Master Issues Log (MIL). The MIL will be developed in and accessed/tracked through the Cx Database.

2.4 COMMISSIONED SYSTEMS SUBMITTALS AND O&M DATA

A. CM shall provide CxA with documentation required for Commissioning work. At minimum, documentation shall include: Requirements as described in Section 013000, O&M data, performance data, any performance test procedures, manufacturer's installation manuals, manufacturer's laboratory testing documentation, and Contractor or Owner's-contracted testing documentation related to the systems to be commissioned.

2.5 SITE VISIT REPORTS

A. BECxA will conduct regular site visits to complete scoped commissioning work. BECxA will provide a report for each site visit to members of the BECT.

B. BECxA Site Visit Report will include the following:

1. Attendees and purpose of site visit.
2. Observations regarding commissioned systems and results of completed commissioning work.
3. "Next Steps" section documenting BECx process status and upcoming BECx work / site visits.
4. Current Master Issues Log (MIL).
5. Picture Report (where applicable).

2.6 CM / CONTRACTOR OWNER TRAINING PLAN

A. CM/Contractors/Vendors will provide complete Owner training in Operation and Maintenance of all commissioned systems/equipment required under contract per specifications.

B. CM with assistance from responsible Contractors/Vendors shall develop a detailed program for Owner Training per 017000 Execution and Closeout Procedures and 017900 Demonstration and Training.

2.7 FUNCTIONAL PERFORMANCE TESTS (FPT)

A. BECxA will develop the Functional Performance Testing procedures from the Contract Documents and A/E approved submittals. The Functional Performance Test Procedures will be initially described in the BECx FPT Plan and developed in the Cx Database. The Functional Performance Tests will be executed by the BETA with support from the CM/Contractors. The BECxA will witness Functional Performance Tests and document the results in the Cx Database. Reference Specification 019117 Building Enclosure Functional Performance Testing for requirements on tests performed by the BETA.

B. Development of Test Procedures:

1. The purpose of any given specific test is to verify and document compliance with stated criteria of acceptance given on test form. BECxA shall develop specific test procedures based on standard industry test methods (AAMA, ASTM, etc.). Prior to execution, BECxA shall provide a copy of test procedures to Contractors. Contractor will review tests for feasibility, safety, and warranty protection. BECxA shall submit tests to Owner, CM and A/E and other Commissioning team members for review.
2. Test procedures will indicate general specimen type to be tested. Selection of actual test specimens will be selected by the BECxA and BECT on the day of testing from the available specimens identified by the Contractors as ready for testing on the Certificate of Readiness.
3. Test procedure forms developed by the BECxA will include (but not be limited to) the following information:

    a. System and equipment or component name(s)
    b. General location or specimen type
    c. Date
    d. Project name
    e. Participating parties
    f. Specific specified parameters being verified
    g. Test setup parameters
    h. Test procedures
    i. Results section to document test results and observations
    j. Section for comments

4. Specific FPT items may be added, modified or deleted in the BECx plan delivered to the CT to reflect the final construction document requirements. CM and Contractors shall review final construction documentation for applicable details and specifications related to equipment to be commissioned to fully ascertain all the FPT requirements.

2.8 CERTIFICATE OF READINESS FOR FUNCTIONAL PERFORMANCE TESTS (FPT)

A. BECxA will provide a Certificate of Readiness to be signed by the CM, Contractors and Equipment Vendors/Suppliers (where appropriate) as a prerequisite for scheduling of BECx FPTs. Completed Certificate of Readiness should be received two weeks prior to anticipated testing date.

B. The Certificate of Readiness will include the following:

1. Project building area
2. Area for CM to indicate FPTs to be scheduled and specimens (e.g. specific window openings) that are ready for testing.
3. Sign-off for CM, Contractors and Vendors (where appropriate) indicating readiness for associated FPTs to be scheduled.
4. Sign-off for CM that test accommodations required by specification 019117 are provided.

C. The intent of this certificate is for the CM, Contractors and other installers to document ("sign-off") that the equipment/systems are installed per the contract document requirements and are ready for FPT.

D. BECxA and BETA will not schedule tests until completed Certificates of Readiness are received. CM shall maintain free and clear access to all test areas, including exclusion and removal of interior finishes if necessary for observation of potential water leakage into concealed cavities, until testing is complete and satisfactory performance is achieved.

2.9 FINAL COMMISSIONING REPORT

A. The BECx Final Commissioning Report will include:

1. Executive Summary including:

   a. List of Commissioned Equipment/Systems.
   b. List of participants and roles.
   c. Summary of the completed Commissioning activities.
   d. Evaluation regarding status of issue resolution.

2. Design Phase BECx Documentation.
3. Master Issues Log.
4. Site Visit Reports.
5. BECxA executed Functional Performance Tests.
6. Sections will be provided for the following information to be inserted later:

   a. End of Warranty Meeting Minutes

PART 3 - EXECUTION

3.1 COMMISSIONING OVERVIEW

A. The following provides a brief overview of typical Building Enclosure Commissioning tasks during construction and general order in which they occur:

1. BECxA develops project specific Building Enclosure Commissioning Plan in the Cx Database including Functional Performance Test procedures. Building Enclosure Commissioning Team members are provided web access to the Cx Database for review of the Cx Plan prior to BECx Kick-Off meeting.
2. Commissioning during construction begins with a Kick-Off Meeting conducted by BECxA where membership of Building Enclosure Commissioning Team is established, and

responsibilities reviewed. The Building Enclosure Commissioning Plan is reviewed during this meeting.

3. BECxA schedules subsequent meetings as necessary to plan, coordinate and schedule Commissioning activities. Deficiencies and problem resolution will also be discussed at these meetings.
4. CM submits copies of submittals for all systems to be commissioned in Procore software to BECxA for review concurrently with A/E review. BECxA reviews submittals and returns review comments in Procore software.
5. BECxA revises Cx Plan if required based on final A/E approved submittals in Procore software.
6. Contractors install commissioned systems.
7. CM/Contractors develop initial outline Owner Training Program and submit to CT for review.
8. CxA makes regular site visits to observe commissioned system installations. Installations are reviewed against the design drawings and specifications, system manufacturer's requirements, and approved submittals.
9. Any issues noted by BECxA are tracked in a Master Issues Log (MIL) on the Cx Database platform. CM/Contractors correct issues noted by BECxA and update MIL in Cx Database for BECxA verification of issue corrections.
10. CM and Contractors coordinate overall schedule of systems installation and notify the BECxA when specimens ready to test by submitting completed Certificates of Readiness. CM and Contractors submit schedules to BECxA so that BETA may schedule and coordinate site visits and testing.
11. BETA completes testing as required by specification 019117 with support from CM and Contractors. BETA provides documentation of completed FPTs.
12. CxA conducts Commissioning Functional Testing Schedule Meetings with the Commissioning Team to establish a coordinated approach to the integration of the Functional Performance Testing activities within the Master Construction Schedule.
13. Items of non-compliance in material, installation or set-up will be corrected and system shall be retested at Contractor expense.
14. CM/Contractors execute Owner Training exercises per Owner Training Plan.
15. BECxA issues Final Commissioning Report.
16. CxA participates in End of Warranty Review meetings with facility maintenance staff to review systems performance. An updated Warranty Phase Issue Log shall be generated, and the Contractor shall resolve all issues determined by the CT to be subject to Warranty requirements.

3.2 SYSTEMS TO BE COMMISSIONED

A. Building Enclosure Systems to be commissioned:

1. Below Grade Waterproofing, Vapor Barriers, Air and Moisture Barriers, Exterior Cladding, Fenestration, and Roofing Systems responsible for providing the following functions:

    a. Air control
    b. Vapor control
    c. Insulation/thermal protection
    d. Waterproofing

3.3 RESPONSIBILITIES OF COMMISSIONING TEAM MEMBERS

A. Architect/Engineer (A/E)

1. Document design intent of systems. Respond to any issues developed during the commissioning process that may require clarification of design intent.
2. Develop mockup drawings as required for testing within specification section 014339 and 019117.
3. Review and incorporate Building Enclosure Commissioning specification section and Building Enclosure Functional Performance Testing specification section into the construction documents.
4. Attend BECx meetings as requested.
5. Provide construction documents electronically.
6. Review and respond to/incorporate BECxA comments made during design and submittal/shop drawing reviews.
7. Assist in dispute resolution regarding building enclosure systems regarding confirmation of design intent and specification requirements.
8. Review BECxA reports and respond to A/E items.

B. Building Enclosure Commissioning Agent (BECxA)

1. Facilitate cooperation of BECT in Commissioning work.
2. Develop and update BECx plan as necessary.
3. Develop the BECx and Building Enclosure FPT specification sections.
4. Review pertinent building enclosure related submittals and shop drawings. Provide submittal review comments to OR and A/E for inclusion in the submittal comments returned to the CM.
5. Conduct BECx kick-off meeting to review BECx Plan and responsibilities of each member of the BECT.
6. Participate in Contractors' pre-installation/coordination meetings for commissioned systems where specified.
7. Review initial outline Owner Training Program developed by CM/Contractors.
8. Perform construction observation visits to observe and document installation of the building enclosure materials, systems, and components, and observe representative field testing.
9. Perform and document functional performance field testing performed by BETA.
10. Witness building enclosure testing performed by others as required by the Contract Documents.
11. Issue reports documenting the BECx process and activities.
12. Maintain the BECx MIL in the Cx Database. Review and respond to Contractors' responses and documentation verifying corrective actions.
13. Attend and chair BECT meetings as required.
14. Provide the final BECx record.

C. General Contractor (CM)

1. The CM leads the commissioning process for the construction team and facilitates cooperation of Contractors in executing and completing the commissioning work. In addition to the specific CM commissioning roles and responsibilities specified herein, the CM is ultimately responsible for ensuring that the Contractor commissioning roles and responsibilities given in other Sections of this specification are executed and completed as specified.
2. Attend BECx coordination/kick-off meetings and other commissioning team meetings. The CM is responsible for all coordination items with Subcontractors.
3. Incorporate and periodically update commissioning activities into the construction schedule.
4. Notify BECT of schedule updates and onsite activities affecting BECx tasks.
5. Facilitate cooperation of Contractors in commissioning work.

6. Submit copies of initial submittals in Procore software to A/E and BECxA for review. Provide final A/E approved submittals in Procore software to BECxA for record purposes.
7. Review and respond to BECxA's submittal review comments.
8. Review BECx Plan, Pre-Functional Checklists, and FPT procedures.
9. Attend BECx Kick-Off Meeting and other BECT Meetings.
10. Verify building enclosure materials and assemblies are ready for functional performance testing. Submit completed FPT Certificate of Readiness to BECT and coordinate scheduling of Building Enclosure FPT with the BECxA and BETA at least two weeks prior to testing.
11. Ensure resolution of non-compliance and deficiencies in construction or test results. Provide written responses and documentation of completion from the appropriate subcontractors and record responses in the MIL. Documentation includes photographs of addressed items prior to concealment by other components.
12. Provide letters of compatibility for adjacent building enclosure materials and assemblies.
13. Provide Test Accommodations required in specification 019117 Building Enclosure Functional Performance Testing.
14. Schedule, coordinate and assist BECT in FPTs. Attend and participate in FPTs as required to insure Contractor and Vendor participation and completion of scheduled FPT activities. At a minimum, the CM should be present at start and completion of daily FPT activities to ensure Contractor/Equipment Vendor participation, coordination, and completion of Functional Testing work.
15. Facilitate all repairs and retesting of failed functional performance testing and pay for all associated costs of retesting and additional testing including costs related to testing observation and documentation by the BECxA.
16. Following failed field testing, provide a plan of repairs to be performed to the BECT for review. A/E shall approve plan of repairs prior to implementation and retesting. All repairs performed to facilitate successful testing must be approved by the A/E and performed comprehensively throughout project.
17. Verify Contractors correct deficiencies identified during Functional Performance Testing.
18. Develop, with cooperation of Sub-Contractors/Vendors, detailed Owner Training Program. Submit initial outline Owner Training Program to BECT for review within 60 days of completion of submittal process (i.e., all equipment/systems approved by A/E). Revise Owner Training Program as required based on BECxA review comments.
19. CM coordinates training sessions and executes training per Owner Training Program through Contractors.
20. Provide all warranty, operations, and maintenance documentation for all commissioned building enclosure systems, materials, and components to the BECxA in Procore software.
21. Schedule, coordinate and attend the End of Warranty Review Meetings to review system/equipment performance. Correct any deficiency issues noted during Warranty Period per the Project Warranty Process.

D. Contractors/Vendors

1. Review Commissioning Plan and building enclosure related specification sections.
2. Provide project-specific submittals/shop drawings as required by the project specifications that clearly indicate how each system is interfaced with adjacent systems. All typical and project-specific interfaces with adjacent systems must be detailed accurately.
3. Provide letters of compatibility for adjacent building enclosure materials and assemblies.
4. Attend BECx coordination/kick-off meetings and other commissioning team meetings.
5. Prepare Owner Training Program with CM where required by specifications.
6. Address all applicable observations in the MIL.

7. Provide written responses and documentation of completion of addressed items as directed by CM to the Cx Database. Documentation includes photographs of addressed items prior to concealment by other components.
8. Attend all required building enclosure functional performance testing and assist BETA in diagnosing testing failures as requested.
9. Ensure installed work is complete, is in compliance with Contract Documents, and is ready for Functional Performance Testing. Notify CM that systems are ready for Functional Performance Testing and coordinate with CM to submit completed FPT Certificate of Readiness two weeks prior to anticipated test date.
10. Correct deficiencies identified during Functional Performance Testing.
11. Provide warranty, operations, and maintenance documentation for all commissioned building enclosure systems, materials, and components to the CM.
12. Participate in the End of Warranty Review Meetings to review system/equipment performance. Correct any deficiency issues noted during warranty period per the Project Warranty Process.

E. Building Enclosure Testing Agency (BETA)

1. Attend BECx coordination/kick-off meetings.
2. Provide technicians and equipment to complete mockup and field FPTs as required in specification 019117 Building Enclosure Functional Performance Testing.
3. Prepare and submit reports at the conclusion of each test.
4. Perform diagnostic testing, retesting, and/or additional testing due to failed tests and prepare corresponding reports.

3.4 BUILDING ENCLOSURE COMMISSIONING TEAM (BECT) MEETINGS

A. BECx meetings will be held periodically as determined by the BECxA.

B. Discussions held in BECx meetings shall include, but not be limited to, system/materials, mockup/field progress, scheduling, testing, documentation, deficiencies, and problem resolution.

3.5 REPORTING

A. BECxA will regularly communicate with members of Commissioning team, keeping them apprised of Commissioning progress. The BECxA will provide periodic status reports to Owner, A/E, CM, and CxA.

B. BECxA will provide reports for site visits to Owner and CM. Site Visit Reports will include BECx Master Issues Log documenting non-compliance and deficiency items.

C. The BECxA shall submit non-compliance and deficiency reports Owner, A/E, CM, and CxA.

D. The BECxA shall provide a Final BECx Report to Owner.

3.6 SUBMITTAL REVIEWS

A. A/E or CM shall provide BECxA with documentation required for commissioning work. All building enclosure related submittals and shop drawings as required by the specifications shall be provided to the BECxA for review and comment.

B. The BECxA shall review building enclosure related submittals and shop drawings prior to or concurrent with the A/E for conformance as it relates to BECx such that the BECxA comments can be incorporated into the returned submittal.

C. The contractor(s) shall review and address all exterior enclosure related submittal and shop drawing review comments. Revised shop drawing details based on submittal review comments shall be clearly marked on the shop drawing resubmittal to indicate where and what changes have been made. Submittal and shop drawing review comments and responses shall be tracked by the BECxA.

D. The BECxA review of submittals and shop drawings does not substitute for or alter the responsibility of the A/E to review submittals and/or shop drawings for compliance with the project requirements. Final approval of submittals and shop drawings rests solely with the A/E.

E. CM shall provide the final A/E approved O&M data for all commissioned equipment/systems to the CxA in Procore software for record purposes.

3.7 BUILDING ENCLOSURE FUNCTIONAL PERFORMANCE TESTING

A. Refer to Section 019117 - Building Enclosure Functional Performance Testing.

3.8 DOCUMENTATION, NON-CONFORMANCE AND RESOLUTION

A. Documentation:

1. The BECxA shall submit observation reports to Owner, A/E, CM, and CxA and log commissioning observations in the Master Issues Log (MIL).

B. Non-Conformance:

1. Deficiency or non-conformance issues observed during regular site visits and testing visits will be noted and reported to the CM, A/E, and Owner.
2. Corrections of deficiencies identified and immediately repaired by Contractors during site observations and testing may be documented by the BECxA.
3. Deficiencies are handled in the following manner:

    a. When there is no dispute on deficiency and Subcontractor accepts responsibility for remedial action:

        1) BECxA documents deficiency and Subcontractor response and intentions. BECxA submits report and MIL to Owner, A/E, CM, and CxA. Copy is provided to Subcontractor by CM.
        2) Subcontractor corrects deficiency and provides written response and/or documentation on the MIL that the deficiency has been addressed.

    b. When there is a dispute about a Deficiency Issue, regarding whether it is a deficiency or who is responsible:

        1) BECxA documents deficiency and Contractor’s response. BECxA submits observation report and MIL to Owner, A/E, CM, and CxA. Copy is provided to Subcontractor by CM.

2) CM facilitates resolution of deficiency. Other parties are brought into discussions as needed. Final interpretive authority is with A/E. Final Acceptance authority is with the Owner/Owner.
3) CM documents resolution process.
4) Once interpretation and resolution has been decided, appropriate party corrects deficiency and provides written response and/or documentation on the MIL that the deficiency has been addressed.

C. Costs for BECx MIL Issue Corrections and FPT retesting:

1. Cost for Contractor to correct and retest any FPT deficiency item, if they are responsible for deficiency, will be theirs. If Contractor is not responsible, cost recovery for retesting will be negotiated with CM.
2. BECx MIL issue verifications will not be scheduled until Contractor responsible for issue correction updates issue for “Recheck” in Cx Database. If any BECx MIL issue marked for “Recheck” in the Cx Database is found to remain uncorrected by BECxA on recheck, the CM will pay BECxA labor and expenses for any issue reverifications at a rate of $5000 per man-day. BECxA will provide a man-hour estimate for any required issue reverifications. CM must pay Cx MIL issue reverification costs to BECxA in advance for BECxA to schedule Cx MIL issue reverification site visits.
3. FPTs will not be scheduled without signed Certificate of Readiness from CM and Contractors confirming that the work is “complete” and ready for testing. If any portion of the system fails to function as designed, the CM will pay BECxA labor and expenses for any required FPT retesting at a rate of $5000 per man-day. BECxA will provide a man-hour estimate for any required FPT retesting. CM must pay retesting costs to BECxA in advance for BECxA to schedule FPT retesting site visits.

D. Costs for BETA and BECxA Functional Performance Additional Testing:

1. Cost for Contractor to correct and retest any PFC or FPT deficiency item, if they are responsible for deficiency, will be theirs. If Contractor is not responsible, cost recovery for retesting will be negotiated with Contractor.
2. Additional Services for BECxA to complete any Functional Performance Testing during Owner move-in or after Owner occupancy (regardless of whether the testing was attempted prior to that point or not) will be paid for by the CM at a cost of $5000 per man-day. CM must pay testing costs to BECxA in advance for BECxA to schedule testing site visits during Owner move-in or after Owner occupancy.

E. Approval:

1. BECxA notes each test result on test form. BECxA recommends acceptance of each test to Owner. A/E and Owner provide formal approval of FPT. The Owner gives final approval, providing a signature to CM and Contractor.

3.9 TRAINING OF OWNER PERSONNEL

A. CM/Contractors/Vendors will provide complete training in operation and maintenance of systems if required in the Contract Documents.

B. CM and Contractors will be responsible for

1. Developing Owner Training Program.

2. Scheduling of Owner Training with Owner and Contractors. Owner Training Schedule will be provided to BECxA to allow BECxA to schedule site visits to attend a sampling of the training sessions.
3. Execution of Owner Training.
4. Documentation of completed Owner Training.

C. BECxA will monitor the completion of the Owner Training as follows:

1. BECxA will review Owner Training Program submitted by CM.
2. BECxA will attending a sampling of the Owner Training sessions and review the final executed Owner Training Program documentation.

D. General sequencing of the development of the Owner Training Program and completion of the Owner training is as follows:

1. BECxA will review the Owner training requirements (including preparation of Owner Training Program) with the CM/Contractors at the Commissioning Kick-Off meeting.
2. CM will prepare an outline of the Owner Training Program within 60 days of completion of submittal process (i.e., all equipment/systems approved by A/E). Submit Owner Training Program outline to BECT for review.
3. Schedule for Owner Training sessions will be reviewed and updated as required throughout the project construction by BECT at contractor progress meetings (attended by BECxA during periodic site visits). CM will submit final Owner Training Schedule to BECT 30 days prior to start of training exercises to allow CxA sufficient time to schedule site visit trips to witness a sampling of the Owner training exercises.
4. Contractors/vendors will execute training exercises per Training Program.
5. CM will submit a copy of the final executed Owner Training Program and Owner Training Manuals including all training documentation (sign-in sheets, handouts, training DVDs, etc.) to BECxA on completion of Owner Training exercises (BECxA copy is in addition to any copies required by other specifications for Owner use).

3.10 END OF WARRANTY PERIOD MEETING

A. CT will participate in an End of Warranty Period Meeting with the Owner and O&M staff to review the facility and its performance. The End of Warranty Period meeting will be held 10-11 months into the one-year warranty period.

B. The End of Warranty Review meeting shall address:

1. Any outstanding construction deficiencies.
2. Any deficiencies that were noted by the operations staff during the warranty period.
3. Any problems noted by the operations staff related to operating and maintaining the facility as originally intended.

C. CxA will provide a written report for the Warranty Period Meeting. Report will document the process for resolution of all outstanding issues.

1. Outstanding issues noted during the Warranty Period Meeting will be assigned by the CM to the appropriate Contractor for correction.
2. CM/Contractor will correct the issue and notify the Owner and CxA of correction.

END OF SECTION 019115

SECTION 019117 - BUILDING ENCLOSURE FUNCTIONAL PERFORMANCE TESTING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. This section includes functional performance testing requirements for the Building Enclosure systems that will be performed by the building enclosure testing agency as part of the building enclosure commissioning process.

1.2 RELATED DOCUMENTS

A. The work under this section is subject to requirements of the Contract Documents, including the Owner's General Conditions and articles of the Construction Manager's General Conditions.

B. Specific building enclosure testing requirements are given in this specification. The following specification sections are related to the testing work specified in this section and may include additional testing requirements beyond those included in this specification:

1. Integrated Exterior Mockups: Refer to 014339
2. Building Systems Commissioning: Refer to 019113
3. Building Enclosure Commissioning: Refer to 019115
4. Basic Concrete Requirements: Refer to Division 03
5. Basic Masonry Requirements: Refer to Division 04
6. Basic Waterproofing, Roofing, Cladding, Air Barrier, Insulation Requirements: Refer to Division 07
7. Basic Fenestration Systems Requirements: Refer to Division 08

PART 2 - PRODUCTS

2.1 TESTING AGENCY

A. The Building Enclosure Testing Agency (BETA) will be the same entity as the building enclosure commissioning agent (BECxA) for this project and will perform the testing defined in this specification.

B. The building enclosure Functional Performance Testing (FPT) included within this specification is performed by the BETA under the direction of the Owner and BECxA. Testing outside of this specification is not the responsibility of the BETA and is to be performed by others as required in the Contract Documents.

C. The BETA shall be responsible for the applicable specified testing outlined herein. The Construction Manager is responsible for any costs associated with retesting and additional testing, including costs related to observation and documentation of retesting and additional testing by the BECxA.

2.2 TEST ACCOMMODATIONS

A. Construction Manager shall provide the following to the BETA to accommodate testing:

1. Access to the interior and exterior sides of the enclosure assemblies, including equipment and operators as needed (i.e., lifts, swing stages, fall protection systems, and/or scaffolding with trained operators to access the interior and exterior).
2. Water sources with standard garden hose connection within 150 feet of each test location with uninterrupted flow at a minimum pressure of 35 psi at the test specimen.
3. Uninterrupted power sources with 120-volt, two minimum 20 amp receptacles within 200 feet of the interior of each test location.
4. Free and clear access to observe the interior and exterior of test specimens, including concealed interior wall cavities. Interior finishes should not be installed around the test locations.

2.3 TEST REPORTS

A. Test reports will be provided by the BETA after each mock-up and field functional performance test.

B. Reports will include a description of the test method(s) and protocol used as well as all relevant testing parameters and pass/fail criteria. Any deviations from the referenced published testing standards or project documents shall be clearly identified and justification provided by the BETA.

C. Reports will identify specific testing locations and specimens and include photographs of the test specimens before, during, and after testing.

D. Reports will include testing results, including any relevant descriptions and photographs of testing failures. Any diagnostic tests performed in response to failures should also be documented in test reports.

PART 3 - EXECUTION

3.1 MOCK-UP TESTS

A. Mock-ups should be constructed, tested, and accepted prior to commencement of installation of building enclosure systems, assemblies, and components. Refer to project-specific mock-up requirements in Project specification **014339 INTEGRATED EXTERIOR MOCKUPS** and architectural drawings provided by the Architect/Engineer (A/E) detailing mock-up sizes and materials. Mock-ups are anticipated to be an on-site, in-situ mock-up. Components and conditions for inclusion in the mock-up include mortar, accessories, structural backup, wall flashings, windows, curtainwall, and precast as required to show complete wall system. Testing is performed on the installed fenestration systems, air barrier, and any terminations or penetrations through primary air and moisture control components, such as cladding girt fasteners and anchors.

B. Refer to project specifications for mock-up submittal/shop drawing requirements including requirements for project-specific transition details indicating how fenestration systems, air barrier, and claddings interface with adjacent systems.

C. Mockup testing to be performed in one round in the following order at locations directed by Architect.

1. Nozzle Water Penetration Test

   a. Test according to AAMA 501.2-15 - Quality Assurance and Diagnostic Water Leakage Field Check of Installed Storefronts, Curtain Walls and Sloped Glazing Systems.
   b. Test two (2) locations of mockup window systems with no evidence of water penetration.

2. Static Quantitative Air Infiltration Test

   a. Test according to ASTM E783-02(2018) - Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors.

      1) Test two (2) locations of mock-up window systems at 1.5 times the performance rating of the lab tested fenestration product, but not more than 0.09 cfm/sq. ft. at a static-air-pressure differential of **6.24** lbf/sq. ft.

   b. Test methods described in ASTM E1186-22 - Standard Practices for Air Leakage Site Detection in Building Envelopes and Air Barrier Systems may be utilized as further diagnostic testing to assist in identifying and prioritizing leak sources.

3. Static Uniform Water Penetration Test

   a. Test according to ASTM E1105-15 - Standard Test Method for Field Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors, and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference, Procedure A.

      1) Field testing conducted at two-thirds of the laboratory water penetration resistance performance criteria of the installed fenestration system, but not less than 6.24 lbf/sq. ft.
      2) Test specimens must include perimeter transitions and interfaces with adjacent construction with no evidence of water penetration.

D. The mock-up test performance criteria of “no evidence of water penetration” is defined as follows:

1. Water is contained and drained to the exterior
2. There is no wetting of interior surfaces visible to the building occupants
3. There is no wetting, staining, or other damage or potential damage to completed building equipment, materials, or finishes

E. The coordination and completion of the mock-up construction is the responsibility of the Construction Manager. The CM shall permit observations of the mock-up by the Building Enclosure Commissioning Agent (BECxA) and any member of the Building Enclosure Commissioning Team throughout construction and testing as required.

F. The CM shall notify the BECxA/BETA at least two weeks in advance of desired testing date.

G. In the event of excessive air or observed water leakage through the test sample either during pre-testing or final testing; additional diagnostic and isolation testing should be conducted to determine the cause of failure.

H. Following failed mock-up testing, CM to provide a plan of repairs to be performed to the BECT for review. A/E shall approve plan of repairs prior to implementation and retesting. All repairs performed to facilitate successful testing must be approved by the A/E and performed comprehensively throughout project.

I. Retesting shall be conducted by the BETA. All costs associated with the repair and retesting shall be the responsibility of the contractor, including costs related to performance, observation, and documentation of retesting and additional testing by the BETA and BECxA.

3.2 FIELD TEST REQUIREMENTS

A. Field tests will focus on interfaces and transitions of building enclosure systems, materials, and assemblies. Testing shall be performed prior to the installation of interior insulation, gypsum wall board, interior supplemental sealant joints, and finishes. Specific test locations/specimens will be further developed and identified in the Building Enclosure Commissioning Plan. Specific test locations and conditions will be selected by the A/E and BECxA to include a representative sample of the project. Construction phase field functional performance testing to be performed with general locations/conditions identified as follows:

1. Nozzle Water Penetration Test

   a. Test according to AAMA 501.2-15 - Quality Assurance and Diagnostic Water Leakage Field Check of Installed Storefronts, Curtain Walls and Sloped Glazing Systems.

      1) Test three (3) locations of glazed aluminum curtain walls prior to ten percent (10%), thirty-five percent (35%), and seventy percent (70%) completion of the curtain wall system completion with no evidence of water penetration.
      2) Test three (3) locations of manufactured roof expansion joints with no evidence of water penetration.
      3) Test three (3) locations of preformed joint sealants with no evidence of water penetration.
      4) Test three (3) locations of exterior expansion joint cover assemblies with no evidence of water penetration.

2. Static Quantitative Air Infiltration Test

   a. Test according to ASTM E783-02(2018) - Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors.

      1) Test three (3) locations of glazed aluminum curtain walls prior to ten percent (10%), thirty-five percent (35%), and seventy percent (70%) completion of the curtain wall system completion.
      2) Test to an allowable air leakage rate of 0.09 cfm/sq. ft. (0.45 L/s per sq. m) at a static-air-pressure differential of 6.24 lbf/sq. ft. (75 Pa) per Section 084413 2.1 I.4 and **3.8** C.2.

3. Static Water Penetration Test

a. Test according to ASTM E1105-15 - Standard Test Method for Field Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors, and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference, Procedure A. Test specimens must include perimeter transitions and interfaces with adjacent construction.

1) Test three (3) locations of glazed aluminum curtain walls prior to ten percent (10%), thirty-five percent (35%), and seventy percent (70%) completion of the curtain wall system completion.
2) Field testing conducted at 10 lb/sq. ft., two-thirds of the 15 lb/sq. ft. laboratory water penetration resistance performance criteria of the installed curtain wall system per Section 084413 2.1 F.1 and **3.8** C.3 with no evidence of water penetration.

B. Field functional performance testing shall be conducted to project performance requirements as set forth in the Construction Documents and below:

Performance Test	Test Specimen	Performance Criteria
AAMA 501.2 Water Nozzle Penetration	Glazed aluminum curtain walls, manufactured roof expansion joints, preformed joint sealants, exterior expansion joint covers	No evidence of water penetration
ASTM E783 Air infiltration	Glazed aluminum curtain walls	< 0.09 cfm/sf at 6.24 psf
ASTM E1105 Uniform Static Water Penetration	Glazed aluminum curtain walls	No evidence of water penetration at 10 psf

C. The field test performance criteria of “no evidence of water penetration” is defined as follows:

1. Water is contained and drained to the exterior
2. There is no wetting of interior surfaces visible to the building occupants
3. There is no wetting, staining, or other damage or potential damage to completed building equipment, materials, or finishes

3.3 TEST FAILURES

A. All failed testing areas demonstrating deficient conditions or performance are to be repaired and retested at CM’s expense. Retesting shall be conducted by the BETA. All costs associated with the repair and retesting including all access, equipment, labor, and materials, as well as costs incurred by the BETA and BECxA site visits shall be the responsibility of the contractor.

B. In addition to re-testing, failed test will result in testing of at least one (1) additional specimen at a location selected by the BECxA at the cost of the contractor. Testing will be concluded only when satisfactory results are achieved. All failed test specimens shall be repaired and retested until passing results are achieved.

C. Efforts will be made to expedite testing and minimize unnecessary delays, while not compromising integrity of tests. BECxA shall not overlook deficient work or loosen acceptance criteria to satisfy scheduling or cost issues unless directed to do so directly by the Owner.

D. Where testing indicates that performance requirements are not met, the contractor shall provide a repair plan for review by the BECT. Once the plan of repairs is agreed upon, Subcontractor corrects deficiency and provides written response and/or documentation on the MIL that the deficiency has been addressed and verifies that material or assembly is ready to be retested. CM informs BECT of retesting schedule and reschedules retesting with BECxA and BETA.

Testing and resolution process is repeated until satisfactory performance is achieved. CM shall maintain free and clear access to the re-test and additional test areas, including exclusion and removal of interior finishes, until satisfactory performance is achieved.

END OF SECTION 019117

SECTION 014339 – INTEGRATED EXTERIOR MOCKUPS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Integrated exterior mockups.

B. Related Requirements:

1. Section 019115 "Building Enclosure Commissioning" and Section 019117 “Building Enclosure Functional Performance Testing” for testing building enclosure systems and assemblies as part of the exterior enclosure commissioning process.

1.2 DEFINITIONS

A. Integrated Exterior Mockups: Mockups of the exterior envelope constructed on-site as freestanding temporary built elements, consisting of multiple products, assemblies, and subassemblies.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Meet with Owner, Construction Manager, Architect, testing and inspecting agency representative, manufacturer’s representatives, fabricators, installers of major systems and other interested parties whose Work is included in integrated exterior mockups.
2. Review locations and extent of mockups.
3. Review testing procedures to be performed on mockups.
4. Review and finalize schedule for mockups, and verify availability of materials, personnel, equipment, and facilities needed to complete mockups and testing and maintain schedule for the Work.

1.4 ACTION SUBMITTALS

A. Shop Drawings: For integrated exterior mockups.

1. Include plans, elevations, sections, and support details.
2. Indicate manufacturer and model number of individual components, subassemblies, and assemblies.
3. Include site location drawing.
4. Revise and resubmit Shop Drawings to reflect approved modifications in details and component interfaces resulting from changes made during testing procedures.

B. Delegated Design Submittal: For temporary structural supports for mockups not attached to building structure, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Preconstruction Test Reports: For integrated exterior mockups.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified in accordance with ASTM E699 for testing indicated and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025 and acceptable to Owner and Architect.

B. Build mockups to do the following:

1. Verify selections made under Sample submittals.
2. Demonstrate aesthetic effects.
3. Demonstrate the qualities of products and workmanship.
4. Demonstrate acceptable coordination between components and systems.
5. Perform preconstruction testing, such as window air- and water-leakage testing.

C. Fabrication: Before fabricating or installing portions of the Work requiring mockups, build mockups for each form of construction and finish required. Use materials and installation methods as required for the Work.

1. Size: As indicated on approved Mockup Shop Drawings, and as follows:

    a. Width: Mockup shall be one structural bay in width (approximately 30 feet)
    b. Height: Minimum truncated height required to include all elements of full-height wall (approximately 16 feet).

2. Build mockups in location indicated or, if not indicated, as directed by Architect or Construction Manager.
3. Employ supervisory personnel who will oversee mockup construction. Employ workers who will be employed to perform same tasks during the construction at Project.
4. Demonstrate the proposed range of aesthetic effects and workmanship.
5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
6. Demolish and remove mockups when directed unless otherwise indicated.

D. Notifications:

1. Notify Architect and Construction Manager seven days in advance of the dates and times when mockups will be constructed.
2. Notify Architect and Construction Manager 14 days in advance of the dates and times when mockups will be tested.
3. Allow seven days for initial review and each re-review of each mockup.

E. Approval: Obtain Architect's and Construction Manager's approval of mockups before starting fabrication or construction of corresponding Work.

1. Unless otherwise indicated, approved mockups establish the standard by which the Work will be judged.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 COORDINATION

A. Coordinate schedule for construction of mockups, so construction, testing, and review of mockups do not impact Project schedule.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design support structure for free-standing mockups.

B. Structural Performance:

1. Wind Loads: As indicated on Drawings.

C. Mockup Testing Performance Requirements: Perform tests using design pressures and performance criteria indicated for assemblies and products that are specified in other Sections and incorporated into integrated exterior mockups.

2.2 INTEGRATED EXTERIOR MOCKUPS

A. Construct integrated exterior mockups according to approved mockup Shop Drawings. Construct mockups to demonstrate constructability, coordination of trades, and sequencing of Work; and to ensure materials, components, subassemblies, assemblies, and interfaces integrate into a system complying with indicated performance and aesthetic requirements.

B. Design and construct foundation and superstructure to support free-standing integrated exterior mockups.

C. Build integrated exterior mockups using installers and construction methods that will be used in completed construction.

D. Use specified products that have been approved by Architect. Coordinate installation of materials and products specified in individual Specification Sections that include Work included in integrated exterior mockups.

E. The Work of integrated exterior mockups includes, but is not limited to, the following:

1. Cast-In-Place Concrete Exterior Backup Wall System.
2. Masonry veneer.
3. Mortar joints, color and tooling.
4. Control joints.
5. Stone cladding.
6. Typical Exterior Backup Wall System including cold-formed metal framing and sheathing.
7. Composite metal hybrid (CMH) continuous insulation sub-framing support systems.
8. Self-adhering sheet waterproofing.
9. Air barriers.
10. Thermal insulation.
11. Cavity drainage: Through-wall flashing and weeps.
12. Flashing and sheet metal trim.
13. Joint sealants.
14. Metal composite material wall panels.
15. Parapet fascia, trim.
16. Wood veneer laminate wall panels.
17. Aluminum-framed entrances and storefront.
18. Glazed curtain walls.
19. Glazing.

F. Photographic Documentation: Document construction of integrated exterior mockups with photographs. Provide photographs showing details of interface of different materials and assemblies.

1. Document testing procedures, including water leakage and other deficiencies. Photograph modifications to component interfaces intended to correct deficiencies.

G. Provide and document modifications to construction details and interfaces between components and systems required to properly sequence the Work, or to pass performance testing requirements. Obtain Architect's approval for modifications.

H. Retain approved mockups constructed in place. Incorporate fully into the Work.

PART 3 - EXECUTION

3.1 TESTING OF INTEGRATED EXTERIOR MOCKUPS

A. Integrated Exterior Mockup Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

1. Testing and inspecting agency will interpret tests and state in each report whether tested Work complies with or deviates from requirements.

B. Integrated Exterior Mockup Testing Services: Perform the following tests in the following order:

1. Water-Spray Test: Before installation of interior finishes has begun, test areas designated by Architect in accordance with AAMA 501.2 for evidence of water penetration.

a. Perform a minimum of two tests in areas as directed by Architect.

2. Air Leakage: Test in accordance with ASTM E783 at 1.5 times the rate specified in "Mockup Testing Performance Requirements" Paragraph in "Performance Requirements"

Article, but not more than 0.09 cfm/sq. ft. (0.45 L/s per sq. m) at a static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).

a. Perform a minimum of two tests in areas as directed by Architect.

3. Water Penetration: Test in accordance with ASTM E1105 at a minimum uniform and cyclic static-air-pressure differential of 0.67 times the static-air-pressure differential specified for laboratory testing in "Mockup Testing Performance Requirements" Paragraph in "Performance Requirements" Article, but not less than 6.24 lbf/sq. ft. (300 Pa), and verify no evidence of water penetration.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and installations, including connections, and also to observe testing for systems and assemblies required in other Specification Sections.

D. Integrated exterior mockup will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

END OF SECTION 014339

SECTION 017419 - CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes administrative and procedural requirements for the following:

1. Recycling nonhazardous construction waste.
2. Disposing of nonhazardous construction waste.

B. Related Requirements:

1. Section 042000 "Unit Masonry" for disposal requirements for masonry waste.

1.3 DEFINITIONS

A. Construction Waste: Building, structure, and site improvement materials and other solid waste resulting from construction, remodeling, renovation, or repair operations. Construction waste includes packaging.

B. Demolition Waste: Building, structure, and site improvement materials resulting from demolition operations.

C. Disposal: Removal of demolition or construction waste and subsequent salvage, sale, recycling, or deposit in landfill, incinerator acceptable to authorities having jurisdiction, or designated spoil areas on Owner’s property.

D. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.

E. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.

F. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.

1.4 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition and construction waste becomes property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.5 ACTION SUBMITTALS

A. Waste Management Plan: Submit plan within 30 days of date established for the Notice to Proceed.

1.6 INFORMATIONAL SUBMITTALS

A. Waste Reduction Progress Reports: Concurrent with each Application for Payment, submit report. Use Construction Waste Management Tracking Worksheet at the end of this section.

B. Waste Reduction Calculations: Before request for Substantial Completion, submit calculated end-of-Project rates for salvage, recycling, and disposal as a percentage of total waste generated by the Work.

C. Records of Donations: Indicate receipt and acceptance of salvageable waste donated to individuals and organizations. Indicate whether organization is tax exempt.

D. Records of Sales: Indicate receipt and acceptance of salvageable waste sold to individuals and organizations. Indicate whether organization is tax exempt.

E. Recycling and Processing Facility Records: Indicate receipt and acceptance of recyclable waste by recycling and processing facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.

F. Landfill and Incinerator Disposal Records: Indicate receipt and acceptance of waste by landfills and incinerator facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.

G. LEED Submittal: Submit documentation to USGBC, signed by Contractor, tabulating total waste material, quantities diverted and means by which it is diverted, and statement that requirements for the credit have been met. Respond to questions and requests from USGBC regarding construction waste management and disposal until the USGBC has made its determination on the Project's LEED certification application. Document correspondence with USGBC as informational submittals.

H. Qualification Data: For waste management coordinator.

I. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

1.7 QUALITY ASSURANCE

A. Waste Management Coordinator Qualifications: Experienced firm, or individual employed and assigned by General Contractor, with a record of successful waste management coordination of projects with similar requirements. Superintendent may serve as Waste Management Coordinator.

1. Firm employs a LEED-Accredited Professional, certified by the USGBC, as waste management coordinator.
2. Waste management coordinator may also serve as LEED coordinator.

B. Regulatory Requirements: Comply with transportation and disposal regulations of authorities having jurisdiction.

C. Waste Management Conference(s): Conduct conference(s) at Project site to comply with requirements in Section 013100 "Project Management and Coordination." Review methods and procedures related to waste management including, but not limited to, the following:

1. Review and discuss waste management plan including responsibilities of each contractor and waste management coordinator.
2. Review requirements for documenting quantities of each type of waste and its disposition.
3. Review and finalize procedures for materials separation and verify availability of containers and bins needed to avoid delays.
4. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
5. Review waste management requirements for each trade.

1.8 WASTE MANAGEMENT PLAN

A. General: Develop a waste management plan according to requirements in this Section. Plan shall consist of waste identification, waste reduction work plan, and cost/revenue analysis. Indicate quantities by weight or volume, but use same units of measure throughout waste management plan.

B. Waste Identification: Indicate anticipated types and quantities of demolition and construction waste generated by the Work. Include estimated quantities and assumptions for estimates.

C. Waste Reduction Work Plan: List each type of waste and whether it will be salvaged, recycled, or disposed of in landfill or incinerator. Include points of waste generation, total quantity of each type of waste, quantity for each means of recovery, and handling and transportation procedures.

1. Recycled Materials: Include list of local receivers and processors and type of recycled materials each will accept. Include names, addresses, and telephone numbers.
2. Disposed Materials: Indicate how and where materials will be disposed of. Include name, address, and telephone number of each landfill and incinerator facility.
3. Handling and Transportation Procedures: Include method that will be used for separating recyclable waste including sizes of containers, container labeling, and designated location where materials separation will be performed.

D. Cost/Revenue Analysis: Indicate total cost of waste disposal as if there were no waste management plan and net additional cost or net savings resulting from implementing waste management plan. Include the following:

1. Total quantity of waste.
2. Estimated cost of disposal (cost per unit). Include transportation and tipping fees and cost of collection containers and handling for each type of waste.
3. Total cost of disposal (with no waste management).
4. Revenue from salvaged materials.
5. Revenue from recycled materials.
6. Savings in transportation and tipping fees by donating materials.
7. Savings in transportation and tipping fees that are avoided.
8. Handling and transportation costs. Include cost of collection containers for each type of waste.
9. Net additional cost or net savings from waste management plan.

PART 2 - PRODUCTS (Not Used)

2.1 PERFORMANCE REQUIREMENTS

A. General: Achieve end-of-Project rates for salvage/recycling of 75 percent by weight of total nonhazardous solid waste generated by the Work. Practice efficient waste management in the use of materials in the course of the Work. Use all reasonable means to divert construction and demolition waste from landfills and incinerators. Facilitate recycling and salvage of materials.

PART 3 - EXECUTION

3.1 PLAN IMPLEMENTATION

A. General: Implement approved waste management plan. Provide handling, containers, storage, signage, transportation, and other items as required to implement waste management plan during the entire duration of the Contract.

1. Comply with operation, termination, and removal requirements in Section 015000 "Temporary Facilities and Controls."

B. Waste Management Coordinator: Engage a waste management coordinator to be responsible for implementing, monitoring, and reporting status of waste management work plan. Coordinator shall be present at Project site full time for duration of Project.

C. Training: Train workers, subcontractors, and suppliers on proper waste management procedures, as appropriate for the Work.

1. Distribute waste management plan to everyone concerned within three days of submittal return.
2. Distribute waste management plan to entities when they first begin work on-site. Review plan procedures and locations established for salvage, recycling, and disposal.

D. Site Access and Temporary Controls: Conduct waste management operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Designate and label specific areas on Project site necessary for separating materials that are to be salvaged and recycled.
2. Comply with Section 015000 "Temporary Facilities and Controls" for controlling dust and dirt, environmental protection, and noise control.

3.2 RECYCLING DEMOLITION AND CONSTRUCTION WASTE, GENERAL

A. General: Recycle paper and beverage containers used by on-site workers.

B. Preparation of Waste: Prepare and maintain recyclable waste materials according to recycling or reuse facility requirements. Maintain materials free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process.

C. Procedures: Separate recyclable waste from other waste materials, trash, and debris. Separate recyclable waste by type at Project site to the maximum extent practical according to approved construction waste management plan.

1. Provide appropriately marked containers or bins for controlling recyclable waste until removed from Project site. Include list of acceptable and unacceptable materials at each container and bin.

    a. Inspect containers and bins for contamination and remove contaminated materials if found.

2. Stockpile processed materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
3. Stockpile materials away from construction area. Do not store within drip line of remaining trees.
4. Store components off the ground and protect from the weather.
5. Remove recyclable waste from Owner's property and transport to recycling receiver or processor as often as required to prevent overfilling bins.

3.3 RECYCLING CONSTRUCTION WASTE

A. Packaging:

1. Cardboard and Boxes: Break down packaging into flat sheets. Bundle and store in a dry location.
2. Polystyrene Packaging: Separate and bag materials.
3. Pallets: As much as possible, require deliveries using pallets to remove pallets from Project site. For pallets that remain on-site, break down pallets into component wood pieces and comply with requirements for recycling wood.
4. Crates: Break down crates into component wood pieces and comply with requirements for recycling wood.

B. Wood Materials:

1. Clean Cut-Offs of Lumber: Grind or chip into small pieces.

2. Clean Sawdust: Bag sawdust that does not contain painted or treated wood.

C. Gypsum Board: Stack large clean pieces on wood pallets or in container and store in a dry location.

1. Clean Gypsum Board: Grind scraps of clean gypsum board using small mobile chipper or hammer mill. Screen out paper after grinding.

D. Paint: Seal containers and store by type.

3.4 DISPOSAL OF WASTE

A. General: Except for items or materials to be salvaged or recycled, remove waste materials from Project site and legally dispose of them in a landfill or incinerator acceptable to authorities having jurisdiction.

1. Except as otherwise specified, do not allow waste materials that are to be disposed of accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.

B. Burning: Do not burn waste materials.

3.5 ATTACHMENTS

A. Construction Waste Management Tracking Worksheet.

END OF SECTION 017419

Calculator

017419A Construction Waste Management Tracking

Material Description	Material Type	Material Stream	Total Waste (cubic yards)	Commingled Waste: Average Percentage of ADC Produced by the Sorting Facility (%)	Diverted Waste (cubic yards)	Percent Diverted (%)	Waste to Landfill (cubic yards)
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
						0.00%	0.00
Total construction waste (cubic yards)							0.00
Total diverted construction waste (cubic yards)							0.00
For D+C projects	Total number of material streams						0
For ND projects	Total diverted asphalt, brick, and concrete (ABC) waste (cubic yards)						0.00

SECTION 018113.20 - SUSTAINABLE DESIGN REQUIREMENTS - LEED v4.1 BD+C: NEW CONSTRUCTION AND MAJOR RENOVATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes general requirements and procedures for compliance with USGBC's LEED prerequisites and credits needed for Project to obtain LEED Silver certification based on USGBC's "LEED v4.1 for Building Design and Construction" (hereafter, LEED v4.1 BD+C).

1. Specific requirements for LEED are also included in other Sections.
2. Other LEED prerequisites and credits needed to obtain LEED certification depend on product selections and may not be specifically identified as LEED requirements. Compliance with requirements needed to obtain LEED prerequisites and credits may be used as one criterion to evaluate substitution requests and comparable product requests.
3. A copy of LEED Project checklist is attached at end of this Section for information only.

    a. Some LEED prerequisites and credits needed to obtain indicated LEED certification depend on Architect's design and other aspects of Project that are not part of the Work of the Contract.

1.2 DEFINITIONS

A. ANSI/BIFMA e3 Furniture Sustainability Standard: Standard addressing environmental and social impacts throughout the furniture supply chain.

B. BUG Rating Method: The BUG rating of a fixture determines how much light trespass is produced by considering backlight (B), uplight (U), and glare (G).

C. Chain-of-Custody Certificates: Certificates signed by manufacturers certifying that wood used to make products was obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001. Certificates to include evidence that manufacturer is certified for chain of custody by an FSC-accredited certification body.

D. Cradle to Cradle: Product certification assessing material health, material reutilization, renewable energy and carbon management, water stewardship, and social fairness.

E. Declare: A product transparency disclosure that identifies material source, composition, and end-of-life procedures.

F. Environmental Product Declaration (EPD): A transparency reporting tool communicating what a product is made of and the environmental impact.

G. Health Product Declaration (HPD): Disclosure of products contents and associated health information.

H. Recycled Content: The recycled content value of a material assembly to be determined by weight. The recycled fraction of the assembly is then multiplied by the cost of assembly to determine the recycled content value.

1. "Postconsumer" material is defined as waste material generated by households or by commercial, industrial, and institutional facilities in their role as end users of the product, which can no longer be used for its intended purpose.
2. "Preconsumer" material is defined as material diverted from the waste stream during the manufacturing process. Reutilization of materials (such as rework, regrind, or scrap, generated in a process and capable of being reclaimed within the same process that generated it) is excluded.
3. ded.

I. Regional Materials: Materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site. If only a fraction of a product or material is extracted/harvested/recovered and manufactured locally, then only that percentage (by weight) contributes to the regional value.

J. WaterSense Label: The WaterSense label from the EPA specifies water efficiency and performance.

K. Whole-Building Life-Cycle Assessment: The Life Cycle Assessment (LCA) is a methodology that evaluates the carbon and other environmental impacts of building materials over the projected lifespan of the building.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site. Review sustainability goals, municipal and state sustainability requirements, LEED objectives, and action plans for meeting requirements.

1.4 ADMINISTRATIVE REQUIREMENTS

A. Respond to questions and requests from Architect about USGBC's LEED prerequisites and credits that are Contractor's responsibility, that depend on product selection or product qualities, or that depend on Contractor's procedures until USGBC has made its determination on Project's LEED certification application.

1.5 ACTION SUBMITTALS

A. General: Submit sustainable design submittals required by other Sections.

B. Sustainable design submittals are in addition to other submittals.

1. If submitted item is identical to that submitted to comply with other requirements, include additional copy with other submittal as a record of compliance with indicated LEED requirements instead of separate sustainable design submittal. Mark additional copy "Sustainable design submittal."

C. Sustainable Design Documentation Submittals:

1. Plumbing submittal packages.
2. Mechanical submittal packages.
3. EPDs complying with LEED requirements.

4. Documentation for products that comply with LEED requirements for multi-attribute optimization.
5. Sustainability reports for products that comply with LEED requirements for sourcing of raw materials.
6. Material ingredient reports for products that comply with LEED requirements for material ingredient reporting.
7. Documentation for products that comply with LEED requirements for material ingredient optimization.
8. Documentation complying with Section 017419 "Construction Waste Management and Disposal."
9. Product data for adhesives and sealants used inside the weatherproofing system, indicating VOC content and laboratory test reports showing compliance with requirements for low-emitting materials.
10. Product data for paints and coatings used inside the weatherproofing system, indicating VOC content and laboratory test reports showing compliance with requirements for low-emitting materials.
11. Laboratory test reports for flooring, indicating compliance with requirements for low-emitting materials.
12. Laboratory test reports for wall materials, indicating compliance with requirements for low-emitting materials.
13. Laboratory test reports for ceilings, indicating compliance with requirements for low-emitting materials.
14. Laboratory test reports for insulation, indicating compliance with requirements for low-emitting materials.
15. Laboratory test reports for furniture, indicating compliance with requirements for low-emitting materials.
16. Laboratory test reports for products containing composite wood or agrifiber products or wood glues, indicating compliance with requirements for low-emitting materials.
17. Construction Indoor Air Quality (IAQ) Management:

    a. Construction IAQ management plan.
    b. Product data for temporary filtration media.
    c. Product data for filtration media used during occupancy.
    d. Construction Documentation: Six photographs at three different times during construction period, along with a brief description of SMACNA approach employed, documenting implementation of IAQ management measures, including protection of ducts and on-site stored or installed absorptive materials.

18. IAQ Assessment:

    a. Signed statement describing the building air flush-out procedures, including dates when flush-out was begun and completed and statement that filtration media was replaced after flush-out.
    b. Product data for filtration media used during flush-out and occupancy.
    c. Report from testing and inspecting agency indicating results of IAQ testing and documentation showing compliance with IAQ testing procedures and requirements.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For LEED coordinator.

B. Project Materials Cost Data: Provide statement indicating total cost for materials used for Project. Costs exclude labor, overhead, and profit. Include breakout of costs for the following categories of items:

1. Plumbing.
2. Mechanical.
3. Electrical.
4. Specialty items, such as elevators and equipment.

C. Sustainable Design Action Plans: Provide preliminary submittals within 30 days of the Notice to Proceed, indicating how the following requirements will be met:

1. List of proposed products with EPDs.
2. List of proposed products complying with requirements for multi-attribute optimization.
3. List of proposed products complying with requirements for sourcing of raw materials.
4. List of proposed products complying with requirements for material ingredient reporting.
5. List of proposed products complying with requirements for material ingredient optimization.
6. Waste management plan complying with Section 017419 "Construction Waste Management and Disposal."
7. Construction IAQ management plan.
8. IAQ assessment plan.

D. Sustainable Design Progress Reports: Concurrent with each Application for Payment, submit reports comparing actual construction and purchasing activities with sustainable design action plans.

1.7 QUALITY ASSURANCE

A. LEED Coordinator: Engage an experienced LEED AP to coordinate LEED requirements. LEED coordinator may also serve as waste management coordinator.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide products and procedures necessary to obtain LEED credits indicated as Contractor's responsibility. Although other Sections may specify some requirements that contribute to these LEED credits, Contractor provides additional materials and procedures necessary to obtain LEED credits indicated.

B. At least 20 different products from at least five different manufacturers have EPDs that comply with LEED requirements. Product-specific Type III EPDs are valued as one and one-half of a product.

C. At least 10 percent, by cost, of permanently installed products for Project comply with LEED requirements for multi-attribute optimization.

D. At least 20 different products from at least five different manufacturers have publically released reports that comply with LEED requirements for sourcing of raw materials.

E. At least 20 different products from at least five different manufacturers comply with LEED requirements for material ingredient reporting.

F. At least 10 percent, by cost, of permanently installed products for Project comply with LEED requirements for material ingredient optimization.

G. Recycled Content: Building materials have recycled content such that postconsumer recycled content plus one-half of preconsumer recycled content for Project constitutes a minimum of 15 percent of cost of materials used for Project.

1. Cost of postconsumer recycled content plus one-half of preconsumer recycled content of an item to be determined by dividing weight of postconsumer recycled content plus one-half of preconsumer recycled content in the item by total weight of the item and multiplying by cost of the item.
2. Do not include plumbing, mechanical and electrical components, and specialty items, such as elevators and equipment, in the calculation.

2.2 LOW-EMITTING MATERIALS

A. Paints and Coatings: For field applications that are inside the weatherproofing system, 75 percent of paints and coatings meet the VOC emissions evaluation and 100 percent meet the VOC content evaluations.

B. Adhesives and Sealants: For field applications that are inside the weatherproofing system, 75 percent of adhesives and sealants meet the VOC emissions evaluation and 100 percent meet the VOC content evaluations.

C. Flooring: A minimum of 90 percent of flooring products meet the VOC emissions evaluation or inherently non-emitting sources criteria or salvaged and reused materials criteria. Subflooring is excluded.

D. Walls: A minimum of 75 percent of wall panel products meet the VOC emissions evaluation or inherently non-emitting sources criteria or salvaged and reused materials criteria. Wall panel products include wall paneling, wall coverings, wall tile, surface wall structures, cubicle/curtain/partition walls, trim, doors, frames, windows, and window treatments. Removable/interchangeable fabric panels, built-in cabinetry, and vertical structural elements are excluded.

E. Ceilings: A minimum of 90 percent of ceilings meet the VOC emissions evaluation or inherently non-emitting sources criteria or salvaged and reused materials criteria. Ceiling products include ceiling panels, ceiling tile, surface ceiling structures, suspended systems, and glazed skylights. Overhead structural elements are excluded.

F. Insulation: A minimum of 75 percent of insulation products meet the VOC emissions evaluation. Insulation products include all thermal and acoustic boards, batts, rolls, blankets, sound attenuation fire blankets, and foamed-in-place, loose-fill, blown, and sprayed insulation. HVAC duct and plumbing piping insulation are excluded.

G. Furniture: A minimum of 75 percent of furniture meets the furniture emissions evaluation or inherently non-emitting sources or salvaged and reused materials criteria. All standalone furniture is included.

H. Composite Wood: A minimum of 75 percent of all composite wood meet the formaldehyde emissions evaluation or salvaged and reused materials criteria. Composite wood materials include particleboard, MDF, hardwood veneer plywood, and structural composite wood.

PART 3 - EXECUTION

3.1 NONSMOKING BUILDING

A. Smoking is not permitted on the project site and all tobacco products are prohibited on University property.

3.2 CONSTRUCTION WASTE MANAGEMENT

A. Comply with Section 017419 "Construction Waste Management and Disposal."

3.3 CONSTRUCTION INDOOR AIR QUALITY (IAQ) MANAGEMENT

A. Comply with SMACNA's "SMACNA IAQ Guideline for Occupied Buildings under Construction."

1. If Owner authorizes use of permanent heating, cooling, and ventilating systems during construction period as specified in Section 015000 "Temporary Facilities and Controls," install MERV 8 filter media in accordance with ASHRAE 52.2 at each return-air inlet for the air-handling system used during construction.
2. Replace air filters immediately prior to occupancy with new filters specified in Section 234100 "Particulate Air Filtration."

3.4 INDOOR AIR QUALITY (IAQ) ASSESSMENT

A. Flush-Out:

1. After construction ends, prior to occupancy and with all interior finishes installed, perform a building flush-out by supplying a total volume of 14,000 cu. ft. (4 300 000 L) of outdoor air per sq. ft. (sq. m) of floor area while maintaining an internal temperature of at least 60 deg F (16 deg C) and a relative humidity no higher than 60 percent.
2. If occupancy is desired prior to flush-out completion, the space may be occupied following delivery of a minimum of 3500 cu. ft. (1 070 000 L) of outdoor air per sq. ft. (sq. m) of floor area to the space. Once a space is occupied, it is ventilated at a minimum rate of 0.30 cfm per sq. ft. (1.52 L/s per sq. m) of outside air or the design minimum outside-air rate prerequisite, whichever is greater. During each day of the flush-out period, ventilation begins a minimum of three hours prior to occupancy and continues during occupancy. These conditions are maintained until a total of 14,000 cu. ft./sq. ft. (4 300 000 L/sq. m) of outside air has been delivered to the space.

B. Air-Quality Testing: Owner will engage testing agency to perform the following:

1. Conduct baseline IAQ testing, after construction ends and prior to occupancy, using testing protocols consistent with the EPA's "Compendium of Methods for the Determination of Air Pollutants in Indoor Air," and as additionally detailed in USGBC's "LEED v4.1 Reference Guide for Building Design and Construction."

2. Demonstrate that contaminant maximum concentrations listed below are not exceeded:

    a. Carbon Monoxide: 9 ppm and no greater than 2 ppm above outdoor levels.
    b. Particulates (PM10): 50 mcg/cu. m.
    c. Particulates (PM2.5): 12 mcg/cu. m.
    d. Ozone: 0.07 ppm, in accordance with ASTM D5149.
    e. Formaldehyde: 20 mcg/cu. m.
    f. Acetaldehyde: 140 mcg/cu. m.
    g. Benzene: 3 mcg/cu. m.
    h. Hexane: 7000 mcg/cu. m.
    i. Naphthalene: 9 mcg/cu. m.
    j. Phenol: 200 mcg/cu. m.
    k. Styrene: 900 mcg/cu. m.
    l. Tetrachloroethylene: 35 mcg/cu. m.
    m. Toluene: 300 mcg/cu. m.
    n. Vinyl Acetate: 200 mcg/cu. m.
    o. Dichlorobenzene: 800 mcg/cu. m.
    p. Xylenes - Total: 700 mcg/cu. m.

3. For each sampling point where the maximum concentration limits are exceeded, take corrective action until requirements have been met.
4. Air-sample testing to be conducted as follows:

    a. All measurements to be conducted prior to occupancy but during normal occupied hours, and with building ventilation system starting at the normal daily start time and operated at the minimum outside-airflow rate for the occupied mode throughout the duration of the air testing.
    b. Building to have all interior finishes installed, including, but not limited to, millwork, doors, paint, carpet, and acoustic tiles. Nonfixed furnishings such as workstations and partitions are encouraged, but not required, to be in place for the testing.
    c. Number of sampling locations varies depending on the size of building and number of ventilation systems. For each portion of building served by a separate ventilation system, the number of sampling points to not be less than one per 5000 sq. ft. (465 sq. m). For large open spaces, one sampling point per 50,000 sq. ft. (4654 sq. m) may be used.
    d. Air samples to be collected between 3 and 6 ft. (0.9 and 1.8 m) from the floor to represent the breathing zone of occupants, and over a minimum four-hour period.

SIGNATURE OF AUTHORIZED REPRESENTATIVE: _____ **Date:** _____

NOTES / DEFINITIONS:

1. Furnish Costs include all expenses to deliver the material to the project site, including taxes, transport, fabrication and profit. Do not include site labor or installation.
2. Within 100 miles distance is defined as travel by air to the project site, not travel distance by road. http://www.distancefromto.net/
3. Environmental Product Declarations which conform to ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and have at least a cradle to gate scope. http://productguide.ulenvironment.com/QuickSearch.aspx
4. The end use product has a published, complete Health Product Declaration with full disclosure of known hazards in compliance with the Health Product Declaration open Standard.
5. Extended producer responsibility. Products purchased from a manufacturer (producer) that participates in an extended producer responsibility program or is directly responsible for extended producer responsibility. (e.g. Closed Loop or Take Back Program)
7. Wood products must be certified by the Forest Stewardship Council (FSC) and must be provide proof of vendor FSC Chain-of-Custody with this Product Data Submittal. http://info.fsc.org/certificate.php
8. Post-Consumer Recycled Content: Sourced from recovered Consumer Waste and used as a raw material (e.g. plastic bottles, newspaper, etc).
9. Pre-Consumer Recycled Content: Recovered Industrial Materials diverted from municipal solid waste for use in a different mfg. process, prior to use by a consumer. Note: "home scrap" from the original mfg. process that are reused / reprocessed do not qualify.
10. TVOC Emissions for Building products must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.1–2010
11. All paints and coatings wet-applied on site must meet applicable VOC limits of the California Air Resources Board (CARB) 2007, Suggested Control Measure (SCM) for Architectural Coatings, or the South Coast Air Quality Management District (SCAQMD) Rule 1113, effective June 3, 2011. All adhesives and sealants wet-applied on site must meet the applicable chemical content requirements of SCAQMD Rule 1168, July 1, 2005, Adhesive and Sealant Applications, as analyzed by the methods specified in Rule 1168.
12. Composite Wood Evaluation as defined by the California Air Resources Board (CARB), Airborne Toxic Measure to Reduce Formaldehyde Emissions from Composite Wood Products Regulation, must be documented to have low formaldehyde emissions that meet the CARB ATCM for formaldehyde requirements for ultra-low-emitting formaldehyde (ULEF) resins or no added formaldehyde (NAUF) resins.

SECTION 024119 - SELECTIVE DEMOLITION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Demolition and removal of selected portions of building or structure.
2. Demolition and removal of selected site elements.
3. Salvage of existing items to be reused or recycled.

1.3 DEFINITIONS

A. Remove: Detach items from existing construction and dispose of them off-site unless indicated to be salvaged or reinstalled.

B. Remove and Salvage: Detach items from existing construction, in a manner to prevent damage, and deliver to Owner.

C. Remove and Reinstall: Detach items from existing construction, in a manner to prevent damage, prepare for reuse, and reinstall where indicated.

D. Existing to Remain: Leave existing items that are not to be removed and that are not otherwise indicated to be salvaged or reinstalled.

E. Dismantle: To remove by disassembling or detaching an item from a surface, using gentle methods and equipment to prevent damage to the item and surfaces; disposing of items unless indicated to be salvaged or reinstalled.

1.4 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.5 PREINSTALLATION MEETINGS

A. Predemolition Conference: Conduct conference at Project site.

1. Inspect and discuss condition of construction to be selectively demolished.
2. Review structural load limitations of existing structure.
3. Review and finalize selective demolition schedule and verify availability of materials, demolition personnel, equipment, and facilities needed to make progress and avoid delays.
4. Review requirements of work performed by other trades that rely on substrates exposed by selective demolition operations.
5. Review areas where existing construction is to remain and requires protection.

1.6 INFORMATIONAL SUBMITTALS

A. Engineering Survey: Submit engineering survey of condition of building.

B. Proposed Protection Measures: Submit report, including Drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and for noise control. Indicate proposed locations and construction of barriers.

C. Schedule of Selective Demolition Activities: Indicate the following:

1. Detailed sequence of selective demolition and removal work, with starting and ending dates for each activity. Ensure Owner's on-site operations are uninterrupted.
2. Interruption of utility services. Indicate how long utility services will be interrupted.
3. Coordination for shutoff, capping, and continuation of utility services.
4. Use of elevator and stairs.
5. Coordination of Owner's continuing occupancy of portions of existing building and of Owner's partial occupancy of completed Work.

D. Predemolition Photographs or Video: Show existing conditions of adjoining construction, including finish surfaces, that might be misconstrued as damage caused by demolition operations.

E. Warranties: Documentation indicating that existing warranties are still in effect after completion of selective demolition.

1.7 CLOSEOUT SUBMITTALS

A. Inventory: Submit a list of items that have been removed and salvaged.

1.8 FIELD CONDITIONS

A. Owner will occupy portions of building immediately adjacent to selective demolition area. Conduct selective demolition so Owner's operations will not be disrupted.

B. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

C. Notify Architect of discrepancies between existing conditions and Drawings before proceeding with selective demolition.

D. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.

1. If suspected hazardous materials are encountered, do not disturb; immediately notify Architect and Owner. Hazardous materials will be removed by Owner under a separate contract.

E. Storage or sale of removed items or materials on-site is not permitted.

F. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.

1. Maintain fire-protection facilities in service during selective demolition operations.

1.9 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials and using approved contractors so as not to void existing warranties. Notify warrantor before proceeding.

B. Notify warrantor on completion of selective demolition, and obtain documentation verifying that existing system has been inspected and warranty remains in effect. Submit documentation at Project closeout.

1.10 COORDINATION

A. Arrange selective demolition schedule so as not to interfere with Owner's operations.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ASSE A10.6 and NFPA 241.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Review Project Record Documents of existing construction or other existing condition and hazardous material information provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in Project Record Documents.

C. Perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during selective building demolition operations.

1. Perform surveys as the Work progresses to detect hazards resulting from selective demolition activities.

D. Survey of Existing Conditions: Record existing conditions by use of measured drawings, preconstruction photographs or video and templates.

1. Inventory and record the condition of items to be removed and salvaged. Provide photographs or video of conditions that might be misconstrued as damage caused by salvage operations.
2. Before selective demolition or removal of existing building elements that will be reproduced or duplicated in final Work, make permanent record of measurements, materials, and construction details required to make exact reproduction.

3.2 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

B. Existing Services/Systems to Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off utility services and mechanical/electrical systems serving areas to be selectively demolished.

1. Owner will arrange to shut off indicated services/systems when requested by Contractor.
2. If services/systems are required to be removed, relocated, or abandoned, provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building.
3. Disconnect, demolish, and remove fire-suppression systems, plumbing, and HVAC systems, equipment, and components indicated on Drawings to be removed.

    a. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
    b. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material and leave in place.
    c. Equipment to Be Removed: Disconnect and cap services and remove equipment.
    d. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
    e. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.
    f. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
    g. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material and leave in place.

3.3 PROTECTION

A. Temporary Protection: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.

1. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
2. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.
3. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
4. Cover and protect furniture, furnishings, and equipment that have not been removed.
5. Comply with requirements for temporary enclosures, dust control, heating, and cooling specified in Section 015000 "Temporary Facilities and Controls."

B. Temporary Shoring: Design, provide, and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.

1. Strengthen or add new supports when required during progress of selective demolition.

C. Remove temporary barricades and protections where hazards no longer exist.

3.4 SELECTIVE DEMOLITION, GENERAL

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Proceed with selective demolition systematically, from higher to lower level. Complete selective demolition operations above each floor or tier before disturbing supporting members on the next lower level.
2. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping. Temporarily cover openings to remain.
3. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
4. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain portable fire-suppression devices during flame-cutting operations.
5. Maintain fire watch during and for at least two hours after flame-cutting operations.
6. Maintain adequate ventilation when using cutting torches.
7. Remove decayed, vermin-infested, or otherwise dangerous or unsuitable materials and promptly dispose of off-site.
8. Remove structural framing members and lower to ground by method suitable to avoid free fall and to prevent ground impact or dust generation.
9. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.

10. Dispose of demolished items and materials promptly. Comply with requirements in Section 017419 "Construction Waste Management and Disposal."

B. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

C. Removed and Salvaged Items:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers.
3. Store items in a secure area until delivery to Owner.
4. Transport items to Owner's storage area designated by Owner.
5. Protect items from damage during transport and storage.

D. Removed and Reinstalled Items:

1. Clean and repair items to functional condition adequate for intended reuse.
2. Pack or crate items after cleaning and repairing. Identify contents of containers.
3. Protect items from damage during transport and storage.
4. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.

E. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Architect, items may be removed to a suitable, protected storage location during selective demolition and cleaned and reinstalled in their original locations after selective demolition operations are complete.

3.5 SELECTIVE DEMOLITION PROCEDURES FOR SPECIFIC MATERIALS

A. Concrete: Demolish in small sections. Using power-driven saw, cut concrete to a depth of at least 3/4 inch (19 mm) at junctures with construction to remain. Dislodge concrete from reinforcement at perimeter of areas being demolished, cut reinforcement, and then remove remainder of concrete. Neatly trim openings to dimensions indicated.

B. Concrete: Demolish in sections. Cut concrete full depth at junctures with construction to remain and at regular intervals using power-driven saw, and then remove concrete between saw cuts.

C. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, and then remove masonry between saw cuts.

D. Concrete Slabs-on-Grade: Saw-cut perimeter of area to be demolished, and then break up and remove.

3.6 DISPOSAL OF DEMOLISHED MATERIALS

A. Remove demolition waste materials from Project site and dispose of them in an EPA-approved construction and demolition waste landfill acceptable to authorities having jurisdiction and recycle or dispose of them according to Section 017419 "Construction Waste Management and Disposal."

1. Do not allow demolished materials to accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
3. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
4. Comply with requirements specified in Section 017419 "Construction Waste Management and Disposal."

B. Burning: Do not burn demolished materials.

3.7 CLEANING

A. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

END OF SECTION 024119

SECTION 033000 - CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. All labor, materials, equipment, special tools and services to complete cast-in-place concrete work required for the Project, as herein specified, and as indicated on the Drawings.

B. Related Sections:

1. Section 041500 – Masonry Reinforcement and Accessories.
2. Section 042000 – Unit Masonry
3. Section 051200 – Structural Steel.
4. Section 053000 – Metal Decking.
5. Section 071000 – Waterproofing.
6. Section 312000 – Earthwork.
7. Section 315000 – Temporary Retention System, Bracing, and Underpinning.
8. Section 316320 – Drilled Piers.
9. Divisions 21 through 26 – Pads, inserts, sleeves and embedments for mechanical and electrical items specified therein.

1.3 REFERENCES

A. A copy of each reference shall be kept in the field office for the duration of the project. The reference standards shall govern the work except as modified herein.

B. American Concrete Institute (ACI) 301-16 Specifications for Structural Concrete is hereby incorporated as part of this Section. Supplemental requirements and modifications listed herein take precedence over the requirements of ACI 301. All ACI 301 items, unless modified by the Contract Documents are incorporated as written. When part of an item is modified or voided, the unaltered provisions of the item shall apply as written.

C. ACI 305.1-14 Specification for Hot Weather Concreting.

D. ACI 306.1-90 Standard Specification for Cold Weather Concreting.

E. The ACI MNL-15(16) Field Reference Manual.

F. Other ACI references as noted in this Section.

G. American Association of State Highway and Transportation Officials (AASHTO) Specifications as noted in this Section.

H. ASTM International (ASTM) Specifications as noted in this Section.

I. Concrete Reinforcing Steel Institute (CRSI) Manual of Standard Practice, 29th Edition.

J. National Ready Mixed Concrete Association (NRMCA) Quality Control Manual.

1.4 SUBMITTALS

A. General.

1. Shop drawings shall be produced by the Contractor and submitted to the Architect/Engineer for review. The Architect/Engineer will endeavor to complete review of a shop drawing submittal within 14 days of receipt of the submittal. Fabrication of material prior to the receipt of corresponding approved shop drawings shall be at the Contractor's risk.
2. The Contractor is responsible to furnish field-verify information, coordinate material requirements, and review shop drawings prior to submittal of shop drawings to the Architect/Engineer. Receipt of shop drawings by Architect/Engineer will be an assumption by Architect/Engineer that this has been done.
3. Notations by the Architect/Engineer made on the shop drawings do not authorize additional compensation for the Contractor.
4. The Contract Documents (Drawings and Specifications) govern all concrete work. Errors on shop drawings or discrepancies between shop drawings and Contract Documents shall be governed by the Contract Documents. Even if shop drawings contain errors after review by the Architect/Engineer, no additional compensation shall be due the Contractor to correct work to what is shown on the Contract Documents.
5. Architectural and mechanical drawings supplement the structural drawings. Requirements for concrete work may be shown on architectural and mechanical drawings.
6. The Architect's and Engineer’s review of details and construction operations shall not relieve the Contractor of responsibility to successfully complete the work in accordance with these Specifications and within the Contract time.
7. Shop drawings may be received and returned electronically. If paper copies are submitted no more than two copies will be returned to the Contractor or Construction Manager.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Product Certifications: For regional materials, indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include distance to Project and cost for each regional material.
3. Laboratory Test Reports: For curing and sealing compounds, indicating compliance with requirements for low-emitting materials.

C. Submit mix designs and test results conforming to the requirements of Section 4 of ACI 301. Submit request for approval to use admixtures, if any. A complete mix design submittal must be furnished at least three weeks prior to the planned use of that mix. The Contractor is cautioned to undertake mix design preparation and submittal procedures immediately after authorization to proceed with the Project.

1. The submitted mix designs shall address weather conditions that are expected to occur during the concrete construction phase. Concrete mixes shall not only be designed for average temperature and humidity conditions, but also for adverse conditions (hot and cold weather), as applicable to this project.

D. Submit letter stating that concrete subcontractors and suppliers are familiar with the reference standards.

E. Submit a Quality Control Plan in accordance with Section 1 of ACI 301.

F. Submit reinforcing steel shop drawings in accordance with Section 3 of ACI 301.

G. Submit formwork shop drawings for record only. For multistory construction submit record calculations of shoring and reshoring loads sealed by a professional engineer licensed in the state where the Project is located. Design and inspection of formwork for structural adequacy is the Contractor's responsibility. Prior to submittal, formwork shop drawings shall be reviewed by the Contractor's registered professional engineer.

H. For exposed-to-view concrete work submit formwork shop drawings for architectural review of formwork factors affecting appearance of the completed Work, including types of forms, ties, finishes, and joint types and locations. Review is for general architectural applications and features only.

1. Where the finish is to match a reference sample, produce a mockup that matches the reference sample in a location approved by the Architect. Obtain acceptance of the mockup before proceeding with that finish in the locations designated on the Drawings.

I. Submit procedures and records required in hot and cold weather concreting work.

J. Submit insert certifications and installation instructions requested herein for ledge angle inserts (See ACI 301, Section 5.2.1.10).

K. Submit documentation that the epoxy coating applicator is certified under the Concrete Reinforcing Steel Institute’s Fusion-Bonded Epoxy Coating Applicator Plant Certification Program.

L. Submit the following certifications:

1. All coating, floor covering and surface treatment manufacturer's approvals (in writing) of concrete curing compounds that are not removed prior to the product’s installation.
2. Subsequent treatment manufacturers' approvals (in writing) of form release agent.

M. Submit the following product samples for review:

1. Samples of form(s) to be used for exposed-to-view concrete.

N. The following submittals shall be provided in accordance with ACI 301 and Division 01 - General Requirements.

1. Contractor’s proposed Testing Agency.
2. Field and Laboratory tests that are the Contractor’s responsibility.
3. Data and test documentation on proposed materials including but not limited to:
   a. Cement.
   b. Aggregates.
   c. Admixtures.
   d. Reinforcing.
   e. Curing materials.
   f. Related materials for concrete construction specified herein.
   g. Material for repair of surface defects if other than site-mixed portland-cement mortar.
4. Construction joints not shown on the drawings.
5. Method of developing bond at joints (except slabs on grade).
6. Method of adding admixtures.
7. Procedure for adding water to ready-mixed concrete at site, including method of measuring water.
8. Method(s) for preserving moisture in the concrete.
9. Ready-mixed concrete delivery tickets.
10. Thermal control plan for all mass concrete placements.

O. Submit NRMCA Certificate of Conformance for concrete production facilities.

P. Submit documentation of all flatwork finishers and flatwork supervisors' certifications.

1.5 QUALITY ASSURANCE

A. Regulatory requirements:

1. Comply with applicable laws, ordinances, and the Kentucky Building Code (KBC).
2. Comply with the referenced ACI publications, as modified and supplemented in this Section.

B. Tests and inspections:

1. The Owner will employ a Geotechnical Engineer to inspect and approve foundation bearings and backfill compaction. Do not place concrete until subgrade approvals have been obtained.
2. The Owner will employ a testing and inspection agency to provide the services specified in Section 1.6.3 of ACI 301, including supplemental requirements defined in Article 1.8 of this Specification.
3. The Contractor shall select an independent testing agency, subject to the Architect/Engineer's approval, to perform all testing required by the Contractor for qualification of proposed materials and the establishment of mix designs, for the Contractor's use in determining concrete strengths for early form removal, and for all other testing services needed or required by the Contractor.

C. Flatwork finishers certification:

1. All flatwork finishers shall be ACI Concrete Flatwork Technician certified.
2. The on-site flatwork supervisor shall be ACI Concrete Flatwork Finisher and Technician certified.

D. Ready Mixed Plant Certification:

1. All ready-mixed concrete production facilities shall have a current Certification of Ready Mixed Concrete Production Facilities from the NRMCA, or equivalent.

E. Preconstruction Meeting:

1. A preconstruction meeting shall be arranged by the Contractor to review concrete pre-placement and placement activities, inspection and testing requirements, formed and unformed concrete finishes, hot and cold weather concreting procedures, form removal, critical tolerances, and acceptance procedures for architectural concrete.
2. The meeting shall be held three weeks or more before the first non-foundation concrete placement.
3. Ready-mix supplier, Contractor, concrete finishers, Construction Manager, Owner's concrete testing agency, and Architect/Engineer shall attend.

1.6 DELIVERY, STORAGE AND HANDLING

A. Deliver reinforcement to the project site bundled, tagged and marked. Use durable tags indicating bar size, lengths, etc., and other information corresponding to markings shown on placing drawings.

B. All reinforcement at the site shall be stored off the ground and protected from damage, accumulation of dirt and excessive rust.

C. Comply with ASTM D3963 'Standard Specification for Fabrication and Jobsite Handling of Epoxy-Coated Steel Reinforcing Bars' and the Appendix of ASTM A775 'Standard Specification for Epoxy-Coated Steel Reinforcing Bars' for jobsite handling of epoxy-coated rebar.

D. All formwork at the site shall be stored in a clean, dry location off the ground, covered and protected from damage and accumulation of dirt, etc.

1.7 SUBSTITUTIONS

A. Requests for product substitutions must be submitted for review and approval, with all necessary documentation, a minimum of 10 days before bids are due. Product substitutions will only be permitted if incorporated into the bid documents by addendum.

1.8 SUPPLEMENTAL REQUIREMENTS AND MODIFICATIONS TO ACI 301-16

A. The following statements modify and supplement ACI 301. All unaltered parts of ACI 301 shall apply as written.

B. The Section and paragraph numbers correspond to those in ACI 301. Note that each technical section of ACI 301 includes General requirements, Products, and Execution per the Three-Part Section Format of the Construction Specification Institute.

Section 1 (ACI 301) - General Requirements

1.5.3.1 The Contractor shall submit a quality control plan that addresses the following.

(a) Control and maintenance of project documents.
(b) Subcontractor/supplier services and verification of purchased products and materials.
(c) Concrete production inspection and testing.
(d) Pre-placement inspection including formwork, reinforcing and embedments.
(e) Placement inspection including consolidation, finishing and initial curing of concrete.
(f) Post-placement inspection including monitoring of moist curing and curing temperatures, verification of in-place strength before removal of shoring, and protection of exposed surfaces.

1.6.2.2(c) The Contractor shall arrange for all testing and inspections, giving the Owner's testing agency at least 24 hours advance notice.

1.6.2.2(d)1 The Contractor shall provide curing boxes as required by ASTM C31. Coordinate quantity and location with the Construction Manager and Testing Agency.

1.6.3.1(c) The Owner's testing agency shall report in writing all test results to Architect/Engineer, Contractor, Construction Manager and concrete supplier within three (3) working days after the tests are performed. Report by phone or email the results of early break cylinders to Contractor and Construction Manager. Reports of strength tests shall contain the name of the project, date and time of placement, location of placement, placement method, water added at site, sample location, weather conditions, batch ticket number, batch size, mix identification, specified strength, breaking strength and type of break, specimen diameter and weight, types of admixtures, percentage of entrained air, slump, concrete temperature, and detailed information of storage and curing of specimens before testing.

1.6.3.2(d)1 Unless noted otherwise concrete shall have at least one strength test for each 150 cubic yards, or fraction thereof, placed in any one day, nor less than one test for each 5000 square feet of surface area of slabs or walls, or fraction thereof. Strength tests are not required for backfill concrete.

1.6.3.2(d)2 Determine the slump (ASTM C143) for each batch of concrete that high-range water-reducer (superplasticizer) is added to in the field. Test and report slump both before and after superplasticizer is added.

1.6.3.2(e)1 When 6 by 12 in. cylinders are used make four test specimens for each sample (five required for mixes requiring 56 day strength tests). When 4 by 8 in. cylinders are used make five test specimens for each sample (six required for mixes requiring 56 day strength tests). One specimen shall be a hold specimen, to be tested only if a defective specimen is found.

1.6.3.2(e)2 Age of concrete for acceptance shall be 28 days unless otherwise shown in TABLE 4.2.2.8.b. Concrete mixes with strength specified at 56 days shall have one cylinder tested at 7 days, one at 28 days, and two 6 by 12 in. cylinders or three 4 by 8 in. cylinders at 56 days.

1.6.3.2(f) Air content tests shall be conducted on the first three batches in each placement of all mixes in which air entrainment is specified and until three consecutive batches have air contents within the range specified, at which time every third batch shall be tested. This test frequency shall be maintained until a batch is not within the range specified, at which time testing of each batch will be resumed until three consecutive batches have air contents within the specified range.

1. For pumped concrete the second or third batch in the placement, and periodically throughout the placement but not less than once for each 100 cubic yards, shall have air content checked at both the end of the truck discharge and at the end of the hose.
2. Concrete that does not satisfy air entrainment requirements shall be rejected.

1.6.3.2(g) Testing services provide a basis for acceptance or rejection of concrete furnished by this contract. Therefore, it is necessary that testing for air content and slump not only be done after all adjustments have been made, but before the concrete is discharged.

1.6.3.3(f) The Owner will employ an inspection agency to visually inspect the placement of reinforcing steel. Reference KBC 1704.4. Do not place concrete until all outstanding issues cited in the inspection reports have been corrected. Inspection of reinforcing steel to include, but not limited to:

1. Size, spacing, and quantity of bars.
2. Bar splices.
3. Embedments.
4. Concrete cover.
5. Support and securement.
6. Coatings.

1.6.3.3(g) The Owner will employ an inspection agency to inspect concrete operations including, but not limited to:

1. Use of proper concrete mix.
2. Consolidation.
3. Finish and finishing operations.
4. Curing methods, materials, and procedures.
5. Shoring removal and reshoring operations.
6. Formwork materials.

1.6.4.1(a) Contractor shall be responsible for costs of tests on hardened concrete performed by Owner's testing agency if the tests are required to verify the strength or air content of the concrete because representative concrete cylinder tests or air content tests failed to meet acceptance criteria. Owner will be responsible for costs of tests on hardened concrete performed by Owner's testing agency if the tests are at the Owner's request and representative concrete cylinder and air content tests meet acceptance criteria.

1.6.8.4 Concrete which fails to meet the requirements of this Specification shall be rejected.

1.7.1.6 The Contractor shall bear all costs of correcting rejected work, including the cost of the Architect's and Engineer's additional services thereby made necessary.

1.8.4 Masonry shall not be placed on or supported off of structural floors until the concrete is at least 28 days old and all shoring has been removed.

Section 2 (ACI 301) - Formwork and Formwork Accessories

2.1.2.1(g) Form tie configuration and spacing for all exposed-to-view concrete shall be submitted for review and approval of the Architect.

2.2.1.3 Form release agent shall be a commercial formulation form coating compound that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces. The form release agent manufacturer shall certify that the form release agent is chemically and physically compatible with all subsequent treatments of concrete surfaces. Furthermore, the form release agent shall be approved in writing by the manufacturers of all subsequent treatments.

2.2.1.4 Preformed Expansion Joint Filler: Non-impregnated type, closed cell resilient polyethylene foam, 1/2 in. thick unless otherwise noted on the Drawings.

2.2.1.5(a) Waterstops:

1. Bentonite rope joint sealant shall be installed in all vertical and horizontal construction joints in concrete walls below and exposed to grade, including slab/wall construction joints, unless otherwise noted. Secure with manufacturer's adhesive and mechanical fasteners as required for a secure installation. Construction joint shall be clean and dry. Prior approved products: Volclay Waterstop-RX 101T, HYPER STOP DB-2515, QUELLMAX 18x24.
2. Unless otherwise noted provide ribbed type, virgin PVC waterstop meeting Corps of Engineers CRD-C 572 at expansion joints in below grade and exposed to grade walls. Expansion Joint Waterstop shall be type with center bulb, and center bulb shall be 100% within joint. Do not embed center bulb in concrete. Expansion Joint Waterstop to be minimum 9 in. wide, and all butt joints shall be cut in miter box and welded per manufacturer's recommendations. Provide premolded unions, fittings and appropriate adhesive. Thoroughly clean joint, secure waterstop to reinforcing mat with hog rings, and vibrate concrete to eliminate voids.

2.2.1.5(b) Embedded items shall not be made of aluminum.

2.2.2.1 Design and engineering of formwork shall be the responsibility of the Contractor. Design of formwork and preparation of formwork drawings shall be under the

supervision of a licensed design engineer registered in the state where the Project is located. Formwork drawings shall be sealed by the licensed design engineer responsible for the design of the formwork.

2.2.2.3 Earth cuts may be used for vertical forms for footings below ground where the ground stands vertical and is approved by the Owner's testing agency prior to placement of concrete.

2.2.2.5(e) Construction joints shall be located such that the maximum placement length of a continuous concrete wall will not exceed 100 feet in any one day.

2.2.3.2 Form ties for exposed-to-view concrete walls shall leave a 1 in. diameter cone hole. The holes shall be left open or epoxy mortared at the discretion of the Architect. The ties shall be one of the following:

(a) Stainless steel "snap-ties" with a 1 in. break back.
(b) Galvanized "coil-bolt" type tie.
(c) "She-bolt" tie with the inner male unit galvanized.
(d) Other removable type tie with approval of the Architect.

2.3.1.2(a) Exposed edges of columns, walls, slabs and beams shall have 3/4 in. bevels, unless otherwise noted.

2.3.1.5(a) Concrete construction tolerances, even portions above 100 feet in elevation, shall be in accordance with ACI 117 with the following exceptions:

1. Variation in concrete edges supporting masonry and surfaces behind masonry and glass curtain wall shall not exceed plus or minus 1/2 in. from theoretical plan dimension.
2. Variation of beam soffit supporting masonry shall not exceed plus or minus 1/2 in. from theoretical elevation.
3. The class of surface for offset between adjacent pieces of formwork facing material shall be Class A for all surfaces exposed to view, and class C for all surfaces not exposed to view when the project is complete. Refer to 5.3.3.7 for ribbed slabs formed with metal pans.
4. Tolerances for placing anchor bolts and other embedded items for structural steel work (Section 051200) shall be in accordance with the AISC Code of Standard Practice for Steel Buildings and Bridges.

2.3.1.5(b) A preconstruction meeting shall be arranged by the Contractor for the purpose of reviewing critical tolerances, methods of making measurements, and the basis for acceptance or rejection of completed work to avoid misunderstandings at the time of final acceptance.

2.3.1.6(a) If required, retighten forms and bracing after concrete placement, but before concrete has taken its initial set, to eliminate mortar leaks and maintain proper alignment.

2.3.1.12(a) All sleeves, inserts and embedded items required by mechanical trades shall be furnished and placed by the appropriate mechanical contractor. All other sleeves, inserts, reglets, dovetail anchor slots, anchors and embedded items shall be furnished by the appropriate supplier and placed by the Contractor performing the work of this Section.

2.3.1.12(b) Sleeves, inserts, anchors and embedded items not shown on structural drawings must be approved by Architect/Engineer before placement of concrete.

2.3.1.14(a) Remove chips, wood, sawdust, dirt and debris just before concrete is placed.

2.3.1.18 Provisions for Other Trades: Provide openings in concrete and concrete formwork to accommodate work of other trades. Determine size and location of openings, recesses and chases from trades providing such items. Accurately place and securely support items built into forms. Size and location of openings, recesses and chases not shown on structural drawings must be approved by Architect/Engineer before placement of concrete.

2.3.2.4(a) Forms may be removed when the in-place concrete reaches the specified 28-day compression strength, or when the concrete reaches 75% of the specified 28-day compression strength and is no less than 7 days old. The 7-day minimum age requirement may be waived pending review of the proposed mix designs, forming systems, reshoring procedures and in-place concrete strengths.

2.3.3.4(a) Reshoring is required for multistory construction. The Architect/Engineer has the prerogative of disallowing any specific procedures the Architect/Engineer considers to be deleterious to the performance of the structure in its completed form.

2.3.3.4(b) The attention of the Contractor is directed to the following:

1. Live load and superimposed dead load capacities of each level are noted on the Drawings. Live loads are typically reduced per the building code for the design of beams and girders.
2. In general, the weight of newly placed concrete for a level, plus adequate construction load allowance, will exceed the combined live and superimposed dead load capacity of the level below.
3. When shores or reshores must extend to the ground to provide the required load-carrying capacity, the floors above the ground shall not be considered contributory to the shoring and reshoring capacity.

2.3.4.2(b)1 When Windsor Probe tests are used to evaluate the in-place strength of the concrete for form removal, the tests shall be performed by an approved testing agency in accordance with ASTM C803, with at least one test for each 1800 square feet of elevated structure. Windsor Probe tests shall be correlated to laboratory cured cylinders or drilled cores of the same material and mix-design to be tested.

2.3.4.3 Forms may not be removed until the actual in-place strength of the concrete is demonstrated by field-cured test cylinders, Windsor Probes, pullout tests, or the maturity method (ASTM C1074), regardless of the results of tests on laboratory-cured cylinders. These additional test cylinders or other tests shall be arranged and paid for by the Contractor.

Section 3 (ACI 301) - Reinforcement and Reinforcement Supports

3.1.3.1(a) Protect reinforcement surfaces from contact with soil, oil, formwork release agent, or other materials that decrease bond to concrete.

3.2.1.1(a) All reinforcing steel shall have a minimum F_y of 60 ksi. In addition, all reinforcing steel to be welded shall meet ASTM A706 and have a maximum carbon equivalent of 0.45%.

3.2.1.2(b)1 Provide epoxy coated steel where shown on the Drawings.

3.2.1.2(b)2 Epoxy coating shall be applied in plants certified in accordance with the CRSI Epoxy Coating Plant Certification Program.

3.2.1.2(b)3 Since the epoxy coating is flammable, the coated bars shall not be exposed to any fire or flame. Cutting coated bars by burning will not be permitted.

3.2.1.2(b)4 Repairs of coatings on epoxy coated bars and coated accessories shall be made at all breaks, abrasions, etc. exceeding an area of 0.01 sq. in., and at cut ends.

3.2.1.2(b)5 Every reasonable effort shall be made to repair all damaged areas of epoxy-coated reinforcing steel and accessories before any rusting occurs. If infrequent and small damaged areas do rust, the rust shall be thoroughly removed by media blasting or other approved method before the areas are repaired. The Contractor shall exercise care to ensure that coated bars, when incorporated into the work, are free from dirt, paint, oil, grease, or other foreign substances. The Architect/Engineer reserves the right to require cleaning of the reinforcement without additional compensation due the Contractor. It is the intent of this specification that an entirely rust-free and completely coated steel reinforcement system be provided before the concrete is placed. Placing of concrete shall be performed with methods and equipment that will not damage the coated materials.

3.2.1.2(b)6 Epoxy coating field patching material shall conform to ASTM A775 or ASTM A934 as applicable and shall be approved in writing by the epoxy coating manufacturer. The patching material shall be applied in accordance with the manufacturer's written instructions.

3.2.1.7(a)1 Welded wire reinforcement shall be in accordance with ASTM A1064 (smooth wire) unless noted otherwise on the Drawings. Furnish in flat sheets.

3.2.1.9(a) All clips, chairs, bars, and bar supports and other metallic materials used for installation or support of epoxy-coated reinforcing shall be entirely coated with epoxy or another polymer approved by the epoxy coating manufacturer.

3.2.1.9(b) Bar supports touching forms in concrete exposed to view, exterior or interior, shall be stainless steel, except use plastic or epoxy coated bar supports where bars are epoxy coated. Provide bar spacers for reinforcement in all walls.

3.2.1.10(a) Mechanical and welded splices of reinforcing steel shall be in accordance with ACI 318 and ACI 439.3R and approved by the Architect/Engineer.

3.2.1.11 Tie wire for holding reinforcing steel in position for Architectural Concrete shall be stainless steel except where bars are epoxy coated. Tie wire for all epoxy-coated bars shall be mylar or plastic-coated. Typically, ends of tie wire shall have a minimum of 1 in. clear distance to face of concrete.

3.2.1.16 Recycled content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content shall not be less than 60 percent.

3.2.2.2(a)1 Welding of reinforcing steel and welded wire reinforcement is not permitted without the approval of the Architect/Engineer.

3.3.2.8(e) Bending of reinforcing steel partially embedded in concrete is not permitted, unless otherwise detailed on the Contract Documents.

3.3.2.11 Placement of bars shall also be in accordance with the detailed recommendations given in the Concrete Reinforcing Steel Institute's "Placing Reinforcing Bars", 10th Edition.

3.3.2.12 Provide material and placement of contingency reinforcement as noted on the drawings. Bars are to be cut, bent and placed as directed by the Architect/Engineer as extra reinforcement without additional cost.

Section 4 (ACI 301) - Concrete Mixtures

4.1.1.1 The ready-mix concrete producer is completely and solely responsible for the design, production, and delivery of the concrete mixes to satisfy this Specification. The Contractor shall coordinate the review of the mix designs between the Ready-Mix Producer, Forming Contractor, and Placing/Finishing Contractor. The Contractor is responsible for informing the Ready-Mix Producer of the conditions at the job site, such as methods being used for placing concrete. Adjustments required to facilitate placing and achieve the desired results shall fall within the criteria of this Specification and shall be at no additional cost to the Owner. All mix designs and proposed adjustments to the same shall be submitted to the Architect/Engineer for review.

4.1.5 Regional Materials:

4.1.5.1 Concrete shall be manufactured within 500 miles of Project Site.

4.2.1.1(a)1 Cement for all concrete shall be ASTM C150, Type I or Type II, or ASTM C595, Type IL, unless otherwise noted. Air-entrained cement shall not be used. Air requirements shall be met by use of separate admixtures.

4.2.1.1(d)1 Class C and Class F fly ashes shall comply with ASTM C618, except that in addition to the requirements of ASTM C618, Type F fly ash shall have a maximum Loss on Ignition of 3%, with a maximum variation of 1%. Contractor's mix design submittal for mixes which include fly ash must be accompanied by complete chemical and physical analyses and quality control records for the proposed fly ash source for at least two years immediately prior to the proposed use on this project.

4.2.1.1(d)2 When fly ash is used, the ratio of fly ash to total cementitious materials shall be not less than 15% and no greater than 25%.

4.2.1.1(e)1 Ground granulated blast-furnace slag shall be Grade 100 or Grade 120 per ASTM C989.

4.2.1.1(e)2 When ground granulated blast-furnace slag is used, the maximum amount shall be limited to 40% by weight of the total cementitious materials.

4.2.1.2(a) All normal weight aggregates shall be graded, a mix of fine, intermediate, and coarse aggregates, and shall also conform to Kentucky Transportation Cabinet (KYTC) 601.02 as required for superstructures.

1. Aggregate certification submittal shall include copies of test reports on the proposed fine, intermediate, and coarse aggregates showing source of the materials and conformance with specification requirements. Tests shall be performed by a testing laboratory acceptable to the Architect/Engineer. Date of test(s) shall not be more than six months prior to date of submittal. Contractor shall furnish similar copies, of current date, when there is a

change in source of material and at any time upon demand by the Architect/Engineer.

4.2.1.3(a) Concrete mixer washout water shall not be used in any concrete except Backfill Concrete.

4.2.1.4.2(a) Calcium chloride, or admixtures containing more than .05% calcium chloride ions are not permitted. Written conformance to this requirement and the chloride content is required from the admixture manufacturer prior to mix design review.

4.2.1.4.3 High-range water-reducing admixture (superplasticizer) conforming to ASTM C494, Type F or G shall be used in all concrete with a specified maximum water-cementitious materials ratio below 0.42. The admixture may also be used at Contractor's option in other mixes, with the written approval of the Architect/Engineer, at no additional cost to the owner.

4.2.1.4.4 Water-reducing, non-chloride, non-corrosive, accelerating admixture conforming to ASTM C494, Type C or E, shall be used when early initial set is required. The admixture must have non-corrosive test data of a year's duration from an independent testing laboratory using an acceptable, accelerated corrosion test method such as that using electrical potential measures.

4.2.1.4.5 Water-reducing, retarding admixture conforming to ASTM C494, Type D shall be used when delay of the setting time for concrete is required.

4.2.1.4.6 Extended set-control admixtures, if used shall be added to the concrete during or immediately after the batching process. The dosage rate for each Mix Type shall be pre-determined by trial mixtures in which the admixture is added to a minimum 8 cu. yd. batch.

4.2.1.4.7 All admixtures shall be approved by the cement manufacturer.

4.2.1.6(a) Materials used for exposed concrete shall be furnished from the same source throughout the project unless otherwise approved by the Architect/Engineer.

4.2.2.2(a) Concrete shall be produced to have a maximum slump at the point of placement of 4 inches with a tolerance of one inch. This maximum slump may not be exceeded except by the addition of high-range water-reducer (superplasticizer). In those portions of the structure where member dimensions or congestion due to reinforcing steel prevent the proper placement and consolidation of the concrete at the maximum slump specified, superplasticizer shall be used by the Contractor in lieu of increasing the slump by the addition of water. Approved mix designs, with smaller size aggregates, may also be used in congested areas to facilitate concrete placement.

1. When superplasticizer is added at the site the maximum pre-adjusted slump shall be 4" and the maximum superplasticized slump shall be 8".

4.2.2.4(c)1 For pumped concrete, air content shall be periodically tested at both the truck discharge and end of hose. The required air content for acceptance at the truck discharge shall be adjusted, if necessary, to account for loss of air content during pumping.

4.2.2.4(d)1 Tolerance on air content for slabs that receive a trowel finish shall be +0.5%, -1.5%.

4.2.2.5(b) Maximum concrete temperature at time of discharge shall not exceed 95 °F. If necessary, use nitrogen cooling to maintain concrete temperature.

4.2.2.7(d)1 Chloride ion concentration - Maximum water-soluble chloride ion concentrations in hardened concrete at an age of 28 to 42 days contributed from all ingredients, including water, aggregates, cementitious materials and admixtures shall not exceed the limits indicated in Table 4.2.2.8(b). Immediately after receipt of contract, Contractor shall test proposed individual concrete ingredients for total chloride ion content. If the total chloride ion content calculated on the basis of the proposed concrete mix proportions exceeds the specified limits, it will be necessary to test hardened concrete samples of the proposed mix for water-soluble chloride ion content. If these test results exceed the specified limits, it will be necessary to vary ingredients and material sources and retest until specified limits are met.

a. Testing shall be performed by an independent testing laboratory employed and paid by the Contractor following ASTM C1218 test procedures.

4.2.2.8(b) Strength - Minimum concrete strengths shall be in accordance with Table 4.2.2.8(b). Note that some mixes may be specified with compressive strength requirements at other than 28 days.

Table 4.2.2.8(b) - Mixes and Locations

MIX TYPE	LOCATION	SPECIFIED STRENGTH (psi at days) (1)	MIN. PORTLAND CEMENT (lb. / cu. yd.) (2)	MAX % OF CHLORIDE BY WEIGHT OF CEMENT	MAX W/CM RATIO (7)	AIR % (1,3)	AGG. SIZE (4)
A	Foundations: Footings, drilled piers, pier caps, grade beams	4000 at 28	520	0.30	0.50	-	No. 57, 1 in.
B	Elevated beams, joists and slabs, columns as noted in the column schedule, and building foundation walls	5000 at 28	565	0.30	0.45	-	No. 57, 1 in.
C	Exterior Concrete	5000 at 28	600 (5)	0.15	0.40	6 +/- 1.5	No. 57, 1 in.
D	Interior slabs on grade, interior slabs on metal deck, and all concrete U.N.O.	4000 at 28	520	0.30	0.50	-	No. 57, 1 in.
E	Columns as noted in column schedule	7000 at 56	675 + 125 fly ash (6)	0.30	0.40	-	No. 57, 1 in.
F	Stair pan fills	3000 at 28	500	0.30	0.50	-	No. 8, 3/8 in.

MIX TYPE	LOCATION	SPECIFIED STRENGTH (psi at days) (1)	MIN. PORTLAND CEMENT (lb. / cu. yd.) (2)	MAX % OF CHLORIDE BY WEIGHT OF CEMENT	MAX W/CM RATIO (7)	AIR % (1,3)	AGG. SIZE (4)
G	Backfill concrete	1500 at 28	280	1.0	-	-	No. 57, 1 in.
H	Linacc vault walls and roof	3000 at 14 5000 at 56	540	0.30	0.45	-	No. 467, 1 1/2 in.

NOTES:
1. Concrete which is placed and does not meet strength or air content requirements shall be removed and replaced at no cost to the Owner.
2. Including fly ash or ground granulated blast-furnace (GGBF) slag in mixes where permitted. Not applicable if a specified minimum amount of fly ash or GGBF slag is listed with the mix. The minimum cement requirement may be met by substituting 1.33 lb. of fly ash for each 1.0 lb. of portland cement replaced, or 1.0 lb. of GGBF slag for each 1.0 lb. of portland cement replaced. The ratio of fly ash to total cementitious materials shall be no less than 15% and no greater than 25%; the ratio of GGBF slag to total cementitious materials shall be no greater than 40%; and the total of fly ash and GGBF slag shall be no greater than 50% of total cementitious materials.
3. Tolerance on entrained air content shall be as delivered.
4. Normal weight aggregate unless indicated lightweight (LW) concrete at 117 lb. / cu. ft.
5. Fly ash not permitted in this mix.
6. Fly ash can be omitted from this mix if minimum 25% of the cement content is replaced with GGBF slag.
7. Maximum w/cm ratio shall be based on the final total cementitious content submitted by ready-mixed producer.

4.2.3.5(a) Mix designs incorporating superplasticizer must be accompanied by test results from cylinders made from trial batches or field test data in which the superplasticizer was added to a minimum 8 cu. yd. batch in a truck mixer.

4.3.1.1(a) Site produced concrete is prohibited.

4.3.1.4 When a high-range water-reducer (superplasticizer) is added at the site it shall be premeasured and added in accordance with the manufacturer's written instructions and specifications, using truck-mounted power injection equipment capable of rapidly and uniformly distributing the admixture to the concrete. The concrete shall be mixed for a minimum of six minutes after addition of the superplasticizer prior to discharge.

4.3.2.1(a) Slump adjustment: When concrete arrives at the project with slump below that suitable for placing, and below the slump specified, water may be added only if neither the maximum water-cementitious materials ratio nor the maximum slump is exceeded, provided that:

1. The approved mix design has allowed for the addition of water on site.
2. The amount of water added at the site is accurately measured to plus or minus 1 gallon of the desired added amount.
3. The water addition is followed by 3 minutes of mixing at mixing speed prior to discharge.
4. Standard cylinder samples as required by these Specifications are taken after addition of water.

5. The person authorized to add water shall be mutually approved by Architect/Engineer, Contractor, Construction Manager and Ready-Mix Producer.

4.3.2.1(b) Do not add water to concrete after high-range water-reducing admixtures have been added.

4.3.2.1(c) The maximum water-cementitious materials ratio is defined as that of the mix design furnished by the ready-mix producer. (Not to exceed values noted in Table 4.2.2.8(b)).

4.3.2.1(d) Concrete arriving at the site above the maximum slump shall be rejected.

4.3.2.1(e) Addition of cement, except as part of initial batching at the plant in accordance with an approved mix design, is prohibited.

4.3.2.2(a) The concrete must be discharged from the ready-mix trucks within 1-1/2 hours after the introduction of mixing water to the cement and aggregates.

1. During hot weather or under conditions contributing to rapid setting of concrete, a shorter mixing time than specified in ASTM C94 may be required. When air temperature is between 85 °F (30 °C) and 90 °F (32 °C), reduce mixing and delivery time from 1-1/2 hours to 75 minutes, and when air temperature is above 90 °F (32 °C) reduce mixing and delivery time to 60 minutes.

4.3.2.3 Furnish to the Project Superintendent 2 delivery tickets with each load of concrete. Tickets shall contain the following information.

(a) Date.
(b) Producer and plant.
(c) Job.
(d) Contractor.
(e) Truck No. and time dispatched.
(f) Concrete designation and cement type.
(g) Admixtures description and content.
(h) Time discharge started and completed.
(i) Amount of concrete in load.
(j) Amount of water in mix at plant.
(k) Amount of any material added at the site and authorized signature.

Section 5 (ACI 301) - Handling, Placing and Constructing

5.1.2.1(d)1 Notify the Architect/Engineer at least two working days prior to placing concrete.

5.1.2.1(d)2 No concrete shall be placed without Owner’s Testing Agency being present. Give due notice to the Architect/Engineer and all Contractors affected before placing concrete. Allow adequate time for installation of all necessary parts.

5.2.1.1(a) Water used for curing exposed surfaces shall be free of substances that will stain or discolor concrete.

5.2.1.2 Curing Compounds:

(a) Curing Compound for unformed surfaces that will not receive a coating or bonded floor covering shall conform to the requirements of ASTM C1315, Type I, Class A.
(b) Curing Compound for formed surfaces, and unformed surfaces that will receive a coating or bonded floor covering, shall be a dissipating or removable curing compound that conforms to ASTM C309. Furthermore, the curing compound shall be approved in writing by the manufacturers of all coatings, floor coverings and surface treatments used on the project. Confirm types and locations of coatings, flooring, and surface treatments with Architect.
(c) Curing compound(s) shall comply with all applicable environmental and clean air regulations for the community in which this Project is located.

5.2.1.3 Waterproof curing sheets shall comply with ASTM C171. Prior approved materials:

(a) Orange Label Sisalkraft paper manufactured by the Fortifiber Building Systems Group.
(b) Polyethylene film, minimum 8 mils thickness. Except do not use on surfaces that will be left exposed to view when the project is complete.
(c) BurLene curing blankets manufactured by the Max Katz Bag Company, Inc.

5.2.1.7(a) Epoxy bonding agent shall comply with ASTM C881, Type V, Grade 2, with Class corresponding to temperature at time of pour.

5.2.1.7(b) Latex bonding agent shall comply with ASTM C1059, Type II.

5.2.1.10 Related materials for concrete construction shall be as follows:

5.2.1.10(a) Vapor retarder under interior slabs-on-grade: Minimum 15 mils thick, puncture resistant, high tensile strength plastic sheet material meeting ASTM E1745, Class A requirements. Include manufacturer’s pressure sensitive tape and mastic.

5.2.1.10(b) Non-slip Aggregate used as the abrasive aggregate for a non-slip floor finish shall be fused aluminum oxide grits, or crushed emery. Emery aggregate shall contain not less than 40% aluminum oxide nor less than 24% ferric oxide. Use material that is factory-graded, packaged, rustproof and non-glazing, and is unaffected by freezing, moisture and cleaning materials.

5.2.1.10(c) A floor sealer shall be used where shown on the architectural contract documents. The compound shall be a V.O.C. compliant water-based, non-yellowing acrylic sealer. Apply according to manufacturer’s recommendations.

5.2.1.10(d) Non-shrink grout shall have a minimum compression strength of 7000 psi at 28 days and be a non-shrink, non-metallic, non-staining, non-corrosive, premixed grout. Comply with ASTM C1107.

Prior approved grouts:
1. Dayton Superior Sure-Grip High Performance Grout
2. Euclid Hi Flow or NS Grout
3. Master Builders MasterFlow 713 or MasterFlow 928 grout

5.2.1.10(e) Neoprene bearing pads shown on drawings shall be 100% virgin chloroprene (Neoprene) and shall meet AASHTO specifications. Shore "A" hardness shall be 60 unless otherwise noted. Submit certification and test reports for the actual production run of these pads as part of the shop drawing submittal procedure.

5.2.1.10(f) Ledge Angle Inserts and Bolts:

1. Inserts shall be wedge type inserts. The main body of the insert shall have an overall height of at least 3-7/8 in. and provide a minimum 1-3/4 in. vertical adjustment for 3/4 in. diameter askew head bolts. The inserts shall have an attached anchor loop that projects at least 2-1/2 in. behind the body of the insert.
2. The insert supplier shall certify the inserts will simultaneously support a vertical load of 1000 pounds and a pullout load of 1600 pounds with a safety factor of 3. Vertical slip shall not exceed 1/16 in. Certification must be accompanied by test results from an independent testing agency.
3. Bolts shall be ¾ in. diameter Askew Head Bolts supplied by the insert manufacturer, of a length required to meet the capacity requirements shown above, including all concrete construction tolerances, shims, etc.
4. Steel shims shall be provided as detailed on the Drawings. Shims shall be "U-shaped" and shall fully bear against the concrete surface.
5. Inserts, bolts, nuts, washers and shims are to be hot-dipped galvanized in accordance with ASTM A153.
6. Submittals required by Insert Manufacturer:
    a. Installation instructions indicating the following:
        1) Minimum air temperature restrictions, if any, for torqueing bolts.
        2) Specified torque to obtain a factor of safety of 2 against slip between angle, shims and insert.
        3) Any special instructions regarding proper installation of proposed insert.
    b. Test data for insert furnished indicating shear and pullout capacity of insert.
    c. Certification as described herein.
7. Inserts shall be installed with a minimum of 1-1/2 in. of concrete below the insert.
8. See details on Drawings for additional information.

5.2.1.10(h) Dovetail Anchor Slots: 22 gauge minimum, G60 galvanized. Provide where masonry is backed by concrete. Maximum horizontal slot spacing is 16 in. c/c. Refer to architectural drawings.

5.2.1.10(i) Epoxy Adhesive:

1. Two-component, high modulus, high strength, structural epoxy adhesive for use in installing reinforcing steel dowels into hardened concrete.
2. ASTM C 881, Type IV, Grade 3 with class corresponding to temperature at time of placement.

5.3.1.3(d) Verify position and securement of embedded items before placing concrete.

5.3.1.4(a)1 Following approval of prepared subgrades by Soils Technician, spread and compact granular base course to 100% maximum dry density as determined by standard Proctor Method ASTM D698.

5.3.1.4(c) At all interior slabs-on-grade install vapor retarder over base in accordance with ASTM E1643 with all joints lapped 6 inches minimum and taped. Protect from damage during subsequent operations until concrete is placed. If surface of base is rough, place 1/2 in. of fine graded, compacted material over base before installation of vapor retarder. Vapor retarder to be continuous at turned down slabs from lower to higher slab elevations. Do not place vapor retarder under exterior slabs-on-grade.

5.3.1.5(a) Make provisions in advance for wind-breaks, shading, fogging, sprinkling, ponding, or wet curing as dictated by conditions at time of concrete placement.

5.3.1.7 Discharge of concrete from ready-mix trucks shall not begin until testing agency has made preliminary checks of slump (and air content - if required).

5.3.2.1(a)1 Adequate protection against rain, sleet or snow shall be defined as protection that prevents any and all adverse affects of the rain, sleet or snow on the appearance, strength or durability of the concrete.

5.3.2.1(b)1 Placement of concrete in cold weather shall also comply with Article 1.9 of this specification, titled Cold Weather Concreting.

5.3.2.1(c)1 Placement of concrete in hot weather shall also comply with Article 1.10 of this specification, titled Hot Weather Concreting.

5.3.2.1(d) Evaporation Retarder - When low humidity and/or dry winds create conditions suitable for plastic cracking, evaporation retarder may be required to be applied by spray one or more times during the finishing operation. Evaporation retarder shall not be used as a finishing aid.

5.3.2.3(c)1 Pumping pipes and hoses shall be supported above in-place reinforcing on plywood or tires to cushion impacts, prevent abrasions of epoxy coatings and PT sheathing, and prevent displacement of reinforcement.

5.3.2.4(i) Assume 1/2 in. average extra concrete will be required to account for deflection of metal deck.

5.3.2.4(j) Concrete is not permitted to be placed in standing water or under water without approval of Architect/Engineer.

5.3.2.6(d) Bond is required for vertical construction joints in horizontal members, except for slabs on grade.

5.3.3.3(a) *Surface finish-1.0* (SF-1.0):

1. No formwork facing material is specified.
2. Patch voids larger than 1-1/2 in. wide or 1/2 in. deep.
3. Remove projections larger than 1/2 in.
4. Tie holes need not be patched.
5. Surface tolerance Class C as specified in ACI 117.
6. Mockup not required.

5.3.3.3(b) *Surface finish-2.0* (SF-2.0):

1. Patch voids larger than 3/4 in. wide or 1/2 in. deep.
2. Remove projections larger than 1/8 in.
3. Patch tie holes unless indicated otherwise in Contract Documents.
4. Surface tolerance Class A as specified in ACI 117.
5. Mockup not required.

5.3.3.3(c) *Surface finish-3.0* (SF-3.0):

1. Patch voids larger than 3/4 in. wide or 1/2 in. deep.
2. Remove projections larger than 1/8 in.
3. Patch tie holes unless indicated otherwise in Contract Documents.

4. Surface tolerance Class A as specified in ACI 117.
5. Provide mockup of concrete surface appearance and texture.

5.3.3.4(b)1 Where a grout-cleaned rubbed finish is indicated, grout color shall match color of concrete surface to which the grout is applied. When the color of the grout lightens due to drying, rub the surface and keep the surface damp for 36 hours afterward.

5.3.3.4(c)1 Where a cork-floated finish is specified, grout color shall match color of concrete surface to which the grout is applied.

5.3.3.7 Specified Finishes of Formed Surfaces:

(a) NON-EXPOSED SURFACES shall be SF-1.0 per 5.3.3.3(a). This includes all non-exposed flat surface and ribbed slabs. Metal pans shall be new or factory reconditioned, with stiffeners to support concrete without sags and bulges in order to satisfy a Class D surface tolerance per ACI 117.

(b) EXPOSED SURFACES shall be SF-2.0 per 5.3.3.3(b). Vertical surfaces to be cast against Class 1 High Density Overlaid Plyform (HDO – Concrete Form) true to line. Slab and beam soffits to be cast against Class 1 HDO Plyform or Class 1 Medium Density Overlaid Plyform (MDO – Concrete Form). This finish applies to all exposed to view formed surfaces that are not designated Architectural Concrete, both interior and exterior.
   1. Formwork shall be in 8-foot lengths and 4-foot widths unless otherwise noted.

(c) ARCHITECTURALLY EXPOSED SURFACES shall be SF-3.0 per 5.3.3.3(c) cast against Class 1 High Density Overlaid Plyform (HDO – Concrete Form) true to line, unless specified otherwise in Section 6 (ACI 301). This finish applies to all formed surfaces exposed to view which are designated Architectural Concrete, both interior and exterior.
   1. Material and layout must be approved by Architect prior to placing concrete.
   2. Formwork shall be in 8-foot lengths and 4-foot widths unless otherwise noted.

5.3.3.8 In the case of disagreement regarding use of damaged or worn formwork impairing the concrete surface the Architect's decision shall be final.

5.3.4.2.1 Slabs shall be finished in accordance with 5.3.4.2(i) 'Unspecified unformed surface finishes' (as described in ACI 301), unless indicated otherwise on the architectural drawings or in 5.3.4.2(j).

5.3.4.2(c)1 Do not apply a 'hard-troweled' finish to air-entrained concrete specified to receive a 'trowel' finish.

5.3.4.2(c)2 Rider-operated floats and trowels shall not be used on air-entrained concrete specified to receive a trowel finish.

5.3.4.2(j) Specified Finishes of Unformed Surfaces:

Type A Exterior areas exposed to vehicular or pedestrian traffic to receive a floated or light broom finish per the Architect's direction. Finish slabs to a manual straightedge 'conventional' tolerance per ACI 117 (1/2 in. in

10 feet) and provide positive drainage with no “ponds” greater than 6 in. in diameter. Do not “over finish” slabs.

Type B Building interior slabs-on-grade and supported decks and all other slabs not specifically indicated shall receive a steel trowel finish in accordance with 5.3.4.2(c). Finish slabs to a ‘flat’ tolerance (SOF_F=35, MLF_F= 28, SOF_L=25, MLF_L=20) in accordance with ACI 117. Measure floor finish tolerance within 72 hours after floor finishing and before removal of supporting formwork or shoring. Levelness tolerance (SOF_L) is not applicable to un-shored suspended floors.

Type C Slabs to receive future waterproofing membrane or insulation with topping slabs shall have a floated finish in accordance with 5.3.4.2(b).

Type D Slabs to receive future topping slabs bonded to base slab shall be finished in accordance with 5.3.4.2(f).

Type E Stair treads and landings, interior or exterior, shall receive a non-slip floated finish with a non-slip aggregate finished to a manual straightedge ‘flat’ tolerance per ACI 117 (1/4 in. in 10 feet).

5.3.4.2(j)1 Unformed surfaces which do not comply with the specified tolerances, and are deemed unacceptable by the Architect or installer of subsequent floor covering(s), shall be remedied by the Contractor in a manner acceptable to the Architect at no additional cost to the Owner.

5.3.5.1 Where not otherwise shown on Drawings, provide control joints in slabs on grade at column centerlines and at the following maximum spacing:

(a) Slabs less than 5 in. thick – 12 ft. c/c
(b) Slabs 5 in. to 8 in. thick – 16 ft. c/c
(c) Topping slabs – 8 ft. c/c
(d) Maximum panel width-to-length ratio: 1.5.

5.3.6.4(a) When forms are removed prior to 7 days, apply one coat of liquid curing compound to all formed surfaces within an hour of formwork removal.

5.3.6.5(e)1 A thin layer of water shall be applied to the slab surface just prior to placement of the waterproof sheet. The sheet shall remain in place for a minimum of 7 days. All edges and laps of the waterproof sheet shall be weighted down. All tears in the sheet shall be immediately repaired and the concrete surface re-wetted so that no portion of the concrete surface remains uncovered and all portions of the concrete surface remain continuously moist.

5.3.6.5(f)1 Apply curing compound to flatwork in two coats at right angles to each other per manufacturer’s recommendations. Total application rate shall be in accordance with manufacturer’s recommendations, but not less than 1 gal./200 ft^2. For rough surfaces, such as broom or scratch finishes, increase application rate per manufacturer’s recommendations, but by not less than 50%.

a. Correct coverage shall be maintained by the applicator and determined through accurate measurement of the material and the number of square feet to which it is applied.

b. Curing compound shall also be applied to formed surfaces, including beam and slab soffits, per manufacturer's recommendations when forms are removed sooner than 7 days after concrete is cast.

5.3.6.5(g) Unless otherwise noted, preservation of moisture in concrete shall be by application of a curing compound satisfying the requirements of 5.2.1.2. Apply the curing compound in accordance with 5.3.6.5(f)1.

5.3.6.5(h) Where curing compound will not be compatible with applied finishes or is not permitted because of proximate occupancy, application of water-retention sheeting materials per 5.3.6.5(e) or a continuous wet cure per 5.3.6.5(a), 5.3.6.5(b), 5.3.6.5(c) or 5.3.6.5(d) is required. Apply water-retention sheeting materials or wet cure all slabs to receive a bonded topping or bonded waterproof membrane. Wet cure slabs shown on the architectural drawings as requiring a wet cure.

5.3.7.1(a) All voids, damaged places, fins, projections, and honeycomb areas shall be removed down to sound concrete and repaired immediately after form removal. Any concrete that is not formed as shown on the contract drawings, is out of alignment or level, or indicates a defective surface or unsoundness of any nature shall be removed and replaced to the limits required by the Architect/Engineer unless permission is granted to patch or otherwise correct the defective work. Permission to patch or attempt the correction shall not be construed as a waiver of the Architect/Engineer's right to require complete removal of the defective work should the patching or correction prove to be, in the opinion of the Architect/Engineer, unsatisfactory either as to structure or appearance.

5.3.7.2(a) Grout tie holes with non-shrink grout in below-grade walls. Coat the applied area with the specified bonding agent per the manufacturer's instructions. **Do not grout tie holes in exposed to view walls unless otherwise noted**.

5.3.7.5(a) Repair materials other than site-mixed portland-cement mortar shall be submitted for approval.

5.3.7.7 All patching materials shall be proportioned to match color of surrounding material after patch material has cured. Prior to starting patching operation, test different techniques, grout mixes, and curing procedures on concealed areas to best match cast concrete. Obtain approval from the Architect/Engineer of patching material and methods prior to proceeding with patching.

Section 6 (ACI 301) – Architectural Concrete

6.1.1.1 Surfaces designated as Architectural Concrete on the Drawings shall comply with section 6 of ACI 301.

6.1.1.2 Refer to the architectural drawings for locations requiring special formwork or finishes; locations and size of form joints and ties; and location, size and profile of reveal patterns.

6.1.4.4(a)1 Preconstruction mock-ups shall be prepared at the site to demonstrate the Contractor's ability to form, place and achieve the architectural finishes specified.

6.1.4.4(b)1 Unless indicated otherwise on the drawings, wall mock-ups shall be minimum 12 feet long by 8 feet tall with full-scale thickness, and shall contain the following:

a. Horizontal construction joint
b. Vertical construction joint
c. Form ties
d. Rustications and bevels
e. Simulated repair area
f. Typical Reinforcing
g. Sealer or coating, if applicable

6.1.4.4(d) Accepted mock-ups shall be used as a standard for the Work. The mock-ups shall be kept intact and protected until directed by the Architect to be destroyed and debris removed from the site. A non-exposed-to-view concrete wall within the structure may be used as a mock-up panel with Architect's prior approval.

6.1.4.5(a)1 The Architect will periodically observe completed portions of architectural concrete for acceptance. The frequency of periodic acceptance shall be established and agreed upon in a preconstruction meeting arranged by the Contractor.

6.1.4.5(b)1 Architectural concrete declared un-acceptable during periodic observation requires submittal of a revised method of producing acceptable concrete before proceeding with additional architectural concrete construction.

6.2.1.8(c) Form ties for architectural concrete shall comply with 2.2.3.2.

6.2.2.1(e)1 To ensure that reused forms will not contain patches resulting from alterations, forms shall be reused only on identical sections.

6.2.2.1(f) Unless otherwise specified, formwork for architectural concrete finishes shall comply with SF-3.0 in accordance with 5.3.3.3(c).

Section 7 (ACI 301) - Lightweight Concrete

7.1.1 Delete this section of ACI 301.

Section 8 (ACI 301) – Mass Concrete

8.1.1.1 Concrete which is thicker than 4 feet in its minimum dimension for foundation concrete and thicker than 3 feet in its minimum dimension for concrete above grade, shall be subject to the provisions of this section.

8.2.1.2 Where necessary, use a retarding admixture conforming to ASTM C494, pretested with project materials under project conditions, to prevent cold joints or to help reduce the maximum temperature and rate of temperature rise of the concrete.

8.2.1.3 Do not use accelerating admixtures in mass concrete.

Section 9 (ACI 301) – Post-Tensioned Concrete

9.1.1.1 Delete this section of ACI 301.

Section 10 (ACI 301) – Shrinkage-Compensating Concrete for Interior Slabs

10.1.1 Delete this section of ACI 301.

Section 11 (ACI 301) – Industrial Floor Slabs

11.1.1 Delete this section of ACI 301.

Section 12 (ACI 301) – Tilt-Up Construction

12.1.1 Delete this section of ACI 301.

Section 13 (ACI 301) – Precast Structural Concrete

13.1.1 Delete this section of ACI 301. Where applicable, Precast Structural Concrete is specified in Specification Section 034100 – Precast Structural Concrete.

Section 14 (ACI 301) – Precast Architectural Concrete

14.1.1 Delete this section of ACI 301. Where applicable, Precast Architectural Concrete is specified in Specification Section 034500 – Precast Architectural Concrete.

END OF FOREGOING PARAGRAPH 1.8 ENTITLED "SUPPLEMENTAL REQUIREMENTS AND MODIFICATIONS TO ACI 301-16".

1.9 COLD WEATHER CONCRETING

A. The provisions of ACI 306.1 shall be followed for all concrete placed or cured when the average daily temperature is below 40 °F. The methods of protection to be used for cold weather concrete, including preservation of moisture for curing of the concrete, shall be submitted in writing to the Architect/Engineer for review at least one week prior to cold weather placement.

B. Plan construction schedule and obtain needed materials and equipment on the job site in advance of cold weather.

C. All reinforcement, formwork and top 12 inches of the subgrade shall be clear of ice and snow and be not less than 40 °F at time of placement of concrete. The temperature of large embedded items, such as weld plate assemblies for structural steel framing, shall be no less than 35 °F at time of placement.

D. The concrete temperature as placed shall not be less than specified in column (2) of Table 3.2.1 in ACI 306.1, and shall not exceed these values by more than 20 °F. The temperature of the concrete being discharged shall be tested by the testing agency whenever cylinders are cast, and hourly by the Contractor. The Contractor shall maintain and submit same to the Architect/Engineer weekly.

E. Any covering, insulation or housing shall be extended to protect projecting reinforcement and embedded items.

F. The Contractor shall install and read maximum/minimum thermometers twice daily during the construction and curing of all structural slabs in cold weather. Provide one thermometer for each 3000 square feet of slab. Place the thermometers near slab perimeter. The Contractor shall submit those temperature readings to the Architect/Engineer weekly.

G. Concrete shall be exposed to ambient temperature in a gradual manner after being cured. Refer to ACI 306.1, Table 3.2.1.

1.10 HOT WEATHER CONCRETING

A. The provisions of ACI 305.1 shall be followed for all concrete placed when the ambient air temperature is greater than 80 °F. Note: Concrete protection during windy conditions combined with heat or low humidity shall also conform to ACI 305.1. The methods of protection used for hot weather concreting shall be submitted in writing to the Architect/Engineer for review at least one week prior to hot weather placement.

B. Plan construction schedule and obtain needed materials and equipment on the job site in advance of hot weather.

C. The Contractor and ready-mix supplier shall review concrete mixes for use in hot weather with respect to placing requirements, strength and durability.

D. Concrete temperatures as discharged from the truck shall not exceed 95 °F. Ice, if used, shall be considered part of the total mix water (50 lbs. ice = 6 gallons of water). (Retarders in low slump superplasticized mixes may be required to comply with this requirement.)

E. The temperature of the concrete being discharged shall be tested by the testing agency whenever cylinders are cast, and hourly by the Contractor. The Contractor shall maintain a written record of these temperatures and submit same to the Architect/Engineer weekly.

F. Cool and moisten formwork and subgrade by sprinkling with water prior to placing concrete.

G. Placement and Finishing:

1. Concrete shall be discharged from the truck a maximum of one hour after the introduction of mix water to cement and aggregates.
2. Do not add water to mix to increase slump. Use the approved superplasticizer to maintain a placeable concrete mix.
3. Strike off and screed slabs immediately. Protect slab's surface against moisture loss prior to final finishing.
4. Thoroughly vibrate through all wall and column lift lines and adjacent slab placements to prevent cold joints.
5. Immediately apply liquid curing compound as specified in Section 5 (ACI 301) after final finishing. Follow with continuous wet curing as specified in paragraphs 5.3.6.5(a), 5.3.6.5(b), 5.3.6.5(c) or 5.3.6.5(d) (ACI 301) for a minimum of three days.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS ARE INCLUDED IN ARTICLES 1.8 THROUGH 1.10 ABOVE.

PART 3 - EXECUTION

3.1 EXECUTION REQUIREMENTS ARE INCLUDED IN ARTICLES 1.8 THROUGH 1.10 ABOVE.

END OF SECTION

SECTION 03 3010

CAST-IN PLACE CONCRETE (MINOR STRUCTURES)

PART 1 GENERAL

1.01 SUMMARY

A. This specification delineates the requirements for cast-in place concrete for minor structures including concrete kickers for pipe blocking, sidewalks, collars, manholes, manhole bottoms, pipe cradles, piers, and other areas where small quantities of concrete are required. It shall not be used for major structures such as floor slabs, structure or basin walls, roof slabs, or other structural components.

1.02 SCOPE OF WORK

A. Provide all labor, material, equipment, and services to complete all cast-in-place concrete work required by the Project as shown on the Drawings or specified herein.

1.03 REFERENCES

A. The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM)

ASTM A 185	Specification for Steel, Welded Wire, Fabric, Plain, for Concrete Reinforcement
ASTM A 497	Specification for Welded Deformed Steel Wire Fabric for Concrete Reinforcement
ASTM A 615/A615M	Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
ASTM A 616/A616M	Specification for Rail-Steel Deformed and Plain Bars for Concrete Reinforcement
ASTM A 617/A617M	Specification for Axle-Steel Deformed and Plain End Bars for Concrete Reinforcement
ASTM A 706/A706M	Specification for Low-Alloy Steel Deformed Bars for Concrete Reinforcement
ASTM C 33	Specification for Concrete Aggregates

ASTM C 150 Specification for Portland Cement

ASTM C 260 Specification for Air-Entraining Admixtures for Concrete

ASTM C 494 Specification for Chemical Admixtures for Concrete

1.04 SUBMITTALS

A. Copies of all materials required to establish compliance with these Specifications shall be submitted in accordance with the provisions of the General Conditions.

1.05 QUALITY ASSURANCE

A. All work shall be performed to secure for the entire job homogeneous concrete having required strength, durability and weathering resistance, without planes of weakness and other structural defects and free of pronounced honeycombs, air pockets, voids, projections, offsets of plane and other defacements on exposed surfaces.

1.06 DELIVERY, STORAGE AND HANDLING

A. Do not deliver ready-mixed concrete to job site until ready for placement.

B. All materials used for on-site mixed concrete shall be kept clean and free from all foreign matter during transportation and handling and kept separate until measured and placed in the mixer.

C. Store concrete aggregates to prevent contamination or segregation. Store reinforcement of different sizes and shapes in separate piles or racks raised above the ground to avoid excessive rusting.

D. Protect from contaminants such as grease, oil, and dirt. Provide for accurate identification after bundles have been broken and tags removed.

1.07 PROJECT/SITE CONDITIONS

A. Cold Weather

1. Provide and maintain 50 degrees Fahrenheit minimum concrete temperature. Do not place concrete when ambient temperature is below 40 degrees Fahrenheit. Cover concrete and provide with a source of heat sufficient to maintain 50 degrees Fahrenheit minimum while curing.

B. Hot Weather

1. Concrete temperature from initial mixing through final cure shall not exceed 90 degrees Fahrenheit. Cool ingredients before mixing, or substitute chip ice for part of required mixing water or use other suitable means to control concrete temperature to prevent rapid drying of newly

placed concrete. Shade the fresh concrete and start curing as soon as the surface is sufficiently hard to permit curing without damage.

PART 2 PRODUCTS

2.01 CONCRETE

A. Mix Design

1. The concrete mix shall conform to the requirements of the following table according to the class of concrete required. The number in the "Class" column refers to the 28-day compressive strength of the concrete in pounds per square inch (psi).

Class	Minimum Cement Content (Lbs./Cu. Yd.)	*Maximum Slump (Inches)
3000	470	3 to 4
3500	520	3 to 4
4000	550	3 to 4

* Maximum slump unless high range water reducing admixture is used.

B. Area of Application

1. Unless otherwise noted on the Drawings, concrete mixes shall be used as follows:

Class 3000 - kickers for pipe, fittings
Class 3500 - non-reinforced portions of manholes, pipe cradles
Class 4000 - reinforced portions of manholes, sidewalks, piers

2.02 MATERIALS

A. Cement

1. Portland cement for concrete and mortar shall conform to ASTM C 150, Type I or II.

B. Water

1. Water shall be potable.

C. Aggregates

1. Aggregates shall conform to ASTM C 33. Obtain aggregates from one source. Aggregates shall not contain any substance which may be deleteriously reactive with the alkalis in the cement.

D. Admixtures

1. Admixtures for air-entrained concrete shall conform to ASTM C 260, for water reducing (Type A, D or E) accelerating (Type C) and retarding (Type B or D) ASTM C 494. Calcium chloride shall not be used as an admixture. Admixtures shall not be used without prior written approval of the ENGINEER.

E. Reinforcement

1. Reinforcing Bars

a. Reinforcing bars shall conform to ASTM A 615/A615M Grade 60, ASTM A 616/A616M Grade 60, ASTM A 617/A617M Grade 60 or ASTM A 706/A706M Grade 60 as applicable.

2. Welded Wire Fabric

a. Welded wire fabric shall conform to ASTM A 497 or ASTM A 185.

PART 3 EXECUTION

3.01 FORMS

A. Forms shall be used to confine concrete and shape it to the required dimensions. Set forms true to line and grade and make mortar tight. Chamfer above grade exposed joints, edges, and external corners 3/4-inch, unless otherwise indicated. Earth cuts may be used as forms for footing vertical surfaces, if sides are sharp and true, and not exposed in finished structure.

3.02 PLACING REINFORCEMENT AND MISCELLANEOUS MATERIALS

A. Provide bars, wire fabric and other reinforcing materials, including wire ties, supports and other devices necessary to install and secure the reinforcement.

3.03 CONTROL AND CONSTRUCTION JOINTS

A. For sidewalks, provide control joints spaced at an interval equal to the width of the sidewalk, the minimum spacing of 5 feet. Cut joints 1 inch deep with a jointing tool after the surface has been finished. Provide 0.5-inch thick transverse expansion joints at changes in direction, where sidewalk abuts curb, steps, rigid pavement, or other similar structures; space joints not more than 40 feet apart. Limit variation in cross section to 1/4-inch in 5 feet.

3.04 CURING AND PROTECTION

A. Protect concrete from injurious action by sun, wind, rain, flowing water, or mechanical injury. Do not allow concrete to dry out from time of placement until the expiration of the curing period. Forms may be removed 48 hours after concrete placement.

END OF SECTION

***

SECTION 040523 - ADJUSTABLE CONCEALED LINTEL SYSTEM

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Adjustable concealed lintel system and accessories, including spin system with mid-support if needed.

B. Support brackets to be attached to anchor channels or framing and mounting channels.

1.2 REFERENCE STANDARDS

A. ASTM A36/A36M – Standard Specification for Carbon Structural Steel.

B. ASTM A123/A123M – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

C. ASTM A153/A153M – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

D. ASTM B633 – Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.

E. ASTM F568M – Standard Specification for Carbon and Alloy Steel Externally Threaded Metric Fasteners.

F. AWS B2.1/B2.1M – Specification for Welding Procedure and Performance Qualification.

G. AWS D1.1/D1.1M – Structural Welding Code – Steel.

1.3 COORDINATION

A. Coordinate the Work with installation of component assembly into masonry components without interfering with masonry reinforcement.

B. Coordinate welding in accordance with AWS B2.1/B2.1M for mid-span support and HALFEN mounting and framing channels.

1.4 PREINSTALLATION MEETINGS

A. Convene pre-installation meeting 2 weeks before start of work of this section.

B. Require attendance of parties directly affecting work of this section, including Construction Manager, Contractor, Architect, Engineer, installer, and manufacturer’s representative.

C. Review materials, preparation, installation, tolerances, protection, and coordination with other work.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer’s product data, including project specific installation instructions.

B. Shop Drawings:

1. Submit manufacturer's project specific shop drawings, indicating component profiles, sizes, connection attachments, anchorage, size and type of fasteners, and accessories.
2. Indicate welded connections using standard welding symbols.
3. Indicate net weld lengths.

C. Manufacturer's Certification: Submit manufacturer's certification that materials comply with specified requirements and are suitable for intended application.

D. Delegated-Design Submittal: Submit manufacturer's design data, including project specific structural calculations, shop drawings, and installation drawings, signed and sealed by qualified professional engineer registered in state of the installation. System is Delegated-Design for performance requirements and to include all fasteners to primary structure and 13% Tested Thermal Loss.

E. Warranty Documentation: Submit manufacturer's standard warranty.

1.6 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Capable of providing field service representation during installation.
2. Minimum of 5 years of experience in manufacture of adjustable concealed lintel system for masonry.
3. Experience in projects of similar scope.
4. Manufacture in accordance with established quality assurance program.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Storage and Handling Requirements:

1. Store and handle materials in accordance with manufacturer's instructions.
2. Keep materials in manufacturer's original, unopened containers and packaging until installation.
3. Store materials in clean, dry area indoors.
4. Protect materials and finish during storage, handling, and installation to prevent damage.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Product: Subject to compliance with requirements, provide Halfen USA, Inc.; Adjustable Concealed Lintel System Assembly (FBRA-4) or comparable product by the following:

1. FERO Corporation; Custom Concealed Lintel Support System.
2. Hohmann & Barnard, Inc.; Concealed Lintel System.

2.2 MATERIALS

A. Adjustable Concealed Lintel System for Masonry:

1. Concealed Lintel Spines / Horseshoe Plates / Stitching Rods / Mid-span Support / Nuts and Bolts: Structural carbon steel, ASTM A36, then hot-dip galvanized, ASTM A123 or A153 as applicable.

2. Anchor Channels / Support Brackets / Stitching Rods / Nuts and Bolts: Structural carbon steel, ASTM A36, then hot-dip galvanized, ASTM A123 or A153 as applicable.

    a. Bolts and Nuts:

        1) Bolt-Type Fasteners: T-head, in contact with channel slot faces, carbon steel, ASTM F568M.
        2) Finish for Carbon Steel T-Bolts: Hot-dip galvanized, ASTM A123.
        3) Nuts: Carbon steel.

2.3 FABRICATION

A. Fabricate components to design required and provide for site-required adjustments.

B. Weld and grind components flush and smooth with adjacent finish surface.

1. Make exposed joints butt tight, flush, and hairline.
2. Ease exposed edges to small uniform radius.

C. Weld components indicated on shop drawings.

2.4 FINISHES

A. Structural Carbon Steel Components and Anchors: Hot-dip galvanized after fabrication, ASTM A123.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and supports to receive adjustable concealed lintel system.

B. Verify dimensions, tolerances, and method of attachment with other work.

C. Notify Architect of conditions that would adversely affect installation.

D. Do not begin installation until unacceptable conditions are corrected.

3.2 PREPARATION

A. Supply items required to be placed in masonry with setting templates to appropriate sections.

3.3 INSTALLATION

A. Install adjustable concealed lintel system in accordance with manufacturer’s instructions at locations indicated on the Drawings.

B. Install items plumb and level, accurately fitted, free from distortion or defects.

C. Adjust components to suit site conditions.

D. Provide formwork for placement in masonry to maintain true alignment until completion of permanent attachment.

E. Obtain approval from Architect and manufacturer before site cutting or making adjustments not scheduled.

F. Perform field welding in accordance with AWS D1.1/D1.1M where necessary using certified welders.

3.4 TOLERANCES

A. Maximum Variation from Level: 1/8 inch.

3.5 PROTECTION

A. Protect installed adjustable concealed lintel system from damage during construction.

B. Touch-up damage to factory-applied finishes using appropriate materials and techniques.

END OF SECTION 040523

SECTION 040524 - ADJUSTABLE BRICKWORK SUPPORT SYSTEM

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Adjustable Brickwork Support System and Accessories:

1. Support Bracket Types: As indicated on Drawings.
2. Individual Masonry Support Bracket Types: As indicated on Drawings.

B. Assembly provides steel components for adjustable support of brickwork above horizontal masonry joints and openings.

C. System attached to substrate by one of the following:

1. Cast-in channel anchors for attachment of adjustable brickwork supports:

a. Embedded Channel Type: Type HTA.
b. T-head adjusting bolts.
c. Washers.
d. Locking nuts.

2. Special Brackets and Applications:

a. Grouted-in-Wall Anchors: Type KM.

1.2 REFERENCE STANDARDS

A. ASTM A36/A36M – Standard Specification for Carbon Structural Steel.

B. ASTM A123/A123M – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

1.3 COORDINATION

A. Coordinate the Work with installation of adjustable brickwork support system connections onto structural supporting components.

1.4 PREINSTALLATION MEETINGS

A. Convene preinstallation meeting 2 weeks before start of work of this section.

B. Require attendance of parties directly affecting work of this section, including Construction Manager, Contractor, Architect, Engineer, installer, and manufacturer’s representative.

C. Review materials, preparation, installation, tolerances, protection, and coordination with other work.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's product data, including project specific installation instructions.

B. Shop Drawings: Submit manufacturer's project specific shop drawings, indicating component profiles, sizes, connection attachments, anchorage, size and type of fasteners, and accessories.

C. Manufacturer's Certification: Submit manufacturer's certification that materials comply with specified requirements and are suitable for intended application.

D. Delegated-Design Submittal: Submit manufacturer's design data, including project specific structural calculations, shop drawings, and installation drawings, prepared, signed and sealed by qualified professional engineer registered in state of the installation. System is Delegated-Design for performance requirements and to include all fasteners to primary structures and 13% Tested Thermal Loss.

E. Warranty Documentation: Submit manufacturer's standard warranty.

1.6 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Capable of providing field service representation during installation.
2. Minimum of 5 years experience in manufacture of adjustable brickwork support system.
3. Experience in projects of similar scope.
4. Manufacture in accordance with established quality assurance program.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Storage and Handling Requirements:

1. Store and handle materials in accordance with manufacturer's instructions.
2. Keep materials in manufacturer's original, unopened containers and packaging until installation.
3. Store materials in clean, dry area indoors.
4. Protect materials and finish during storage, handling, and installation to prevent damage.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Product: Subject to compliance with requirements, provide Halfen USA, Inc.; Halfen FK4 Adjustable Brickwork Support System Assembly (FBRA-3) or comparable product by the following:

1. FERO Corporation; FERO FAST Thermal Bracket System, consisting of FAST Thermal (Standard, Lintel, Inverted, TTS, Extended Clip Profiles, or other custom) Brackets, Rectangular Washers, Shim Rods, and a minimum of 3 Shim Plates per clip.

2.2 MATERIALS

A. Components of Adjustable Brickwork Support System:

1. Adjustable Brickwork Support System and Accessories:

    a. Support Bracket Types: As indicated on Drawings.
    b. Individual Masonry Support Bracket Types: As indicated on Drawings.

2. Assembly provides steel components for adjustable support of brickwork above horizontal masonry joints and openings.

3. System attached to substrate by one of the following:

    a. Cast-in channel anchors for attachment of adjustable brickwork supports:

        1) Embedded Channel Type: Type HTA.
        2) T-head adjusting bolts
        3) Washers.
        4) Locking nuts.

    b. Special Brackets and Applications:

        1) Grouted-in-Wall Anchors: Type KM.
        2) Parapet Support Brackets: Type HAV.
        3) Support Brackets Facing Brick around Columns:

2.3 FABRICATION

A. Shop assemble items for delivery to site in variety of sizes required. Provide complete assembly.

B. Mechanical Fastenings: Bolts, nuts, and washers consistent with design of components.

2.4 FINISHES

A. Unprotected Steel: Clean surfaces of rust, scale, grease, and foreign matter before finish or galvanizing.

B. Structural Carbon Steel Components: Hot-dip galvanized after fabrication, ASTM A123.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and supports to receive adjustable brickwork support system.

B. Verify dimensions, tolerances, and method of attachment with other work.

C. Notify Architect of conditions that would adversely affect installation.

D. Do not begin installation until unacceptable conditions are corrected.

3.2 PREPARATION

A. Supply items required to be attached to substrate with setting templates to appropriate sections.

3.3 INSTALLATION

A. Install adjustable brickwork support system in accordance with manufacturer's instructions at locations indicated on the Drawings.

B. Install items plumb and level, accurately fitted, free from distortion or defects.

C. Adjust components to suit site conditions.

D. Obtain approval from Architect and manufacturer before site cutting or making adjustments not scheduled.

3.4 TOLERANCES

A. Maximum Variation from Plumb: 1/8 inch.

3.5 PROTECTION

A. Protect installed adjustable brickwork support system from damage during construction.

B. Touch-up damage to factory-applied finishes using appropriate materials and techniques.

END OF SECTION 040524

SECTION 042000 - UNIT MASONRY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Concrete masonry units.
2. Lintels.
3. Brick.
4. Mortar and grout materials.
5. Reinforcement.
6. Ties and anchors.
7. Embedded flashing.
8. Accessories.
9. Mortar and grout mixes.

B. Products Installed but not Furnished under This Section:

1. Steel lintels in unit masonry.
2. Steel shelf angles for supporting unit masonry.
3. Cavity wall insulation adhered to masonry backup.

C. Related Requirements:

1. Section 014339 "Mockups" for integrated exterior mockup requirements.
2. Section 019115 "Building Enclosure Commissioning."
3. Section 044200 "Exterior Stone Cladding" for stone trim secured with stone anchors.
4. Section 072100 "Thermal Insulation" for cavity wall insulation.
5. Section 076200 "Sheet Metal Flashing and Trim" for exposed sheet metal flashing and for furnishing manufactured reglets installed in masonry joints.

1.3 DEFINITIONS

A. CMU(s): Concrete masonry unit(s).

B. Reinforced Masonry: Masonry containing reinforcing steel in grouted cells.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Discussion topics shall include;

    a. Schedule.
    b. Sequence.
    c. Coordination of trades.
    d. Substrate review and acceptance.
    e. Protection
    f. Shop drawings and submittals.
    g. Interface condition and details.
    h. Environmental constraints.
    i. Mockups.
    j. Testing requirements.
    k. Field quality control efforts.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Project specific. For the following:

1. Masonry Units: Indicate sizes, profiles, coursing, and locations of special shapes.
2. Reinforcing Steel: Indicate bending, lap lengths, and placement of unit masonry reinforcing bars. Comply with ACI 315R. Indicate elevations of reinforced walls.
3. Fabricated Flashing: Detail corner units, end-dam units, and other special applications.
4. Coordinate with air/vapor barrier shop drawings, clearly showing flashings, penetrations, locations of control and expansion joints on all building elevations. Include integration with adjacent materials and membranes.

C. Samples for Verification: For each type and color of the following, provide one each:

1. Clay face brick, in the form of straps of five or more bricks.
2. Special brick shapes.
3. Pigmented mortar. Make Samples using same sand and mortar ingredients to be used on Project.
4. Weep/cavity vents.
5. Cavity drainage material.
6. Accessories embedded in masonry.

D. Delegated Design Submittals: For masonry anchors and ties, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

E. Sustainable Design Submittals:

1. Product Certificates: For regional materials, indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include distance to Project and cost for each regional material.

1.6 INFORMATIONAL SUBMITTALS

A. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers,

source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates.

1. Submittal is for information only. Receipt of list does not constitute approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Architect and approved in writing.

B. Material Certificates: For each type of the following:

1. Masonry units.

a. Include data on material properties and test reports for absorption.
b. For brick, include size-variation data verifying that actual range of sizes falls within specified tolerances.
c. For exposed brick, include test report for efflorescence in accordance with ASTM C67/C67M.

2. Cementitious materials. Include name of manufacturer, brand name, and type.
3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.
4. Grout mixes. Include description of type and proportions of ingredients.
5. Reinforcing bars.
6. Joint reinforcement.
7. Anchors, ties, and metal accessories.

C. Qualification Statements: For testing agency.

D. Delegated design engineer qualifications.

E. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.

1. Include test reports for mortar mixes required to comply with property specification. Test in accordance with ASTM C109/C109M for compressive strength, ASTM C1506 for water retention, and ASTM C91/C91M for air content.
2. Include test reports, in accordance with ASTM C1019, for grout mixes required to comply with compressive strength requirement.

F. Statement of Compressive Strength of Masonry: For each combination of masonry unit type and mortar type, provide statement of average net-area compressive strength of masonry units, mortar type, and resulting net-area compressive strength of masonry determined in accordance with TMS 602.

G. Cold-Weather and Hot-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with requirements.

H. Manufacturer's Certificates:

1. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.7 QUALITY ASSURANCE

A. Qualifications:

1. Installers: All masonry flashing installers must complete the International Masonry Institute Flashing Upgrade training course.
2. Delegated Design Engineer: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.
3. Testing Agency Qualifications: Qualified in accordance with ASTM C1093 for testing indicated.

1.8 MOCKUPS

A. Wall Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, to set quality standards for materials and execution, and to set quality standards for installation. See Section 014339 "Mockups" for additional construction requirements for integrated exterior mockups.

1. Build mockups for each type of exposed unit masonry construction typical exterior wall in sizes approximately 96 inches (2438 mm) long by 48 inches (1219 mm) high by full thickness, including face and backup wythes and accessories.

    a. Include a joint with sealant and joint backer (to avoid three-sided sealant adhesion) at least 16 inches (406 mm) long in each mockup.
    b. Include lower corner of window opening at upper corner of exterior wall mockup. Make opening approximately 12 inches (305 mm) wide by 16 inches (406 mm) high.
    c. Include through-wall flashing installed for a 24-inch (610-mm) length in corner of exterior wall mockup approximately 16 inches (406 mm) down from top of mockup, with a 12-inch (305-mm) length of flashing left exposed to view (omit masonry above half of flashing). Include end dams.
    d. Include metal studs, sheathing, sheathing joint-and-penetration treatment, air barrier, veneer anchors, flashing, end dams, cavity drainage material, and mesh weep/vents, and any other accessory that will be used to construct the wall in exterior masonry-veneer wall mockup.

2. Clean one-half of exposed faces of mockups with masonry cleaner as indicated.
3. Protect accepted mockups from the elements with weather-resistant membrane.
4. Approval of mockups is for color, texture, and blending of masonry units; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship and also to confirm whether the components are properly installed per the design intent and recognized industry standards to remain air and watertight.
5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations by Change Order.
6. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
7. Refer to Section 019117 “Building Enclosure Functional Performance Testing” for mockup testing requirements.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.

B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

D. Deliver preblended, dry mortar mix in moisture-resistant containers. Store preblended, dry mortar mix in delivery containers on elevated platforms in a dry location or in covered weatherproof dispensing silos.

E. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.10 FIELD CONDITIONS

A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.

1. Extend cover a minimum of 24 inches (610 mm) down both sides of walls, and hold cover securely in place.
2. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches (610 mm) down face next to unconstructed wythe, and hold cover in place.

B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least three days after building masonry walls or columns.

C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.

1. Protect base of walls from rain-splashed mud and from mortar splatter by spreading coverings on ground and over wall surface.
2. Protect sills, ledges, and projections from mortar droppings.
3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.
4. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.

D. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in TMS 602.

1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F (4 deg C) and higher and will remain so until masonry has dried, but not less than seven days after completing cleaning.

E. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in TMS 602.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain exposed masonry units cementitious mortar components and mortar aggregate from single source producer or manufacturer.

B. For exposed masonry units and cementitious mortar components *within each specified color range*, obtain each color and grade from single source with resources to provide materials of consistent quality in appearance and physical properties.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design masonry anchors and ties.

B. Provide unit masonry that develops indicated net-area compressive strengths at 28 days.

1. Determine net-area compressive strength of masonry from average net-area compressive strengths of masonry units and mortar types (unit-strength method) in accordance with TMS 602.
2. Determine net-area compressive strength of masonry by testing masonry prisms in accordance with ASTM C1314.

2.3 UNIT MASONRY, GENERAL

A. Masonry Standard: Comply with TMS 602, except as modified by requirements in the Contract Documents.

B. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to contain chips, cracks, or other defects exceeding limits stated. Do not use units where such defects are exposed in the completed Work.

C. Fire-Resistance Ratings: Comply with requirements for fire-resistance-rated assembly designs indicated.

1. Where indicated, provide units that comply with requirements for fire-resistive ratings indicated as determined by testing according to ASTM E 119, by equivalent masonry thickness, or by other means, as acceptable to authorities having jurisdiction.

2.4 CONCRETE MASONRY UNITS (CMU-1)

A. Regional Materials: Verify CMUs are manufactured within 100 miles (160 km) of Project site from aggregates and cement that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

B. Shapes: Provide shapes indicated and as follows, with exposed surfaces matching exposed faces of adjacent units unless otherwise indicated.

1. Provide special shapes for lintels, corners, jambs, sashes, movement joints, headers, bonding, and other special conditions.
2. Provide bullnose units for outside corners unless otherwise indicated.

C. CMUs: ASTM C90, normal weight unless otherwise indicated.

1. Unit Compressive Strength: As indicated on Drawings.
2. Size (Width): Manufactured to dimensions 3/8 inch (10 mm) less than nominal dimensions.

2.5 LINTELS

A. Solid Concrete Masonry Lintels: ASTM C1623, matching CMUs in color, texture, and density classification; and with reinforcing bars indicated. Provide lintels with net-area compressive strength of not less than that of CMUs.

B. Masonry Lintels: Prefabricated or built-in-place masonry lintels made from bond beam CMUs matching adjacent CMUs in color, texture, and density classification, with reinforcing bars placed as indicated and filled with coarse grout. Cure precast lintels before handling and installing. Temporarily support built-in-place lintels until cured.

2.6 BRICK (FBR-1A/B, FBR-2, FBR-3)

~~*A. Indigenous Materials: Verify brick is manufactured within 500 miles (800 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles (800 km) of Project site. If transporting materials by rail or water, multiply the distance transported by rail or water by 0.25 to determine the distance to Project site.*~~

~~*B. Regional Materials: Verify brick is manufactured within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.*~~

C. General: Provide shapes indicated and as follows, with exposed surfaces matching finish and color of exposed faces of adjacent units:

1. For ends of sills and caps and for similar applications that would otherwise expose unfinished brick surfaces, provide units without cores or frogs and with exposed surfaces finished.
2. Provide special shapes for applications where stretcher units cannot accommodate special conditions, including those at corners, movement joints, bond beams, sashes, and lintels and where shapes produced by sawing would result in sawed surfaces being exposed to view, including but not limited to, 24-inch long units to be used in areas where exposed brick would be less than a quarter of length of typical brick unit. Provide special shapes as required for Adjustable Concealed Lintel System and Adjustable Brick Support System.

D. Clay Face Brick: Facing brick complying with ASTM C216, Grade SW, Type FBX.

1. Basis-of-Design Manufacturer: Subject to compliance with all specified requirements including, but not limited to, brick color, texture, and size/profile, provide Basis-of-Design as noted below, or from list of Acceptable Manufacturers;

a. Interstate Brick.
b. Belden Brick Company (The).
c. Glen-Gery Corporation.
d. Summit Brick Company.

2. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 6200 psi and Maximum Saturation Coefficient of 0.78.
3. Initial Rate of Absorption: Less than 30 g/30 sq. in. (30 g/194 sq. cm) per minute when tested in accordance with ASTM C67/C67M.
4. Efflorescence: Provide brick that has been tested in accordance with ASTM C67/C67M and is rated "not effloresced."
5. Size (Actual Dimensions): 3-5/8 inches (92 mm) wide by 2-1/4 inches (57 mm) high by 15-5/8 inches (397 mm) long.
6. Application: Use where brick is exposed unless otherwise indicated.
7. Color and Texture:

a. FBR-1A: *Basis-of-Design: Interstate Brick*: Beige; Smooth; Matte Finish; Color: Custom 2-Part blend of Artic White (67%) and Ash (33%). Mortar color: Prism Pigments; P2610 Camel.
b. FBR-1B: *Basis-of-Design: Interstate Brick*: Beige; Textured; Scratch Finish; Color: Custom 2-Part blend of Artic White (67%) and Ash (33%) to match FBR-1A. Mortar color: Prism Pigments; P2610 Camel.
c. FBR-2: Terracotta; Basis-of-Design: Belden Brick Company: Velour Finish; Color: Regal Blend. Mortar color: Prism Pigments; P4640 Rootbeer.
d. FBR-3: Dark Terracotta; Basis-of-Design: Belden Brick Company: Velour Finish; Mix of 50% Bismark Dark and 50% Regal Blend (Pre-Sorted to remove the lightest color in this range). Mortar color: Prism Pigments; P4640 Rootbeer.

2.7 MORTAR AND GROUT MATERIALS

A. Regional Materials: Manufacture aggregate for mortar and grout within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

B. Portland Cement: ASTM C150/C150M, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.

1. Alkali content will not be more than 0.1 percent when tested in accordance with ASTM C114.

C. Hydrated Lime: ASTM C207, Type S.

D. Portland Cement-Lime Mix: Packaged blend of portland cement and hydrated lime containing no other ingredients.

E. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes and complying with ASTM C979/C979M. Use only pigments with a record of satisfactory performance in masonry mortar.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Prism Corporation; Prism Pigments.

F. Aggregate for Mortar: ASTM C144.

1. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.
2. For joints less than 1/4 inch (6.4 mm) thick, use aggregate graded with 100 percent passing the No. 16 (1.18-mm) sieve.
3. White-Mortar Aggregates: Natural white sand or crushed white stone.
4. Colored-Mortar Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color.
5. Aggregate shall contain no more than 50 parts per million of chloride ions and shall be free of organic contaminants.

G. Aggregate for Grout: ASTM C404. Aggregate shall contain no more than 50 parts per million of chloride ions and shall be free of organic contaminants.

H. Cold-Weather Admixture: Not allowed. Nonchloride, noncorrosive, accelerating admixture complying with ASTM C 494/C 494M, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.

I. Water: Potable.

2.8 REINFORCEMENT

A. Uncoated-Steel Reinforcing Bars: ASTM A615/A615M or ASTM A996/A996M, Grade 60 (Grade 420).

B. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells and to hold reinforcing bars in center of cells. Units are formed from 0.148-inch (3.77-mm) steel wire, hot-dip galvanized after fabrication. Provide units designed for number of bars indicated.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Heckmann Building Products, Inc.; No. 376 Rebar Positioner.
b. Hohmann & Barnard, Inc; #RB or #RB-Twin Rebar Positioner.
c. Wire-Bond; O-Ring or Double O-Ring Rebar Positioner.

C. Masonry-Joint Reinforcement, General: ASTM A951/A951M.

1. Interior Walls: Hot-dip galvanized carbon steel.
2. Exterior Walls: Stainless steel.
3. Wire Size for Side Rods: 0.148-inch (3.77-mm) diameter.
4. Wire Size for Cross Rods: 0.148-inch (3.77-mm) diameter.
5. Wire Size for Veneer Ties: 0.148-inch (3.77-mm) diameter.
6. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches (406 mm) o.c.
7. Provide in lengths of not less than 10 ft. (3 m), with prefabricated corner and tee units.

D. Masonry-Joint Reinforcement for Single-Wythe Masonry: Ladder or truss type with single pair of side rods.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Hohmann & Barnard, Inc.
b. Wire-Bond.

2.9 TIES AND ANCHORS

A. General: Ties and anchors extend at least 1-1/2 inches (38 mm) into veneer but with at least a 5/8-inch (16-mm) cover on outside face.

B. Materials: Provide ties and anchors specified in this article that are made from materials that comply with the following unless otherwise indicated:

1. Stainless Steel Wire: ASTM A580/A580M, Type 304.
2. Stainless Steel Sheet: ASTM A240/A240M or ASTM A666, Type 304.

C. Partition Top Anchors: 0.105-inch- (2.66-mm-) thick metal plate with a 3/8-inch- (10-mm-) diameter metal rod 6 inches (152 mm) long welded to plate and with closed-end plastic tube fitted over rod that allows rod to move in and out of tube. Fabricate from stainless steel.

D. Rigid Anchors: Fabricate from steel bars 1-1/2 inches (38 mm) wide by 1/4 inch (6.4 mm) thick by 24 inches (610 mm) long, with ends turned up 2 inches (51 mm) or with cross pins unless otherwise indicated.

1. Corrosion Protection: Hot-dip galvanized to comply with ASTM A153/A153M.

E. Adjustable Masonry-Veneer Anchors (FBRA-1/2):

1. General: Provide anchors that allow vertical adjustment but resist a 100 lbf (445 N) load in both tension and compression perpendicular to plane of wall without deforming or developing play in excess of 1/16 inch (1.6 mm).
2. Fabricate wire ties from 0.187-inch- (4.76-mm-) diameter, stainless steel wire unless otherwise indicated.
3. Masonry-Veneer Anchors; Single-Barrel Screw with Double-Pintle Wingnut: Self-drilling, single-barrel screw with thermally resistant wingnut head designed to receive double-pintle wire tie. Screw has a smooth barrel the same thickness as insulation with factory-installed gasketed washer to seal at face of insulation and sheathing and a coating to reduce thermal conductivity. Use in conjunction with Thermal-Grip brick-tie washers. Use Concrete/CMU Screw where backup in Cast-in-Place Concrete or CMU.

a. Basis-of-Design Product: Subject to compliance with requirements, provide Heckmann Building Products, Inc.; Pos-I-Tie with ThermalClip or a comparable product by one of the following:

1) Hohmann & Barnard, Inc.; 2-Seal Thermal Wing Nut Anchor.

4. Stainless Steel Drill Screws for Steel Studs: ASTM C954 except manufactured with hex washer head and neoprene or EPDM washer, No. 10 (4.83 mm) diameter by length required to penetrate steel stud flange with not less than three exposed threads; either made from Type 410 stainless steel or made with a carbon-steel drill point and 300 Series stainless steel shank.

2.10 EMBEDDED FLASHING

A. Metal Flashing: Provide metal flashing complying with SMACNA's "Architectural Sheet Metal Manual" and as follows:

1. Stainless Steel: ASTM A240/A240M or ASTM A666, Type 304, 0.016 inch (0.40 mm) thick.
2. Fabricate continuous flashings in sections 96 inches (2438 mm) long minimum, but not exceeding 12 ft. (3.7 m). Provide splice plates at joints of formed, smooth metal flashing.
3. Fabricate through-wall flashing with snaplock receiver on exterior face where indicated to receive counterflashing.
4. Fabricate through-wall flashing with drip edge (TWF-2) unless otherwise indicated. Fabricate by extending flashing 1/2 inch (13 mm) out from wall, with outer edge bent down 30 degrees and hemmed.
5. Fabricate metal drip edges (TWF-2) and end dams from stainless steel. Extend at least 3 inches (76 mm) into wall and 1/2 inch (13 mm) out from wall, with outer edge bent down 30 degrees and hemmed. Provide Lipped Brick Profile where indicated on Drawings.
6. Fabricate metal expansion-joint strips and end dams from stainless steel to shapes indicated.
7. Solder metal items at corners. Fabricate fully soldered end dams.

B. Flexible Flashing: Use one of the following unless otherwise indicated:

1. Stainless Steel Fabric Flashing (FLXF-1): Composite, flashing product consisting of 2 mil (0.05 mm) of Type 304 stainless steel sheet, bonded to a layer of polymeric fabric with an adhesive. Flashing to be compatible with fluid applied, vapor-retarding membrane air barrier. Verify in writing from the Manufacturer.

a. Products: Subject to compliance with requirements, provide one of the following:

1) Hohmann & Barnard, Inc; Mighty-Flash.
2) York Manufacturing, Inc; Multi-Flash SS 304.

b. Flashing materials must be able to withstand 300º F temperature without changing the long-term performance of the flashing.

C. Solder and Sealants for Sheet Metal Flashings:

1. Solder for Stainless Steel: ASTM B32, Grade Sn60, with acid flux of type recommended by stainless steel sheet manufacturer.
2. Elastomeric Sealant: ASTM C920, chemically curing silicone sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and remain watertight.

D. Adhesives, Primers, and Seam Tapes for Flashings: Flashing manufacturer's standard products or products recommended by flashing manufacturer for bonding flashing sheets to each other and to substrates. Provide products that are compatible with air barrier membrane.

E. Termination Bars for Flexible Flashing (TWF-1): Stainless steel bars 1/8 inch by 1 inch (3.2 mm by 25 mm).

2.11 ACCESSORIES

A. Compressible Filler (MA-2): Premolded filler strips complying with ASTM D1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.

B. Preformed Control-Joint Gaskets (MA-1): Made from styrene-butadiene-rubber compound, complying with ASTM D2000, Designation M2AA-805 or PVC, complying with ASTM D2287, Type PVC-65406 and designed to fit standard sash block and to maintain lateral stability in masonry wall; size and configuration as indicated.

C. Bond-Breaker Strips (MA-3): Asphalt-saturated felt complying with ASTM D226/D226M, Type I (No. 15 asphalt felt).

D. Weep/Cavity Vents: Use the following unless otherwise indicated:

1. Cellular Plastic Weep/Vent (WPS-1): One-piece, flexible extrusion made from UV-resistant polypropylene copolymer, full height and width of head joint and depth 1/8 inch (3.2 mm) less than depth of outer wythe, in color selected from manufacturer's standard.

a. Products: Subject to compliance with requirements, provide one of the following:

1) Advanced Building Products Inc.; Mortar Maze Weep Vent.
2) Heckmann Building Products, Inc.; No. 85 Cell Vent.
3) Hohmann & Barnard, Inc; QV Quadro-Vent.
4) Mortar Net Solutions.
5) Wire-Bond; Cell Vent (#3601).

E. Cavity Drainage Material (WPS-2): Free-draining mesh, made from polymer strands that will not degrade within the wall cavity. Cavity drainage material should completely fill the full width of the air space.

1. Mortar Deflector: Strips, full depth of cavity and 10 inches (254 mm) high, with dovetail-shaped notches that prevent clogging with mortar droppings.

a. Basis-of-Design Product: Subject to compliance with requirements, provide Mortar Net Solutions; Mortar Net with Insect Barrier or a comparable product by one of the following:

1) Advanced Building Products Inc.
2) Hohmann & Barnard, Inc.
3) Masonry Accessories, Inc.
4) Wire-Bond.

F. Proprietary Acidic Masonry Cleaner: The use of hydrochloric acids and cleaners containing salts that form hydrochloric acid in solution is prohibited. Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Diedrich Technologies, Inc.; a Hohmann & Barnard company.

b. EaCo Chem, Inc.
c. PROSOCO, Inc.

2.12 MORTAR AND GROUT MIXES

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures unless otherwise indicated.

1. Do not use calcium chloride in mortar or grout.
2. Limit cementitious materials in mortar to portland cement and lime.
3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.

B. Preblended, Dry Mortar Mix: Furnish dry mortar ingredients in form of a preblended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

C. Mortar for Unit Masonry: Comply with ASTM C270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry.

1. For masonry below grade or in contact with earth, use Type M.
2. For reinforced masonry, use Type S.
3. For exterior, above-grade, load-bearing, nonload-bearing walls, and parapet walls; for interior load-bearing walls; for interior nonload-bearing partitions; and for other applications where another type is not indicated, use Type S.

D. Pigmented Mortar: Use colored cement product.

1. Pigments do not exceed 10 percent of portland cement by weight.
2. Mix to match Architect's sample.
3. Application: Use pigmented mortar for exposed mortar joints as indicated.

E. Grout for Unit Masonry: Comply with ASTM C476.

1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with TMS 602 for dimensions of grout spaces and pour height.
2. Proportion grout in accordance with ASTM C476, Table 1 or paragraph 4.2.1.2 for specified 28-day compressive strength indicated, but not less than 2000 psi (14 MPa).
3. Provide grout with a slump of 8 to 11 inches (203 to 279 mm) as measured in accordance with ASTM C143/C143M.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
2. Verify that foundations are within tolerances specified.
3. Verify that reinforcing dowels are properly placed.
4. Verify that substrates are free of substances that impair mortar bond.

B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Thickness: Build cavity and composite walls and other masonry construction to full thickness shown. Build single-wythe walls to actual widths of masonry units, using units of widths indicated.

B. Build chases and recesses to accommodate items specified in this and other Sections.

C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match construction immediately adjacent to opening.

D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.

E. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures. Mix units from several pallets or cubes as they are placed.

F. Wetting of Brick: Wet brick before laying if initial rate of absorption exceeds 30 g/30 sq. in. (30 g/194 sq. cm) per minute when tested in accordance with ASTM C67/C67M. Allow units to absorb water so they are damp but not wet at time of laying.

3.3 TOLERANCES

A. Dimensions and Locations of Elements:

1. For dimensions in cross section or elevation, do not vary by more than plus 1/2 inch (13 mm) or minus 1/4 inch (6.4 mm).
2. For location of elements in plan, do not vary from that indicated by more than plus or minus 1/2 inch (13 mm).
3. For location of elements in elevation, do not vary from that indicated by more than plus or minus 1/4 inch (6.4 mm) in a story height or 1/2 inch (13 mm) total.

B. Lines and Levels:

1. For bed joints and top surfaces of bearing walls, do not vary from level by more than 1/4 inch in 10 ft. (6.4 mm in 3 m), or 1/2-inch (13-mm) maximum.
2. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 ft. (3.2 mm in 3 m), 1/4 inch in 20 ft. (6.4 mm in 6 m), or 1/2-inch (13-mm) maximum.

3. For vertical lines and surfaces, do not vary from plumb by more than 1/4 inch in 10 ft. (6.4 mm in 3 m), 3/8 inch in 20 ft. (10 mm in 6 m), or 1/2-inch (13-mm) maximum.
4. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 ft. (3.2 mm in 3 m), 1/4 inch in 20 ft. (6.4 mm in 6 m), or 1/2-inch (13-mm) maximum.
5. For lines and surfaces, do not vary from straight by more than 1/4 inch in 10 ft. (6.4 mm in 3 m), 3/8 inch in 20 ft. (10 mm in 6 m), or 1/2-inch (13-mm) maximum.
6. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 ft. (6.4 mm in 3 m), or 1/2-inch (13-mm) maximum.
7. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch (1.6 mm) except due to warpage of masonry units within tolerances specified for warpage of units.

C. Joints:

1. For bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch (3.2 mm), with a maximum thickness limited to 1/2 inch (13 mm).
2. For exposed bed joints, do not vary from bed-joint thickness of adjacent courses by more than 1/8 inch (3.2 mm).
3. For head and collar joints, do not vary from thickness indicated by more than plus 3/8 inch (10 mm) or minus 1/4 inch (6.4 mm).
4. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch (3.2 mm). Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 inch (3.2 mm).
5. For exposed bed joints and head joints of stacked bond, do not vary from a straight line by more than 1/16 inch (1.6 mm) from one masonry unit to the next.

3.4 LAYING MASONRY WALLS

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.

B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in bond pattern indicated on Drawings; do not use units with less-than-nominal 4-inch (102-mm) horizontal face dimensions at corners or jambs.

C. Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 4 inches (102 mm). Bond and interlock each course of each wythe at corners. Do not use units with less-than-nominal 4-inch (102-mm) horizontal face dimensions at corners or jambs.

D. Stopping and Resuming Work: Stop work by stepping back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.

E. Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.

F. Fill space between steel frames and masonry solidly with mortar unless otherwise indicated.

G. Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below, and rod mortar or grout into core.

H. Fill cores in hollow CMUs with grout 24 inches (610 mm) under bearing plates, beams, lintels, posts, and similar items unless otherwise indicated.

I. Build nonload-bearing interior partitions full height of story to underside of solid floor or roof structure above unless otherwise indicated.

1. Install compressible filler in joint between top of partition and underside of structure above.
2. Anchor top of partitions as noted on contract documents providing a “soft joint”.
3. At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Section 078443 "Joint Firestopping."

3.5 MORTAR BEDDING AND JOINTING

A. Lay CMUs and hollow brick as follows:

1. Bed face shells in mortar and make head joints of depth equal to bed joints.
2. Bed webs in mortar in all courses of piers, columns, and pilasters.
3. Bed webs in mortar in grouted masonry, including starting course on footings.
4. Fully bed entire units, including areas under cells, at starting course on footings where cells are not grouted.
5. Fully bed units and fill cells with mortar at anchors and ties as needed to fully embed anchors and ties in mortar.

B. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.

C. Set stone trim units in full bed of mortar with full vertical joints. Fill dowel, anchor, and similar holes.

1. Clean soiled surfaces with fiber brush and soap powder and rinse thoroughly with clear water.
2. Allow cleaned surfaces to dry before setting.
3. Wet joint surfaces thoroughly before applying mortar.
4. Rake out mortar joints for pointing with sealant.

D. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.

E. Cut joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint) unless otherwise indicated.

F. Cut joints flush where indicated to receive waterproofing cavity wall insulation and air barriers unless otherwise indicated.

3.6 ANCHORED MASONRY VENEERS

A. Anchor masonry veneers to wall framing with masonry-veneer anchors to comply with the following requirements:

1. Fasten screw-attached anchors through sheathing to wall framing with metal fasteners of type indicated. Use two fasteners unless anchor design only uses one fastener. Anchor penetrations through the air/vapor barrier must be sealed with compatible sealant unless pre-construction mock-up testing does not dictate this requirement.
2. Embed tie sections in masonry joints.
3. Locate anchor sections to allow maximum vertical differential movement of ties up and down.
4. Space anchors as indicated, but not more than 18 inches (457 mm) o.c. vertically and 24 inches (610 mm) o.c. horizontally, with not less than one anchor for each 2 sq. ft. (0.2 sq. m) of wall area. Install additional anchors within 12 inches (305 mm) of openings and at intervals, not exceeding 8 inches (203 mm), around perimeter.

B. Provide airspace between back of masonry veneer and face of insulation. Refer to Exterior Wall Types on Drawings for airspace depth.

1. Keep airspace clean of mortar droppings and other materials during construction. Bevel beds away from airspace, to minimize mortar protrusions into airspace. Do not attempt to trowel or remove mortar fins protruding into airspace.
2. Cavity Protection: Provide means and methods to prevent bridging of cavity with mortar. Use "clean out" board or other means to keep cavity clean of mortar and mortar droppings. Strike off back of face veneer to remove excess, extruded mortar.

3.7 MASONRY-JOINT REINFORCEMENT

A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch (16 mm) on exterior side of walls, 1/2 inch (13 mm) elsewhere. Lap reinforcement a minimum of 6 inches (152 mm).

1. Space reinforcement not more than 16 inches (406 mm) o.c.
2. Space reinforcement not more than 8 inches (203 mm) o.c. in foundation walls and parapet walls.
3. Provide reinforcement not more than 8 inches (203 mm) above and below wall openings and extending 12 inches (305 mm) beyond openings.

B. Interrupt joint reinforcement at control and expansion joints unless otherwise indicated.

C. Provide continuity at wall intersections by using prefabricated T-shaped units.

D. Provide continuity at corners by using prefabricated L-shaped units.

E. Cut and bend reinforcing units as directed by manufacturer for continuity at corners, returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

3.8 CONTROL AND EXPANSION JOINTS

A. General: Install control- and expansion-joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement. Provide a maximum control joint spacing per ACI 530/NCMA TEK-Notes. Control and expansion joints are to meet NCMA and BIA standards.

B. Form control joints in concrete masonry using one of the following methods:

1. Fit bond-breaker strips into hollow contour in ends of CMUs on one side of control joint. Fill resultant core with grout, and rake out joints in exposed faces for application of sealant.
2. Install preformed control-joint gaskets designed to fit standard sash block.
3. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar, or rake out joint for application of sealant.
4. Install temporary foam-plastic filler in head joints, and remove filler when unit masonry is complete for application of sealant.

C. Form expansion joints in brick as follows:

1. Build in compressible joint fillers where indicated.
2. Locate expansion joints as indicated on Drawings. Space no more than 25 feet on center.

D. Provide horizontal, pressure-relieving joints by either leaving an airspace or inserting a compressible filler of width required for installing sealant and backer rod specified in Section 079200 "Joint Sealants," but not less than 3/8 inch (10 mm).

1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

3.9 LINTELS

A. Install steel lintels where indicated. Provide steel hot-dipped galvanized lintels per the construction documents.

B. Provide concrete or masonry lintels where indicated and where openings of more than 12 inches (305 mm) for brick-size units and 24 inches (610 mm) for block-size units are indicated without structural steel or other supporting lintels.

C. Provide minimum bearing of 8 inches (203 mm) at each jamb unless otherwise indicated.

3.10 FLASHING AND CAVITY VENTS

A. General: Install embedded flashing and weep vents in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated. Install cavity vents at shelf angles, ledges, and other obstructions to upward flow of air in cavities, and where indicated.

B. Install flashing as follows unless otherwise indicated:

1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as recommended by flashing manufacturer.
2. At masonry-veneer walls, extend flashing through veneer, across airspace behind veneer, and up face of sheathing a minimum of 6 inches above the top of the cavity drainage material; upper termination of flashing to be integrated with the AWB such that a continuous air and water control layer is provided. Fasten upper edge of flexible flashing to sheathing through termination bar. Provide a termination bead of sealant. Confirm compatibility of materials.

3. At lintels and shelf angles, extend flashing 6 inches (152 mm) minimum, to edge of next full unit at each end. At heads and sills, extend flashing 6 inches (152 mm) minimum, to edge of next full unit and turn ends up not less than 2 inches (51 mm) to form end dams.
4. Install metal drip edges beneath flexible flashing at exterior face of wall. Stop flexible flashing 1/2 inch (13 mm) back from outside face of wall, and adhere flexible flashing to top of metal drip edge. Set drip edge in a bead of sealant.

C. Install reglets and nailers for flashing and other related construction where they are indicated to be built into masonry.

D. Install weep vents in exterior wythes and veneers in head joints of first course of masonry immediately above embedded flashing.

1. Use specified weep/cavity vent products to form weep holes.
2. Space weep vents 24 inches (610 mm) o.c. unless otherwise indicated and at end dam locations.

E. Place cavity drainage material in airspace behind veneers to comply with configuration requirements for cavity drainage material in "Accessories" Article.

F. Install cavity vents in head joints in exterior wythes at 24 inches O.C. unless otherwise indicated. Use specified weep/cavity vent products to form cavity vents.

1. Close cavities off vertically and horizontally with blocking in manner indicated. Install through-wall flashing and weep vents above horizontal blocking.

3.11 REINFORCED UNIT MASONRY

A. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.

1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated. Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and that of other loads that may be placed on them during construction.

B. Placing Reinforcement: Comply with requirements in TMS 602.

C. Grouting: Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure.

1. Comply with requirements in TMS 602 for cleanouts and for grout placement, including minimum grout space and maximum pour height. Consolidate grout with mechanical vibrator.
2. Limit height of vertical grout pours to not more than 60 inches (1524 mm).

3.12 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections. Allow inspectors access to scaffolding and work areas as needed to perform tests and inspections. Retesting of materials that fail to comply with specified requirements will be at Contractor's expense.

B. Inspections: Special inspections in accordance with Level 3 in TMS 402.

1. Begin masonry construction only after inspectors have verified proportions of site-prepared mortar.
2. Place grout only after inspectors have verified compliance of grout spaces and of grades, sizes, and locations of reinforcement.
3. Place grout only after inspectors have verified proportions of site-prepared grout.

C. Testing Prior to Construction: One set of tests.

D. Testing Frequency: One set of tests for each 5000 sq. ft. (464 sq. m) of wall area or portion thereof.

E. Clay Masonry Unit Test: For each type of unit provided, in accordance with ASTM C67/C67M for compressive strength.

F. Concrete Masonry Unit Test: For each type of unit provided, in accordance with ASTM C140/C140M for compressive strength.

G. Mortar Aggregate Ratio Test (Proportion Specification): For each mix provided, in accordance with ASTM C780.

H. Grout Test (Compressive Strength) and Slump Test: For each mix provided, in accordance with ASTM C1019.

I. Prism Test: For each type of construction provided, in accordance with ASTM C1314 at 7 days and at 28 days.

3.13 REPAIRING, POINTING, AND CLEANING

A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.

B. Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application, where indicated.

C. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry within 24 to 48 hours and as follows:

1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
2. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Architect's approval of sample cleaning before proceeding with cleaning of masonry.
3. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
4. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
5. Clean concrete masonry by applicable cleaning methods indicated in NCMA TEK 8-4A.
6. Clean masonry with a masonry cleaner applied according to manufacturer's written instructions.

3.14 MASONRY WASTE DISPOSAL

A. Salvageable Materials: Unless otherwise indicated, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.

B. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.

1. Crush masonry waste to less than 4 inches (102 mm) in each dimension.
2. Mix masonry waste with at least two parts of specified fill material for each part of masonry waste. Fill material is specified in Section 312000 "Earth Moving."
3. Do not dispose of masonry waste as fill within 18 inches (457 mm) of finished grade.

C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other masonry waste, and legally dispose of off Owner's property.

END OF SECTION 042000

SECTION 044200 - EXTERIOR STONE CLADDING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Stone panels set with individual anchors.
2. Stone panels mechanically anchored on steel stud frames.

B. Related Requirements:

1. Section 042000 "Unit Masonry".
2. Section 054000 "Cold-Formed Metal Framing" for steel stud frames supporting stone cladding.
3. Section 079200 "Joint Sealants" for sealing joints in stone cladding system with elastomeric sealants.

1.3 DEFINITIONS

A. Definitions contained in ASTM C 119 apply to this Section.

B. IBC: International Building Code.

C. Stone Cladding Assembly: An exterior wall covering system consisting of stone panels together with anchors, backup structure, fasteners, and sealants used to secure the stone to the building structure and to produce a weather-resistant covering.

1. Backup structure includes steel stud frames, miscellaneous steel framing required to secure stone to the building structure, concrete and CMU. Refer to Drawings for Exterior Wall Types.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each variety of stone, stone accessory, and manufactured product.

B. Sustainable Design Submittals:

1. Product Certificates: For regional materials, indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include distance to Project and cost for each regional material.
2. Environmental Product Declaration (EPD): For each product.

C. Shop Drawings: Show project specific fabrication and installation details for stone cladding assembly, including dimensions and profiles of stone units.

1. Show locations and details of joints both within stone cladding assembly and between stone cladding assembly and other construction.
2. Include details of sealant joints.
3. Show locations and details of anchors and backup structure.
4. Show direction of veining, grain, or other directional pattern.
5. Coordinate with air/vapor barrier shop drawings, clearly showing flashings, penetrations, locations of control and expansion joints on all building elevations. Include integration with adjacent materials and membranes.

D. Samples for Initial Selection: For joint materials involving color selection.

E. Stone Samples for Verification: Sets for each variety, color, and finish of stone required; not less than 12 inches (300 mm) square.

1. Sets shall consist of at least five Samples, exhibiting extremes of the full range of color and other visual characteristics expected and will establish the standard by which stone will be judged.

F. Sealant Samples for Verification: For each type and color of joint sealant required.

G. Delegated-Design Submittal: For stone cladding assembly.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, fabricator, professional engineer and testing agency.

B. Welding certificates.

C. Material Test Reports:

1. Stone Test Reports: For stone variety proposed for use on Project, by a qualified testing agency, indicating compliance with required physical properties, other than abrasion resistance, according to referenced ASTM standards. Base reports on testing done within previous three years.
2. For metal components, by a qualified testing agency, indicating chemical and physical properties of metal.
3. Sealant Compatibility and Adhesion Test Report: From sealant manufacturer complying with requirements in Section 079200 "Joint Sealants" and indicating that sealants will not stain or damage stone. Include interpretation of test results and recommendations for primers and substrate preparation needed for adhesion.

D. Preconstruction test reports.

E. Source quality-control reports.

F. Cold-Weather and Hot-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with cold-weather and hot-weather requirements.

1.7 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop with at least 10 years experience that employs skilled workers who custom fabricate stone cladding assemblies similar to that required for this Project and whose products have a record of successful in-service performance.

B. Installer Qualifications: A firm or individual experienced with at least 10 years experience in installing stone cladding assemblies similar in material, design, and extent to that indicated for this Project, whose work has a record of successful in-service performance.

C. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.

D. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel and AWS D1.6/D1.6M, "Structural Welding Code - Stainless Steel."

E. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.

1. Build mockups of typical exterior wall area not less than 72 inches (1800 mm) long by 48 inches (1200 mm) high.

    a. Include typical components, attachments to building structure, integration with adjacent assemblies and methods of installation. Photograph mockup before concealing portions or provide stepped mockup to allow review of each condition.
    b. Include sealant-filled joint complying with requirements in Section 079200 "Joint Sealants."
    c. Include an area that has been damaged and repaired.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Sealant Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for compatibility and adhesion testing and propensity to stain stone according to sealant manufacturer's standard testing methods and Section 079200 "Joint Sealants," Samples of materials that will contact or affect joint sealants.

B. Preconstruction Field Testing of Sealants: Before installing joint sealants, field test their adhesion to joint substrates according to Section 079200 "Joint Sealants."

1.9 DELIVERY, STORAGE, AND HANDLING

A. Store and handle stone and related materials to prevent deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breaking, chipping, and other causes.

1. Lift stone with wide-belt slings; do not use wire rope or ropes that might cause staining. Move stone, if required, using dollies with cushioned wood supports.
2. Store stone on wood skids or pallets with nonstaining, waterproof covers. Arrange to distribute weight evenly and to prevent damage to stone. Ventilate under covers to prevent condensation. Do not use chemically treated wood or wood containing tannin or other substances that may stain the stone.

B. Mark stone units, on surface that will be concealed after installation, with designations used on Shop Drawings to identify individual stone units. Orient markings on vertical panels so that they are right side up when units are installed.

C. Deliver sealants to Project site in original unopened containers labeled with manufacturer's name, product name and designation, color, expiration period, pot life, curing time, and mixing instructions for multicomponent materials.

D. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

E. Store aggregates in locations where grading and other required characteristics can be maintained and where contamination can be avoided.

1.10 FIELD CONDITIONS

A. Protect stone cladding during erection by doing the following:

1. Cover tops of stone cladding installation with nonstaining, waterproof sheeting at end of each day's work. Cover partially completed structures when work is not in progress. Extend cover a minimum of 24 inches (600 mm) down both sides and hold securely in place.
2. Prevent staining of stone from sealants, and other sources. Immediately remove such materials without damaging stone.
3. Protect base of walls from rain-splashed mud splatter by coverings spread on ground and over wall surface.
4. Protect sills, ledges, and projections from sealant droppings.

B. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Remove and replace stone cladding damaged by frost or freezing conditions. Comply with cold-weather construction and protection requirements for masonry contained in TMS 602/ACI 530.1/ASCE 6.

C. Hot-Weather Requirements: Comply with hot-weather construction and protection requirements for masonry contained in TMS 602/ACI 530.1/ASCE 6.

D. Environmental Limitations for Sealants: Do not install sealants when ambient and substrate temperatures are outside limits permitted by sealant manufacturer or below 40 deg F (5 deg C) or when joint substrates are wet.

1.11 COORDINATION

A. Coordinate installation of inserts that are to be embedded in concrete or masonry, flashing reglets, and similar items to be used by stone cladding Installer for anchoring, supporting, and

flashing of stone cladding assembly. Furnish setting drawings, templates, and directions for installing such items and deliver to Project site in time for installation.

B. Time delivery and installation of stone cladding to avoid extended on-site storage and to coordinate with work adjacent to stone cladding.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations for Stone: Obtain stone, regardless of finish, from single quarry, whether specified in this Section or in another Section of the Specifications, with resources to provide materials of consistent quality in appearance and physical properties.

1. For stone types that include same list of varieties and sources, provide same variety from same source for each.
2. Make quarried blocks available for examination by Architect.

B. Source Limitations for Other Materials: Obtain each type of stone accessory, sealant, and other material from single manufacturer for each product.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design stone cladding assembly.

B. General: Design stone anchors and anchoring systems according to ASTM C 1242.

1. Stone anchors shall withstand not less than two times the weight of the stone cladding in both compression and tension.

C. Structural Performance: Stone cladding assembly shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Wind Loads: As indicated.
2. Equipment Loads: Allow for loads due to window cleaning and maintenance equipment.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

E. Shrinkage and Creep: Allow for progressive vertical shortening of building frame equal to 1/8-inch in 10 feet (3 m).

F. Safety Factors for Stone: Design stone cladding assembly to withstand loads indicated without exceeding stone's allowable working stress determined by dividing stone's average ultimate strength, as established by testing, by the following safety factors:

1. Safety Factor for Granite: 3.

2. Safety Factor for Stone: 6.

G. Design stone anchors and backup structure to withstand loads indicated without exceeding allowable working stresses established by the following:

1. For Structural Steel: AISC 360.
2. For Cold-Formed Steel: AISI's "North American Specification and Commentary for the Design of Cold-Formed Steel Structural Members."
3. For Cold-Formed Stainless Steel: ASCE/SEI 8, "Specification for the Design of Cold-Formed Stainless Steel Structural Members."
4. For Cast-in-Place and Postinstalled Fasteners in Concrete: One-fourth of tested capacity when installed in concrete with compressive strength indicated.
5. For Postinstalled Fasteners in Masonry: One-sixth of tested capacity when installed in masonry units indicated.

H. Limit deflection in each prefabricated assembly caused by indicated loads and thermal movements, acting singly or in combination with one another, to not more than 1/720 of assembly's clear span or the following, whichever is smaller:

1. 1/16 inch (1.5 mm), measured in plane of wall.
2. 1/4 inch (6 mm), measured perpendicular to wall.

I. Provisions for Fabrication and Erection Tolerances: Allow for fabrication and erection tolerances of building's structural system. Concrete fabrication and erection tolerances are specified in Section 033000 "Cast-in-Place Concrete."

J. Provision for Deflection of Building Structure:

1. Deflection Due to Weight of Stone Cladding Assembly: Allow for L/600 of structural members supporting stone cladding assembly.
2. Live Load Deflection: Allow for L/600 of structural members supporting stone cladding assembly, due to live loads imposed on building's structural frame after stone installation.

K. Corrosion and Staining Control: Prevent galvanic and other forms of corrosion as well as staining by isolating metals and other materials from direct contact with incompatible materials. Materials shall not stain exposed surfaces of stone and joint materials.

L. Season stone to extent that excess water does not damage stone during freezing temperatures and to ensure color change does not occur.

2.3 GRANITE (STN-2)

A. Material Standard: Comply with ASTM C 615/C 615M.

B. Regional Materials: Stone shall be fabricated within 100 miles of Project site from materials that have been extracted, harvested, or recovered within 100 miles of Project site.

C. Varieties and Sources: Subject to compliance with requirements, provide the following:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Coldspring USA; Mesabi Black Granite or approved equal.

D. Cut stone from one block or contiguous, matched blocks in which natural markings occur.

E. Finish: Diamond 10 finish.

F. Thickness: As indicated on Drawings.

2.4 SANDSTONE (STN-1)

A. Material Standard: Comply with ASTM C 616/C 616M, Classification II Quartzitic Sandstone.

B. Regional Materials: Stone shall be fabricated within 100 miles of Project site from materials that

C. have been extracted, harvested, or recovered within 100 miles of Project site.

D. Varieties and Sources: Subject to compliance with requirements, provide the following:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Russell Stone Products; Bloom Run Sandstone or approved equal.

E. Finish: Saw cut, smooth finish.

F. Thickness: As indicated on Drawings.

2.5 FRAMING FOR BACKUP STRUCTURE

A. Steel Stud Frames: Galvanized-steel wall framing complying with Section 054000 "Cold-Formed Metal Framing."

2.6 ANCHORS AND FASTENERS

A. Fabricate anchors from stainless steel, ASTM A 240/A 240M or ASTM A 666, Type 316; temper as required to support loads imposed without exceeding allowable design stresses. Fabricate dowels and pins for anchors from stainless steel, ASTM A 276, Type 316.

B. Adjustable, Screw-Attached Veneer Anchors (STNA-1): Units consisting of a wire tie section and a metal anchor section that allow vertical adjustment but resist tension and compression forces perpendicular to plane of wall, for attachment over sheathing to metal studs, and as follows:

1. Products: Subject to compliance with requirements, provide one of the following:

a. Heckmann Building Products, Inc.; Pos-I-Tie KeyBolt with KeyBolt Slot

2. Structural Performance Characteristics: Capable of withstanding a 100-lbf (445-N) load in both tension and compression without deforming or developing play in excess of 0.05 inch (1.3 mm).
3. Anchor Section: Zinc-alloy barrel section with flanged head with eye and corrosion-resistant, self-drilling screw. Eye designed to receive wire tie and to serve as head for drilling fastener into framing. Barrel length to suit sheathing thickness, allowing screw to seat directly against framing with flanged head covering hole in sheathing.
4. Stone anchor: Stainless steel split-bend stone anchor.

2.7 STONE ACCESSORIES

A. Setting Shims: Strips of resilient plastic or vulcanized neoprene, Type A Shore durometer hardness of 50 to 70, nonstaining to stone, of thickness needed to prevent point loading of stone on anchors and of depths to suit anchors without intruding into required depths of pointing materials.

B. Setting Buttons: Resilient plastic buttons, nonstaining to stone, sized to suit joint thicknesses and bed depths of stone units without intruding into required depths of pointing materials.

C. Concealed Sheet Metal Flashing: Fabricated from stainless steel in thicknesses indicated, but not less than 0.0156 inch (0.4 mm) thick, and complying with Section 076200 "Sheet Metal Flashing and Trim."

D. Cellular Plastic Weep/Vents: One-piece, flexible extrusion made from UV-resistant polypropylene copolymer, of length required to extend from exterior face of stone to cavity behind, in color selected from manufacturer's standard.

E. Sealants for Joints in Stone Cladding: Manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated below that comply with applicable requirements in Section 079200 "Joint Sealants" and do not stain stone:

1. Joint Sealant: Silicone, nonstaining, S, NS, 100/50, NT.
2. Joint-Sealant Colors: Match color of stone.

F. Sealant for Filling Kerfs: Same sealant used for joints in stone cladding.

2.8 STONE FABRICATION

A. General: Fabricate stone units in sizes and shapes required to comply with requirements indicated.

1. For granite, comply with recommendations in NBGQA's "Specifications for Architectural Granite."
2. For stone, comply with recommendations in ILI's "Indiana Limestone Handbook."

B. Control depth of stone and back check to maintain minimum clearance of 1-1/2 inches (38 mm) between backs of stone units and surfaces or projections of structural members, fireproofing (if any), backup walls, and other work behind stone.

C. Dress joints (bed and vertical) straight and at right angle to face unless otherwise indicated. Shape beds to fit supports.

D. Cut and drill sinkages and holes in stone for anchors, fasteners, supports, and lifting devices as indicated or needed to set stone securely in place.

E. Finish exposed faces and edges of stone to comply with requirements indicated for finish and to match approved samples and mockups.

F. Quirk-miter corners unless otherwise indicated; provide for cramp anchorage in top and bottom bed joints of corner pieces.

G. Cut stone to produce uniform joints 3/8 inch (10 mm) wide and in locations indicated.

H. Contiguous Work: Provide chases, reveals, reglets, openings, and similar features as required to accommodate contiguous work.

I. Fabricate molded work, including washes and drips, to produce stone shapes with a uniform profile throughout entire unit length, with precisely formed arris slightly eased to prevent snipping, and with matching profile at joints between units.

1. Produce moldings and molded edges with machines that use abrasive shaping wheels made to reverse contour of molding shape.

J. Clean backs of stone to remove rust stains, iron particles, and stone dust.

K. Inspect finished stone units at fabrication plant for compliance with requirements for appearance, material, and fabrication. Replace defective units.

1. Grade and mark stone for overall uniform appearance when assembled in place. Natural variations in appearance are acceptable if installed stone units match range of colors and other appearance characteristics represented in approved samples and mockups.

2.9 FABRICATION OF BACKUP STRUCTURE

A. Fabrication of Steel Stud Frames: Fabricate and assemble by welding to comply with requirements in Section 054000 "Cold-Formed Metal Framing."

2.10 SOURCE QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform source quality-control testing.

1. Retesting of materials that fail to meet specified requirements shall be done at Contractor's expense.
2. Furnish test specimens randomly selected from same blocks as actual materials proposed for incorporation into the Work.
3. Flexural Strength Tests: ASTM C 880/C 880M, performed on specimens of same thickness, orientation of cut, and finish as installed stone. One set of test specimens is required to be tested for every 3000 sq. ft. (300 sq. m), but not fewer than two sets for each stone variety.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces to receive stone cladding and conditions under which stone cladding will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of stone cladding.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of stone cladding.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLING BACKUP STRUCTURE

A. Installing Steel Stud Frames: Install to comply with requirements in Section 054000 "Cold-Formed Metal Framing."

1. Install steel stud frames level, plumb, and true to line with no variation in plane or alignment exceeding 1/16 inch (1.5 mm) and no variation in position exceeding 1/8 inch (3 mm).
2. Clean welds, bolted connections, and abraded areas immediately after erection. Repair galvanizing to comply with ASTM A 780/A 780M.

3.3 SETTING STONE CLADDING, GENERAL

A. Before setting stone, clean surfaces that are dirty or stained by removing soil, stains, and foreign materials. Clean stone by thoroughly scrubbing with fiber brushes and then drenching with clear water. Use only mild cleaning compounds that contain no caustic or harsh materials or abrasives.

B. Execute stone cladding installation by skilled mechanics and employ skilled stone fitters at Project site to do necessary field cutting as stone is set.

1. Use power saws with diamond blades to cut stone. Produce lines cut straight and true, with edges eased slightly to prevent snipping.

C. Contiguous Work: Provide reveals, reglets, and openings as required to accommodate contiguous work.

D. Set stone to comply with requirements indicated (running bond ashlar pattern as indicated on Drawings). Install anchors, supports, fasteners, and other attachments indicated or necessary to secure stone cladding in place. Shim and adjust anchors, supports, and accessories to set stone accurately in locations indicated, with uniform joints of widths indicated, and with edges and faces aligned according to established relationships and indicated tolerances. Anchor penetrations through the air/vapor barrier must be sealed with compatible sealant unless pre-construction mock-up testing does not dictate this requirement.

E. Provide expansion, control, and pressure-relieving joints of widths and at locations indicated.

1. Sealing expansion and other joints is specified in Section 079200 "Joint Sealants."
2. Keep expansion joints free.

F. Install concealed flashing at continuous shelf angles, lintels, ledges, and similar obstructions to downward flow of water, to divert water to building exterior. Extend flashing 6 inches (150 mm) at ends and turn up not less than 2 inches (50 mm) to form end dams. At top of flashing install termination bar to reglet to the back-up to terminate the flashing.

G. Keep cavities open where unfilled space is indicated between back of stone units and backup wall.

1. Place weep holes in joints where moisture may accumulate, including at base of cavity walls and above shelf angles and flashing. Locate weep holes at intervals not exceeding 24 inches (600 mm). Use cellular plastic weep/vents.

3.4 JOINT-SEALANT INSTALLATION

A. Prepare joints and apply sealants of type and at locations indicated to comply with applicable requirements in Section 079200 "Joint Sealants."

3.5 INSTALLATION TOLERANCES

A. Variation from Plumb: For vertical lines and surfaces of walls, do not exceed 1/4 inch in 10 feet (6 mm in 3 m), 3/8 inch in 20 feet (10 mm in 6 m), or 1/2 inch in 40 feet (12 mm in 12 m) or more. For external corners, corners and jambs within 20 feet (6 m) of an entrance, expansion joints, and other conspicuous lines, do not exceed 1/8 inch in 10 feet (3 mm in 3 m), 1/4 inch in 20 feet (6 mm in 6 m), or 3/8 inch in 40 feet (10 mm in 12 m) or more.

B. Variation from Level: For lintels, sills, water tables, parapets, horizontal bands, horizontal grooves, and other conspicuous lines, do not exceed 1/8 inch in 10 feet (3 mm in 3 m), 1/4 inch in 20 feet (6 mm in 6 m), or 3/8 inch (10 mm) maximum.

C. Variation of Linear Building Line: For positions shown in plan and related portions of walls and partitions, do not exceed 1/4 inch in 20 feet (6 mm in 6 m) or 1/2 inch in 40 feet (12 mm in 12 m) or more.

D. Variation in Cross-Sectional Dimensions: For thickness of walls from dimensions indicated, do not exceed plus or minus 1/4 inch (6 mm).

E. Variation in Joint Width: Do not vary from average joint width more than plus or minus 1/8 inch (3 mm) or a quarter of nominal joint width, whichever is less. For joints within 60 inches (1500 mm) of each other, do not vary more than 1/8 inch (3 mm) or a quarter of nominal joint width, whichever is less from one to the other.

F. Variation in Plane between Adjacent Stone Units (Lipping): Do not exceed 1/16-inch (1.5-mm) difference between planes of adjacent units.

3.6 ADJUSTING AND CLEANING

A. Remove and replace broken, chipped, stained, or otherwise damaged stone, defective joints, and stone cladding that does not match approved samples and mockups. Damaged stone may be repaired if Architect approves methods and results.

B. Replace damaged or defective work in a manner that results in stone cladding's matching approved samples and mockups, complying with other requirements, and showing no evidence of replacement.

C. In-Progress Cleaning: Clean stone cladding as work progresses. Remove excess sealant and smears as sealant is installed.

D. Final Cleaning: Clean stone cladding no fewer than six days after completion of pointing and sealing, using clean water and stiff-bristle fiber brushes. Do not use wire brushes, acid-type cleaning agents, cleaning agents containing caustic compounds or abrasives, or other materials or methods that could damage stone. Clean stone to comply with stone supplier’s written instructions.

END OF SECTION 044200

SECTION 044310 – SITE STONE MASONRY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Stone veneer and coping adhered to concrete retaining wall backup.

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 03 Section 'Miscellaneous Site Concrete’
   3. Division 07 Section ‘Joint Sealants’
   4. Division 32 Section ‘Crushed Stone Paving’
   5. Division 32 Section 'Unit Paving’
   6. Division 32 Section 'Metal Edging’
   7. Division 32 Section ‘Exterior Planting’

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.
   1. For stone varieties proposed for use on the Project, include test data indicating compliance with physical properties required by referenced ASTM standards.

B. Samples for Initial Selection: For colored mortar and other items involving color selection.

C. Samples for Verification:
   1. For each stone type indicated. Include at least four (4) samples in each set for each type of stone, exhibiting extremes of the full range of color and other visual characteristics expected in completed Work. Samples will establish the standard by which stone provided will be judged.
   2. For each color of mortar required. Label Samples to indicate types and amounts of pigments used.

D. Shop drawings: Submit for fabrication and installation. Show sizes, thicknesses, jointing, anchoring, connection details, support, and dimensions for each stone piece. Show in detail the construction, method of installation and attachment, and anchoring devices. Drawings shall clearly show the relationship to adjoining construction. Stone pieces on the shop drawings shall be numbered and the numbers shall correspond to the numbers of stone pieces delivered to the site. Do not fabricate any pieces until shop drawings have been reviewed by the Landscape Architect. Show location of mortar pointed and soft caulked joints.
   1. Provide shop drawings for the following:
      a. Stone veneer and coping for walls

1.4 INFORMATIONAL SUBMITTALS

A. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, sources of supply, and other information as required to identify materials used. Include mix proportions for mortar and source of aggregates.
   1. Submittal is for information only. Neither receipt of list nor approval of mockups constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Landscape Architect and approved in writing.

B. Qualification Data: For qualified Installer.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A qualified Installer who employs experienced stonemasons and stone fitters.

B. Source Limitations for Stone: Obtain each variety of stone, regardless of finish, from one quarry with resources to provide materials of consistent quality in appearance and physical properties.

C. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

D. Color Selection: Color selection shall be made from the full range of available pigmentation. From that range, five (5) colors will be selected for use in the mockups.

E. Mockups: Build mockups to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

F. Pre-Installation Meeting: Before beginning masonry work, schedule and conduct a meeting at Project site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Contractor, the installer, the installer’s field foreman and manufacturer’s representative. Inform the Landscape Architect five (5) business days in advance of the scheduled meeting time.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Delivery & Handling: Properly crate and band stone units for shipment and receiving at job site. Handle each stone material type to prevent chipping, marking, breakage, soiling, or other damage both during delivery and during storage at site.

B. Storage & Protection: Store stone units on non-staining wood skids or pallets set not less than 4 inches above ground, covered with non-staining, waterproof membrane. Place and stack skids and pavers to distribute weight evenly and to prevent breakage or cracking of pavers. If units are not stored in an enclosed location, protect stored stone units from weather with waterproof cover to prevent staining or contamination, but allow air to circulate around units.

C. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged

materials apply to bulk shipments. Protect materials from deterioration by moisture and temperature during delivery and during storage at site. Protect liquid components from freezing.

D. Deliver pre blended, dry mortar mix in moisture-resistant containers designed for lifting and emptying into dispensing silo. Store pre blended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in a metal dispensing silo with weatherproof cover.

E. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

F. Store aggregates where grading and other required characteristics can be maintained, and contamination avoided.

G. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.7 PROJECT CONDITIONS

A. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment and facilities needed prior to and during execution of the Work.

B. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

C. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery, unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

D. Protection of Stone Masonry: During construction, cover stairs, benches and all other masonry work with waterproof sheeting at end of each day's work. Cover partially completed stone masonry when construction is not in progress.
   1. Extend cover a minimum of 24 inches down both sides and hold cover securely in place.

E. Stain Prevention: Immediately remove mortar and soil to prevent them from staining the surface of stone masonry.
   1. Protect base of walls and all other masonry work from rain-splashed mud and mortar splatter by coverings spread on the ground and over the bench and wall surface.
   2. Protect walls and all other masonry work from mortar droppings.

F. Work Protection Requirements: Provide weather protection during entire time of placement of masonry system. Maintain protection over entire area storage and work area to maintain specified moisture levels, prevent wind or rain disturbance of setting materials, protect from run-off from adjacent areas, and generally maintain optimum installation conditions. Contractor is responsible for means and methods for such protection, including physical cover, work sequencing and scheduling and other means of protection, as Contractor deems appropriate.

G. Weather/Temperature: (Cold Weather Requirements) Do not commence work when a descending air temperature in the shade away from artificial heat reaches 40˚ F, and do not

resume until an ascending air temperature in the shade and away from artificial heat reaches 35˚ F.

1. Verify all Environmental Requirements with manufacturer prior to commencing work.
2. Do not undertake work on frozen substrate or using frozen materials or materials mixed with or coated with ice or frost.
3. Protect work from frost and remove and replace any work damaged by frost or freezing.
4. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
5. Do not build on frozen sub-grade or setting beds. Remove and replace unit paver work damaged by frost or freezing.
6. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.

H. Weather/Temperature: (Hot Weather Requirements) Protect masonry work when temperature and humidity conditions produce excessive evaporation of setting beds and grout. Provide artificial shade and windbreaks and use cooled materials as required.

1. Verify all Environmental Requirements with manufacturer prior to commencing work.
2. Do not apply mortar to substrates with temperatures of 100˚ F and above.
3. Comply with hot-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

I. Utilization Restrictions

1. Plywood panels must be kept on areas which will be subject to continued movement of materials and equipment.

J. Maintenance of Traffic, Access and Utilities: In accordance with Division 01.

1.8 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.9 SEQUENCING AND SCHEDULING

A. Advise installers of other work about specific requirements for placement of reinforcement, veneer anchors, and similar items to be built into stone masonry.

B. Coordinate Work of this Section with Work of all other Sections of Specification.

1.10 CLOSEOUT REQUIREMENTS

A. Project Record Documents: Submit in accordance with Division 01 Section “Closeout Procedures”.

B. Final Cleaning: In accordance with Division 01 Section “Execution Requirements”.
   1. Leave site in an orderly, “broom clean” condition.

C. Operations and Maintenance Data, Warranties:
   1. Provide Maintenance and cleaning instructions for Owner.
   2. Provide to Owner all product warranties provided by manufacturers.

PART 2 - PRODUCTS

2.1 STONE CLAD SEAT WALL – AT BUILDING ENTRY

A. Granite
   1. Products: Subject to compliance with requirements, provide the following:
      a. Mesabi Black Granite as provided by Coldspring USA, 17482 Granite West Road, Cold Spring, MN 56320; Website: https://www.coldspringusa.com/

B. Description: Uniform, Stone, at a minimum, the following physical requirements:

1.	Compressive Strength per (ASTM C 170)	18,680 psi, min.
2.	Flexural Strength per (ASTM C 880)	1200 psi, min.
3.	Modulus of Rupture per (ASTM C 99)	1,552 psi, min.
4.	Absorption per (ASTM C97)	0.05 %, max..
5.	Density (ASTM C503):	175.5 lb/cubic foot, min.
6.	Abrasion (ASTM C241):	25 Ha, min.

   7. Sizes as indicated on the Drawings.
      a. Dimensional Tolerances: Plus or minus 1/16 inch.
      b. Thickness: as indicated on the Drawings.
      c. Joint width shall be 1/4 inch.
   8. Finish:
      a. Finish for unexposed surfaces shall be sawn.
      b. Finish for exposed surfaces:
         1) Veneer: Diamond 100
         2) Cap: Diamond 8

C. Match Landscape Architect’s samples for color, finish, and other stone characteristics relating to aesthetic effects.

2.2 STONE CLAD SEAT WALL – AT ENTRY GARDEN

A. Limestone: Comply with ASTM C 568.
   1. Products: Subject to compliance with requirements, provide the following:
      a. Kentucky River Marble Limestone caps and Kentucky Limestone veneer to match the finishes, patterns, textures, and colors of existing campus seat walls.

B. Description: Uniform, Stone, at a minimum, the following physical requirements:
   1. Sizes as indicated on the Drawings.
      a. Dimensional Tolerances: Plus or minus 1/16 inch.

b. Thickness: as indicated on the Drawings.
c. Joint width shall be 1/4 inch.

2. Finish:
a. Finish for unexposed surfaces shall be sawn.
b. Finish for exposed surfaces:
1) Veneer: To match existing site walls on campus
2) Cap: To match existing site walls on campus

2.3 STONE CLAD RETAINING WALL – AT RAD MED GARDEN

A. Limestone: Comply with ASTM C 568.
1. Products: Subject to compliance with requirements, provide the following:
a. Bloom Run Stone as provided by Russell Stone Products, 2640 Greenville Pike, Grampian, PA 16838

B. Description: Uniform, Stone, at a minimum, the following physical requirements:

1.	Compressive Strength per (ASTM C 170)	18,438 psi, min.
2.	Modulus of Rupture per (ASTM C 99)	1,399 psi, min.
3.	Absorption per (ASTM C97)	1.23%, max..
4.	Density (ASTM C503):	153.94 lb/cubic foot, min.

5. Sizes as indicated on the Drawings.
a. Dimensional Tolerances: Plus or minus 1/16 inch.
b. Thickness: as indicated on the Drawings.
c. Joint width shall be 1/4 inch.
6. Finish:
a. Finish for unexposed surfaces shall be sawn.
b. Finish for exposed surfaces:
1) Veneer: Split-Face
2) Cap: Split-Face

2.4 MORTAR MATERIALS

A. Portland Cement: ASTM C150, Type I or II, except Type III may be used for cold-weather construction. Provide white cement as required to produce mortar color indicated. Mortar shall have added color selected by the Landscape Architect.
1. Low-Alkali Cement: Not more than 0.60 percent total alkali when tested according to ASTM C 114.

B. Hydrated Lime: ASTM C207, Type S.

C. Portland Cement-Lime Mix: Packaged blend of Portland cement complying with ASTM C150, Type I or III, and hydrated lime complying with ASTM C207.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Holcim (US) Inc.; Rainbow Mortamix Custom Color Cement/Lime.
b. Lafarge Holcim; Eaglebond.
c. Lehigh Cement Company; Lehigh Custom Color Portland/Lime Cement.
d. Approved Equal

D. Mortar Cement: complying with ASTM C1329
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

a. Lafarge Holcim; Lafarge Mortar Cement
b. Approved Equal

E. Masonry Cement: complying with ASTM C 91.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the work include, but are not limited to, the following:
a. Holcim (US) Inc.; White Mortamix Masonry Cement.
b. Lafarge Holcim; Trinity Super White Masonry Type S or Trinity White Masonry Type N.
c. Lehigh Cement Company; Lehigh White Masonry Cement.
d. Approved Equal.

F. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with a record of satisfactory performance in stone masonry mortar.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Davis Colors; True Tone Mortar Colors.
b. Lanxess Corporation; Bayferrox Iron Oxide Pigments.
c. Solomon Colors; SGS Mortar Colors.
d. Approved Equal.

G. Aggregate: ASTM C144 and as follows:
1. For joints narrower than ¼" use aggregate graded with 100% passing the No. 8 sieve and 95% the No. 16 sieve.
2. For pointing mortar, use aggregate graded with 100 percent passing No. 16 sieve.
a. White Aggregates: Natural white sand or ground white stone.
b. Colored Aggregates: Natural-colored sand or ground marble, granite, or other sound stone; of color necessary to produce required mortar color.
c. All color selections to be reviewed & approved by the Landscape Architect.

H. Water: Potable.

2.5 MISCELLANEOUS MASONRY ACCESSORIES & MATERIALS

A. Adjustable, Screw-Attached Veneer Anchors:
1. Product: Heckman Building Products, Inc.; Pos-I-Tie KeyBolt with KeyBolt Slot, specified as part of Division 04 Section 'Exterior Stone Cladding'.

B. Compressible Filler: Pre-molded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.

C. Dowels: Fabricate anchors from stainless steel, ASTM A240/A 240M, Type 316. Fabricate dowels from stainless steel, ASTM A276, Type 316.
1. Size: Sufficient to extend at least halfway, but not less than 1-1/2 inches, through stone masonry and with at least 5/8-inch cover on outside face.

D. Epoxy for setting dowels: Two component epoxy or modified acrylic adhesive, specifically recommended by manufacturer or stone supplier for setting dowels in stone.
1. Product: Sikadur Anchoring Adhesives, as manufactured by Sika Corporation, 201 Polito Ave, Lyndhurst, NJ 07071, or Approved Equal.

2.6 MASONRY CLEANERS

A. Proprietary Acidic Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar and grout stains, efflorescence, and other new construction stains from stone masonry surfaces without discoloring or damaging masonry surfaces; expressly approved for intended use by cleaner manufacturer and stone producer.
   1. Manufacturers: Subject to compliance with requirements, [provide products by one of the following] available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Diedrich Technologies, Inc.
      b. Dominion Restoration Products.
      c. EaCo Chem, Inc.
      d. Approved Equal

2.7 MORTAR MIXES

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.
   1. Do not use calcium chloride.
   2. Limit cementitious materials in mortar to Portland cement and lime.
   3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.
   4. Mixing Pointing Mortar: Thoroughly mix cementitious and aggregate materials together before adding water. Then mix again, adding only enough water to produce a damp, unworkable mix that will retain its form when pressed into a ball. Maintain mortar in this dampened condition for one to two hours. Add remaining water in small portions until mortar reaches desired consistency. Use mortar within 30 minutes of final mixing; do not re-temper or use partially hardened material.

B. Pre-blended, Dry Mortar Mix: Furnish dry mortar ingredients in the form of a pre-blended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

C. Mortar for Stone Masonry: Comply with ASTM C270 Specification.
   1. Mortar for Setting Stone: Type N.
   2. Mortar for Pointing Stone: Type N or Type O.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine new and existing surfaces indicated to receive stone masonry, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Starting on the work shall imply acceptance of the surfaces and conditions to perform the work specified.

B. Examine substrate to verify that dovetail slots, inserts, reinforcement, veneer anchors, and other items installed in substrates and required for or extending into stone masonry are correctly installed.

C. Verify by measurements taken at the job site those dimensions affecting the work. Bring field dimensions which are at variance with those on the reviewed shop drawings to the attention of the Landscape Architect. Obtain decision regarding corrective measures before the start of fabrication and installation of items affected.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Advise installers of other work about specific requirements for placement of reinforcement, veneer anchors, flashing, and similar items to be built into stone veneer assemblies.

B. Clean dirty or stained stone surfaces by removing soil, stains, and foreign materials before setting. Clean stone by thoroughly scrubbing with fiber brushes and then drenching with clear water. Use only mild cleaning compounds that contain no caustic or harsh materials or abrasives.

C. Clean the surfaces of each stone before setting by removing foreign matter that might impair the bedding, bonding or appearance of the work. During setting operations dirt or setting materials in contact with exposed surfaces of the stonework shall be removed immediately

D. Do not set patched, chipped, cracked, broken or other defective pieces of stonework. Stains that cannot be removed with clean water and fiber brushes shall be considered a defect, and such pieces shall not be used.

E. Surfaces to which this work is to be secured and the stone surfaces themselves, shall be free from frost, wetness, dirt, grease, visible rust, and foreign materials which will be detrimental to the proper execution of the work.

F. Prevent staining of stone from mortar, grout, sealants, and other sources. Immediately remove such materials without damaging stone.

3.3 SETTING OF STONE MASONRY, GENERAL

A. Sort stone before it is placed to remove stone that does not comply with requirements relating to aesthetic effects, physical properties, or fabrication, or that is otherwise unsuitable for intended use.

B. Set stone to comply with requirements indicated on Drawings. Install anchors, supports, fasteners, and other attachments indicated or necessary to secure stone masonry in place. Set stone accurately in locations indicated with edges and faces aligned according to established relationships and indicated tolerances.
   1. Shim and adjust anchors, supports and accessories for proper setting and securing of stone.
   2. Completely fill holes, slots and other sinkages for anchors, fasteners and supports with mortar during setting of stones.
   3. Fill holes for dowels with epoxy during setting of stones.

C. Perform necessary field cutting and trimming as stone is set.
   1. Use power saws to cut stone that is fabricated with saw-cut surfaces.
   2. Cut lines straight and true, with edges eased slightly to prevent snipping.

3. Use hammer and chisel to split stone that is fabricated with split surfaces. Make edges straight and true, matching similar surfaces that were shop or quarry fabricated.
4. Pitch face at field-split edges as needed to match stones that are not field split.

D. Maintain uniform joint widths except for variations due to different stone sizes and where minor variations are required to maintain bond alignment if any. Lay walls with joints not less than 1/4 inch at narrowest points or more than 3/8 inch at widest points.

E. Provide expansion joints where indicated on the Drawings. Do not fill with mortar. Install continuous strips of preformed joint filler to allow for installation of backer rod and sealant.
1. Keep sealant joints free of mortar and other rigid materials.
2. Expansion joints are specified in Division 07 Section "Sitework Joint Sealants."

F. Exercise care to protect work already in place. Repair work damaged as a result of these stone operations at no additional cost and satisfaction of Owner.

G. Cover and protect the tops of all unfinished work when not being worked on, by means of waterproof paper, tarps, or other approved means.

H. All Supporting members shall be securely attached and located as shown on drawings and shall be set in true plane.

3.4 CONSTRUCTION TOLERANCES

A. Variation from Plumb: For vertical lines and surfaces, do not exceed 1/4 inch in 10 feet. For external corners, expansion joints, control joints, and other conspicuous lines, do not exceed 1/4 inch in 20 feet.

B. Variation from Level: For horizontal lines of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous lines, do not exceed 1/4 inch in 20 feet.

C. Variation of Linear Building Line: For position shown in plan, do not exceed 1/2 inch in 20 feet.

D. Measure variation from level, plumb, and position shown in plan as variation of the average plane of the face of each stone from level, plumb, or dimensioned plane.

E. Variation in Mortar-Joint Thickness: Do not vary from joint size range indicated.

F. Variation in Plane between Adjacent Stones: Do not exceed one-half of tolerance specified for thickness of stone.

3.5 INSTALLATION OF ANCHORED STONE MASONRY

A. Anchor stone masonry to concrete with corrugated-metal veneer anchors unless otherwise indicated. Secure anchors by inserting dovetailed ends into dovetail slots in concrete.

B. Anchor stone masonry to unit masonry with corrugated-metal or individual wire veneer anchors unless otherwise indicated. Embed anchors in unit masonry mortar joints or grouted cells for distance at least one-half of unit masonry thickness.

C. Embed veneer anchors in mortar joints of stone masonry at least halfway, but not less than 1-1/2 inches, through stone masonry and with at least 5/8-inch cover on out-side face.

D. Space anchors to provide not less than 1 anchor per 2 sq. ft. of wall area. Install additional anchors within 12 inches of openings, sealant joints, and perimeter at intervals not exceeding 12 inches.

E. Space anchors not more than 18 inches o.c. vertically and 32 inches o.c. horizontally, with not less than 1 anchor per 2.67 sq. ft. of wall area. Install additional anchors within 12 inches of openings, sealant joints, and perimeter at intervals not exceeding 12 inches.

F. Set stone in full bed of mortar with full head joints unless otherwise indicated. Build anchors into mortar joints as stone is set.

G. Fill space between back of stone masonry and backing wall with mortar as stone is set.

H. Rake out joints for pointing with mortar to depth of not less than 3/4 inch before setting mortar has hardened. Rake joints to uniform depths with square bottoms and clean sides.

3.6 INSTALLATION OF ADHERED STONE MASONRY VENEER

A. Install flashing over sheathing and behind weather-resistant sheathing paper by fastening through sheathing into framing.

B. Install lath over weather-resistant sheathing paper by fastening through sheathing into framing to comply with ASTM C 1063.

C. Install lath over unit masonry and concrete to comply with ASTM C 1063.

D. Install scratch coat over metal lath 3/8 inch thick to comply with ASTM C 926.

E. Coat backs of stone units and face of masonry backup with cement-paste bond coat, then butter both surfaces with setting mortar. Use sufficient setting mortar so a slight excess will be forced out the edges of stone units as they are set. Tap units into place, completely filling space between units and masonry backup.

F. Rake out joints for pointing with mortar to depth of not less than 3/4 inch before setting mortar has hardened. Rake joints to uniform depths with square bottoms and clean sides.

3.7 POINTING

A. Prepare stone-joint surfaces for pointing with mortar by removing dust and mortar particles. Where setting mortar was removed to depths greater than surrounding areas, apply pointing mortar in layers not more than 3/8 inch deep until a uniform depth is formed.

B. Point stone joints by placing and compacting pointing mortar in layers not more than 3/8 inch deep. Compact each layer thoroughly and allow to become thumbprint hard before applying next layer.

C. Tool joints, when pointing mortar is thumbprint hard, with a smooth jointing tool to produce the following joint profile:
   1. Joint Profile: Smooth, flat face slightly below edges of stone.

3.8 ADJUSTING AND CLEANING

A. Remove and replace stone masonry of the following description:
   1. Broken, chipped, stained, or otherwise damaged stone. Stone may be repaired if methods and results are approved by Landscape Architect.
   2. Defective joints.
   3. Stone masonry not matching approved samples and mockups.
   4. Stone masonry not complying with other requirements indicated.

B. Replace in a manner that results in stone masonry matching approved samples and mockups, complying with other requirements, and showing no evidence of replacement.

C. In-Progress Cleaning: Clean stone masonry as work progresses. Remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean stone masonry as follows:
   1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
   2. Test cleaning methods on mockup; leave one-half of panel uncleaned for comparison purposes. Obtain Landscape Architect's approval of sample cleaning before cleaning stone masonry.
   3. Clean stonework not less than six days after completion of work, using clean water and stiff bristle brushes. Do not use wire brushes, acid type cleaning agents or other cleaning compounds with caustic or harsh fillers.
   4. Protect adjacent stone and non-masonry surfaces from contact with cleaner by covering them with liquid strippable masking agent, polyethylene film, or waterproof masking tape.

3.9 PROTECTION

A. All stonework in progress shall be adequately protected from staining, scratching, chipping or other damage. Once the stone has been completed, the contractor shall execute the steps necessary to protect the finished areas. Wood, which may stain or deface the stone shall not be used as protection.

B. Provide final protection and maintain conditions, which ensure stonework being without damage, discolorations, or deterioration during subsequent construction and until time of substantial completion.

3.10 EXCESS MATERIALS AND WASTE

A. Excess Stone: Stack excess stone where directed by Owner for Owner's use.

B. Disposal as Fill Material: Dispose of clean masonry waste, including mortar and excess or soil-contaminated sand, by crushing and mixing with fill material as fill is placed.
   1. Crush masonry waste to less than 4 inches in greatest dimension.
   2. Mix masonry waste with at least two parts of specified fill material for each part of masonry waste. Fill material is specified in Division 31 Section "Earthwork."
   3. Do not dispose of masonry waste as fill within 18 inches of finished grade.

C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other waste, and legally dispose of off Owner's property.

3.11 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day's work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 044310

SECTION 051200 - STRUCTURAL STEEL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes all labor, materials, equipment, special tools and services to complete Structural Steel and Other Steel work required for the Project, as herein specified, and as indicated on the Drawings, including but not limited to:

1. All Structural Steel indicated, including design of connections not shown on the Drawings.
2. All accessories, attachments, anchors and rough hardware for structural steel work. Accessories include anchor bolts, embed plates, deck support angles, etc.
3. All Other Steel indicated on the Structural Drawings (S series), including steel stud shear connectors, metal deck, grating, wall girts, screen wall framing, elevator rail supports, sump pit embeds and covers are included under this Section.
4. Prime painting, galvanizing, and Architecturally Exposed Structural Steel where indicated on the Drawings.
5. Quality control, testing and inspection specified to be performed by the Contractor.
6. Coordination with related and adjacent work shown on the Drawings.
7. Setting of items built into cast-in-place concrete or unit masonry and grouting of base plates is not included in this section.
8. Provide temporary guards on the steel frame at the perimeter of each floor and all floor and roof openings; verify scope with CM or GC.

B. The Contract Documents do not differentiate between fabrication and erection work. Should fabrication and erection be performed by separate contractors, the fabricator is responsible for the scope of work of erector and is responsible for resolution of any disputes that may arise.

C. Metal Deck work is to be performed by the Contractor of this Section, including submittals, erection, quality control, testing and inspection specified herein. See the related sections for additional requirements specific to metal deck.

D. Related Sections:

1. Section 033000 - Cast-In-Place Concrete.
2. Section 042000 - Unit Masonry.
3. Section 053000 - Metal Decking.
4. Section 054000 - Cold Formed Metal Framing.
5. Section 055000 - Metal Fabrications.
6. Section 099000 - Painting.

1.3 REFERENCES

A. Comply with the provisions of the following codes, specifications and standards; use the latest edition unless date is indicated. Modifications in this specification, when in conflict with the referenced codes, specifications and standards, shall take precedence.

1. “Kentucky Building Code” (KBC).

2. American Institute of Steel Construction (AISC) ANSI/AISC 303-16: "Code of Standard Practice for Steel Buildings and Bridges," June 15, 2016, as modified by the project drawings and this specification; and modifications in Part 4 at the end of this section.
3. ANSI/AISC 360-16: "Specification for Structural Steel Buildings" and including the "Commentary on the Specification for Structural Steel Buildings", July 7, 2016.
4. Research Council on Structural Connections (RCSC): "Specification for Structural Joints using High-Strength Bolts", June 11, 2020.
5. ASTM International (ASTM) Specifications and references as noted in this Section.
6. American Welding Society (AWS) D1.1/D1.1M-2010: "Structural Welding Code – Steel."
7. AWS-C5.4-93: "Recommended Practices for Stud Welding".
8. ASTM A6/A6M-17: "Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling ".
9. International Code Council Evaluation Service (ICC-ES) AC193: "Acceptance Criteria for Mechanical Anchors in Concrete Elements".
10. ICC-ES AC308: "Acceptance Criteria for Post-Installed Adhesive Anchors in Concrete Elements".
11. Steel Structures Painting Council (SSPC) "SSPC Painting Manual": "Systems and Specifications" and "Good Painting Practice"
12. American Galvanizer's Association (AGA) Recommendations and Suggested Specifications for Hot-Dip Galvanizing.
13. OSHA Regulations, current edition.

1.4 QUALIFICATIONS

A. Contractor must have a minimum of 5 years of successful experience in the type of work required and submit with his Bid evidence of qualifications required herein.

B. Steel Fabricator:

1. 10 years of successful experience in the fabrication of structural steel.
2. Completion of 10 projects of similar size and complexity within the last 5 years. Submit a list of projects and their locations. Each project listed is to have at least 70 percent of the steel quantity of the work being bid.
3. The steel fabricator must be certified under the AISC Certification Program for Structural Steel Fabricators – Standard for Steel Building Structures and Standard for Steel Bridges for the pedestrian bridge. Evidence of current auditing by an independent, approved inspection agency that the fabricator has established quality control procedures comparable to the AISC program may be considered in lieu of AISC certification.
4. Steel fabricator must have an established in-house quality control program for shop drawing production, material tracking, material inspection, welder certification, weld quality, and fabrication accuracy. Fabricator shall be registered and approved per Section 1704.2.5 of the Building Code, and submit required certificate of compliance. Failure to meet these qualifications will require additional inspections prescribed in Building Code Chapter 17 to be performed by the Owner's inspection agency at the Contractor's expense.

C. Steel Erector:

1. 5 years of successful experience in the erection of structural steel.
2. Submit a list of 6 similar completed projects; include key personnel, and equipment.
3. The steel erector must be certified under the AISC Certification Program for Structural Steel Erectors – Standard for Structural Steel Erectors. Evidence by an independent, approved inspection agency that the erector has established quality control procedures, including weld testing, comparable to the AISC program may be considered in lieu of AISC certification.

1.5 SUBMITTALS

A. The Contractor shall review submittals for compliance with the Contract Documents, accuracy, dimensions, fit-up, construct-ability, and coordination with other work. The structural engineer's review will be for general intent of strength and serviceability only.

B. Submit for record with Bid evidence of Contractor's, Fabricator's and Erector's qualifications.

C. Submit for record evidence of Steel Fabricator's and Erector's quality control programs, procedures and certifications showing conformance with Chapter 17 of the Building Code.

D. Prior to preparing shop drawings, submit for record calculations of connections designed by the contractor, prepared, signed and sealed by a Professional Engineer registered in the state in which this project is located.

E. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

F. Submit detailed drawings, include:

1. Complete details and schedules for fabrication and shop assembly of all members.
2. Complete details, schedules, procedures and diagrams for field erection.
3. Temporary bracing and shoring, including calculations.
4. Limits of prime painted surfaces vs. bare steel, show also on overall plans.
5. Evidence that shop drawings (piece and erection drawings) have been reviewed by the Fabricator's Professional Engineer prior to submittal.
6. Layout and installation drawings for all anchor bolts and other items to be embedded in concrete or masonry work by others. Drawings shall dimension the locations of all embedded items noting pertinent tolerances for the installation.

G. Prior to fabrication, submit for record two copies of producer's or manufacturer's specifications and installation instructions for the following items. Include laboratory test reports and other data for evidence as required to show compliance with these specifications (including specified standards). Indicate by transmittal form that copies of each applicable instruction have been distributed to fabricators, installers and erectors.

1. Structural steel: Submit the mill report for each heat of steel used prior to the start of fabrication. Mill reports shall show chemical analysis to include C, Mn, Cr, Mo, V, Ni, Cu and full mechanical properties of the structural steel provided. For unsatisfactory mill test report, retest or reject steel.
2. High-strength bolts, including nuts and washers: Submit certification of inspection test report for each production lot indicating proof load, tensile strength and hardness of high strength bolts. For unsatisfactory test reports, retest or reject bolts.
3. Welding materials and procedures: Submit written welding procedures for all welding on the project, both shop and field. Procedures for complete penetration welds shall include test records to verify the heat-affected zone and show that parent metal for the test meets the grade specified for the project. Welding sequence and procedures are to minimize the effect of weld shrinkage, residual stresses, and to maintain erection tolerances.
4. Mechanical and adhesive anchors, include manufacturer's evaluation reports (ESR) and specific project locations and conditions where proposed for use.
5. Primer paint and surface preparation procedures.
6. Hot-dip galvanizing and surface preparation procedures

H. During fabrication and construction, Contractor shall submit quality control, inspection and test reports immediately to the Owner's representative and inspector, with a copy to the structural engineer within one week. Include:

1. Welder certification for shop and field welders.
2. Welding, fabrication and erection inspection reports.
3. Welding verification inspection and test reports for all shop and field welds.
4. Shear stud tests and installation reports.
5. Bolt and anchor tests and installation reports.
6. Contractor's weekly inspection report summary.

I. Submit record drawings of the erected steel members to the Owner's representative.

J. Submittals for record, informational submittals, compliance reports and inspection reports will not be reviewed or returned.

1.6 CONTRACTOR DESIGNED CONNECTIONS

A. The Contractor shall be responsible for the structural design and detailing of all connections not shown on the Drawings, in addition to detailing those connections shown on the Drawings. The structural design and detailing of connections shall be in accordance with the following provisions and those identified on the drawings.

B. Design of all connections shall be under the direct supervision of a suitably qualified and experienced structural Professional Engineer, registered in the state in which this project is located, who shall sign and seal the shop drawings of the work for which he is responsible.

C. The Contractor shall design connections using the concepts, specific configuration details, and typical connection notes indicated on the Drawings as minimum requirements.

D. The Contractor shall prepare sketches of all connection details, with locations clearly marked on plans and elevations, and submit these in conjunction with pertinent design notes and calculations for review by the Owner's structural engineer, prior to preparing and submitting related shop drawings.

E. All beam connections shall be simple beam connections unless indicated otherwise on the drawings. Simple beam connections shall be designed for the reaction noted on the Drawings, or where no reaction is called out, for the reaction from the maximum uniform load capacity of the beam. Connections shall also meet the minimum requirements indicated on the Drawings.

F. All gusset, brace and truss member connections shall be designed for the member forces shown on the drawings, or full capacity of the members' flanges if no forces are shown. Connections shall also meet the minimum requirements indicated on the Drawings.

G. Design of connections includes the analysis and design of connected material to determine requirements for stiffeners, doubler plates, etc. Even if doubler plates and stiffeners are not shown on the contract documents they may be required based on the Contractor's connection design and shall be included in the work.

H. All member splices shall be designed to develop the full capacity of the smaller member.

I. The Contractor may propose alternate connections to those shown on the Drawings by submitting sketches, design notes and calculations of all alternate connection details, with locations clearly marked on plans and elevations, at the beginning of the project. Acceptance is at the discretion and judgment of the Owner's structural engineer. Shop drawings submitted by the Contractor showing either details or alternate connections not previously reviewed in accordance with these provisions shall be subject to rejection.

1.7 QUALITY CONTROL

A. Personnel performing the work shall have experience relevant to anticipated conditions, materials, installation requirements and all special techniques involved. Contractor shall have an experienced foreman or superintendent who will be present while work is performed.

B. The Contractor is responsible for and shall perform quality control, testing and inspection of all work as required by the Contract Documents, referenced codes, specifications and standards. Contractor shall employ qualified inspectors to perform inspections, tests and quality control daily. Submit reports weekly.

C. The Contractor shall reject and replace work that is not in conformance.

D. Qualify welding processes and welding operators in accordance with AWS "Standard Qualification Procedure". All welding shall be performed by operators who are qualified for the types of welds used. Verify each operator's qualifications with Owner's inspector prior to using in production.

1. Welders shall retake qualification test if, as determined by the Owner's representative, there is a reasonable doubt as to the proficiency of the welder. If the welder does not requalify he/she shall not perform welding on this project.
2. The Contractor shall pay all costs associated with welder qualification.

E. Qualify mechanical fasteners, mechanical anchors, adhesive anchors and installation processes in accordance with manufacturer's engineering reports and code recognized approval procedure. Installers shall be certified by the manufacturer or an independent organization. Verify each installer's qualifications with the Owner's inspector prior to using in production.

F. Source quality control: All materials shall be Identifiable. Unidentifiable materials shall be tested or rejected.

1. Materials delivered with certificate are classified as Identifiable; those without certificates are classified as Unidentifiable.
2. Test material not identifiable by heat number and mill test, or another acceptable manufacturer's identification per ASTM A370-17. Testing to be performed by Contractor's testing agency as follows:
    a. Shear connectors: Each lot of 100 studs; tensile tests on 3 finished studs per AWS.
    b. Structural shapes and plates: From coupons taken from material; one tensile test and one bend test per 5 tons of each shape.
    c. High strength bolts: Each lot of 100 bolts; tensile tests on 2 bolts in full size and one tensile test on a ½" diameter machined specimen.
    d. Other materials: Test as directed.

G. The Contractor shall arrange for review by the Owner's inspection agency. The Contractor shall not rely on the Owner's inspector for the Contractor's quality control. Contractor shall furnish Owner's inspector with the following:

1. One complete set of fabrication and erection drawings.
2. Material bills and mill test reports.
3. Information regarding time, place of rolling and shipment of materials to shop.
4. If requested, representative sample pieces for testing.
5. Full and ample means and assistance for testing materials.
6. Complete set of welding procedures.
7. Welder qualifications.
8. All manufacturers' installation instructions.
9. Anchor installer qualifications.
10. AISC fabricator certification documents QA/QC manual and most recent AISC audit.

11. AISC erector certification documents QA/QC manual and most recent AISC audit.
12. Qualifications for Contractor's quality control personnel and independent testing agency.
13. Reports for all quality control, tests and inspection by Contractor.

H. Structural inspections required by Chapter 17 of the Building Code shall be performed by an approved inspector retained by the Owner.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Material storage: Protect structural steel members and packaged materials from corrosion and deterioration. Store off ground and pitched to drain off water.

B. Do not store materials on the structure in a manner that might cause distortion or damage to the members or the supporting structures. Repair or replace damaged materials or structures as directed.

C. Deliver welding electrodes to job in unbroken packages bearing name of manufacturer. Special handling for electrodes is required per AWS. Provide and use an oven for electrodes requiring continuous drying prior to use.

1.9 ERECTION ENGINEERING

A. The Contractor shall be solely responsible for the procedure, means and methods of erection as well as safe erection of the work. The Contractor shall be solely responsible for compliance with all pertinent statutes, regulations and/or ordinances with respect to the erection of the work.

B. The structural engineer of record has analyzed the completed steel structural system for service conditions only. The Contractor shall analyze the steel structure at various stages of his erection to ensure stability of the structure and/or its sub-assemblies as well as to ensure that none of the temporary or permanent components of the structure are over-stressed.

C. The Contractor shall be solely responsible for the design of any shoring towers, temporary braces, and/or temporary guys including the foundations and/or anchorages thereof that may be required to execute the work. The Contractor's erection analysis, procedures and drawings shall be prepared under the supervision of a suitably qualified and experienced Professional Engineer, registered in the state in which this project is being constructed, who shall sign and seal the erection drawings.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Structural steel:

1. Wide flange shapes: ASTM A992 (Fy 50ksi).
2. Steel pipes: ASTM A53, Type E or S, Grade B (Fy 35ksi). Spiral Pipe is not permitted.
3. Hollow structural sections (HSS): ASTM A500, Grade C (Round Fy 46ksi; Square and rectangular Fy 50ksi).
4. Other rolled shapes, plates and bars: ASTM A36 (Fy 36ksi) unless noted otherwise.
5. Plates and bars noted Grade 50: ASTM A572 (Fy 50ksi).
6. All steel to be welded shall conform to chemical and metallurgical limitations specified in AWS D1.1 and D1.3.
7. Special care shall be used to select plate and rolled sections free from internal laminations. The Contractor shall assure compliance with provisions for lamination inspection.

8. All end plates and other plates and shapes exceeding 1" in thickness and intended to receive other material welded normal to them with complete penetration welds or fillet welds exceeding 5/16" in size, shall be fully killed and be capable of through-thickness tension test reduction of area values of 20 percent minimum.
9. Comply with AASHTO Fracture Toughness requirements for Bridge Steels ASTM A709 “Zone 2 Welded Fractures Critical” where noted on structural drawings or below. Provide Charpy V-Notch Impact testing with samples from the core of shapes and plates. Use frequency “P” for the Charpy testing. Steel shall be silicon killed, fine grained. Fracture critical steel includes:
    a. Steel noted on plans or details as “FC”.
    b. Top and bottom chords of trusses.
    c. Top flange and bottom flanges of plate girders, where flange thickness exceeds 1½”.
    d. Flanges of rolled or built-up columns where flange thickness exceeds 1½”.
    e. Plates exceeding 1” in thickness with perpendicular attachments, such as base plates and end plates, by penetration welds or fillet welds exceeding 5/16” in size.

B. Threaded fasteners:

1. Anchor rods: ASTM F1554, Fy 36ksi, minimum. Supply all anchor rods with two heavy-hex nuts, one nut to be used for base plate leveling, unless otherwise shown.
2. Structural bolts: ASTM F3125, grade F1852, type 1, 120 ksi, quenched and tempered medium-carbon steel, 3/4” min. diameter, tension control assemblies with heavy-hex nuts and hardened washers. Use tension control assemblies conforming to ASTM F1852 everywhere access permits. For all bolts unless noted otherwise.
3. Structural bolts noted A490 or F2280: ASTM F3125, grade F2280, type 1, 150 ksi, quenched and tempered alloy steel 3/4” min. diameter, tension control assemblies with heavy-hex nuts and hardened washers. Use only where grade A490 or F2280 bolts are noted on the drawings or acceptable to the engineer of record by written request. Use tension control assemblies where access permits.
4. Where access prevents the use of a tension control bolt, use load indicator washer conforming to ASTM F959, in accordance with "Specification for Structural Joints Using High-Strength Bolts” (6-11-2020), paragraph 8.2.4, and mark bolt(s) for inspection. Load indicator washers shall be self-indicating to allow visual observation, and provided with 1 or more additional flat washers, based on hole type, as required by the manufacturer. Install with grade A325 (or A490 where indicated) heavy-hex structural bolts, A563 heavy-hex nuts and F436 hardened washers.

C. Welding electrodes:

1. Use electrodes as required by AISC “Specification for Structural Steel Buildings” and the AWS Code. As minimum use E70 XX electrodes, low hydrogen.
2. For complete penetration welds of beams, columns and trusses, use E70TG-K2 electrodes or better.
3. Charpy V-Notch Impact requirements for welds for and/or to Fracture Critical Steel shall be in accordance with AASHTO/AWS Bridge Welding Code as required to match that specified for the parent material.

D. Steel stud shear connectors: ASTM A108 or A29, Grades 1010 - 1020, Type B, and AWS D1.1.

E. Mechanical and adhesive anchors: ICC-ES approved with current ESR for cracked concrete, zinc coat unless noted otherwise, galvanize or use stainless steel where exposed to weather. Type and embedment depth into concrete as indicated on the drawings, if not shown embed 8 x diameter, but never less than the manufacturer's recommended standard embedment. Manufacturers may include:

1. Hilti, Inc.
2. Powers Fasteners, Inc.

3. Simpson Strong-Tie Company, Inc.

F. Galvanizing: ASTM A123. Galvanize bolts and washers connecting galvanized members per ASTM A153, Class C. Touch up with galvanizing repair compound.

G. Galvanizing repair: Zinc rich galvanize repair compound containing 90% minimum zinc by weight in the dried film. Comply with DOD-P-21035 or The Society for Protective Coatings, Paint Specifications No. 20 (SSPC-PS 20).

H. Structural steel primer paint: One coat rust inhibitive primer, gray. Paint shall be weldable with negligible effect on weld integrity. Where steel is AESS or field painted: One coat of zinc rich primer, refer to Specification 099000 Painting, and verify compatibility with topcoats.

2.2 FABRICATION

A. The fabricator shall track materials, assemble, inspect, and test the work under supervision of qualified quality control personnel, who shall ensure conformance with established written procedures to meet the design requirements. Inspector shall make written daily reports of progress, deviations, deficiencies, and corrections, and confirm work is satisfactory. Submit reports weekly.

B. General:

1. Fabricate items of structural steel in accordance with this specification, the referenced codes and standards, the contract design drawings, and the final reviewed shop drawings.
2. Detail and fabricate steel to allow for erection in compliance with OSHA regulations. Complete detailing for compliance, including modification of details shown on the contract drawings where required.
3. Provide camber in structural members as shown. Unless otherwise shown, fabricate beams with mill camber up.
4. Properly mark and match-mark materials for field assembly. Fabricate for delivery sequence that will expedite erection and minimize field handling of materials.
5. Where finishing is required, complete the assembly, including connections and welding of units, before start of finishing operations.
6. Furnish main steel members in one piece without splicing unless otherwise shown or approved.
7. All exterior hollow steel members shall be completely sealed air tight with welded plates.
8. Provide holes for drainage in any exterior members that will collect and hold water, either during construction or in final structure.
9. Mill all surfaces in contact bearing. Cut and fit bearing and column stiffeners and straighten base plates to provide full bearing over entire cross-section.
10. Seams in hollow structural shapes shall be oriented away from public view.
11. Plates that are subjected to axial tension shall be oriented with the roll direction as shown on the Drawings. Where not shown, orient the roll direction nominally parallel to the direction of primary tensile stress in the plate.

C. Connections:

1. Provide welded shop connections unless otherwise shown.
2. Provide bolted field connections unless otherwise shown.
3. Provide high-strength bolts for all bolted connections.
4. Cut, drill, or punch holes perpendicular to metal surfaces. Do not flame cut holes or enlarge holes by burning. Drill holes in bearing plates.
5. Comply with AWS D1.1 Code for procedures, preheat, appearance and quality of welds, including methods used in correcting welding work. Assemble and weld built-up sections by methods that will produce true alignment of axis without warp.

6. Consider toughness and notch sensitivity of steel in formation of the welding procedures to prevent brittle and premature fracture during fabrication and erection. Toughness requirements are to match those of the parent metal. Weld in a manner to minimize accumulation and concentration of through-thickness strains due to weld shrinkage. Sequence welds in a manner to reduce residual stresses caused by welding to a minimum value.

D. Provisions: Provide holes, weld nuts, welded studs, etc., required for securing other work to structural steel and for the passage of other work through steel framing members as required.

2.3 FINISHING

A. Galvanize structural steel where indicated on the Drawings, including all exterior plates and shapes, mechanical support frames, ledge angles, lintels, and lintel plates.

1. Clean steel to be galvanized of foreign substances per ASTM A385. Power tool clean all welds and adjacent areas to remove flux and splatter before galvanizing.
2. Provide 2.3-oz./sf zinc coating per ASTM A123.

B. Prime paint structural steel where indicated on the Drawings, do not paint at field weld locations or slip critical faying surfaces. Do not paint galvanized steel or steel which is to be fireproofed, U.N.O.

1. Surface Preparation (after SSPC SP-1 Solvent Wipe):
   a. Where standard primer indicated - SSPC SP-3 “Power Tool Cleaning.”
   b. Where indicated “Architecturally Exposed” - SSPC SP-6 “Commercial Blast Cleaning.”
2. Immediately after surface preparation, apply structural steel primer paint in accordance with the manufacturer’s instructions and at a rate to provide a uniform dry film thickness of 2.0 mils. Use painting methods that will result in full coverage of joints, corners, edges and all exposed surfaces. No sags or runs permitted on steel that will be exposed in the finished work.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Establish permanent benchmarks, in addition to those provided, as needed for accurate erection of structural steel.

B. Field survey and measure all existing conditions prior to preparation of shop drawings. Employ a licensed land surveyor for all steel erection work.

C. Check elevations of concrete bearing surfaces and locations of anchor bolts and similar devices before fabrication work and report dimensional discrepancies to the Owner’s representative. Do not proceed with fabrication until corrections have been made or until compensating adjustments to structural steel have been approved by the Owner’s structural engineer.

D. Furnish templates and detailed setting drawings as needed to ensure accurate positions of anchors.

E. Verify positions of anchor bolts before fabrication of steel. Report deviations from design locations and submit written recommendations for corrections.

F. Notify the Owner’s representative in writing of conditions that would hinder proper and timely installation, or impair performance of finished work.

3.2 INSPECTION BY CONTRACTOR

A. Quality control, testing and inspection by Contractor for fabrication and erection shall conform to requirements of the Contract Documents, referenced codes, specifications and standards; and the following:

1. Inspection by Contractor shall be at Contractor's expense, by a testing agency or qualified inspector other than that employed by Owner, and shall be performed before Owner's inspection of material involved.
2. Contractor shall submit weekly written inspection report summaries to the Owner's representative, inspector, and structural engineer. In general, these reports shall:
    a. Verify that welders are certified.
    b. Confirm use of qualified welding procedures and:
        1) Welding equipment is used per manufacturer's recommendations.
        2) Proper use of drying oven and preheating.
        3) Fit-up and structural steel compliance with the specified dimensional standard.
        4) Proper use of run-out plates.
    c. Inspect every weld for quality and conformance. Systematically record welds, include:
        1) Location and type of weld.
        2) Weather conditions during welding.
        3) Identification marks of welders.
    d. Include shear studs, bolts, anchors and other items.
    e. Report all defects and deficiencies.
    f. Report and describe how corrections were made.
3. Acceptance criteria used for the inspection of welds shall be as specified in AWS D1.1.

B. Visually inspect all material for defects before and after cleaning. Material with visible defects shall be rejected.

C. Lamination inspection: All wide flange or plate material 1 inch or greater in thickness within 6 inches of complete penetration welds for flange or perpendicular plate connections shall be ultrasonically tested for laminations per ASTM A578, Level II. Perform such testing before fabrication and test flange and plate material adjacent to and behind welds again after welding. Inspect all material visually for lamellar tears.

1. Material in which defects are found shall be rejected and replaced with satisfactory new material, or repaired by welding, subject to approval of the Owner's structural engineer. Repaired material shall be re-tested at no additional cost to Owner.

D. Penetration welds: Inspect all (100%) complete and partial penetration welds visually. Inspect all (100%) complete penetration welds by ultrasonic or radiographic tests for entire length of weld. All inspections to occur a minimum of 24 hours after completion of welding.

1. Material that fails testing shall be corrected and re-tested over entire length of weld until satisfactory results are achieved.
2. Ultrasonic testing shall be performed by a specially trained, qualified technician to operate equipment, examine welds, and maintain a record of welds examined, defects found, and dispositions of defects.
3. When ultrasonic indications arising from weld root can be interpreted as either a weld defect or backing strip, the backing strip shall be removed and the weld shall be re-tested.
4. Ultrasonic instrumentation shall be calibrated by technician to evaluate the quality of welds per AWS D1.1.
5. Other methods of inspection, for example, x-ray, gamma ray, magnetic particle, or dye penetrant, may be used on welds if acceptable to the Owner's structural engineer.

E. Fillet welds: Inspect all (100%) shop and field fillet welds visually for proper size, quality of weld and placement per reviewed shop drawings. Inspect 5% of a mix of field and shop welds by magnetic particle method, ASTM 109.

F. Shear studs: Test and install as specified in AWS D1.1 requirements for stud welding.

G. High strength bolted connections: At beginning of bolting operations, verify bolt installation techniques and test bolts in field conditions for proper pretension per manufacturer's requirements. Retest when changes in bolt lots, lubrication and weather exposure conditions occur. Inspect all bolted connections for bolt size, quantity, type, and tension.

H. Mechanical and adhesive anchors: Verify installers are certified and materials are used in conformance with manufacturer's recommendations. Observe hole preparation and installation technique at all anchors as work progresses. Proof test 5% of all anchors in each condition, distributed throughout the project, and at least 1 anchor in each steel framing connection. Amount of testing shall be increased if failures occur.

3.3 INSPECTION BY OWNER

A. The Owner will engage an independent inspection agency to perform shop and field verification inspection services in accordance with referenced standards. The Contractor shall schedule and coordinate inspections.

1. The Owner will pay costs of initial inspection.
2. Material that fails inspection shall be corrected by Contractor and re-inspected until satisfactory results are achieved.
3. The Contractor shall pay costs incurred by Owner's inspection agency, architect, and/or engineer for re-inspection of corrections made because of failed initial tests.
4. Inspection may be performed in shop or field.
5. Contractor shall perform all necessary preparatory work for inspection such as cleaning, marking and removal of back-up bars, if needed, without additional costs.
6. Acceptance criteria used for the inspection of welds shall be as specified in AWS D1.1.

B. Inspections do not relieve Contractor of responsibility for contract compliance. The Owner's representative shall have the right to inspect or test work and reject faulty materials of workmanship at any time before final acceptance.

C. General:

1. Review Contractor's quality control program.
2. Review Contractor's fabrication and erection inspection reports for compliance with the requirements of AWS D1.1 and Inspection by Contractor, above.
3. Verify welder's certifications.
4. Provide required verification inspections.
5. Record types and locations of all defects discovered, report such discoveries to Contractor, and record corrections performed. Reports will be made not less than weekly to the Owner's representative.

D. Penetration welds: All (100%) complete and partial penetration welds shall be visually inspected. Twenty percent (20%) of complete penetration welds shall be inspected ultrasonically for the entire length of weld. Columns, beams and plate material perpendicular in connections with penetration welds will be checked for lamellar tears. Further inspection may be required if unacceptable welds or material are found. Contractor shall pay cost of such additional inspection. Rejection of any portion of a weld shall require re-inspection of 100% of that weld after repair.

E. Fillet welds: Twenty percent (20%) of the field-placed fillet welds shall be visually inspected. Five percent (5%) of shop-placed welds shall be visually inspected to verify fabrication quality control. Inspector is to verify placement of welds per reviewed show drawings, as well as proper size and quality of weld.

F. Shear studs: At start of shear stud installation, Owner's inspector shall observe construction installation and the Contractor's quality control, specified in AWS D1.1, (requirements for stud welding) and perform the following additional requirements:

1. 100% of the first 100 studs and 50% of the next 200 studs installed shall be bend tested to a 15-degree angle. If more than 4 studs fail, installation shall cease until installation procedures have been adjusted to achieve satisfactory results, and Contractor shall bend test all studs installed to date.
2. For balance of job, bend tests at least 10% of all field-applied shear studs. A failure rate of not more than 2% of studs tested will be acceptable.
3. Contractor shall correct failed stud installations.
4. Owner's inspector shall check stud installation using the contract drawings and reviewed shop drawings to verify quantity and location of studs.
5. If operators or equipment are changed or the deck becomes wet, testing shall revert to that at the beginning of the project.

G. High strength bolted connections:

1. Observe Contractor's testing and installation techniques meet manufacturer requirements.
2. Visually inspect all bolted connections for bolt size, quantity, type, and tension. Inspection shall also confirm that bolts' threads are not in the shear plane where required.
3. Two bolts per thousand of each grade and type shall be removed from ongoing field bolting operations and checked for proper tension when installed per manufacturer's instructions. Condition of bolts tested shall match field conditions.
4. One bolt per two thousand of each grade and type shall be randomly tested for material requirements of ASTM F3125; including, but not limited to, chemical composition, hardness, dimension, and tensile strength.

H. Mechanical and adhesive anchors: Verify installer certification. As work progresses, observe installation for conformance with manufacturer's recommendations and witness Contractor's proof testing.

I. Remedies: Defective material shall be removed and replaced by the Contractor unless corrective procedures are permitted by the engineer. Corrections shall be tested at Contractor's expense until satisfactory results are achieved.

3.4 OXYGEN (FLAME) CUTTING

A. Manual oxygen cutting shall be done in the shop only and only with a mechanically guided torch. Alternatively, an unguided torch may be used provided the cut is not within 0.5 inches, of the finished dimension and the final removal is completed by chipping or grinding to produce a surface quality equal to that of the base metal at cut edges.

B. Control process to prevent excessive hardening of edges of steel where material is to be welded or is subject to axial tension.

C. Clean and repair all cut edges by welding and/or grinding to remove all gouges, cuts, burrs, and jags to meet the requirements of AWS D1.1.

D. Re-entrant cuts shall have as large a radius as possible without over cutting.

E. The use of oxygen-cut holes for bolted connections is not permitted under any circumstances. Violation will be cause for the rejection of any pieces in which oxygen cut bolt holes exist.

F. Oxygen cutting of structural steel in the field is not allowed except with the written consent and approval of the Owner's structural engineer.

3.5 BASE PLATES AND ANCHORS

A. Furnish anchor rods, and other items built into cast-in-place concrete or unit masonry to appropriate installer, together with template and detailed setting drawings required to assure accurate positioning of the items.

B. Templates, furnished by the Contractor for all anchor rods, shall be used to set the anchors. Templates shall be fabricated from steel plate, minimum thickness 1/8". The installer is to check carefully the setting of the bolts to the proper position prior to placement of concrete. Anchor bolts shall have nuts and washers. Damaged threads shall be repaired or re-cut to permit full tightening of nuts.

C. Anchors, embed plates and other items shall not be welded to reinforcing steel.

D. Base plates supported on concrete, whether shop attached or shipped loose, shall be furnished with and set upon leveling nuts. Base plates shall have holes for bleeding off air during grouting.

E. Setting base plates:

1. Prior to setting, clean existing and new concrete surfaces and roughen with bush hammer to improve bond. Clean the bottom surface of the base plates. Chip out any areas required to set shear lugs, making sure that the reinforcing steel is not damaged.
2. Tighten anchor bolts after the base plates have been positioned and leveled. Do not remove wedges or shims, but if protruding, cut off flush with the edge of the base plate.

3.6 BOLTS

A. Assemble joint using drifts to obtain correct alignment.

B. Fit bolts. Use hardened washers under the turned part. Lubricate bolts to prevent nuts seizing on the bolts. Lubricate with a liquid high-pressure lubricant and apply only to the outstanding threads after the bolts have been inserted through the steel work, taking care to prevent lubricant getting between the plies of the joint.

C. Tighten bolts sufficiently in an appropriate sequence to bring joint surfaces into uniformly close contact.

D. Pretension all high strength bolts to the appropriate levels using tension control bolts or load indicator washers.

E. Mark each bolted connection when all bolts in the connection are prestensioned. Do not touch-up paint or cover until bolts have been inspected. The inspector shall mark connections that have been inspected.

3.7 MECHANICAL AND ADHESIVE ANCHORS

A. Post-installed anchors into concrete shall only be used as shown in the structural details, and only as submitted and reviewed. They shall not be used where cast-in-place anchors are required.

B. Adhesive anchoring shall not be used in overhead or upward conditions. Adhesive anchors in near horizontal positions shall use a hybrid adhesive.

C. Anchors shall be ICC-ES approved with current ESR for cracked concrete, zinc coat unless noted otherwise, galvanize or use stainless steel where exposed to weather.

D. Anchor size, type, embedment depth into concrete, edge distances and spacing are crucial, and shall be as indicated on the structural drawings. If not shown, embed 8 x diameter, but never less than the manufacturer's recommended standard embedment, with edge distances at least 8 x diameter and spacing at least 12 x diameter.

E. The Contractor shall arrange for a representative of the manufacturer to provide onsite installation training for their products. Adhesive anchor installers shall also be certified by a recognized program, such as by ACI and CRSI. Submit documentation of training and certification of personnel prior to performing such work. Provide copy to the Owner’s inspector.

F. Holes into concrete must not interfere with reinforcing bars. The Contractor shall review the structural drawings and use ferro-scan, chipping or other means to locate reinforcing bars in the area. Space holes to fit around rebar and fabricate fixture to match.

G. Install in strict accordance with the manufacturer’s ESR, written instructions and recommendations. Holes in concrete shall be the proper size and thoroughly cleaned with all dust removed. Drill holes using a hollow bit and functioning vacuum system, then brush and blowout with compressed air.

H. Install into dry concrete in clean, dust free holes using method and procedure that meets manufacturer’s recommendations including temperature range, humidity, installation time and cure time. Follow the manufacturer’s printed installation instructions. Instructions must be included in the anchor packaging.

I. Provide standard size holes in the fastened steel element (1/16” larger than anchor diameter). Mark and drill all holes in the concrete before setting steel. Some anchors may be set after steel is in place to allow some alignment. Do not oversize holes. Use washers beneath nuts.

J. Contractor shall perform quality control, inspect and test anchors.

K. When exposed to view in the final structure, bolts shall be of a length that will extend entirely through but not more than ¼-inch beyond the nuts unless otherwise shown on the drawings.

3.8 WELDING (APPLIES TO BOTH SHOP AND FIELD WELDS)

A. Weld using only qualified and approved AWS procedures. Use drying oven for electrodes and preheat steel per AWS requirements.

B. Weld in manner to prevent warping or distortion of finished product. Use jigs that will not restrain piece from moving during welding or cooling after welding. Sequence weld passes at a joint to prevent excessive heat build-up or cause shrinkage cracks to form. Adequately peen and brush joint after successive passes to prevent slag inclusions, open pockets, and inadequate fusion.

C. Provisions shall be made in detailing of lengths of members for dimensional changes as a result of shrinkage stresses so as to provide required finished dimension.

D. During assembling and welding, hold components with adequate clamps or other means to keep parts straight, accurately aligned and positioned, and in close contact. Plan sequence of field welding to minimize locked-in stresses and distortion.

E. Provide adequate screening from wind for field welding.

F. Cut out defective welds or parts of welds with a chisel or air arc, and re-weld.

G. Tack welds and temporary welds made in material that will be subject to tension or architecturally exposed shall be removed and ground smooth.

H. Fillet weld sizes shall comply with the minimum requirements of the AWS D1.1 Code regardless of smaller sizes being noted on the contract design drawings.

I. Where structural steel members are to remain exposed in the finished work, welds exposed to view shall be uniform and smooth. Penetration welds shall not project more than 1/16” above the adjacent surfaces where exposed to view. Grind welds if necessary to meet this provision.

J. Remove run-off tabs and grind surfaces smooth where the tabs interfere with architectural treatment or are exposed to view in the final structure. Remove backup bars where exposed to public view in the completed structure.

K. All exposed to public view or to weather welds shall be continuous. In the event that an intermittent weld is specified, provide seal welds between.

L. Heavy sections and those weldments having a high degree of restraint must be welded in a sequence with the proper preheat such that no permanent distortion occurs. Submit a welding sequence for review for these types of connections.

M. Splices of members in tension, all members of moment frames, and all bracing members of braced frames that are made from plates more than 1½” thick or ASTM A6 Group 4 or 5 rolled shapes shall develop the force due to the design load, but not less than 50% of the effective strength of the member. A smaller percentage may be used only if it is justified by engineering analysis that considers other factors including handling, shipping and erection.

3.9 ERECTION

A. Comply with this specification, the referenced codes and standards, the contract design drawings, and the final shop drawings. Comply with requirements of governing authorities, including requirements for work above public streets and sidewalks.

B. Provide all temporary shoring and bracing members as required, with connections of sufficient strength to bear imposed loads, including all construction loads and Building Code wind loads. Comply with FM bulletin I-7:

1. The structural steel framework is "non-self-supporting" and therefore requires temporary support bracing. Do not remove temporary support members and connections until the structure is complete and functioning as the designed unit. The unit is complete when all structural steel and metal deck is completed, and supporting concrete, including walls, floor diaphragms and slabs on metal deck are placed and cured.
2. Members and connections shown and reviewed via the shop drawing process are analyzed only for loads due to the final structure. Loads imposed on the connections and members during the erection process, and safety of erection of same, shall be responsibility of the structural steel Contractor.
3. Provide temporary guy lines to achieve proper alignment of the structures as erection proceeds.

C. Provide temporary planking and working platforms as needed for the work. Provide temporary guards on the steel frame at the perimeter of each floor and all floor and roof openings.

D. Field assembly:

1. Set structural frames accurately to the lines and elevations indicated. Align and adjust the various members forming a part of a complete frame or structure before permanently fastening. Clean bearing surfaces and other surfaces that will be in permanent contact before assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignments.
2. Level and plumb individual members of the structure within specified AISC tolerances, unless more restrictive tolerances are specified on the drawings.
3. Splice members only where shown or specified.
4. On exposed welded construction, remove erection bolts, fill holes with plug welds and grind smooth.
5. Comply with AISC Specifications for bearing, adequacy of temporary connections, alignments and the removal of paint on surfaces adjacent to field welds.
6. Do not enlarge unfair holes in members by burning or by use of drift pins except in secondary bracing members. Ream holes that must be enlarged to admit bolts. Where a hole is required to be enlarged by more than 3/32-inch ream to and use the next larger bolt size.
7. Do not use gas cutting torches in the field for correcting fabrication errors, except on secondary members that are not under stress. Finish gas-cut sections equal to a sheared appearance.

E. Shear connectors: Inspect composite deck installation before installation of shear studs and report adverse conditions to the Owner's representative. Deck shall be in continuous contact with top of beam flanges, embossing flattened or removed, and no lap joints. Do not start work until such conditions are corrected. Start of work is acceptance of conditions and responsibility for corrections.

1. Areas of beams to which studs are welded directly shall be free of loose mill scale, and heavy rust that would adversely affect welding. Where studs are to be welded through metal deck, top flanges of beam shall be free of dirt, moisture and debris before installation of deck. Remove water in deck flutes so that it is not trapped between deck and beam.
2. Field weld studs to structural members after steel framing and metal deck are in place.
3. Workmanship shall be in accordance with the AWS D1.1 Code. Quality control, including inspection and testing, shall be in accordance with this specification and AWS D1.1 Code.

3.10 CLEANING

A. Following erection, clean all steel work of mud and dirt accumulated during erection. Thoroughly clean and remove dirt, debris, oil, water, and other foreign material from steel and leave ready for painting or fireproofing.

B. Field coat all damaged and abraded areas of galvanized steel with galvanizing repair compound applied per manufacturer's instructions.

C. Field prime paint all welded, damaged and abraded areas and previously unprimed steel at welds, slip critical connections, etc. with same material used for shop painting.

PART 4 - ADDITIONAL REQUIREMENTS

4.1 MODIFICATIONS TO THE AISC CODE OF STANDARD PRACTICE

A. Modifications to the AISC Code of Standard Practice are described throughout the Contract Documents and within this Section. Requirements of the Contract Documents that modify or conflict with referenced standards shall take precedence over the standard. Where a numbered paragraph is noted below, the requirements of said paragraph in the AISC "Code of Standard

Practice for Steel Buildings and Bridges", June 15, 2016, and its Commentary are deleted and the requirements noted herein shall apply.

1.4.1 Contract documents for structural work shall be issued as printed or printable contract documents. Requirements shall be the plain text and drawings printed on the documents. Digital information in any electronic file or model shall not be used in lieu of or for augmentation of the printed contract documents.

1.8.1 (a) Steel Contractor shall provide, install and remove any shoring necessary for the installation of new structural steel.

1.8.3 Fabricator shall survey and determine existing dimensions and elevations required for structural steel work or arrange for field verification through the GC or CM, with no additional cost to the Owner.

3.1 (j) Dimensions and elevations for structural steel may require coordination with architectural components, mechanical requirements, and existing conditions and may not be completely shown on the structural drawings.

3.1.1.1 Connections shall be as indicated in the design documents with engineering design and detailing of all parts, copes, stiffeners and welds completed by the Fabricator using option 2 and option 3.

3.1.1.2 Should connection configurations differing from the design documents be needed, Fabricator shall propose and submit details prior to shop drawing preparation. The submittal shall clearly define the location of all connections submitted for review. See Section 4.2.3.

3.1.1.3 If additional information or clarifications regarding connections is desired, the Fabricator shall contact the structural engineer of record.

3.1.2.1 Connection design shall account for concentrated forces using option 3B. Even if reinforcement details and quantities are not shown on the design documents, reinforcement may be required by connection design and shall be included in the work and bid.

3.2 Architectural, Electrical and Mechanical Design Drawings and Specifications

Architectural, Electrical and Mechanical Drawings may be used as a supplement to the Structural Drawings to define detail configurations and construction information, including dimensions and locations.

3.5 Revisions to Design Drawings and Specifications

Revisions are addressed in Section 9.3

3.6 Fast-Track Project Delivery

When it is required that a project be bid before the requirements of Section 3.1 can be met, the Owner may provide sufficient information in the form of scope, drawings, weights, outline specifications, and other descriptive data to enable the fabricator and erector to prepare a knowledgeable bid. Construction shall not commence until drawings are issued for construction, any adjustments to the bid is made and written notice to proceed is given by the Owner.

4.2.4 Legibility of Drawings

Drawings shall be clearly legible and drawn to an identifiable scale that is appropriate to clearly convey the information, but not less than 1/8” to the foot, unless a smaller scale is approved by the Owner’s representative.

4.4 Review of Shop Drawings

Shop drawings shall be made by the Contractor and shall be submitted for review. The architect and engineer will endeavor to complete their review of shop drawing submittals within 14 days of engineer's receipt of submittals for those shop drawings deemed critical; other shop drawings, 28 days. Shop drawings shall be returned noted: "No exceptions noted," or "Exceptions noted," or "Exceptions noted, revise and resubmit." Fabrication of material prior to the receipt of shop drawings for that material noted "No exceptions noted" or "Exceptions noted" shall be at the Contractor's risk.

4.4.1 Review of shop drawings does not relieve the Contractor of the responsibility for accuracy of detail dimensions; the general fit-up of parts to be assembled in the field; the ability to erect the material; the adequacy of any members or connections designed by the Contractor; or the Contractor's safety measures.

4.4.2 Any notations made on the shop drawings or answers to a Request For Information (RFI) do not authorize additional compensation for the Contractor without the issuance of a formal change order.

4.5 Fabrication and/or Erection Drawings Not Furnished by the Fabricator

Fabrication and erection drawings shall be made by the Fabricator or his subcontractor and shall be the responsibility of the Fabricator.

9.3.1 Revisions to the structural steel requirements are made by issuance of new documents, reissuance of existing documents, answers to RFIs, or by annotation of shop or erection drawings.

9.3.2 A revision to the contract price is made by formal change order.

END OF SECTION

SECTION 053000 - METAL DECKING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Metal Deck work shall be performed by or under the Contractor of Section 051200, Structural Steel, and as specified in Section 051200, with the additional requirements herein.

B. Section includes all labor, materials, equipment, special tools and services to complete Metal Deck Work required for the Project, as herein specified, and as indicated on the Drawings, including but not limited to:

1. The extent of metal decking, including basic layout and type of deck units is indicated on the Drawings.
2. Performance requirements.
3. All floor decks.
4. All roof decks.
5. All fasteners and accessory items required to make a complete installation.
6. Detailing of metal deck and accessories.
7. Installation of all metal deck and accessories including roof sump pans and reinforcing for all openings up to but not exceeding 12 inches by 12 inches.
8. Repair of deck finishes.

C. Metal deck serves other functions in addition to resisting directly applied loads. The manufacturer shall review the use, details and method of installation of his product as indicated and shall disclose to the Owner's representative any and all deviations from his recommended use and method of installation and shall also make recommendations for the use and method of installation of his product to achieve the intended purpose and result. Such disclosures shall be made within the time stipulated for the submission of shop drawings.

D. Related Sections:

17. Factory Mutual (FM) Class I Construction (roof deck).
18. Underwriters Laboratories (UL) Online Certifications Directory – Fire Resistance Ratings, www.UL.com.
19. OSHA Regulations, current.

1.4 QUALIFICATIONS

A. Deck manufacturer shall be a member of the Steel Deck Institute and shall have an established quality control program with current auditing by an approved inspection agency in conformance with Chapter 17 of the Building Code. Failure to meet these qualifications will require additional inspections prescribed in Building Code Chapter 17 to be performed by the Owner's inspection agency at the Contractor's expense.

B. Deck detailer and deck supplier shall be approved by the deck manufacturer.

1.5 SUBMITTALS

A. Submit for record evidence of deck manufacturer's qualifications.

B. Submit for record evidence of deck manufacturer's quality control programs, procedures and certifications showing conformance with Chapter 17 of the Building Code.

C. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

D. Submit detailed drawings, include:

1. Unit dimensions, section properties and finish of all types of deck.
2. Drawings to scale indicating layout and types of deck panels, supplementary framing, reinforcement, cut openings, accessories, and sequence of installation.
3. Type and location of welds and other fasteners, and anchorage details.
4. Details of accessories, pour stops, closure strips, plates, and their attachment.
5. Primer paint and color where painted, or surfaces treated for fireproofing, with extent shown on plan.

E. Prior to fabrication, submit for record two copies of manufacturer's evaluation report (ESR), product data, load and diaphragm capacities, specifications, and installation instructions for each type of decking, surface treatment, finish, fasteners and accessories showing compliance

with all requirements of the specifications. Indicate by transmittal form that copies of all applicable instructions have been provided to steel fabricator and erector.

F. Submit for record galvanizing repair and touch up paint product data.

G. Upon request, submit samples for review and acceptance by the Owner's representative. Samples may be used for bond tests of subsequent coatings.

H. Submittals for record, informational submittals, compliance reports and inspection reports will not be reviewed or returned.

1.6 QUALITY CONTROL

A. The Contractor is responsible for and shall perform quality control, inspection, and testing of all metal deck work as required by the Contract Documents, referenced codes, specifications and standards. The Contractor shall reject and replace work that is not in conformance.

B. Qualify welding processes and welding operators in accordance with AWS "Standard Qualification Procedure". All welding shall be performed by operators who are qualified for the types of welds used. Verify each operator's qualifications with Owner's inspector prior to using in production.

C. Qualify mechanical fasteners and installation processes in accordance with manufacturer's engineering reports and code recognized approval procedure. Installers shall be certified by the manufacturer or an independent organization. Verify each installer's qualifications with the Owner's inspector prior to using in production.

D. Decking in place is subject to inspection and testing. Expense of removing and replacing portions of decking for testing purposes will be borne by Owner if satisfactory; expense shall be paid by Contractor if unsatisfactory. Remove defective work and replace with new acceptable work.

1.7 DELIVERY, STORAGE AND HANDLING

A. Do not bend or mar deck. Protect deck and packaged materials from corrosion and deterioration. Store off ground and pitched to drain off water. Cover deck with waterproof covering and ventilate.

B. Do not handle or store deck bundles on the structure in a manner that might cause distortion or damage to the deck or the supporting structures. Repair or replace damaged materials or structures as directed. Bent and damaged deck will be rejected.

C. Deliver welding electrodes to job in unbroken packages bearing name of manufacturer. Special handling for electrodes is required per AWS. Provide and use an oven for electrodes requiring continuous drying prior to use.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Metal deck serves other functions in addition to resisting directly applied gravity loads. Metal decks are horizontal shear diaphragms that provide local bracing and transfer horizontal loads as part of the overall lateral force resisting system of the structure. The deck must be fastened at regular intervals to all supporting steel and be capable of these functions.

1. Floor metal deck is required to brace the compression flanges of all supporting members during construction, particularly under the load of the floor concrete prior to the concrete setting up.
2. Floor composite metal deck must bond with the concrete floor to develop a composite slab, and is part of the composite framing system of the supporting steel and concrete.
3. Roof metal deck is required to permanently brace the compression flanges of all supporting members, including miscellaneous framing, and act as a shear diaphragm as an essential part of the lateral force resisting system of the structure.

B. Provide deck capable of supporting construction loads, including wet concrete, if applicable, without shoring. Construction loading shall be 20 psf live load or 150 pound/foot concentrated load (see SDI for loading diagrams) in addition to wet weight of concrete plus 1" deflection added concrete.

C. Compute properties of deck sections based on effective design width as limited by AISI Specifications. All data shall be derived from tests certified by an independent testing agency.

D. Provide decking tested and listed in the UL Fire Resistance Directory for specific UL designs indicated on the Architectural Documents. Assemblies shall provide a 2-hour floor rating and a 2-hour roof rating, unless noted otherwise. Units for those assemblies shall bear the UL label.

E. Provide roof decking tested and complying with specified Factory Mutual requirements. Units shall be installed and fastened to meet FM approval.

F. Provide and fasten deck capable of supporting a diaphragm load as noted on the drawings, but not less than 280 pounds per linear foot, working stress load. Apply manufacturer's recommended safety factor, but not less than SF = 2.5. Space attachments no farther apart than the minimum attachments indicated on the drawings and specified herein.

G. Composite deck: Design and fabricate deck with the combined steel deck and concrete section capable of supporting a minimum superimposed live load of 200 psf, working stress load (ignore strength of any concrete reinforcing steel).

H. Roof deck: Design and fabricate deck capable of supporting total dead and live loads of 100 psf. Deflection shall not exceed 1/360 of the span under a live load of 25 psf. Anchor roof deck units to resist net uplift of 30 psf, working stress loads, FM Class I requirements, or as required by the contract documents, whichever is greater.

I. Deck shall have wide ribs suitable for shear stud placement where studs are required. The configuration of the metal deck shall allow studs to develop the full shear value for the particular weights of the concrete as listed in the AISC Specifications, latest edition. The Contractor shall provide written verification of the stud values with a specific deck type and stud spacing.

J. Accessories for a complete installation, including:

1. Provide continuous sheet metal closures, screeds and pour stops at all slab openings, slab edges and deck ends without gaps or voids, of adequate thickness to support concrete and construction loads without distortion.
2. Provide continuous sheet metal plates at all ridges, valleys, change of roof deck direction and areas where roof deck is not nested, lapped or interlocked.
3. Provide roof sump pans for all roof drains.

2.2 MANUFACTURERS

A. Manufacturer of steel deck products shall be a current member of the Steel Deck Institute. Manufacturers may include:

1. Canam.
2. Cordeck.
3. DACS, Inc.
4. Epic Metals Corp.
5. Gooder-Henrichsen Co.
6. Marlyn Steel Decks, Inc.
7. Miami Metal Deck.
8. New Millennium Building Systems.
9. OEG Building Materials.
10. Roof Deck Inc.
11. Sloan Supply Company, Inc.
12. Tri-State Decking, Inc.
13. Valley Joist, Div. Ebsco Industries, Inc.
14. Vulcraft Group, Nucor Corporation.

2.3 MATERIALS

A. Steel for metal deck units and accessories: ASTM A653, SQ33 or higher. Conform to AISI Specification for Design of Cold-Formed Steel Structural Members.

B. Miscellaneous steel shapes: ASTM A 36.

C. Shop finish: ASTM A 924, hot dip galvanizing.

D. Galvanizing repair: Zinc rich galvanize repair compound containing 90% minimum zinc by weight in the dried film. Comply with DOD-P-21035 or The Society for Protective Coatings, Paint Specifications No. 20 (SSPC-PS 20).

E. Welding materials: comply with AWS D1.1 and D1.3.

F. Deck fasteners, subject to compliance with all requirements of the drawings, specifications, and manufacturer:

1. All deck shall be fastened to the supporting steel by either welds, screws, or powder or air actuated pin fasteners. All fasteners must be recognized by the Steel Deck Institute, the ICC-ES International Code Council Evaluation Service, Factory Mutual and Underwriters Laboratory.
2. Fastener spacing indicated on the drawings or in this specification is based on welding to steel supports. Where manufactured fasteners are used, fastener spacing may need to be reduced and is to be designed by the Contractor's engineer and submitted for review.
3. The following manufacturers supply products that generally comply with these requirements:
    a. HILTI Corporation, PO Box 21148, Tulsa, OK, 74121.
    b. ITW Buildex, 1349 West Bryn Mawr Ave., Itasca, Illinois 60143.
    c. PNEUTEK, Inc., 17 Friars Drive, Hudson, NH, 03051.
    d. Simpson Strong-Tie®, 5956 W Las Positias Blvd., Pleasanton CA, 94588.
4. Powder actuated or pneumatic fasteners shall be a minimum of 0.157" diameter. Screws to supports shall be minimum #12. Fasteners shall be zinc coated or galvanized.

2.4 FABRICATION

A. Provide all deck of each type from a single manufacturer.

B. Supply deck units in lengths for 3 or more spans on 4 or more supports, where possible, with interlocking or nested side laps. Where ends are lapped, detail fastening to penetrate through all adjacent sheets and secure deck to supporting steel, especially at 4 corner laps.

C. Deck to receive concrete shall be vented or formed with punched hanger slots in each rib at a maximum of 18" o.c.

D. Minimum thickness of material as fabricated shall be within 5% of the design thickness.

E. Deck gage noted is minimum thickness and may have to be increased based on design considering design loads, steel strength, concrete slab thickness, and span variations. Each deck sheet shall be clearly marked as to location if deck gage or strength varies on the structure.

F. Composite floor deck: G60 galvanized units with depth and minimum thickness as shown on the drawings and as required by design, but not thinner than 20 gage.

G. Roof deck: G90 galvanized units with depth and minimum thickness as shown on the drawings and as required by design, but not thinner than 20 gage. 1½" deep units to be wide rib, type B deck. 3" deep units to be type N. Provide deck configurations complying with SDI roof deck requirements, and Factory Mutual requirements for Type 1 construction. Top surfaces shall not have stiffening ribs.

H. Roof sump pans: 14 gage minimum thickness, galvanized sheet steel with level bottoms, sloped sides, recessed 1½" below deck surface. Size to receive roof drains, with bearing flanges not less than 3" wide. Cut holes for drains in the field.

I. Sheet metal plate: closures, screeds and pour stops, not thinner than 18 gage.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Installer shall examine the area and conditions under which metal decking is to be installed.

B. Notify Owner's representative in writing of conditions detrimental to proper and timely completion of the work.

C. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install deck units and accessories in accordance with manufacturer's recommendations and final reviewed shop drawings, referenced standards and as specified herein.

1. Place deck units in straight alignment, flat and square without warp or excessive deflection, and adjust to final position with proper end bearing on supports before permanently fastening.
2. Place deck units as shown on reviewed installation drawings.
3. Do not stretch or contract side lap interlocks.
4. Fasten as work progresses, do not leave material unsecured.
5. Coordinate with the manufacturer and structural steel erector in sizing and locating decking bundles to prevent overloading structural members.
6. Do not use deck units for storage or working platforms until permanently secured. Do not overload deck in any case.

B. Provide complete, continuous coverage of entire floor and roof areas without gaps or voids other than specifically indicated openings. Include pour stops and other closures to form concrete at edges, openings, and as needed to contain concrete fill without leaks or migrations.

1. Cut and neatly fit deck units and accessories around other work projecting through or adjacent to the decking.
2. Provide neat, square and trim cuts.
3. Cut openings in deck true to dimensions using metal saws, drills, or cutting torch.
4. Do not use cutting torch where decking is to be permanently exposed to view.
5. Where concrete or other fill is to be placed on deck, seal joints and gaps wider than 1/8" with sheet steel or tape.

C. Attachment of deck.

1. Attachment to supports shall be with fusion welds (puddle welds) with a diameter of 5/8" minimum; or an elongated weld of 3/8" minimum width and ¾" minimum length; or an approved mechanical fastener.
2. Mechanically fasten side laps between supports.
3. Fasten accessories to steel supports at 12" o.c. and to deck at 6" o.c.

D. Welds shall comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work. Weld metal shall penetrate all layers of deck material at end laps and have adequate fusion to the supporting members.

E. Mechanical fasteners to steel supporting members shall be ICC-ES approved with current ESR and submitted for review prior to use. The Contractor shall arrange for a representative of the manufacturer to provide onsite installation training for their products. Submit documentation of training of personnel prior to performing such work. Provide copy to the Owner's inspector.

F. Avoid concentrated loads and impact loads during erection and construction. Plank the deck in all traffic areas to prevent damage to units.

G. Metal deck to receive spray-on finish, insulation, or fireproofing (see architectural contract documents) shall be cleaned of all grease, mill oil, paraffin, dirt, salt and other contaminants which would impair adhesion. All required cleaning shall be done prior to metal deck installation using a cleaning method that is compatible with finish application.

3.3 INSTALLATION, COMPOSITE DECK

A. Installed deck shall be suitable for installation of shear studs with 1" minimum lateral concrete cover typically, and 2" lateral concrete cover at deck mid-height in the load direction. Coordinate installation of deck with installer of shear studs. Shear stud installer shall inspect deck installation.

B. Provide minimum 2" bearing over steel supports and install deck with butted joints, maximum 1/8" gap and with flutes aligned.

C. Bottoms of flutes shall be in full, continuous contact with steel supports. Flatten or remove embossings or ribs as needed to achieve this condition.

D. Attach composite deck to all supports at 12" o.c. Mechanically fasten side laps with #10 screws or button punch, space not to exceed 36" o.c.

3.4 INSTALLATION, ROOF DECK

A. Provide a minimum of 2" bearing and lap ends not less than 2". Do not extend bottom sheet past the support.

B. Minimum attachment.

1. Attach 3" roof deck at 8" o.c. to all supports at ends, end laps and intermediate supports. Attach at 12" o.c. maximum at all edges and where not perpendicular to deck span. Secure deck to each supporting member in ribs in which side laps occur.
2. Attach 1½" roof deck to all supports at 6" o.c. at all ends and end laps. Attach at 12" o.c. at all intermediate supports, edges and where not perpendicular to deck span. Secure deck to each supporting member in ribs in which side laps occur.
3. Mechanically fasten side laps with minimum #10 screws, space not to exceed 24" o.c.
4. Fasteners may need to be larger and/or spaced closer for F.M. and U.L. ratings, diaphragm loading specified, or other requirements. Contractor shall verify fasteners and spacing with manufacturer for the specific deck product and show on the installation drawings.

C. Reinforce deck at openings.

1. Reinforce deck at openings and penetrations with dimensions less than 12" with minimum 18 gage galvanized steel sheet at least 12" wider and longer than the opening. Fusion weld reinforcement to the top of deck at each corner and 6" o.c. along each side.
2. Reinforcing may be omitted for penetrations 4" and smaller that fit between deck ribs.
3. Where deck penetration exceeds 12", frame the opening with a welded angle frame or structural members spanning between joists or beams.
4. Where deck opening or penetration is larger than 12" and less than 24", as an alternate to framed openings, if acceptable to the Owner's engineer, use a 1-1/2 x 1-1/2 x ¼" steel angle on the underside of deck at right angles to ribs, each side of the opening. Extend angles 3 ribs beyond each side of opening and weld deck to angle in each rib. Reinforce opening sides parallel to ribs with 12" wide, 18 gage galvanized steel sheet, 12" longer than opening, each side, placed on top of deck, weld at each corner and 6" o.c. along each side. Side reinforcing may be omitted when a roof sump pan is to be installed over opening.
5. Provide additional metal reinforcement and closure pieces as required for strength, continuity of decking, and support of other work shown.

D. Place roof sump pans over openings provided in roof decking and weld to top of deck at each corner, at each deck flute and not more than 6" o.c. Cut opening in roof sump bottom to accommodate drain size.

E. Provide continuous sheet metal plates at all ridges, valleys, change of roof deck direction and areas where roof deck is not nested, lapped or interlocked. Attach directly to the steel deck at 6" o.c. each side as a finished surface for the application of insulation and roofing.

3.5 INSPECTION

A. Contractor's inspector shall inspect all metal deck work, fasteners and welds as part of the required quality control. Inspect as work proceeds and areas are completed, but ahead of concrete or roof placement. Confirm in reports:

1. Proper material is installed properly, including gage of material and, if gage varies, at correct locations on the structure.
2. Welding qualifications and fastener certifications for deck installers.
3. All (100%) deck welds and mechanical fasteners are installed and inspected, including layout, spacing, size and quality, per the Structural Drawings and project requirements.

4. Galvanized finish is repaired.

B. Owner's inspector shall review Contractor's inspections and verify the installed deck work.

3.6 FINISH REPAIR AND CLEANING

A. Repair galvanized finish on all galvanized steel roof deck, and any deck with exterior exposure, by field coating all damaged and abraded areas with galvanizing repair compound. After decking installation and ahead of roofing, wire brush, clean and paint scarred areas, welds and rust spots on top and bottom surfaces of decking units and supporting steel members. Touch-up surfaces with galvanizing repair paint applied in accordance with manufacturer's instructions.

B. Following erection, clean all steel deck of mud and dirt accumulated during erection. Thoroughly clean and remove dirt, debris, oil, water, and other foreign material from deck surfaces. Clean composite deck with detergent to remove oil and slick sports that would prevent concrete from bonding. Leave ready for concrete fill, roofing, painting or fireproofing.

END OF SECTION

SECTION 054000 - COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Exterior non-load-bearing wall framing.
2. Soffit framing.

B. Related Requirements:

1. Section 055000 "Metal Fabrications" for miscellaneous steel shapes, masonry shelf angles, and connections used with cold-formed metal framing.
2. Section 092116.23 "Gypsum Board Shaft Wall Assemblies" for interior non-load-bearing, metal-stud-framed, shaft-wall assemblies, with height limitations.
3. Section 092216 "Non-Structural Metal Framing" for standard, interior non-load-bearing, metal-stud framing, with height limitations and ceiling-suspension assemblies.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For the following, including installation drawings:

1. Cold-formed steel framing materials.
2. Exterior non-load-bearing wall framing.
3. Vertical deflection clips.
4. Single deflection track.
5. Drift clips.
6. Soffit framing.
7. Post-installed anchors.
8. Power-actuated anchors.
9. Sill sealer gasket.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental Product Declaration: For each product.
3. Health Product Declaration: For each product.
4. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop and Installation Drawings: Project specific.

1. Show detail, length and location of all light gage materials, including any subassemblies to be shop fabricated. Show all welds whether shop or field and indicate all connections to steel frame, concrete and masonry portions of the work.

    a. Show schematic framing elevations indicating stud spacing, stud gage, double or multiple studs, slip joints, bracing and bridging.
    b. Indicate number and size of fasteners and/or size and length of weld.
    c. Include color code identification for gage of members.
    d. For prefabricated framing (if any), show individual panel drawings for each condition including configuration, dimensions, materials, attachments and panel locations.

2. Manufacturer's Certification:

    a. Certify compliance with structural criteria. Published load tables and literature are usually acceptable.

3. Mill Certificates: Submit upon request only.
4. Design Calculations and Shop Drawing Preparation: For cold-formed metal framing indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer registered in the State responsible for their preparation. Shop drawings shall also bear the engineer’s signature and seal.
5. Include layout, spacings, sizes, thicknesses, and types of cold-formed steel framing; fabrication; and fastening and anchorage details, including mechanical fasteners.
6. Indicate reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining work.

D. Delegated Design Submittal: For cold-formed steel framing. Include calculations stamped and signed by qualified professional engineer.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Welding certificates.

C. Product Certificates: For each type of code-compliance certification for studs and tracks.

D. Product Test Reports: For each listed product, for tests performed by a qualified testing agency.

1. Steel sheet.
2. Expansion anchors.
3. Power-actuated anchors.
4. Mechanical fasteners.
5. Vertical deflection clips.
6. Horizontal drift deflection clips
7. Miscellaneous structural clips and accessories.

E. Research Reports:

1. For nonstandard cold-formed steel framing post-installed anchors and power-actuated fasteners, from ICC-ES or other qualified testing agency acceptable to authorities having jurisdiction.

1.5 QUALITY ASSURANCE

A. Reference Standards:

1. Specification for the Design of Cold-Formed Steel Structural Members, 2001 Edition, by the American Iron and Steel Institute.

B. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated.

C. Product Tests: Mill certificates or data from a qualified independent testing agency indicating steel sheet complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, and metallic-coating thickness.

D. Code-Compliance Certification of Studs and Tracks: Provide documentation that framing members are certified according to the product-certification program of the Certified Steel Stud Association, the Steel Framing Industry Association, the Steel Stud Manufacturers Association, or the Supreme Steel Framing System Association.

E. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3/D1.3M, "Structural Welding Code - Sheet Steel."

F. Codes and References to be complied with:

1. “Kentucky Building Code”.
2. ASTM A 780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
3. ASTM A 1003 - Standard Specification for Steel Sheet, Carbon, Metallic- and Nonmetallic-Coated for Cold-Formed Framing Members.
4. ASTM A 653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvannealed) by the Hot-Dip Process.
5. ASTM C 955 - Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases.
6. ASTM C 1513 - Standard Specification for Steel Tapping Screws for Cold-Formed Steel Framing Connections.
7. ASTM C1007 - Standard Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories.
8. AISI - Standard for Cold-Formed Steel Framing General Provisions.
9. AISI - North American Specification (NASPEC) for the Design of Cold-Formed Steel Structural Members - 2001, including 2004 Supplement..
10. American Welding Society (AWS) D1.1 "Structural Welding Code - Steel."
11. AWS D1.3 "Structural Welding Code - Sheet Steel."

G. Engineering Responsibility: Preparation of Shop Drawings, design calculations, and other structural data by a qualified professional engineer.

H. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of cold-formed metal framing that are similar to those indicated for this Project in material, design, and extent.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Protect and store cold-formed steel framing from corrosion, moisture staining, deformation, and other damage during delivery, storage, and handling as required in AISI S202.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ClarkDietrich.
2. MBA Building Supplies.
3. MRI Steel Framing, LLC.
4. Marino\WARE.
5. Mill Steel Framing; Mill Steel Company.
6. Steel Network, Inc. (The).
7. Telling Industries.
8. United Metal Products, Inc.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design cold-formed steel framing.

B. Structural Performance: Provide cold-formed steel framing capable of withstanding design loads within limits and under conditions indicated.

1. Design Loads: As indicated on Drawings.
2. Deflection Limits: Design framing systems to withstand design loads without deflections greater than the following:

    a. Exterior Non-Load-Bearing Framing: Horizontal deflection of 1/360 (Metal Panels) and 1/600 (Brick) of the wall height.

3. Design framing systems to provide for movement of framing members located outside the insulated building envelope without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change of 120 deg F (67 deg C).
4. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure as follows:

    a. Upward and downward movement of 3/4 inch (19 mm).

5. Design exterior non-load-bearing wall framing to accommodate horizontal deflection without regard for contribution of sheathing materials. Design exterior non-load-bearing wall framing to accommodate load from angle at base of wall and/or window sill supporting curtain wall framing and /or storefront framing. Refer to details on drawings.

C. Cold-Formed Steel Framing Standards: Unless more stringent requirements are indicated, framing complies with AISI S100 and AISI S240.

D. Fire-Resistance Ratings: Comply with ASTM E119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency acceptable to authorities having jurisdiction.

2.3 COLD-FORMED STEEL FRAMING MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Framing Members, General: Comply with AISI S240 for conditions indicated.

C. Steel Sheet: ASTM A1003/A1003M, Structural Grade, Type H, metallic coated, of grade and coating designation as follows:

1. Grade: As required by structural performance.
2. Coating: G90 (Z275).

D. Steel Sheet for Vertical Deflection and Drift Clips: ASTM A653/A653M, structural steel, zinc coated, of grade and coating as follows:

1. Grade: As required by structural performance.
2. Coating: G90 (Z275).

2.4 EXTERIOR NON-LOAD-BEARING WALL FRAMING (STL STUD-1)

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: Minimum 16 ga., 54 mils.
2. Minimum Flange Width: 2 inches (51 mm).
3. Section Properties: As required by structural performance.

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with unstiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: Matching steel studs.
2. Flange Width: 1-1/4 inches (32 mm).

C. Vertical Deflection Clips, Exterior: Manufacturer's standard bypass and head clips, capable of accommodating upward and downward vertical displacement of primary structure through positive mechanical attachment to stud web.

D. Single Deflection Track: Manufacturer's single, deep-leg, U-shaped steel track; unpunched, with unstiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal loads and transfer them to the primary structure, and as follows:

1. Minimum Base-Metal Thickness: Minimum 16 ga., 54 mils.
2. Flange Width: 1 inch (25 mm) plus the design gap for one-story structures and 1 inch (25 mm) plus twice the design gap for other applications.

E. Drift Clips: Manufacturer's standard bypass or head clips, capable of isolating wall stud from upward and downward vertical displacement and lateral drift of primary structure through positive mechanical attachment to stud web and structure.

2.5 SOFFIT FRAMING

A. Exterior Soffit Frame: Manufacturer's standard C-shaped steel sections, of web depths indicated, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: Minimum 16 ga., 54 mils.
2. Minimum Flange Width: 2 inches (51 mm), minimum.
3. Section Properties: As required by structural performance.

2.6 FRAMING ACCESSORIES

A. Fabricate steel-framing accessories from ASTM A1003/A1003M, Structural Grade, Type H, metallic coated steel sheet, of same grade and coating designation used for framing members.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:

1. Supplementary framing.
2. Bracing, bridging, and solid blocking.
3. Web stiffeners.
4. Anchor clips.
5. End clips.
6. Foundation clips.
7. Gusset plates.
8. Stud kickers and knee braces.
9. Hole-reinforcing plates.
10. Backer plates.

2.7 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A36/A36M, zinc coated by hot-dip process according to ASTM A123/A123M.

B. Anchor Bolts: ASTM F1554, Grade 55, threaded carbon-steel hex-headed bolts, carbon-steel nuts, and flat, hardened-steel washers; zinc coated by hot-dip process according to ASTM A153/A153M, Class C.

C. Post-Installed Anchors: Fastener systems with bolts of same basic metal as fastened metal, if visible, unless otherwise indicated; with working capacity greater than or equal to the design load, according to an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC01 ICC-ES AC193 ICC-ES AC58 or ICC-ES AC308 as appropriate for the substrate.

1. Uses: Securing cold-formed steel framing to structure.

2. Type: Torque-controlled expansion anchor Torque-controlled adhesive anchor or adhesive anchor.
3. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B633 or ASTM F1941 (ASTM F1941M), Class Fe/Zn 5, unless otherwise indicated.
4. Material for Exterior or Interior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless steel bolts, ASTM F593 (ASTM F738M), and nuts, ASTM F594 (ASTM F836M).

D. Power-Actuated Anchors: Fastener systems with working capacity greater than or equal to the design load, according to an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC70.

E. Mechanical Fasteners: ASTM C1513, corrosion-resistant-coated, self-drilling, self-tapping, steel drill screws.

1. Head Type: Low-profile head beneath sheathing; manufacturer's standard elsewhere.

F. Welding Electrodes: Comply with AWS standards.

2.8 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: ASTM A780/A780M MIL-P-21035B or SSPC-Paint 20.

B. Cement Grout: Portland cement, ASTM C150/C150M, Type I; and clean, natural sand, ASTM C404. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.

C. Nonmetallic, Nonshrink Grout: Factory-packaged, nonmetallic, noncorrosive, nonstaining grout, complying with ASTM C1107/C1107M, and with a fluid consistency and 30-minute working time.

D. Shims: Load-bearing, high-density, multimonomer, nonleaching plastic; or cold-formed steel of same grade and metallic coating as framing members supported by shims.

E. Sill Sealer Gasket: Closed-cell neoprene foam, 1/4 inch (6 mm) thick, selected from manufacturer's standard widths to match width of bottom track or rim track members as required.

2.9 FABRICATION

A. Fabricate cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.

1. Fabricate framing assemblies using jigs or templates.
2. Cut framing members by sawing or shearing; do not torch cut.
3. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, pneumatic pin fastening, or riveting as standard with fabricator. Wire tying of framing members is not permitted.

a. Comply with AWS D1.3/D1.3M requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.

b. Locate mechanical fasteners and install according to Shop Drawings, with screws penetrating joined members by no fewer than three exposed screw threads.

4. Fasten other materials to cold-formed steel framing by welding, bolting, pneumatic pin fastening, or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies by means that prevent damage or permanent distortion.

C. Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable variation of 1/8 inch in 10 feet (1:960) and as follows:

1. Spacing: Space individual framing members no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error are not to exceed minimum fastening requirements of sheathing or other finishing materials.
2. Squareness: Fabricate each cold-formed steel framing assembly to a maximum out-of-square tolerance of 1/8 inch (3 mm).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, conditions, and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Before sprayed fire-resistive materials are applied, attach continuous angles, supplementary framing, or tracks to structural members indicated to receive sprayed fire-resistive materials.

B. After applying sprayed fire-resistive materials, remove only as much of these materials as needed to complete installation of cold-formed framing without reducing thickness of fire-resistive materials below that required to obtain fire-resistance ratings indicated. Protect remaining fire-resistive materials from damage.

C. Install load-bearing shims or grout between the underside of load-bearing wall bottom track and the top of foundation wall or slab at locations with a gap larger than 1/4 inch (6 mm) to ensure a uniform bearing surface on supporting concrete or masonry construction.

D. Install sill sealer gasket at the underside of wall bottom track or rim track and at the top of foundation wall or slab at stud or joist locations.

3.3 INSTALLATION, GENERAL

A. Cold-formed steel framing may be shop or field fabricated for installation, or it may be field assembled.

B. Install cold-formed steel framing according to AISI S200, AISI S202, and manufacturer's written instructions unless more stringent requirements are indicated.

C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.

1. Screw, bolt, or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch (1.6 mm).

D. Install cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened.

1. Cut framing members by sawing or shearing; do not torch cut.
2. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, or riveting. Wire tying of framing members is not permitted.

a. Comply with AWS D1.3/D1.3M requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
b. Locate mechanical fasteners, install according to Shop Drawings, and comply with requirements for spacing, edge distances, and screw penetration.

E. Install framing members in one-piece lengths unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads equal to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion joints with cold-formed steel framing. Independently frame both sides of joints.

H. Install insulation, specified in Section 072100 "Thermal Insulation," in framing-assembly members, such as headers, sills, boxed joists, and multiple studs at openings, that are inaccessible on completion of framing work.

I. Fasten hole-reinforcing plate over web penetrations that exceed size of manufacturer's approved or standard punched openings.

3.4 INSTALLATION OF EXTERIOR NONLOADBEARING WALL FRAMING

A. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure.

B. Fasten both flanges of studs to top and bottom track unless otherwise indicated. Space studs as follows:

1. Stud Spacing: As indicated on Drawings.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.

D. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.

1. Install single deep-leg deflection tracks and anchor to building structure.
2. Install double deep-leg deflection tracks and anchor outer track to building structure.
3. Connect vertical deflection clips to bypassing and infill studs as designed and anchor to building structure.
4. Connect drift clips to cold-formed steel framing and anchor to building structure.

E. Install horizontal bridging in wall studs, spaced vertically in rows indicated on Installation Drawings but not more than 48 inches (1220 mm) apart. Fasten at each stud intersection.

1. Channel Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs.
2. Strap Bridging: Combination of flat, taut, steel sheet straps of width and thickness indicated and stud-track solid blocking of width and thickness to match studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.
3. Bar Bridging: Proprietary bridging bars installed according to manufacturer's written instructions.

F. Top Bridging for Single Deflection Track: Install row of horizontal bridging within 12 inches (305 mm) of single deflection track. Install a combination of bridging and stud or stud-track solid blocking of width and thickness matching studs, secured to stud webs or flanges.

1. Install solid blocking at centers indicated on Installation Drawings.

G. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, and fasteners, to provide a complete and stable wall-framing system.

3.5 INSTALLATION TOLERANCES

A. Install cold-formed steel framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet (1:960) and as follows:

1. Space individual framing members no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error are not to exceed minimum fastening requirements of sheathing or other finishing materials.

3.6 REPAIR

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed steel framing with galvanized repair paint according to ASTM A780/A780M and manufacturer's written instructions.

3.7 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Field and shop welds will be subject to testing and inspecting.

C. Testing agency will report test results promptly and in writing to Contractor and Architect.

D. Cold-formed steel framing will be considered defective if it does not pass tests and inspections.

E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.8 PROTECTION

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that cold-formed steel framing is without damage or deterioration at time of Substantial Completion.

END OF SECTION 054000

SECTION 055000 - METAL FABRICATIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Steel framing and supports for operable partitions.
2. Steel framing and supports for overhead doors.
3. Steel tube reinforcement for low partitions.
4. Steel framing and supports for mechanical and electrical equipment.
5. Steel framing and supports for applications where framing and supports are not specified in other Sections.
6. Elevator machine beams**,** hoist beams, and divider beams.
7. Steel shapes for supporting elevator door sills.
8. Shelf angles.
9. Metal ladders.
10. Ladder safety cages.
11. Elevator pit sump covers.
12. Miscellaneous steel trim including steel angle corner guards, steel edgings and loading-dock edge angles.
13. Metal bollards.
14. Loose bearing and leveling plates for applications where they are not specified in other Sections.
15. Slotted channel frame supports for ceiling hung lights, booms and medical equipment.

B. Products furnished, but not installed, under this Section include the following:

1. Loose steel lintels.
2. Anchor bolts, steel pipe sleeves, slotted-channel inserts, and wedge-type inserts indicated to be cast into concrete or built into unit masonry.
3. Steel weld plates and angles for casting into concrete for applications where they are not specified in other Sections.

C. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for installing anchor bolts, steel pipe sleeves, slotted-channel inserts, wedge-type inserts, and other items cast into concrete.
2. Section 042000 "Unit Masonry" for installing loose lintels, anchor bolts, and other items built into unit masonry.
3. Section 051200 "Structural Steel Framing."

1.3 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of metal fabrications that are anchored to or that receive other work. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

1.4 ACTION SUBMITTALS

A. Product Data: For the following:

1. Paint products.
2. Grout.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

C. Shop Drawings: Show project specific fabrication and installation details. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items. Provide Shop Drawings for the following:

1. Steel framing and supports for operable partitions.
2. Steel framing and supports for overhead doors.
3. Steel tube reinforcement for low partitions.
4. Steel framing and supports for mechanical and electrical equipment.
5. Steel framing and supports for applications where framing and supports are not specified in other Sections.
6. Elevator machine beams**,** hoist beams, and divider beams.
7. Steel shapes for supporting elevator door sills.
8. Shelf angles.
9. Metal ladders.
10. Ladder safety cages.
11. Elevator pit sump covers.
12. Miscellaneous steel trim including steel angle corner guards, steel edgings and loading-dock edge angles.
13. Metal bollards.
14. Loose steel lintels.

D. Delegated-Design Submittal: For miscellaneous supports, framing, medical equipment and ladders, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer.

B. Mill Certificates: Signed by stainless-steel manufacturers, certifying that products furnished comply with requirements.

C. Welding certificates.

D. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.

E. Research/Evaluation Reports: For post-installed anchors, from ICC-ES.

F. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
3. AWS D1.6/D1.6M, "Structural Welding Code - Stainless Steel."

1.7 FIELD CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design miscellaneous supports, framing, medical equipment and ladders.

B. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 METALS

A. Metal Surfaces, General: Provide materials with smooth, flat surfaces unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

B. Recycled Content: Provide manufacturer documentation for recycled content, indicating postconsumer and preconsumer recycled content.

C. Regional Materials: Manufacture products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

D. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

E. Stainless-Steel Sheet, Strip, and Plate: ASTM A 240/A 240M or ASTM A 666, (interior) and Type 316L (exterior).

F. Stainless-Steel Bars and Shapes: ASTM A 276, Type 304 (interior) and Type 316L (exterior).

G. Steel Tubing: ASTM A 500/A 500M, cold-formed steel tubing.

H. Steel Pipe: ASTM A 53/A 53M, Standard Weight (Schedule 40) unless otherwise indicated.

I. Slotted Channel Framing: Cold-formed metal box channels (struts) complying with MFMA-4.

1. Size of Channels: As indicated.
2. Material: Galvanized steel, ASTM A 653/A 653M, structural steel, Grade 33 (Grade 230), with G90 (Z275) coating.

J. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M, unless otherwise indicated.

2.3 FASTENERS

A. General: Unless otherwise indicated, provide Type 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5, at exterior walls. Select fasteners for type, grade, and class required.

1. Provide stainless-steel fasteners for fastening aluminum.
2. Provide stainless-steel fasteners for fastening stainless steel.

B. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with hex nuts, ASTM A 563 (ASTM A 563M); and, where indicated, flat washers.

C. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, ASTM F 593 (ASTM F 738M); with hex nuts, ASTM F 594 (ASTM F 836M); and, where indicated, flat washers; Alloy Group 2 (A4).

D. Anchor Bolts: ASTM F 1554, Grade 36, of dimensions indicated; with nuts, ASTM A 563 (ASTM A 563M); and, where indicated, flat washers.

1. Hot-dip galvanize or provide mechanically deposited, zinc coating where item being fastened is indicated to be galvanized.

E. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488/E 488M, conducted by a qualified independent testing agency.

F. Cast-in-Place Anchors in Concrete: Either threaded type or wedge type unless otherwise indicated; galvanized ferrous castings, either ASTM A 47/A 47M malleable iron or ASTM A 27/A 27M cast steel. Provide bolts, washers, and shims as needed, all hot-dip galvanized per ASTM F 2329.

G. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors.

1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5, unless otherwise indicated.
2. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless-steel bolts, ASTM F 593 (ASTM F 738M), and nuts, ASTM F 594 (ASTM F 836M).

H. Slotted-Channel Inserts: Cold-formed, hot-dip galvanized-steel box channels (struts) complying with MFMA-4, 1-5/8 by 7/8 inches (41 by 22 mm) by length indicated with anchor straps or studs not less than 3 inches (75 mm) long at not more than 8 inches (200 mm) o.c. Provide with temporary filler and tee-head bolts, complete with washers and nuts, all zinc-plated to comply with ASTM B 633, Class Fe/Zn 5, as needed for fastening to inserts.

2.4 MISCELLANEOUS MATERIALS

A. Shop Primers: Provide primers that comply with Section 099113 "Exterior Painting," Section 099123 Interior Painting," and Section 099600 "High-Performance Coatings."

B. Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat.

1. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.

C. Water-Based Primer: Emulsion type, anticorrosive primer for mildly corrosive environments that is resistant to flash rusting when applied to cleaned steel, complying with MPI#107 and compatible with topcoat.

D. Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.

E. Shop Primer for Galvanized Steel: Primer formulated for exterior use over zinc-coated metal and compatible with finish paint systems indicated.

F. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.

G. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187/D 1187M.

H. Shrinkage-Resistant Grout: Factory-packaged, nonmetallic, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

I. Concrete: Comply with requirements in Section 033000 "Cast-in-Place Concrete" for normal-weight, air-entrained, concrete with a minimum 28-day compressive strength of 3000 psi (20 MPa).

2.5 FABRICATION, GENERAL

A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Form exposed work with accurate angles and surfaces and straight edges.

E. Weld corners and seams continuously to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners or welds where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) fasteners unless otherwise indicated. Locate joints where least conspicuous.

G. Fabricate seams and other connections that are exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.

I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.

J. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches (3.2 by 38 mm), with a minimum 6-inch (150-mm) embedment and 2-inch (50-mm) hook, not less than 8 inches (200 mm) from ends and corners of units and 24 inches (600 mm) o.c., unless otherwise indicated.

K. Stainless steel is to be produced in a clean environment completely separated from other steel manufacturing areas to avoid cross contamination of metal.

2.6 MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Provide steel framing and supports not specified in other Sections as needed to complete the Work.

B. Fabricate units from steel shapes, plates, and bars of welded construction unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction.

1. Fabricate units from slotted channel framing where indicated.
2. Furnish inserts for units installed after concrete is placed.

C. Fabricate supports for operable partitions and overhead doors from continuous steel members of sizes indicated with attached bearing plates, anchors, and braces as recommended by the product's manufacturer and as designed by the delegated design engineer. Drill or punch bottom flanges of members to receive anchor bolts and hanger rods as required by the product manufacturer; locate holes where indicated on Shop Drawings.

D. Galvanize miscellaneous framing and supports where indicated.

E. Prime miscellaneous framing and supports with zinc-rich primer or primer specified in Section 099600 "High-Performance Coatings" where indicated.

2.7 SHELF ANGLES

A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to concrete framing. Provide horizontally slotted holes to receive 3/4-inch (19-mm) bolts, spaced not more than 6 inches (150 mm) from ends and 24 inches (600 mm) o.c., unless otherwise indicated.

1. Provide mitered and welded units at corners.
2. Provide open joints in shelf angles at expansion and control joints. Make open joint approximately 2 inches (50 mm) larger than expansion or control joint.

B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete.

C. Galvanize and prime shelf angles located in exterior walls.

D. Prime shelf angles located in exterior walls with zinc-rich primer or primer specified in Section 099600 "High-Performance Coatings."

E. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

2.8 METAL LADDERS (MET FAB-1)

A. General:

1. Comply with ANSI A14.3**,** except for elevator pit ladders.
2. For elevator pit ladders, comply with ASME A17.1/CSA B44.

B. Steel Ladders:

1. Siderails: Continuous, 3/8-by-2-1/2-inch (9.5-by-64-mm) steel flat bars, with eased edges.
2. Rungs: 3/4-inch- (19-mm-) diameter steel bars.
3. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
4. Provide nonslip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
5. Provide platforms as indicated fabricated from welded or pressure-locked steel bar grating, supported by steel angles. Limit openings in gratings to no more than 1/2 inch (12 mm) in least dimension.
6. Support each ladder at top and bottom and not more than 60 inches (1500 mm) o.c. with welded or bolted steel brackets.
7. Galvanize ladders, including brackets.

2.9 LADDER SAFETY CAGES

A. General:

1. Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or with stainless-steel fasteners.
2. Provide primary hoops at tops and bottoms of cages and spaced not more than 20 feet (6 m) o.c. Provide secondary intermediate hoops spaced not more than 48 inches (1200 mm) o.c. between primary hoops.
3. Fasten assembled safety cage to ladder rails and adjacent construction by welding or with stainless-steel fasteners unless otherwise indicated.

B. Steel Ladder Safety Cages:

1. Primary Hoops: 1/4-by-4-inch (6.4-by-100-mm) flat bar hoops.
2. Secondary Intermediate Hoops: 1/4-by-2-inch (6.4-by-50-mm) flat bar hoops.
3. Vertical Bars: 3/16-by-1-1/2-inch (4.8-by-38-mm) flat bars secured to each hoop.
4. Galvanize ladder safety cages, including brackets and fasteners.

2.10 ELEVATOR PIT SUMP COVERS

A. Fabricate from 3/16-inch (4.8-mm) abrasive-surface floor plate with four 1-inch- (25-mm-) diameter holes for water drainage and for lifting.

B. Provide steel angle supports as indicated.

2.11 MISCELLANEOUS STEEL TRIM

A. Unless otherwise indicated, fabricate units from steel shapes, plates, and bars of profiles shown with continuously welded joints and smooth exposed edges. Miter corners and use concealed field splices where possible.

B. Provide cutouts, fittings, and anchorages as needed to coordinate assembly and installation with other work.

1. Provide with integrally welded steel strap anchors for embedding in concrete or masonry construction.

C. Galvanize and prime exterior miscellaneous steel trim.

D. Prime exterior miscellaneous steel trim with zinc-rich primer or primer specified in Section 099600 "High-Performance Coatings."

2.12 METAL BOLLARDS (MET FAB-2)

A. Fabricate metal bollards from Schedule 40 steel pipe.

1. Cap bollards with 1/4-inch- (6.4-mm-) thick steel plate.

B. Fabricate bollards with 3/8-inch- (9.5-mm-) thick steel baseplates for bolting to concrete slab. Drill baseplates at all four corners for 3/4-inch (19-mm) anchor bolts.

1. Where bollards are to be anchored to sloping concrete slabs, angle baseplates for plumb alignment of bollards.

C. Prime bollards with zinc-rich primer and provide High-Performance Coating in Safety Yellow.

2.13 LOOSE BEARING AND LEVELING PLATES

A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction. Drill plates to receive anchor bolts and for grouting.

B. Galvanize plates.

C. Prime plates with zinc-rich primer or primer specified in Section 099600 "High-Performance Coatings."

2.14 LOOSE STEEL LINTELS

A. Fabricate loose steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated. Fabricate in single lengths for each opening unless otherwise indicated. Weld adjoining members together to form a single unit where indicated.

B. Size loose lintels to provide bearing length at each side of openings equal to 1/12 of clear span, but not less than 8 inches (200 mm) unless otherwise indicated.

C. Galvanize and prime loose steel lintels located in exterior walls.

D. Prime loose steel lintels located in exterior walls with zinc-rich primer or primer specified in Section 099600 "High-Performance Coatings."

2.15 STEEL WELD PLATES AND ANGLES

A. Provide steel weld plates and angles not specified in other Sections, for items supported from concrete construction as needed to complete the Work. Provide each unit with no fewer than two integrally welded steel strap anchors for embedding in concrete.

2.16 FINISHES, GENERAL

A. Finish metal fabrications after assembly.

B. Finish exposed surfaces to remove tool and die marks and stretch lines, and to blend into surrounding surface.

2.17 STEEL AND IRON FINISHES

A. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M for other steel and iron products.

1. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.

B. Preparation for Shop Priming Galvanized Items: After galvanizing, thoroughly clean railings of grease, dirt, oil, flux, and other foreign matter, and treat with metallic phosphate process.

C. Shop prime iron and steel items not indicated to be galvanized unless they are to be embedded in concrete, sprayed-on fireproofing, or masonry, or unless otherwise indicated.

1. Shop prime with universal shop primer or primers specified in Section 099113 "Exterior Painting" or primers specified in Section 099123 "Interior Painting" unless zinc-rich primer or primers specified in Section 099600 "High-Performance Coatings" are indicated.

D. Preparation for Shop Priming: Prepare surfaces to comply with requirements indicated below:

1. Exterior Items: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
2. Items Indicated to Receive Zinc-Rich Primer: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
3. Items Indicated to Receive Primers Specified in Section 099600 "High-Performance Coatings": SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
4. Other Items: SSPC-SP 3, "Power Tool Cleaning."

E. Shop Priming: Apply shop primer to comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.

1. Stripe paint corners, crevices, bolts, welds, and sharp edges.

2.18 SUSPENDED EQUIPMENT SUPPORTS AND TRACK:

A. Ceiling mounted, suspended equipment, medical related or otherwise, shall be "Unistrut" slotted channel shape P1001 minimum or as required to comply with equipment manufacturer’s details, loads, and deflection limitations. The support system, including fastening to superstructure and any miscellaneous steel items required shall be engineered by Unistrut. The magnitude and

locations of loads shall be coordinated with the manufacturer of the suspended equipment. Engineered sealed shop drawings shall be submitted. Tracks shall be installed per equipment manufacturers printed instructions and shall conform to the tolerances specified by the equipment manufacturer. See structural drawings for additional Unistrut support system requirements.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.

B. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

C. Field Welding: Comply with the following requirements:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag screws, wood screws, and other connectors.

E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

F. Corrosion Protection: Coat concealed surfaces of aluminum that come into contact with grout, concrete, masonry, wood, or dissimilar metals with the following:

1. Cast Aluminum: Heavy coat of bituminous paint.
2. Extruded Aluminum: Two coats of clear lacquer.

3.2 INSTALLING MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.

B. Anchor supports for operable partitions and overhead doors securely to, and rigidly brace from, building structure.

3.3 INSTALLATION OF SHELF ANGLES

A. Install shelf angles as required to keep masonry level, at correct elevation, and flush with vertical plane.

3.4 INSTALLATION OF METAL LADDERS

A. Secure ladders to adjacent construction with the clip angles attached to the stringer.

B. Install brackets as required for securing of ladders welded or bolted to structural steel or built into masonry or concrete.

3.5 INSTALLATION OF ELEVATOR PIT SUMP COVERS

A. Install tops of elevator sump pit cover plates and frames flush with finished surface. Adjust as required to avoid lippage that could present a tripping hazard.

3.6 INSTALLING METAL BOLLARDS

A. Anchor bollards to existing construction with expansion anchors. Provide four 3/4-inch (19-mm) bolts at each bollard unless otherwise indicated.

3.7 INSTALLING BEARING AND LEVELING PLATES

A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of plates.

B. Set bearing and leveling plates on wedges, shims, or leveling nuts. After bearing members have been positioned and plumbed, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with nonshrink grout. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.8 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.

1. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.

B. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 099113 "Exterior Painting." and Section 099123 "Interior Painting."

C. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780/A 780M.

END OF SECTION 055000

SECTION 055113 - METAL PAN STAIRS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Preassembled steel stairs with concrete-filled treads.
2. Steel tube railings and guards attached to metal stairs.
3. Steel tube handrails attached to walls adjacent to metal stairs.

B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for concrete fill for stair treads and platforms.
2. Section 055213 "Pipe and Tube Railings" for pipe and tube railings.

1.2 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written instructions to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of anchorages for metal stairs, railings, and guards.

1. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, blocking for attachment of wall-mounted handrails, and items with integral anchors, that are to be embedded in concrete or masonry.
2. Deliver such items to Project site in time for installation.

C. Coordinate locations of hanger rods and struts with other work so they do not encroach on required stair width and are within fire-resistance-rated stair enclosure.

D. Schedule installation of railings and guards so wall attachments are made only to completed walls.

1. Do not support railings and guards temporarily by any means that do not satisfy structural performance requirements.

1.3 ACTION SUBMITTALS

A. Product Data: For metal pan stairs and the following:

1. Shop primer products.
2. Handrail wall brackets.
3. Grout.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental product declaration.
3. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings:

1. Include project specific plans, elevations, sections, details, and attachments to other work.
2. Indicate sizes of metal sections, thickness of metals, profiles, holes, and field joints.
3. Include plan at each level.
4. Indicate locations of anchors, weld plates, and blocking for attachment of wall-mounted handrails.

D. Delegated Design Submittal: For stairs, railings and guards, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer's experience with providing delegated design engineering services of the kind indicated, including documentation that engineer is licensed in the State in which Project is located.

B. Welding certificates.

C. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.

D. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3/D1.3M, "Structural Welding Code - Sheet Steel."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store materials to permit easy access for inspection and identification.

1. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers.
2. Protect steel members and packaged materials from corrosion and deterioration.

3. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures.

    a. Repair or replace damaged materials or structures as directed.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design stairs, railings and guards, including attachment to building construction.

B. Structural Performance of Stairs: Metal stairs withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 100 lbf/sq. ft. (4.79 kN/sq. m).
2. Concentrated Load: 300 lbf (1.33 kN) applied on an area of 4 sq. in. (2580 sq. mm).
3. Uniform and concentrated loads need not be assumed to act concurrently.
4. Stair Framing: Capable of withstanding stresses resulting from railing and guard loads in addition to loads specified above.
5. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch (6.4 mm), whichever is less.

C. Structural Performance of Railings and Guards: Railings and guards, including attachment to building construction, withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails and Top Rails of Guards:

    a. Uniform load of 50 lbf/ft. (0.73 kN/m) applied in any direction.
    b. Concentrated load of 200 lbf (0.89 kN) applied in any direction.
    c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Infill of Guards:

    a. Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
    b. Infill load and other loads need not be assumed to act concurrently.

3. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

    a. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 METALS (MET STAIR-1, MET RAIL 2)

A. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

B. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

1. Recycled Content: Provide manufacturer documentation for recycled content, indicating postconsumer and preconsumer recycled content.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

C. Steel Tubing for Railings and Guards: ASTM A500/A500M (cold formed) or ASTM A513/A513M.

1. Recycled Content: Provide manufacturer documentation for recycled content, indicating postconsumer and preconsumer recycled content.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

D. Steel Pipe for Railings and Guards: ASTM A53/A53M, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

2.3 FASTENERS

A. General: Provide Type 304 stainless steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 5 where built into exterior walls.

1. Select fasteners for type, grade, and class required.

B. Fasteners for Anchoring Railings and Guards to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings and guards to other types of construction indicated and capable of withstanding design loads.

C. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563 (ASTM A563M); and, where indicated, flat washers.

2.4 MISCELLANEOUS MATERIALS

A. Handrail Wall Brackets: Steel

B. Welding Electrodes: Comply with AWS requirements.

C. Shop Primers: Provide primers that comply with Section 099600 "High-Performance Coatings."

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

E. Nonmetallic, Shrinkage-Resistant Grout: ASTM C1107/C1107M, factory-packaged, nonmetallic aggregate grout; recommended by manufacturer for interior or exterior use; noncorrosive and nonstaining; mixed with water to consistency suitable for application and a 30-minute working time. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

2.5 FABRICATION, GENERAL

A. Provide complete stair assemblies, including metal framing, hangers, struts, railings and guards, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.

1. Join components by welding unless otherwise indicated.
2. Use connections that maintain structural value of joined pieces.

B. Assemble stairs, railings, and guards in shop to greatest extent possible.

1. Disassemble units only as necessary for shipping and handling limitations.
2. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately.

1. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated.
2. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work with accurate angles and surfaces and straight edges.

F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Weld exposed corners and seams continuously unless otherwise indicated.
5. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish #1 - No evidence of welded joint.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.

1. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated.
2. Locate joints where least conspicuous.
3. Fabricate joints that will be exposed to weather in a manner to exclude water.
4. Provide weep holes where water may accumulate internally.

2.6 FABRICATION OF STEEL-FRAMED STAIRS

A. NAAMM Stair Standard: Comply with NAAMM AMP 510, "Metal Stairs Manual," for Architectural Class, unless more stringent requirements are indicated.

B. Stair Framing:

1. Stringers: Fabricate of steel plates or steel channels or steel rectangular tubes as indicated on Drawings.

    a. Stringer Size: As required to comply with "Performance Requirements" Article and as indicated on Drawings.
    b. Provide closures for exposed ends of channel and rectangular tube stringers.
    c. Finish: Shop primed and finish painted.

2. Platforms: Construct of steel plate or steel channel or steel rectangular tube headers and miscellaneous framing members as required to comply with "Performance Requirements" Article and indicated on Drawings.

    a. Provide closures for exposed ends of channel and rectangular tube framing.
    b. Finish: Shop primed and finish painted.

3. Weld stringers to headers; weld framing members to stringers and headers.
4. Where stairs are enclosed by gypsum board shaft-wall assemblies, provide hanger rods or struts to support landings from floor construction above or below.

    a. Locate hanger rods and struts where they do not encroach on required stair width and are within the fire-resistance-rated stair enclosure.

5. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

C. Metal Pan Stairs: Form risers, subtread pans, and subplatforms to configurations shown from steel sheet of thickness needed to comply with performance requirements, but not less than 0.067 inch (1.7 mm).

1. Steel Sheet, Uncoated: Cold-rolled steel sheet unless otherwise indicated.
2. Directly weld metal pans to stringers; locate welds on top of subtreads where they will be concealed by concrete fill. Do not weld risers to stringers.
3. Attach risers and subtreads to stringers with brackets made of steel angles or bars. Weld brackets to stringers and attach metal pans to brackets by welding, riveting, or bolting.
4. Shape metal pans to include nosing integral with riser.
5. At Contractor's option, provide stair assemblies with metal pan subtreads filled with reinforced concrete during fabrication.
6. Provide subplatforms of configuration indicated or, if not indicated, the same as subtreads. Weld subplatforms to platform framing.

    a. Smooth Soffit Construction: Construct subplatforms with flat metal under surfaces to produce smooth soffits.

2.7 FABRICATION OF STAIR RAILINGS AND GUARDS

A. Comply with applicable requirements in Section 055213 "Pipe and Tube Railings."

B. Fabricate railings and guards to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of member, post spacings, wall bracket spacing, and anchorage, but not less than that needed to withstand indicated loads.

1. Rails and Posts: As indicated on Drawings.
2. Picket Infill: As indicated on Drawings, spaced to prohibit the passage of a 4-inch (100-mm) diameter sphere.

C. Welded Connections: Fabricate railings and guards with welded connections.

1. Fabricate connections that are exposed to weather in a manner that excludes water.

    a. Provide weep holes where water may accumulate internally.

2. Cope components at connections to provide close fit, or use fittings designed for this purpose.
3. Weld all around at connections, including at fittings.
4. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
5. Obtain fusion without undercut or overlap.
6. Remove flux immediately.
7. Finish welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish #1 - No evidence of a welded joint as shown in NAAMM AMP 521.

D. Form changes in direction of railings and guards as follows:

1. As detailed.

E. For changes in direction made by bending, use jigs to produce uniform curvature for each repetitive configuration required. Maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

F. Close exposed ends of railing and guard members with prefabricated end fittings.

G. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated.

1. Close ends of returns unless clearance between end of rail and wall is 1/4 inch (6 mm) or less.

H. Connect posts to stair framing by direct welding unless otherwise indicated.

I. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work.

1. Furnish inserts and other anchorage devices for connecting to concrete or masonry work.
2. For nongalvanized railings and guards, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.
3. Provide type of bracket with flange tapped for concealed anchorage to threaded hanger bolt and that provides 1-1/2-inch (38-mm) clearance from inside face of handrail to finished wall surface.

J. Fillers: Provide fillers made from steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports.

1. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

2.8 FINISHES

A. Finish metal stairs after assembly.

B. Preparation for Shop Priming: Prepare uncoated, ferrous-metal surfaces to comply with SSPC-SP 3, "Power Tool Cleaning."

C. Apply shop primer to uncoated surfaces of metal stair components, except those with galvanized finishes and those to be embedded in concrete or masonry unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify elevations of floors, bearing surfaces and locations of bearing plates, and other embedments for compliance with requirements.

1. For wall-mounted railings, verify locations of concealed reinforcement within gypsum board assemblies.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF METAL PAN STAIRS

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction.

1. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

1. Grouted Baseplates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting plates.

a. Clean bottom surface of plates.
b. Set plates for structural members on wedges, shims, or setting nuts.

c. Tighten anchor bolts after supported members have been positioned and plumbed.
d. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
e. Promptly pack grout solidly between bearing surfaces and plates so no voids remain.

1) Neatly finish exposed surfaces; protect grout and allow to cure.
2) Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints.

1. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
2. Comply with requirements for welding in "Fabrication, General" Article.

F. Place and finish concrete fill for treads and platforms to comply with Section 033000 "Cast-in-Place Concrete."

3.3 INSTALLATION OF RAILINGS AND GUARDS

A. Adjust railing and guard systems before anchoring to ensure matching alignment at abutting joints with tight, hairline joints.

1. Space posts at spacing indicated or, if not indicated, as required by design loads.
2. Plumb posts in each direction, within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
3. Align rails and guards so variations from level for horizontal members and variations from parallel with rake of stairs for sloping members do not exceed 1/4 inch in 12 feet (6 mm in 3.5 m).
4. Secure posts, rail ends, and guard ends to building construction as follows:

a. Anchor posts to steel by welding to steel supporting members.
b. Anchor handrail and guard ends to concrete and masonry with steel round flanges welded to rail and guard ends and anchored with post-installed anchors and bolts.

B. Attach handrails to wall with wall brackets.

1. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.
2. Secure wall brackets to building construction as required to comply with performance requirements and as follows:

a. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
b. For hollow masonry anchorage, use toggle bolts.
c. For steel-framed partitions, use hanger or lag bolts set into fire-retardant-treated wood backing between studs. Coordinate with stud installation to locate backing members.

3.4 REPAIR

A. Touchup Painting:

1. Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 099600 "High-Performance Coatings."

END OF SECTION 055113

SECTION 055119 - METAL GRATING STAIRS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Metal grating stairs and catwalk.
2. Steel railings and guards.

1.2 COORDINATION

A. Coordinate installation of anchorages for metal stairs, railings, guards and catwalk.

1. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.
2. Deliver such items to Project site in time for installation.

1.3 ACTION SUBMITTALS

A. Product Data: For metal grating stairs and the following:

1. Gratings.
2. Grout.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental product declaration.
3. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings:

1. Include plans, elevations, sections, details, and attachment to other work.
2. Indicate sizes of metal sections, thickness of metals, profiles, holes, and field joints.
3. Include plan at each level.

D. Delegated Design Submittal: For stairs, railings, guards, and catwalk including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer's experience with providing delegated design engineering services of the kind indicated, including documentation that engineer is licensed in the State in which Project is located.

B. Welding certificates.

1.5 QUALITY ASSURANCE

A. Delegated Design Engineer Qualifications: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.

B. Installer Qualifications: Fabricator of products.

C. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store materials to permit easy access for inspection and identification.

1. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers.
2. Protect steel members and packaged materials from corrosion and deterioration.
3. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures.

a. Repair or replace damaged materials or structures as directed.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design stairs, railings, guards, and catwalk including attachment to building construction.

B. Structural Performance of Stairs and Catwalk: Metal stairs and catwalk withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 100 lbf/sq. ft. (4.79 kN/sq. m).
2. Concentrated Load: 300 lbf (1.33 kN) applied on an area of 4 sq. in. (2580 sq. mm).
3. Uniform and concentrated loads need not be assumed to act concurrently.
4. Stair Framing: Capable of withstanding stresses resulting from railing and guard loads in addition to loads specified above.
5. Limit deflection of treads, platforms, and framing members to L/360.

C. Structural Performance of Railings and Guards: Railings and guards, including attachment to building construction, withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails and Top Rails of Guards:

a. Uniform load of 50 lbf/ft. (0.73 kN/m) applied in any direction.
b. Concentrated load of 200 lbf (0.89 kN) applied in any direction.

c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Infill of Guards:

a. Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
b. Infill load and other loads need not be assumed to act concurrently.

3. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

a. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 METALS (MET FAB-4)

A. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

B. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

C. Steel Bars for Grating Treads: ASTM A36/A36M or steel strip, ASTM A1011/A1011M or ASTM A1018/A1018M.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

D. Steel Wire Rod for Grating Crossbars: ASTM A510/A510M.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

E. Steel Pipe for Railings and Guards: ASTM A53/A53M, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
2. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

F. Provide galvanized finish for exterior installations and where indicated.

2.3 FASTENERS

A. General: Provide zinc-plated fasteners with coating complying with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 12 for exterior use, and Class Fe/Zn 5 where built into exterior walls.

1. Select fasteners for type, grade, and class required.

B. Fasteners for Anchoring Railings and Guards to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings and guards to other types of construction indicated and capable of withstanding design loads.

C. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563 (ASTM A563M); and, where indicated, flat washers.

D. Anchor Bolts: ASTM F1554, Grade 36, of dimensions indicated; with nuts, ASTM A563 (ASTM A563M); and, where indicated, flat washers.

1. Provide mechanically deposited or hot-dip, zinc-coated anchor bolts for stairs indicated to be galvanized.

E. Post-Installed Anchors: Torque-controlled expansion anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E488/E488M, conducted by a qualified independent testing agency.

1. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless steel bolts, ASTM F593, and nuts, ASTM F594.

2.4 MISCELLANEOUS MATERIALS

A. Welding Electrodes: Comply with AWS requirements.

B. Galvanizing Repair Paint: High-zinc-dust-content paint complying with ASTM A780/A780M.

C. Shrinkage-Resistant Grout: Factory-packaged, nonmetallic, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

2.5 FABRICATION, GENERAL

A. Provide complete stair and catwalk assemblies, including metal framing, hangers, railings, guards, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms and catwalks on supporting structure.

1. Join components by welding unless otherwise indicated.

2. Use connections that maintain structural value of joined pieces.

B. Assemble stairs, railings, guards and catwalk in shop to greatest extent possible.

1. Disassemble units only as necessary for shipping and handling limitations.
2. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately.

1. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated.
2. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work with accurate angles and surfaces and straight edges.

F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Weld exposed corners and seams continuously unless otherwise indicated.
5. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish # 3 - Partially dressed weld with spatter removed.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.

1. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated.
2. Locate joints where least conspicuous.
3. Fabricate joints that are exposed to weather in a manner to exclude water.
4. Provide weep holes where water may accumulate internally.

2.6 FABRICATION OF STEEL-FRAMED STAIRS

A. NAAMM Stair Standard: Comply with NAAMM AMP 510, "Metal Stairs Manual," for Industrial Class, unless more stringent requirements are indicated.

B. Stair Framing:

1. Fabricate stringers of steel plates.

a. Stringer Size: As required to comply with "Performance Requirements" Article
b. Finish: Galvanized.

2. Construct platforms and tread supports of steel plate or channel headers and miscellaneous framing members as required to comply with "Performance Requirements" Article.

a. Provide closures for exposed ends of channel framing.
b. Finish: Galvanized.

3. Weld stringers to headers; weld framing members to stringers and headers.

4. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

C. Heavy-Duty Metal Bar-Grating Stairs and Catwalk: Form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual."

1. Fabricate treads and platforms from welded steel grating with 1-1/2-by-1/4-inch bearing bars at 13/16 inch o.c. and 3/4-inch-by-1/8-inch crossbars at 4 inches (100 mm) o.c.

D. Risers: Open.

E. Toe Plates: Provide toe plates around openings and at edge of open-sided floors and platforms, and at open ends and open back edges of treads.

1. Material and Finish: Steel plate to match finish of other steel items.
2. Fabricate to dimensions and details indicated.

2.7 FABRICATION OF STAIR RAILINGS AND GUARDS AND CATWALK

A. Comply with applicable requirements in Section 055213 "Pipe and Tube Railings."

B. Fabricate railings and guards to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of member, post spacings, wall bracket spacing, and anchorage, but not less than that needed to withstand indicated loads.

C. Welded Connections: Fabricate railings and guards with welded connections.

1. Fabricate connections that are exposed to weather in a manner that excludes water.

a. Provide weep holes where water may accumulate internally.

2. Cope components at connections to provide close fit, or use fittings designed for this purpose.
3. Weld all around at connections, including at fittings.
4. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
5. Obtain fusion without undercut or overlap.
6. Remove flux immediately.
7. Finish welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish #3 - Partially dressed weld with spatter removed as shown in NAAMM AMP 521.

D. Form changes in direction of railings and guards as follows:

1. As detailed.

E. For changes in direction made by bending, use jigs to produce uniform curvature for each repetitive configuration required.

1. Maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

F. Close exposed ends of railing and guard members with prefabricated end fittings.

G. Connect posts to stair framing by direct welding unless otherwise indicated.

H. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work.

1. Furnish inserts and other anchorage devices for connecting to concrete or masonry work.
2. For galvanized railings and guards, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous-metal components.

2.8 FINISHES

A. Finish metal stairs and catwalk after assembly.

B. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A153/A153M for steel and iron hardware and with ASTM A123/A123M for other steel and iron products.

1. Do not quench or apply post-galvanizing treatments that might interfere with paint adhesion.
2. Fill vent and drain holes that are exposed in the finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

C. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed products:

1. Exterior Stairs: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify elevations of floors, bearing surfaces and locations of bearing plates, and other embedments for compliance with requirements.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF METAL STAIRS AND CATWALK

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs and catwalk to in-place construction.

1. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs and catwalk. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

1. Grouted Baseplates: Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces.

a. Clean bottom surface of baseplates.
b. Set steel-stair baseplates on wedges, shims, or leveling nuts.
c. After stairs have been positioned and aligned, tighten anchor bolts.
d. Do not remove wedges or shims, but if protruding, cut off flush with edge of bearing plate before packing with grout.
e. Promptly pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

1) Neatly finish exposed surfaces; protect grout and allow to cure.
2) Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints.

1. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
2. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
3. Comply with requirements for welding in "Fabrication, General" Article.

F. Attach toeplates to gratings at locations indicated.

3.3 INSTALLATION OF RAILINGS AND GUARDS

A. Adjust railing and guard systems before anchoring to ensure matching alignment at abutting joints with tight, hairline joints.

1. Space posts at spacing indicated or, if not indicated, as required by design loads.
2. Plumb posts in each direction, within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
3. Align rails and guards so variations from level for horizontal members and variations from parallel with rake of stairs for sloping members do not exceed 1/4 inch in 12 feet (6 mm in 3.5 m).
4. Secure posts, rail ends, and guard ends to building construction as follows:

a. Anchor posts to steel by welding to steel supporting members.
b. Anchor handrail and guard ends to concrete and masonry with steel round flanges welded to rail and guard ends and anchored with post-installed anchors and bolts.

3.4 REPAIR

A. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780/A780M.

END OF SECTION 055119

SECTION 055213 - PIPE AND TUBE RAILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Steel pipe and tube railings.
2. Stainless-steel tube railings. Barrier rail (cane detection)

B. Related Requirements:

1. Section 055112 "Metal Pan Stairs" for steel tube railings associated with metal pan stairs.
2. Section 057300 "Decorative Metal Railings" for ornamental railings fabricated from pipes and tubes.

1.3 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

C. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

1.4 ACTION SUBMITTALS

A. Product Data: For the following:

1. Railing brackets.
2. Grout, anchoring cement, and paint products.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

C. Shop Drawings: Include project specific plans, elevations, sections, details, and attachments to other work.

D. Samples: For each type of exposed finish required.

1. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
2. Fittings and brackets.
3. Assembled Sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Sample need not be full height.

a. Show method of connecting members at intersections.

E. Delegated-Design Submittal: For railings, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Welding certificates.

C. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.

D. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

E. Product Test Reports: For pipe and tube railings, for tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.

F. Evaluation Reports: For post-installed anchors, from ICC-ES.

G. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.6/D1.6M, "Structural Welding Code - Stainless Steel."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design railings, including attachment to building construction.

B. Structural Performance: Railings, including attachment to building construction, shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails and Top Rails of Guards:

a. Uniform load of 50 lbf/ ft. (0.73 kN/m) applied in any direction.
b. Concentrated load of 200 lbf (0.89 kN) applied in any direction.
c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Infill of Guards:

a. Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
b. Infill load and other loads need not be assumed to act concurrently.

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C, material surfaces).

2.2 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails unless otherwise indicated.

1. Provide type of bracket with flange tapped for concealed anchorage to threaded hanger bolt and that provides 1-1/2-inch (38-mm) clearance from inside face of handrail to finished wall surface.

2.3 STEEL AND IRON (MET RAIL 1)

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Tubing: ASTM A 500 (cold formed) or ASTM A 513.

C. Pipe: ASTM A 53/A 53M, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.

D. Plates, Shapes, and Bars: ASTM A 36/A 36M.

E. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M, unless otherwise indicated.

2.4 STAINLESS STEEL (MET RAIL 3)

A. Tubing: ASTM A 554, Grade MT 304.

2.5 FASTENERS

A. General: Provide the following:

1. Ungalvanized-Steel Railings: Plated steel fasteners complying with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5 for zinc coating.
2. Stainless-Steel Railings: Type 304 stainless-steel fasteners.

B. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.

C. Fasteners for Interconnecting Railing Components:

1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless otherwise indicated.

2.6 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

1. For stainless-steel railings, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.

B. Shop Primers: Provide primers that comply with Section 099600 "High-Performance Coatings."

C. Intermediate Coats and Topcoats: Provide products that comply with Section 099600 "High-Performance Coatings."

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187/D 1187M.

E. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix

does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

2.7 FABRICATION

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Shop assemble railings to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form work true to line and level with accurate angles and surfaces.

E. Fabricate connections that are exposed to weather in a manner that excludes water. Provide weep holes where water may accumulate.

F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

G. Connections: Fabricate railings with welded connections unless otherwise indicated.

H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove flux immediately.
4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

I. Form Changes in Direction as Follows:

1. As detailed.

J. For changes in direction made by bending, use jigs to produce uniform curvature for each repetitive configuration required. Maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

K. Close exposed ends of railing members with prefabricated end fittings.

L. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch (6 mm) or less.

M. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.

1. At brackets and fittings fastened to plaster or gypsum board partitions, provide crush-resistant fillers or other means to transfer loads through wall finishes to structural supports and prevent bracket or fitting rotation and crushing of substrate.

N. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.

O. For railing posts set in concrete, provide steel sleeves not less than 6 inches (150 mm) long with inside dimensions not less than 1/2 inch (13 mm) greater than outside dimensions of post, with metal plate forming bottom closure.

2.8 STEEL AND IRON FINISHES

A. For nongalvanized-steel railings, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves; however, galvanize anchors to be embedded in exterior concrete or masonry.

B. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with requirements indicated below:

1. Railings Indicated to Receive Primers Specified in Section 099600 "High-Performance Coatings": SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
2. Other Railings: SSPC-SP 3, "Power Tool Cleaning."

C. Primer Application: Apply shop primer to prepared surfaces of railings unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Shop, Field, and Maintenance Painting of Steel," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.

1. Shop prime uncoated railings with primers specified in Section 099600 "High-Performance Coatings" are indicated.

2.9 STAINLESS-STEEL FINISHES

A. Remove tool and die marks and stretch lines, or blend into finish.

B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

C. Directional Satin Finish: No. 4.

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine plaster and gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements are clearly marked for Installer. Locate reinforcements and mark locations if not already done.

3.2 INSTALLATION, GENERAL

A. Fit exposed connections together to form tight, hairline joints.

B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.

1. Do not weld, cut, or abrade surfaces of railing components that are coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
2. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet (6 mm in 3.5 m).

C. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

D. Adjust railings before anchoring to ensure matching alignment at abutting joints.

E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.3 RAILING CONNECTIONS

A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.

B. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches (50 mm) beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches (150 mm) of post.

3.4 ANCHORING POSTS

A. Use metal sleeves preset and anchored into concrete for installing posts. After posts are inserted into sleeves, fill annular space between post and sleeve with nonshrink, nonmetallic grout, mixed and placed to comply with anchoring material manufacturer's written instructions.

B. Cover anchorage joint with flange of same metal as post, welded to post after placing anchoring material.

C. Install removable railing sections, where indicated, in slip-fit metal sockets cast in concrete.

3.5 ATTACHING RAILINGS

A. Anchor railing ends at walls with round flanges anchored to wall construction and welded to railing ends.

B. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces and welded to railing ends.

C. Attach railings to wall with wall brackets. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads.

D. Secure wall brackets and railing end flanges to building construction as follows:

1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
2. For hollow masonry anchorage, use toggle bolts.
3. For steel-framed partitions, use hanger or lag bolts set into fire-retardant-treated wood backing between studs. Coordinate with stud installation to locate backing members.

3.6 ADJUSTING AND CLEANING

A. Clean stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

B. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 099600 "High-Performance Coatings."

3.7 PROTECTION

A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

END OF SECTION 055213

SECTION 05 5600

CASTINGS

PART 1 GENERAL

1.01 SCOPE OF WORK

A. Provide all labor, materials, and equipment required to install castings as shown on the Drawings and specified herein. Included in this section are manhole covers, steps, valve boxes, hatch covers, and commemorative plaques.

1.02 RELATED WORK NOT INCLUDED

A. Concrete work is included in Division 03.

B. Masonry work is included in Division 04.

C. Surface preparation and finishing of castings is included in Division 09.

D. Floor drains and roof drains are included in Division 15.

E. Special cast valves are included in Division 15.

1.03 SUBMITTALS

A. The CONTRACTOR shall submit to the ENGINEER, in accordance with Division 01, copies of construction details of castings proposed for use.

PART 2 MATERIALS

2.01 GENERAL

A. All castings shall be gray iron, conforming to the requirements of the ASTM Standards, Designation A 48-83, Class 35-B for manhole casting and Class 20 for valve boxes.

2.02 MANHOLE CASTINGS

A. Frames and Covers

1. Manhole castings shall consist of cast iron frames and 22-3/4 inch diameter covers. All manhole castings shall be designed for H-20 traffic loading. The frame shall be at least 7 inches high overall. Manhole covers must set neatly in the frame, with contact surfaces machined smooth for even bearing. The top of the cover shall be flush with the frame edge. The top of the cover shall have sufficient corrugations to prevent slipperiness and be marked in large letters "SANITARY SEWER" or "STORM SEWER" as applies. Covers shall have one or 2 pick holes only, about 1-1/2 inches wide and 1/2-inch deep with 3/8-inch square undercut at rear and

3/4-inch square undercut on sides. Covers on sanitary sewer manholes must not be perforated.

B. Steps

1. Polypropylene plastic encapsulated steel manhole steps shall be of patterns shown on the detail Drawings, and have corrugated treads. In case of need for nonprotruding steps, shop drawings of special inset cast iron steps shall be reviewed by and be acceptable to the ENGINEER prior to use.

2. It is intended that the polypropylene plastic encapsulated steel step be M.A. Industries PS-1, PS-1PF, or equal.

2.03 VALVE BOXES

A. Slide Type for Iron Body Gate Valves

1. Valve boxes for sizes through 12-inch valves shall be the cast iron slide type, without screw, of sufficient length to allow for 30 inches of cover over the top of the pipe. The inner section shall have a minimum inside diameter of 5-1/4 inches with a hood type base that will cover the packing gland on valves through 12 inches in size (minimum of 8 inches inside diameter). The base of the top section shall be flanged at least 1-1/4 inches. The caps shall be circular with a corrugated surface and have pick holes in the periphery and be marked "Water," "Gas," "Sewer," or "Air" according to use. The valve boxes shall be Tyler Pipe/Utilities Division, 6855 Series, or equal.

2. For vertical valves larger than 12-inch size, provide Tyler Pipe/Utilities Division Series 6865 with No. 8 base, or equal.

3. Valve boxes for valves in the horizontal position shall be cast iron Tyler Pipe/Series 6855 or equal, with a base that is sized to allow covering of the bevel gear case and centering of the operating nut in the valve box.

PART 3 EXECUTION

3.01 INSTALLATION OF CASTINGS

A. Installation In or On Structures

1. The installation of castings is generally covered under specifications for pipe work and manholes. Castings shall be leveled, plumbed, and secured before pouring concrete or attaching to masonry with solid, watertight, cement mortar joints.

B. Installation on Buried Valves

1. Valve box construction shall consist of the approved manufactured box and accessories. Line pipe shall not be accepted for use as valve boxes.

2. Mechanically tamp backfill, or backfill with crushed rock to the bottom of the packing gland of the operating nut. Install valve box base centered over operating nut.

3. Install valve box shafts, of the required height, and top section to proposed top elevation. Mechanically tamp backfill around box or backfill with crushed rock.

4. Place reinforced concrete collar around top section when shown on the Drawings.

5. Furnishing and installation of the valve box and accessories, including the concrete valve box collar, shall be included in the price bid for furnishing and installation of the valve.

END OF SECTION

***

SECTION 057100 - DECORATIVE METAL STAIRS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes decorative metal stairs.

B. Related Requirements:

1. Section 055113 "Metal Pan Stairs."

1.2 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written instructions to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of anchorages for metal stairs.

1. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.
2. Deliver such items to Project site in time for installation.

1.3 ACTION SUBMITTALS

A. Product Data: For metal stairs and the following:

1. Shop primer products.
2. Precast terrazzo treads.
3. Grout.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental product declaration.

C. Shop Drawings:

1. Include plans, elevations, sections, details, and attachments to other work.
2. Indicate sizes of metal sections, thickness of metals, profiles, holes, and field joints.
3. Include plan at each level.

D. Samples for Verification: For each type and finish of tread.

E. Delegated Design Submittal: For stairs, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer's experience with providing delegated design engineering services of the kind indicated, including documentation that the engineer is licensed in the State in which Project is located.

B. Welding certificates.

C. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store materials to permit easy access for inspection and identification.

1. Keep members off ground and spaced by using pallets, dunnage, or other supports and spacers.
2. Protect members and packaged materials from corrosion and deterioration.
3. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures.

a. Repair or replace damaged materials or structures as directed.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design stairs, and railings, including attachment to building construction.

B. Structural Performance of Stairs: Metal stairs withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 100 lbf/sq. ft. (4.79 kN/sq. m).
2. Concentrated Load: 300 lbf (1.33 kN) applied on an area of 4 sq. in. (2580 sq. mm).
3. Uniform and concentrated loads need not be assumed to act concurrently.
4. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
5. Limit deflection of treads, platforms, and framing members to L/720 or 1/4 inch (6.4 mm), whichever is less.

2.2 METALS (DEC STAIR-1)

A. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

B. Steel Plates, Shapes, and Bars: ASTM A36/A36M.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

C. Steel Tubing: ASTM A500/A500M (cold formed) or ASTM A513/A513M.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

D. Uncoated, Cold-Rolled Steel Sheet: ASTM A1008/A1008M, either commercial steel, Type B, or structural steel, Grade 25 (Grade 170), unless another grade is required by design loads; exposed.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

E. Uncoated, Hot-Rolled Steel Sheet: ASTM A1011/A1011M, either commercial steel, Type B, or structural steel, Grade 30 (Grade 205), unless another grade is required by design loads.

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

2.3 FASTENERS

A. General: Provide zinc-plated fasteners with coating complying with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 12 for exterior use, and Class Fe/Zn 5 where built into exterior walls.

1. Select fasteners for type, grade, and class required.

B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563 (ASTM A563M); and, where indicated, flat washers.

C. Anchor Bolts: ASTM F1554, Grade 36, of dimensions indicated; with nuts, ASTM A563 (ASTM A563M); and, where indicated, flat washers.

D. Post-Installed Anchors: Torque-controlled expansion anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E488/E488M, conducted by a qualified independent testing agency.

1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 5, unless otherwise indicated.

2.4 MISCELLANEOUS MATERIALS

A. Welding Electrodes: Comply with AWS requirements.

B. Shop Primers: Provide primers that comply with Section 099600 "High-Performance Coatings."

C. Shrinkage-Resistant Grout: Factory-packaged, nonmetallic, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

2.5 PRECAST TERRAZZO TREADS

A. Precast Terrazzo Stair Treads: Epoxy terrazzo units cast in maximum lengths possible. Comply with manufacturer's written instructions for fabricating precast terrazzo units in sizes and profiles indicated.

1. Epoxy Resin Matrix: Manufacturer's standard, recommended for use indicated.
2. Aggregates: Comply with NTMA gradation standards for mix indicated, and containing no deleterious or foreign matter.

    a. Abrasion and Impact Resistance: Less than 40 percent loss per ASTM C131/C131M.
    b. 24-Hour Absorption Rate: Less than 0.75 percent.
    c. Dust Content: Less than 1.0 percent by weight.

3. Reinforcement: ASTM A615/A615M, Grade 60 (Grade 420) bars, as required by unit size, profile, and thickness.
4. Abrasive Inserts: 1/2-inch- (13-mm-) wide, alundum oxide/epoxy mixture.

    a. Provide three inserts, 1/2 inch (13 mm) apart, with first insert located 1 inch (25 mm) from nosing at adjacent stair riser locations.

5. Color: As indicated on Drawings.
6. Finish: Honed.
7. Surface Sealer: Slip and stain-resistant, penetrating sealer that is chemically neutral with pH factor between 7 and 12; does not affect color or physical properties of terrazzo type indicated; is recommend by sealer manufacturer for use with specified terrazzo; and complies with NTMA guide specification for terrazzo type applicable for this Project.

2.6 FABRICATION, GENERAL

A. Provide complete stair assemblies, including metal framing, hangers, struts, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.

1. Join components by welding unless otherwise indicated.
2. Use connections that maintain structural value of joined pieces.

B. Assemble stairs in shop to greatest extent possible.

1. Disassemble units only as necessary for shipping and handling limitations.
2. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately.

1. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated.
2. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work with accurate angles and surfaces and straight edges.

F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Weld exposed corners and seams continuously unless otherwise indicated.
5. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish #1 - No evidence of a welded joint.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.

1. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated.
2. Locate joints where least conspicuous.

2.7 FABRICATION OF STAIRS

A. NAAMM Stair Standard: Comply with NAAMM AMP 510, "Metal Stairs Manual," for Architectural Class, unless more stringent requirements are indicated.

B. Stair Framing:

1. Stringers: Fabricate of AESS steel tubes and as indicated on Drawings.

a. Stringer Size: As required to comply with "Performance Requirements" Article and As indicated on Drawings.
b. Provide closures for exposed ends of tube stringers.
c. Finish: Shop primed.

2. Platforms: Construct of steel rectangular tube headers and miscellaneous framing members as required to comply with "Performance Requirements" Article and indicated on Drawings.

a. Provide closures for exposed ends of tube framing.
b. Finish: Shop primed.

3. Weld stringers to headers; weld framing members to stringers and headers.

C. Subtreads, Risers, and Subplatforms:

1. Fabricate subtreads and subplatforms of steel plates.
2. Form subtreads, risers, and subplatforms to configurations indicated from of thickness needed to comply with performance requirements, but not less than 0.075 inch (1.9 mm) thick.
3. Weld subtreads to stringers.

    a. Locate welds on top of subtreads where they will be concealed by finished treads.

4. Provide subplatforms of configuration indicated or, if not indicated, the same as subtreads.

    a. Weld subplatforms to platform framing.
    b. Locate welds on top of subplatforms where they will be concealed by finished flooring.
    c. Smooth Soffit Construction: Construct subplatforms with flat metal under surfaces to produce smooth soffits.

2.8 STAIR RAILINGS

A. Comply with applicable requirements in Section 057313 "Glazed Decorative Metal Railings."

1. Connect posts to stair framing by direct welding unless otherwise indicated.

2.9 FINISHES

A. Finish metal stairs after assembly.

B. Steel Shop Prime Finish:

1. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
2. Apply shop primer to uncoated surfaces of metal stair components, except those with galvanized finishes and those to be embedded in concrete or masonry unless otherwise indicated. Comply with SSPC-PA 1, "Shop, Field, and Maintenance Painting of Steel," for shop painting.

    a. Stripe paint corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify elevations of floors, bearing surfaces and locations of bearing plates, and other embedments for compliance with requirements.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLING METAL STAIRS

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction.

1. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

1. Grouted Baseplates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting plates.

a. Clean bottom surface of plates.
b. Set plates for structural members on wedges, shims, or setting nuts.
c. Tighten anchor bolts after supported members have been positioned and plumbed.
d. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
e. Promptly pack grout solidly between bearing surfaces and plates so no voids remain.

1) Neatly finish exposed surfaces; protect grout and allow to cure.
2) Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.

E. Fit exposed connections accurately together to form hairline joints.

1. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
2. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
3. Field Welding: Comply with requirements for welding in "Fabrication, General" Article.

F. Install precast terrazzo treads according to manufacturer's written instructions.

3.3 REPAIRS

A. Touchup Painting:

1. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.

a. Apply by brush or spray to provide a minimum 2.0-mil (0.05-mm) dry film thickness.

2. Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 099600 "High-Performance Coatings."

END OF SECTION 057100

SECTION 057300 - DECORATIVE METAL RAILINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Exterior stainless steel decorative railings and swing gates.

B. Related Requirements:

1. Section 055213 "Pipe and Tube Railings" for nonornamental railings fabricated from pipes and tubes.

1.2 COORDINATION AND SCHEDULING

A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver items to Project site in time for installation.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data:

1. Manufacturer's product lines of decorative metal railings assembled from standard components.
2. Illuminated posts.
3. Stainless steel cable and cable fittings.
4. Fasteners.
5. Post-installed anchors.
6. Nonshrink, nonmetallic grout.
7. Anchoring cement.
8. Metal finishes.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

C. Shop Drawings: Include plans, elevations, sections, and attachment details.

1. For illuminated railings, include wiring diagrams and roughing-in details.

D. Samples for Initial Selection: For products involving selection of color, texture, or design, including mechanical finishes.

E. Samples for Verification: For each type of exposed finish required.

1. Sections of each distinctly different linear railing member, including top rails, posts, and balusters
2. Illuminated posts.
3. Fittings, end caps, and brackets.
4. Welded connections.
5. Cable and cable hardware and connections.
6. Assembled Sample of railing system, made from full-size components, including top rail, illuminated post, and guard infill. Sample need not be full height.

a. Show method of connecting and finishing members at intersections.

F. Delegated Design Submittal: For railings and gates, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For delegated design professional engineer and testing agency.

B. Mill Certificates: Signed by manufacturers of stainless steel products, certifying that products furnished comply with requirements.

C. Welding certificates.

D. Product Test Reports: For tests on railings performed by a qualified testing agency, in accordance with ASTM E894 and ASTM E935.

E. Research Reports: For post-installed anchors, from ICC-ES or other qualified testing agency acceptable to authorities having jurisdiction.

F. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel in accordance with the following:

1. AWS D1.6/D1.6M, "Structural Welding Code - Stainless Steel."

B. Fabricator Qualifications: A firm experienced in producing decorative metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

C. Installer Qualifications: Fabricator of products.

D. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

1. Build mockups for each form and finish of railing, consisting of two posts, top rail, infill area, and anchorage system components that are full height and are not less than 24 inches (600 mm) in length.
2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store decorative metal in a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Protect mechanical finishes on exposed surfaces of railings from damage by applying a strippable, temporary protective covering before shipping.

1.9 FIELD CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design railings and gates, including attachment to building construction.

B. Structural Performance: Railings, including attachment to building construction, are to withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails and Top Rails of Guards:

a. Uniform load of 50 lbf/ft. (0.73 kN/m) applied in any direction.
b. Concentrated load of 200 lbf (0.89 kN) applied in any direction.
c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Infill of Guards:

a. Concentrated load of 50 lbf (0.22 kN) applied horizontally on an area of 1 sq. ft. (0.093 sq. m).
b. Infill load and other loads need not be assumed to act concurrently.

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior railings by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Brackets, Flanges, and Anchors: Same metal and finish as supported rails unless otherwise indicated.

2.3 STAINLESS STEEL DECORATIVE RAILINGS (MET RAIL-6)

A. Basis-of-Design Product: Subject to compliance with requirements, provide Wagner Companies (The); R&B Wagner, Inc.; Legato Railing System (without panel clips) and with Ultra-tec Cable Railing Assembly with “Invisiware” Fittings or a comparable product by one of the following:

1. C.R. Laurence Co., Inc.; CRH Americas, Inc.
2. Julius Blum & Co., Inc.

B. Source Limitations: Obtain stainless steel decorative railing components from single source from single manufacturer.

C. Pipe: ASTM A312/A312M, Grade TP 316. 1.90” Schedule 40 round stainless steel posts and top rail.

D. Mounting Type: Fascia mount.

E. Castings: ASTM A743/A743M, Grade CF 8M or CF 3M.

F. Plate, Sheet, and Strip: ASTM A240/A240M or ASTM A666, Type 316.

G. Flat Bar: ASTM A666, Type 316.

H. Bars and Shapes: ASTM A276/A276M, Type 316.

I. Illuminated Posts: Provide internal illumination using concealed, internally wired, integrated LED lamps without light leaks. Make provisions for servicing and for concealed connection to electric service.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Wagner Companies (The); R&B Wagner, Inc.; Integrated Lumenpod 30 Post Lighting or a comparable product by one of the following:

a. C.R. Laurence Co., Inc.; CRH Americas, Inc.
b. Julius Blum & Co., Inc.

2. LED Luminaires: Comply with Division 26. Provide Wagner Lumenpost Integrated Driver Enclosures as required.

J. Stainless Steel Cable and Cable Fittings:

1. Cable: 1-by-19 wire cable made from wire complying with ASTM A492, Type 316.
2. Cable Diameter: 1/4 inch (6.4 mm).
3. Cable Fittings: Connectors of types indicated, fabricated from stainless steel, and with capability to sustain, without failure, a load equal to minimum breaking strength of cable with which they are used.

2.4 SWING GATES

A. Gate Configuration: As indicated on Drawings.

B. Gate Frame Height: As indicated on Drawings.

C. Gate Opening Width: As indicated on Drawings.

D. Infill: Comply with requirements for adjacent fence.

E. Hardware: Provide card reader on gate as indicated on Drawings.

F. Spring Hinges: BHMA A156.17, Grade 1, suitable for exterior use.

G. Exit Hardware: BHMA A156.3, Grade 1, Type 1 (rim exit device), with push pad actuating bar, suitable for exterior use.

1. Function: 01 - Exit only, no trim or blank escutcheon.
2. Mounting Channel: Bent-plate channel formed from 1/8-inch- (3.2-mm-) thick, aluminum plate. Channel spans gate frame. Exit device is mounted on channel web, recessed between flanges, with flanges extending 1/8 inch (3.2 mm) beyond push pad surface.

2.5 FASTENERS

A. Fastener Materials:

1. Stainless Steel Railing Components: Type 316 stainless steel fasteners.
2. Finish exposed fasteners to match appearance, including color and texture, of railings.

B. Fasteners for Anchoring to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction and capable of withstanding design loads.

C. Provide concealed fasteners for interconnecting railing components and for attaching railings to other work unless otherwise indicated.

D. Post-Installed Anchors: Fastener systems with working capacity greater than or equal to the design load, in accordance with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC193 or ICC-ES AC308.

1. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless steel bolts, ASTM F593 and nuts, ASTM F594.

2.6 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

1. For stainless steel railings, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.

B. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications. In applications where grout installation may be subjected to moisture, the manufacturer shall submit a letter stating the entire grout matrix does not contain any of the following; added gypsum, plaster-of-paris, or sulfur trioxide levels in a portland cement component exceeding ASTM C150's published limits.

C. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.

1. Water-Resistant Product: At exterior locations, provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.7 FABRICATION

A. Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Shop assemble railings to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations.

1. Clearly mark units for reassembly and coordinated installation.
2. Use connections that maintain structural value of joined pieces.

C. Cut, drill, and punch metals cleanly and accurately.

1. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated.
2. Remove sharp or rough areas on exposed surfaces.

D. Form work true to line and level with accurate angles and surfaces.

E. Fabricate connections that will be exposed to weather in a manner to exclude water.

1. Provide weep holes where water may accumulate.
2. Locate weep holes in inconspicuous locations.

F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

G. Connections: Fabricate railings with welded or mechanical connections unless otherwise indicated.

H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove flux immediately.
4. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish #1 welds; ornamental quality with no evidence of a welded joint.

I. Mechanical Connections: Connect members with concealed mechanical fasteners and fittings.

1. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
2. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.

J. Form changes in direction as follows:

1. As detailed.

K. Bend members in jigs to produce uniform curvature for each configuration required. Maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

L. Close exposed ends of hollow railing members with prefabricated cap and end fittings of same metal and finish as railings.

M. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other Work unless otherwise indicated.

N. Provide inserts and other anchorage devices for connecting railings to concrete or masonry Work.

1. Fabricate anchorage devices capable of withstanding loads imposed by railings.
2. Coordinate anchorage devices with supporting structure.

O. Stainless Steel Cable Guard Infill: Fabricate cable guard infill assemblies in the shop to field-measured dimensions with fittings machine swaged.

1. Minimize amount of turnbuckle take-up used for dimensional adjustment, so maximum amount is available for tensioning cable.
2. Tag cable assemblies and fittings to identify installation locations and orientations for coordinated installation.

2.8 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

2.9 STAINLESS STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Stainless Steel Finishes:

1. Directional Satin Finish: ASTM A480/A480M, No. 4.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Perform cutting, drilling, and fitting required for installing railings.

1. Fit exposed connections together to form tight, hairline joints.
2. Install railings level, plumb, square, true to line; without distortion, warp, or rack.
3. Set railings accurately in location, alignment, and elevation; measured from established lines and levels.
4. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
5. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
6. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet (6 mm in 3 m).

B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

C. Adjust railings before anchoring to ensure matching alignment at abutting joints.

D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.2 RAILING CONNECTIONS

A. Nonwelded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Use wood blocks and padding to prevent damage to railing members and fittings. Seal recessed holes of exposed locking screws, using plastic cement filler colored to match finish of railings.

B. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article, whether welding is performed in the shop or in the field.

C. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve, extending 2 inches (50 mm) beyond joint on either side; fasten internal sleeve securely to one side; and locate joint within 6 inches (150 mm) of post.

3.3 ANCHORING POSTS

A. Anchor posts to metal surfaces with flanges, angle type, or floor type as required by conditions, connected to posts and to metal supporting members as follows:

1. For stainless steel railings, weld flanges to posts and bolt to metal-supporting surfaces.

3.4 ATTACHING RAILINGS

A. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces and welded to railing ends or connected to railing ends, using nonwelded connections.

3.5 GATE INSTALLATION

A. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections and to prepare test reports. .

B. Extent and Testing Methodology: Testing agency will randomly select completed railing assemblies for testing that are representative of different railing designs and conditions in the completed Work. Test railings in accordance with ASTM E894 and ASTM E935 for compliance with performance requirements.

C. Remove and replace railings where test results indicate that they do not comply with specified requirements unless they can be repaired in a manner satisfactory to Architect and comply with specified requirements.

D. Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.

3.7 CLEANING

A. Clean stainless steel by washing thoroughly with clean water and soap, rinsing with clean water, and wiping dry.

3.8 ADJUSTING

A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

B. Lubricate hardware and other moving parts.

3.9 PROTECTION

A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

B. Restore finishes damaged during installation and construction period, so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

END OF SECTION 057300

SECTION 057310 – DECORATIVE SITE RAILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Painted steel handrails
   2. Painted steel guardrails
   3. Wire mesh barrier

B. Related Sections:
   1. Division 03 Section ‘Cast-in-Place Concrete’
   2. Division 03 Section 'Miscellaneous Site Concrete’
   3. Division 07 Section ‘Joint Sealants’
   4. Division 32 Section ‘Exterior Planting’

1.3 DEFINITIONS

A. Railings: Guards, handrails, and similar devices used for protection of occupants at open-sided floor areas, pedestrian guidance and support, visual separation, or wall protection.

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design railings, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. General: In engineering railings to withstand structural loads indicated, determine allowable design working stresses of railing materials based on the following:
   1. Steel: 72 percent of minimum yield strength.

C. Structural Performance: Railings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
   1. Handrails:
      a. Uniform load of 50 lbf/ft. applied in any direction.
      b. Concentrated load of 200 lbf applied in any direction.
      c. Uniform and concentrated loads need not be assumed to act concurrently.
   2. Infill of Guards:
      a. Concentrated load of 50 lbf applied horizontally on an area of 1 sq. ft.
      b. Infill load and other loads need not be assumed to act concurrently.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.
   1. Temperature Change: 120 degrees F, ambient; 180 degrees F, material surfaces.

E. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.5 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction testing on laboratory mockups. Payment for these services will be made by the Contractor. Retesting of products that fail to meet specified requirements shall be done at Contractor's expense.
   1. Build laboratory mockups at testing agency facility; use personnel, materials, and methods of construction that will be used at Project site.
   2. Test railings according to ASTM E 894 and ASTM E 935.
   3. Notify Landscape Architect ten (10) days in advance of the dates and times when laboratory mockups will be tested.

1.6 SUSTAINABLE DESIGN SUBMITTALS

A. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

1.7 ACTION SUBMITTALS

A. Product Data for the following:
   1. Manufacturer's product lines of railings assembled from standard components.
   2. Grout, anchoring cement, and paint products

B. Samples for Initial Selection: For products involving selection of color, texture, or design including mechanical finishes.

C. Samples for Verification: Submit fabricated samples (of sufficient size to fully show construction, materials, and finishes, plus requirements as indicated below) of the following items:
   1. Metal Samples:
      a. Painted Steel
   2. Fabrication: Submit material samples of metals (thickness, weight) indicated for the finished product.
      a. Provide sections of each component member including fittings and brackets. Minimum 6” long sample representing typical fabrication techniques but without finish system (prime and finish paint coats).
      b. Samples to include:
         1) Welded connections.
         2) Fittings and brackets.
   3. Assembled Samples of railing systems, made from full-size components, including top rail, post, handrail, and infill. Show method of finishing members at intersections. Samples need not be full height.

D. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified engineer responsible for their preparation.

E. Shop drawings: Include plans, elevations, sections, details, and attachments to other work.

1.8 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified for professional engineer or testing agency.

B. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.

C. Welding Certificates.

D. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.

E. Preconstruction Test Reports.

1.9 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of railing from single source from single manufacturer.

B. Product Options: Information on Drawings and in Specifications establishes requirements for system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including structural analysis, preconstruction testing, field testing, and in-service performance.
   1. Do not modify intended aesthetic effects, as judged solely by Landscape Architect, except with Landscape Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Landscape Architect for review.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of railings and are based on the specific system indicated.
   1. Do not modify intended aesthetic effects, as judged solely by Landscape Architect, except with Landscape Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Landscape Architect for review.

D. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.6, "Structural Welding Code – Stainless Steel”
   2. AWS D1.1/D1.1M, "Structural Welding Code - Steel."

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

F. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockups for each form and finish of railing consisting of two posts, top rail, interim post, and anchorage system components that are full height and are not less than 24 inches (600 mm) in length.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

G. Preinstallation Conference: Conduct conference at Project site.

1.10 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.
1. Provide allowance for trimming and fitting at site.

1.11 COORDINATION AND SCHEDULING

A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

B. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not suit structural performance requirements.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Brackets, Flanges, and Anchors: Same metal and finish as supported rails unless otherwise indicated.
1. Provide cast-metal brackets with flange tapped for concealed anchorage to threaded hanger bolt.
2. Provide either formed- or cast-metal brackets with predrilled hole for exposed bolt anchorage.
3. Provide formed-steel brackets with predrilled hole for bolted anchorage and with snap-on cover that matches rail finish and conceals bracket base and bolt head.

2.2 STEEL

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Tubing: ASTM A 554, Grade MT 316L.

C. Pipe: ASTM A 312/A 312M, Grade TP 316L.

D. Sheet, Strip, Plate, and Flat Bar: ASTM A 666, Type 316L.

E. Bars and Shapes: ASTM A 276, Type 316L. Uncoated, cold rolled steel sheet: ASTM A1008.

2.3 STEEL FINISHES

A. Galvanized Railings:
1. Hot-dip galvanized exterior steel railings, including hardware, after fabrication.
2. Comply with ASTM A 123/A 123M for hot-dip galvanized railings.
3. Comply with ASTM A 153/A 153M for hot-dip galvanized hardware.
4. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.
5. Fill vent and drain holes that are exposed in the finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
6. For galvanized railings, provide hot-dip galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.
7. Preparing Galvanized Railings for Shop Priming: After galvanizing, thoroughly clean railings of grease, dirt, oil, flux, and other foreign matter, and treat with etching cleaner.
8. Primer Application: Apply shop primer to prepared surfaces of railings unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.
9. Shop prime uncoated railings with primers specified in Section 099113 "Exterior Painting" unless otherwise indicated.
10. Shop-Painted Finish: Comply with Part 2, detailed herein.

2.4 PAINT, GENERAL

A. MPI Standards: Provide products that comply with MPI standards indicated and that are listed in its "MPI Approved Products List."

B. Material Compatibility:
1. Provide materials for use within each paint system that are compatible with one another, and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated.

C. VOC Content: Provide materials that comply with VOC limits of authorities having jurisdiction.

D. Colors: Color to be selected from manufacturer’s full range. Landscape Architect to approve final color selection.

E. Surface Preparation:
1. All surfaces shall be cleaned according to SSPC-SP1 Solvent Cleaning standards to remove all dirt, oils, and foreign matter.
2. All surfaces shall be uniformly scarified by abrasive blast cleaning all surfaces according to SSPC-SP7 Brush-Off Blast standards. This procedure shall create a profile for the new coating system to adhere to.
3. All surfaces must be clean and dry prior to painting.

2.5 PRIMERS

A. Ferrous Metal Primer (Exterior & Interior) – For Paint Shop Applied on Surfaces Blast Cleaned in the Shop (2.5-3.5 mills). Manufacturers:
   1. Sherwin Williams
   2. Con-Lux
   3. Tnemec

B. Ferrous Metal Primer (Exterior & Interior) – For Paint in the Field - Applied on Bolts, Abraded Areas, Masked Areas, and Field Welds After Power Tool and Solvent Cleaning (2-3). Manufacturers:
   1. Sherwin Williams
   2. Con-Lux
   3. Tnemec

C. Galvanized-Metal Substrates (Exterior) – For Paint applied to Guardrails:
   1. Sherwin Williams
   2. Con-Lux
   3. Tnemec

2.6 EXTERIOR FINISH COATS

A. Ferrous Metal Semi-Gloss Acrylic Urethane Finish: 2 coats over primer (2-3 mills each coat).
   1. First Coat:
      a. Sherwin-Williams; DTM Acrylic Top Coat
      b. Con-Lux, Epolon Rust Inhibitor II.
      c. Tnemec, Series 73 Endura – Shield III.
   2. Second Coat:
      a. Sherwin-Williams, DTM Acrylic Top Coat.
      b. Con-Lux, Acrolon Muti/Mill Series.
      c. Tnemec, Series 72 Endura – Shield III.

B. Exterior Polyurethane-Based Clear Satin Varnish: Factory-formulated polyurethane-based clear varnish.
   1. Sherwin-Williams; Wood Classics Fast Dry Oil Varnish, Satin A66-300 Series.
   2. Benjamin Moore; Benwood Interior Wood Finishes Polyurethane Finished Low Lustre No.435
   3. Coronado; 151-100 Alkyd Clear Satin Varnish.
   4. Dulux Paint; 1902-0000 WoodPride Interior Satin Polyurethane Varnish.
   5. Kelly-Moore; 2050 Kel-Aqua Stain Base.
   6. M.A.B. Paint; Rich Lux Water Based Satin Polyurethane.
   7. Pittsburgh Paints; 77-7 Rez Varnish, Interior Satin Oil Clear.

C. Testing of Paint Materials: Owner reserves the right to invoke the following procedure:
   1. Owner will engage the services of a qualified testing agency to sample paint materials,
   2. Contractor will be notified in advance and may be present when samples are taken. If paint materials have already been delivered to Project site, samples may be taken at Project site. Samples will be identified, sealed, and certified by testing agency.
   3. Testing agency will perform tests for compliance with product requirements.
   4. Owner may direct Contractor to stop applying paints if test results show materials being used do not comply with product requirements. Contractor shall remove noncomplying paint materials from Project site, pay for testing, and repaint surfaces painted with rejected materials. Contractor will be required to remove rejected materials from

previously painted surfaces if, on repainting with complying materials, the two paints are incompatible.

2.7 WIRE MESH BARRIER

A. Manufacturer: Subject to compliance with requirements, provide products by the following: Omega II Fence Systems. 1735 St-Elzear Blvd West, Laval, Quebec, Canada H7L 3N6; Phone: 1-800-836-6342; email: customservice@omegatwo.com

B. Post: 2”x2” Powdercoated Steel Post
   1. Height: As shown on drawings.
   2. Color: Signal Black

C. Panel: Omega Architectural Meshwire Panel
   1. Panel Size: As shown on drawings.
   2. Color: Signal Black

2.8 FASTENERS

A. Fastener Materials: Unless otherwise indicated, provide the following:
   1. Stainless-Steel Components: Type 316 stainless-steel fasteners.
   2. Dissimilar Metals: Type 316 stainless-steel fasteners.

B. Fasteners for Anchoring to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.

C. Provide concealed fasteners for interconnecting railing components and for attaching railings to other work unless otherwise indicated.

D. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

E. Post-Installed Anchors: Torque-controlled expansion anchors or per manufacturer recommendation.

F. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless-steel bolts, ASTM F 593 (ASTM F 738M), and nuts, ASTM F 594 (ASTM F 836M) or per manufacturer recommendation.

2.9 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

B. Non-shrink, Nonmetallic Grout: Factory-packaged, non-staining, non-corrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

C. Anchoring Cement: Factory-packaged, non-shrink, non-staining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.
   1. Water-Resistant Product: At exterior locations or where indicated provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.10 FABRICATION

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Make up wire-rope assemblies in the shop to field-measured dimensions with fittings machine swaged. Minimize amount of turnbuckle take-up used for dimensional adjustment so maximum amount is available for tensioning wire ropes. Tag wire-rope assemblies and fittings to identify installation locations and orientations for coordinated installation.

D. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

E. Form work true to line and level with accurate angles and surfaces.

F. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.

G. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

H. Connections: Fabricate railings with welded connections unless otherwise indicated.

I. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove flux immediately.
   4. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Type 1 welds: no evidence of a welded joint.

J. Mechanical Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
   1. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.

K. Form changes in direction as detailed in the Drawings.

L. Bend members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

M. Close exposed ends of hollow railing members with prefabricated end fittings.

N. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.
1. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.

O. For railing posts set in concrete, provide steel sleeves not less than 6 inches long with inside dimensions not less than 1/2 inch greater than outside dimensions of post, with metal plate forming bottom closure. Sleeves to match steel of the handrail.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine step assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

3.2 PREPARATION

A. Coordinate and furnish anchorages and setting drawings, diagrams, templates, instructions, and directions for installing items having integral anchors that are to be embedded in concrete construction. Coordinate delivery of such items to the Project site.

B. Install sleeves and other elements with attachment fasteners that will be concealed by concrete at time of placement of concrete paving.

3.3 PREPARATION FOR PAINTING

A. Comply with manufacturer’s written instructions and recommendations in “MPI Manual” applicable to substrates and paint systems indicated.

B. All surfaces shall be cleaned according to SSPC-SP1 Solvent Cleaning standards to remove all dirt, oils, and foreign matter.

C. All surfaces shall be uniformly scarified by abrasive blast cleaning all surfaces according to SSPC-SP7 Brush-Off Blast standards. This procedure shall create a profile for the new coating system to adhere to.

D. All surfaces must be clean and dry prior to painting.

E. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection.

F. Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.
1. Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated.

G. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.

3.4 SHOP APPLICATION OF COATING SYSTEMS

A. General:
1. Apply coating in a timely fashion after completion of preparation. Schedule work to apply coating over properly prepared surface before corrosion or salt deposition occur.
2. Follow coating manufacturer’s recommendations for preparation of equipment; mixing, thinning, and pot life of coatings; and application.
3. Do not apply coatings outdoors when air temperature is at less than 50 degrees F or greater than 90 degrees F.
4. Do not apply coatings outdoors during inclement weather such as rain, fog, mist, snow, etc., not to damp or wet surfaces, or when these conditions are imminent.
5. Cease exterior painting when the wind velocity exceeds 10 miles per hour.

B. Apply paints according to manufacturer's written instructions and recommendations in "MPI Manual.”
1. Use applicators and techniques suited for paint and substrate indicated.
2. Paint surfaces behind movable items same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed items with prime coat.

C. Tint undercoats same color as topcoat but tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Provide sufficient difference in shade of undercoats to distinguish each separate coat.

D. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.

E. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

3.5 FIELD QUALITY CONTROL - PAINTING

A. Dry Film Thickness Testing: Owner may engage the services of a qualified testing and inspecting agency to inspect and test paint for dry film thickness.
1. Contractor shall touch up and restore painted surfaces damaged by testing.
2. If test results show that dry film thickness of applied paint does not comply with paint manufacturer's written recommendations, Contractor shall pay for testing and apply additional coats as needed to provide dry film thickness that complies with paint manufacturer's written recommendations.

3.6 INSTALLATION, GENERAL

A. Fit exposed connections together to form tight, hairline joints.

B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
   1. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
   2. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
   3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet (5 mm in 3 m).

C. Corrosion Protection: Coat concealed surfaces of copper alloys that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

D. Adjust railings before anchoring to ensure matching alignment at abutting joints.

E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.7 RAILING CONNECTIONS

A. Nonwelded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Use wood blocks and padding to prevent damage to railing members and fittings. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of railings.

B. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.

C. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches (50 mm) beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches (150 mm) of post.

3.8 ANCHORING POSTS

A. Form or core-drill holes not less than 6 inches (152 mm) deep and 1/2 inch (12 mm) larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with non-shrink, non-metallic grout or anchoring cement, mixed and placed to comply with anchoring material manufacturer's written instructions.

B. Cover anchorage joint with flange of same metal as post and as indicated in the Drawings.

3.9 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing and inspecting agency to perform field tests and inspections and prepare test reports. Payment for these services will be made by Owner.

B. Extent and Testing Methodology: Testing agency will randomly select completed railing assemblies for testing that are representative of different railing designs and conditions in the completed Work. Railings will be tested according to ASTM E 894 and ASTM E 935 for compliance with performance requirements.

C. Remove and replace railings where test results indicate that they do not comply with specified requirements unless they can be repaired in a manner satisfactory to Landscape Architect and will comply with specified requirements.

D. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of re-placed or additional work with specified requirements.

3.10 CLEANING, PROTECTION AND ADJUSTMENT

A. Clean steel by washing thoroughly with clean water and soap, rinsing with clean water, and wiping dry.
   1. If necessary, re-polish affected areas to match adjacent finishes.

B. Protection: Protect all work from misuse or damage during construction period with temporary protective coverings approved by ornamental metalwork fabricator. Remove protective covering at the time of Substantial Completion. Work, which is scratched, etched or damaged, may not be accepted by the Landscape Architect, and shall be replaced with acceptable work or, as approved, repaired at no additional cost to Owner.

C. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit or provide new units.

3.11 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day’s work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 057310

SECTION 061053 - MISCELLANEOUS ROUGH CARPENTRY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Wood blocking and nailers.
2. Plywood backing panels.

B. Related Requirements:

1. Section 061600 "Sheathing".

1.3 DEFINITIONS

A. Boards or Strips: Lumber of less than 2 inches nominal (38 mm actual) size in least dimension.

B. Dimension Lumber: Lumber of 2 inches nominal (38 mm actual) or greater size but less than 5 inches nominal (114 mm actual) size in least dimension.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
3. For fire-retardant treatments, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D5664.
4. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

B. Sustainable Design Submittals:

1. Environmental Product Declaration (EPD): For each product.

2. Product Data: For installation adhesives, indicating VOC content.
3. Laboratory Test Reports: For installation adhesives, indicating compliance with requirements for low-emitting materials.

1.5 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For the following, from ICC-ES:

1. Preservative-treated wood.
2. Fire-retardant-treated wood.
3. Power-driven fasteners.
4. Post-installed anchors.

B. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant-treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Stack lumber flat with spacers beneath and between each bundle to provide air circulation. Protect lumber from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 WOOD PRODUCTS, GENERAL

A. Regional Materials: Manufacture dimension lumber, except treated materials, within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.
B. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.

1. Factory mark each piece of lumber with grade stamp of grading agency.
2. Dress lumber, S4S, unless otherwise indicated.

C. Maximum Moisture Content of Lumber: 15 percent for 2-inch nominal (38-mm actual) thickness or less, 19 percent for more than 2-inch nominal (38-mm actual) thickness unless otherwise indicated.

2.2 WOOD-PRESERVATIVE-TREATED MATERIALS

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with ground, Use Category UC3b for exterior construction not in contact with ground, and Use Category UC4a for items in contact with ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium. Do not use inorganic boron (SBX) for sill plates.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or does not comply with requirements for untreated material.

C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.

D. Application: Treat items indicated on Drawings.

2.3 FIRE-RETARDANT-TREATED MATERIALS

A. General: Where fire-retardant-treated materials are indicated, materials shall comply with requirements in this article, that are acceptable to authorities having jurisdiction, and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Lumber and Plywood by Pressure Process (WD BLKG-1): Products with a flame-spread index of 25 or less when tested according to ASTM E84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.

1. Treatment shall not promote corrosion of metal fasteners.
2. Exterior Type: Treated materials shall comply with requirements specified above for fire-retardant-treated lumber and plywood by pressure process after being subjected to accelerated weathering according to ASTM D2898. Use for exterior locations and where indicated.
3. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D3201 at 92 percent relative humidity. Use where exterior type is not indicated.
4. Design Value Adjustment Factors: Treated lumber shall be tested according to ASTM D5664, and design value adjustment factors shall be calculated according to ASTM D6841.

C. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Kiln-dry plywood after treatment to a maximum moisture content of 15 percent.

D. Identify fire-retardant-treated wood with appropriate classification marking of qualified testing agency.

E. Application: Treat items indicated on Drawings.

2.4 MISCELLANEOUS LUMBER

A. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:

1. Blocking.
2. Nailers.
3. Cants.

B. Dimension Lumber Items: Standard, Stud, or No. 3 grade lumber of any species.

C. Concealed Boards: 19 percent maximum moisture content of the following species and grades:

1. Mixed southern pine or southern pine, No. 3 grade; SPIB.

D. For blocking not used for attachment of other construction, Utility, Stud, or No. 3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with its attachment and purpose.

E. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.

2.5 PLYWOOD BACKING PANELS

A. Equipment Backing Panels: Plywood, DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated or, if not indicated, not less than 3/4-inch (19-mm) nominal thickness.

2.6 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. Where carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners of Type 304 stainless steel.

B. Nails, Brads, and Staples: ASTM F1667.

C. Screws for Fastening to Metal Framing: ASTM C1002 or ASTM C954, length as recommended by screw manufacturer for material being fastened.

D. Power-Driven Fasteners: Fastener systems with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC70.

E. Post-Installed Anchors: Fastener systems with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC01 or ICC-ES AC193 as appropriate for the substrate.

1. Material: Carbon-steel components, zinc plated to comply with ASTM B633, Class Fe/Zn 5.
2. Material: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F594, Alloy Group 1 or 2 (ASTM F738M and ASTM F836M, Grade A1 or A4).

2.7 MISCELLANEOUS MATERIALS

A. Flexible Flashing: Composite, self-adhesive, flashing product consisting of a pliable, butyl rubber or rubberized-asphalt compound, bonded to a high-density polyethylene film, aluminum foil, or spunbonded polyolefin to produce an overall thickness of not less than 0.025 inch (0.6 mm).

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Set carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit carpentry accurately to other construction. Locate nailers, blocking, and similar supports to comply with requirements for attaching other construction.

B. Install plywood backing panels by fastening to studs; coordinate locations with utilities requiring backing panels. Install fire-retardant-treated plywood backing panels with classification marking of testing agency exposed to view.

C. Provide blocking and framing as indicated and as required to support facing materials, fixtures, specialty items, and trim.

1. Provide metal clips for fastening gypsum board or lath at corners and intersections where framing or blocking does not provide a surface for fastening edges of panels. Space clips not more than 16 inches (406 mm) o.c.

D. Provide fire blocking in furred spaces, stud spaces, and other concealed cavities as indicated and as follows:

1. Fire block furred spaces of walls, at each floor level, at ceiling, and at not more than 96 inches (2438 mm) o.c. with solid wood blocking or noncombustible materials accurately fitted to close furred spaces.

E. Sort and select lumber so that natural characteristics do not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.

F. Comply with AWPA M4 for applying field treatment to cut surfaces of preservative-treated lumber.

1. Use inorganic boron for items that are continuously protected from liquid water.
2. Use copper naphthenate for items not continuously protected from liquid water.

G. Where wood-preservative-treated lumber is installed adjacent to metal decking, install continuous flexible flashing separator between wood and metal decking.

H. Securely attach carpentry work to substrate by anchoring and fastening as indicated, complying with the following:

1. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code.
2. ICC-ES evaluation report for fastener.

3.2 INSTALLATION OF WOOD BLOCKING AND NAILER

A. Install where indicated and where required for attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.

B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces unless otherwise indicated.

3.3 PROTECTION

A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

B. Protect miscellaneous rough carpentry from weather. If, despite protection, miscellaneous rough carpentry becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

END OF SECTION 061053

SECTION 061600 - SHEATHING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Wall sheathing.
2. Sheathing joint and penetration treatment.

B. Related Requirements:

1. Section 061053 "Miscellaneous Rough Carpentry" for plywood backing panels.
2. Section 072726 “Fluid-Applied Membrane Air Barriers.”

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Indicate type of preservative used and net amount of preservative retained.
2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Include physical properties of treated materials.
3. For fire-retardant treatments, include physical properties of treated plywood both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D5516.
4. For products receiving waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

B. Sustainable Design Submittals:

1. Laboratory Test Reports: For composite wood products, indicating compliance with requirements for low-emitting materials.
2. Product Data: For installation adhesives, indicating VOC content.

3. Laboratory Test Reports: For installation adhesives, indicating compliance with requirements for low-emitting materials.

1.5 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For the following, from ICC-ES:

1. Wood-preservative-treated plywood.
2. Fire-retardant-treated plywood.

B. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications:

1. For testing agency providing classification marking for fire-retardant-treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Stack panels flat with spacers beneath and between each bundle to provide air circulation. Protect sheathing from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Resistance Ratings: As tested according to ASTM E119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

2.2 WOOD PANEL PRODUCTS

A. Thickness: As needed to comply with requirements specified, but not less than thickness indicated.

B. Factory mark panels to indicate compliance with applicable standard.

2.3 PRESERVATIVE-TREATED PLYWOOD

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with ground, Use Category UC3b for exterior construction not in contact with ground, and Use Category UC4a for items in contact with ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.

B. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.

C. Application: Treat items indicated on Drawings and plywood in contact with masonry or concrete or used with roofing, flashing, vapor barriers, and waterproofing.

2.4 FIRE-RETARDANT-TREATED PLYWOOD

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this article that are acceptable to authorities having jurisdiction and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Plywood by Pressure Process: Products with a flame-spread index of 25 or less when tested according to ASTM E84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.

1. Use treatment that does not promote corrosion of metal fasteners.
2. Exterior Type: Treated materials shall comply with requirements specified above for fire-retardant-treated plywood by pressure process after being subjected to accelerated weathering according to ASTM D2898. Use for exterior locations and where indicated.
3. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D3201/D3201M at 92 percent relative humidity. Use where exterior type is not indicated.
4. Design Value Adjustment Factors: Treated lumber plywood shall be tested according to ASTM D5516 and design value adjustment factors shall be calculated according to ASTM D6305. Span ratings after treatment shall be not less than span ratings specified. For roof sheathing and where high-temperature fire-retardant treatment is indicated, span ratings for temperatures up to 170 deg F (76 deg C) shall be not less than span ratings specified.

C. Kiln-dry material after treatment to a maximum moisture content of 15 percent. Do not use material that is warped or does not comply with requirements for untreated material.

D. Identify fire-retardant-treated plywood with appropriate classification marking of qualified testing agency.

E. Application: Treat plywood indicated on Drawings.

2.5 WALL SHEATHING (GYP SHTG-1)

A. Glass-Mat Gypsum Sheathing: ASTM C1177/C1177M.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed; SAINT-GOBAIN; CertainTeed GlasRoc Type X Sheathing.
b. Georgia-Pacific Gypsum LLC; DensGlass Sheathing.
c. Gold Bond Building Products, LLC provided by National Gypsum Company; Gold Bond® eXP® Fire-Shield® Sheathing.
d. USG Corporation; Securock.

2. Type and Thickness: Type X, 5/8 inch (15.9 mm) .
3. Size: 48 by 96 inches (1219 by 2438 mm) for vertical installation.

2.6 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. For wall sheathing, provide fasteners of Type 304 stainless steel.

B. Nails, Brads, and Staples: ASTM F1667.

C. Screws for Fastening Wood Structural Panels to Cold-Formed Metal Framing: ASTM C954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.

D. Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing to be attached.

1. For steel framing less than 0.0329 inch (0.835 mm) thick, use screws that comply with ASTM C1002.
2. For steel framing from 0.033 to 0.112 inch (0.84 to 2.84 mm) thick, use screws that comply with ASTM C954.

2.7 SHEATHING JOINT-AND-PENETRATION TREATMENT MATERIALS

A. Sealant for Glass-Mat Gypsum Sheathing: Coordinate sheathing board joint treatment with the requirements of the air/vapor/water barrier manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of sheathing or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:

1. Table 2304.9.1, "Fastening Schedule," in the ICC's International Building Code.
2. ICC-ES evaluation report for fastener.

D. Coordinate sheathing installation with flashing and joint-sealant installation so these materials are installed in sequence and manner that prevent exterior moisture from passing through completed assembly.

E. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

F. Coordinate sheathing installation with installation of materials installed over sheathing so sheathing is not exposed to precipitation or left exposed at end of the workday when rain is forecast.

3.2 WOOD STRUCTURAL PANEL INSTALLATION

A. General: Comply with applicable recommendations in APA Form No. E30, "Engineered Wood Construction Guide," for types of structural-use panels and applications indicated.

3.3 GYPSUM SHEATHING INSTALLATION

A. Comply with GA-253 and with manufacturer's written instructions.

1. Fasten gypsum sheathing to cold-formed metal framing with screws.
2. Install panels with a 3/8-inch (9.5-mm) gap where non-load-bearing construction abuts structural elements.
3. Install panels with a 1/4-inch (6.4-mm) gap where they abut masonry or similar materials that might retain moisture, to prevent wicking.

B. Apply fasteners so heads bear tightly against face of sheathing, but do not cut into facing.

C. Horizontal Installation: Install sheathing with V-grooved edge down and tongue edge up. Interlock tongue with groove to bring long edges in contact with edges of adjacent panels without forcing. Abut ends over centers of studs, and stagger end joints of adjacent panels not less than one stud spacing. Attach at perimeter and within field of panel to each stud.

1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of panels.

D. Vertical Installation: Install vertical edges centered over studs. Abut ends and edges with those of adjacent panels. Attach at perimeter and within field of panel to each stud.

1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of panels.

E. Seal sheathing joints according to sheathing manufacturer's written instructions.

1. Coordinate sheathing board joint treatment with the requirements of the air/vapor/water barrier manufacturer.

END OF SECTION 061600

SECTION 064013 – EXTERIOR ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Wood cladding for raised garden bed over structure.

B. Related Sections:
   1. Division 03 Section ‘Cast in Place Concrete’
   2. Division 32 Section 'Unit Paving’
   3. Division 32 Section 'Garden Roof Assembly’

1.3 REFERENCE STANDARDS

A. For Lumber grading agencies, and the abbreviations used to reference them, include the following:
   1. NeLMA: Northeastern Lumber Manufacturers' Association.
   2. NLGA: National Lumber Grades Authority.
   3. RIS: Redwood Inspection Service.
   4. SPIB: The Southern Pine Inspection Bureau.

B. For other related assembly materials:
   1. AWS - American Welding Society
      a. AWS D1.1-96: Structural Welding Code--Steel
      b. AWS D1.3-89: Structural Welding Code--Sheet Steel
   2. NAAMM - National Association of Architectural Metal Manufacturers
      a. Metal Finishes Manual for Architectural and Metal Products. 1988.
   3. American Society for Testing and Materials
      a. ASTM A276-96: Specification for Stainless Steel Bars and Shapes
      b. ASTM A666-96: Specification for Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
      c. C157-03 Standard Test Method for Length Change of Hardened Hydraulic-Cement, Mortar, and Concrete
      d. C827-01a Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens of Cementitious Mixtures
      e. ASTM C1107-91a: Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink)
      f. ASTM F593-95: Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
      g. ASTM F594-91: Specification for Stainless Steel Nuts
      h. ASTM C920-95, “Specifications for Use of Elastomeric Joint Sealants”

i. ASTM C1021-97, Practice for Laboratories Engaged in Testing of Building Sealants"
j. ASTM C1087-00, "Test Method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems"
k. ASTM C1193-00, "Guide of Use of Joint Sealants"

1.4 SUBMITTALS

A. Certificates/Manufacturer's Data: Submit for approval of Landscape Architect the sources of supply and manufacturer's specifications, quality control, product data, test reports, and instructions for handling, storage, installation and protection for the following:
1. Wood for Raised Garden Bed Over Structure:
a. MECHANICAL CERTIFICATION: A test report from an independent U.S. testing laboratory indicating conformance to Ipe wood mechanical properties in accordance to the procedures outlined in ASTM Test Method D143 shall be submitted with the material bid.
b. INSPECTION CERTIFICATION: A Certificate of Grade and Inspection from an independent third party inspection and grading agency, Mallinckrodt or pre-approved equal, indicating compliance with material specifications as to producing mill, Iron Woods FEQ grade, species, dimensions, quantity, condition, packaging, and documentation. Inspection will include the physical examination of 100% of the timber produced against the buyer's order, piece by piece, prior to packaging. Inspections are to take place at the mill throughout production and the certificate is to be submitted with the material prior to delivery.
c. For lumber specified to comply with minimum allowable unit stresses. Indicate species and grade selected for each use and design values approved by ALSC's Board of Review.
d. For metal framing anchors include installation instructions.

B. Samples: Submit samples of the following materials. Samples shall be representative of the workmanship and finishes to be incorporated in the completed Project.
1. Wood Slats:
a. Submit six (6) full-size typical slats, showing the range of variation to be expected in appearance of wood slats.
b. The approved samples will set the finish standard for the Work. Greater variation than is represented in the approved samples will not be accepted in the finished work.
c. Product Certificates: Signed by manufacturers of woodwork certifying that products furnished comply with requirements.

C. Shop drawings showing fabrication and installation of custom planters including plans, elevations, details of components, and attachments to other units of Work. Indicate materials and profiles of each member, fitting, joinery, finishes, fasteners, anchorages, and accessory items.
1. Submit complete drawings for entire planter assembly showing shop sizes and shapes, including, thickness, jointing, expansion joints, anchoring, connection with other adjacent work, typical and special anchoring details, and field verified conditions and dimensions. Show electrical connections. Field measurement drawings, as reference only, shall also be submitted with shop drawings.
2. Drawings shall show relationship to adjoining construction after fabrication and, shall indicate the location of each wood unit and metal with a number designation corresponding to number marked on each unit.

a. Show location layouts and patterns coordinated with design drawings and related survey control points and dimensions. Establish and verify dimensions with concrete work of on-site structures and elements, masonry layouts, patterns of other work, and other like conditions.
b. Show location, type, and extent of anticipated field cutting.

3. Do not fabricate any custom wood elements (except for mockups) until Shop Drawings have been approved for fabrication by the Landscape Architect.

D. Field Constructed Mock-ups: Construct at the earliest possible time and at approved location, before proceeding with Work and after Landscape Architect's approval of submitted samples. Submit proposed locations for field mockups and receive approval of locations from Landscape Architect prior to construction of field mockups. Provide and construct entire planter assembly as specified herein to show appearance, workmanship, and finish of work, complete and in coordination with work of other Sections as applicable.
1. Install mock-ups of planter assembly unless otherwise directed. Coordinate with materials requirements as specified in other sections.
2. The field mock-up must be approved by Landscape Architect before all the planter assembly may proceed. Accepted mockup establishes minimum standard of quality and workmanship for work of this Section.
3. Demolish and remove field mockups at a time approved by Landscape Architect when no longer required to serve as a standard of work. Mock-up may be incorporated as part of Work if conforming to specified requirements, and if accepted by Landscape Architect.

E. Maintenance Program: Submit a maintenance program to be followed by the Contractor during construction and by the Owner during the Warranty Period, including provisions, such as temporary protection measures, to protect planter assembly.

1.5 QUALITY ASSURANCE

A. The work of this section shall be performed by companies which specialize in the type of wood work required for this Project, certified in writing, with a minimum of 10 years of documented successful experience and shall be performed by skilled workmen thoroughly experienced in the necessary crafts.

B. Fabrication Qualifications: Fabrications shall be by a firm or firms, which have successfully fabricated each material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than five (5) years.
1. The Landscape Architect and Owner may during the course of the work visit the places of fabrication. The Contractor shall afford these representatives free access and cooperation in the performance of their duties.

C. Installer Qualifications: Installers shall have a minimum of ten (10) years successful experience, either in the present business form or by having principal personnel with equivalent experience elsewhere, in the installation of the wood materials specified, and the products, systems, and scope specified. An experienced (10 years experience) field foreman shall oversee all work. Include evidence of experience including project list.

D. Forest Certification: All wood shall be harvested from forests certified by the Forest Stewardship Council (FSC) and all wood products shall be Chain of Custody certified.
1. "Certified Forest Products Council" Purchasing Policy Guidelines: In an effort to promote sustainable forest management, the material supplier will provide proof of membership in

the Certified Forest Products Council as confirmation of their commitment to the development of sustainable forest resources.

2. "Forest Stewardship Council" Endorsed Third Party Certification: In an effort to promote sustainable forest management, the supplier will provide proof of Chain Of Custody Certification status in an FSC endorsed certification program as an example: Rainforest Alliance SmartWood© Program or approved equal.

E. Welding Standards: Refer to Division 05 “Metal Fabrications”.

F. Field Measurements and Coordination: Verify dimensions with existing conditions and with work specified in other sections which adjoins the work herein specified or to which this work will be attached.
1. Coordinate with related work of other sections, including work of other separate contracts.
2. Field Measurement Drawings: Measurements of adjoining work shall be taken, so that work specified in this Section shall fit closely into spaces provided, and shall allow correct access and clearance at conditions. Measurements shall include both horizontal dimensions and vertical grades. Employ a qualified surveyor as required. Contractor shall prepare a field measurement drawing at a scale of 1/2" = 1' 0" or larger showing existing adjoining work, including, but not limited to conduits and all foundations for structural elements. Drawings will be prepared prior to preparation of shop drawings, and shall be submitted, for reference only, with shop drawing submittal.
3. If any unusual conditions are encountered, the nature and location of conditions shall be shown on shop drawings submitted to the Landscape Architect for determination and approval prior to fabrication.
4. Furnish all necessary templates and patterns required by work of other sections. Furnish components of assemblies that are to be built into work specified as part of other sections.

G. Shop Assembly: To the extent practicable, fitting and assembly of work shall be done in the shop. All work shall be accurately and neatly fabricated, assembled and erected with smooth finish surfaces.
1. Work that cannot be permanently shop-assembled, shall be completely assembled, marked for re-assembly and disassembled in shop before shipment to insure correct assembly in the field.
2. Shop assemble work in largest practical sizes to minimize field work.
3. Shop fabricated items shall properly fit the field condition. In the event that shop fabricated items do not fit the field condition, the item shall be returned to the shop for correction.
4. Connections in the field shall be with approved mechanical fasteners. Welding of assemblies or components in the field shall not be permitted, unless approved in writing by the Landscape Architect and correct protective measures are implemented.

H. Pre-installation Meeting: Before beginning work, schedule and conduct a meeting at the site to review the Contract Documents, the approved submittals and other pertinent matters of the particular installation. Present shall be the Owner, Landscape Architect, Contractor, the installers, and the installers' field foremen. Inform the Landscape Architect ten (10) business days in advance of the scheduled meeting time.

1.6 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of government authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affection transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store wood elements inside a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity. Store products on elevated platforms in a dry location.

B. Deliver wood planter assemblies wrapped in protective coverings or in heavy-duty cartons. Remove protective coverings before they stain or bond to finished surfaces.

1.8 PROJECT CONDITIONS

A. Field Measurements: Where wood elements are indicated to fit to other construction, check actual dimensions of other construction by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1.9 EXTRA MATERIALS

A. Furnish extra materials described below that match materials installed and that are packaged for storage and identified with labels describing contents.
   1. Wood Slats: Twelve (12) extra pieces of each type

B. Packing requirements: Extra materials shall be packed in heavy duty corrugated cardboard boxes. Label each box with list of contents.

PART 2 - PRODUCTS

2.1 FINISH WOOD

A. All finish wood surfaces for all planters shall be: Ipe (Handroanthus spp), unless otherwise specifically indicated on drawings. Available manufacturers as available below or approved equal:
   1. Ironwoods | Timber Holdings USA
      Tel: 414-445-8989
      Email: info@ironwoods.com

B. Finish Wood Lumber Grade: All lumber shall be third party graded and inspected to (Premium Select Clear All Heart) grading rules, defined as follows:
   1. Lumber shall be graded four faces, and four edges.
   2. Lumber shall be straight grained and parallel cut without heart center.
   3. Lumber shall be all heartwood, no sapwood allowed.
   4. Lumber shall be in sound condition, free from worm holes or knots.
   5. Sawn ends shall be finished with Anchor sealer.
   6. Allowable Imperfections defined as - Small drying cracks, small end splits (less than 5/32 inches in width), that do not impair the strength of the material or fastening, Discoloration caused by weathering or chemical reaction, Bow or twist which can be removed using normal installation methods and tools, Roey/Scale grain (one face only).
   7. Not Allowable Imperfections defined as - Longitudinal heart cracks, Internal cracks, Firm or soft sap wood, Fungi Affects - (blue to gray, brown to red, white to yellow, or incipient decay), Bow or twist which cannot be removed by normal installation methods and tools.
   8. Mechanical Properties: Wood supplied shall meet or exceed mechanical properties as defined by U.S. Forest Product Laboratories testing methods. The values for mechanical properties based on the 2" standard are as follows:

Ipe (*Handroanthus spp*)			
Moisture Content	Bending Strength	Modulus of Elasticity	Max. Crush Strength
12%	25,400 psi	3,140,000 psi	13,010 psi
Janka side hardness is 3,680 lb. at 12% M.C.			
Average air dry density is 66 to 75 pcf.			
Basic specific gravity is 0.85-0.97			

C. Finish: No finish shall be applied; finish shall be natural.

2.2 MISCELLANEOUS MATERIALS

A. Wood Coping Fasteners: Provide Type 316L stainless steel fasteners, complying with requirements of ASTM F593-95 and ASTM F594-91. Select fasteners for type, grade, and class required.
   1. Provide concealed fasteners for interconnection of components and for their attachment to other work, except where otherwise indicated.
   2. Provide vandal proof flat-head machine screws for exposed fasteners, unless otherwise indicated.

B. All other fasteners and supports shall be stainless steel.

2.3 FABRICATION

A. Form custom fabrications to required shapes and sizes, with true curves, lines, and angles.

B. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Drill and tap for required fasteners, unless otherwise indicated. Use concealed fasteners wherever possible.

C. Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces, and similar preparations for finishing wood planters, as applicable to each unit of work.

D. Mill joints to a tight, hairline fit. Cope or miter corner joints. Form joints exposed to weather to exclude water penetration.

E. Finish exposed surfaces, including welds, to smooth, sharp, well-defined lines and arises.

F. Assemble items in the shop to the greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspection: Verify the conditions, elevations, and measurements affecting the work of this Section prior to installation. Examine locations to receive planter and do not proceed until any defects detrimental to the finished work are corrected. Take proper precautions so as not to disturb or damage subsurface elements of utilities, conduits, underdrainage systems, water proofing, insulation, or foam fill.

3.2 PREPARATION

A. Coordinate and furnish anchorages and setting drawings, diagrams, templates, instructions, and directions for installing items having integral anchors that are to be embedded in concrete construction. Coordinate delivery of such items to the Project site.

3.3 INSTALLATION

A. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal items to in-place construction.

B. Perform cutting, drilling, and fitting required to install custom fabrications. Set products accurately in location, alignment, and elevation, plumb, level, and true, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, with uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of miscellaneous metal items, restore finishes to eliminate any evidence of such corrective work.

D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.

E. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at the same location.
   1. Retain protective coverings intact and remove simultaneously from similarly finished items to preclude non-uniform oxidation and discoloration.

F. Sort and select lumber so that natural characteristics will not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.

3.4 PROTECTION

A. Protect finishes of planters from damage during construction period with temporary protective coverings approved by fabricator. Remove protective covering at the time of Substantial Completion.

B. Restore finishes damaged during installation and construction so that no evidence remains of correction work. Return items that cannot be refinished in the field as determined by the Landscape Architect to the shop; make required alterations and refinish entire unit; or provide new units as required.

3.5 CLEANUP

A. Legally dispose of off-site all refuse and debris from these operations. Remove or neatly store material at the end of each day’s work. Burning of material or dumping on the site is prohibited.

B. Maintain the site in an orderly condition during the progress of Work. Continuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Leave the site in a neat, orderly, "broom clean" condition.

END OF SECTION 321170

SECTION 070543.11 - COMPOSITE METAL HYBRID (CMH) CONTINUOUS INSULATION SUB-FRAMING SUPPORT SYSTEMS

PART 1- GENERAL

1.01 SECTION INCLUDES

A. Composite metal hybrid (CMH) sub-framing support system with in-fill continuous insulation integrated within exterior wall cladding.

1. Substrate: Exterior sheathing over metal stud framing.

1.02 RELATED REQUIREMENTS

A. Section 054000 – Cold-Formed Metal Framing: Metal stud substrate support framing.

B. Section 061600 – Sheathing.

C. Section 072100 – Thermal Insulation.

D. Section 072726.04 – Fluid-Applied Membrane Air Barriers.

E. Section 074213.23 – Metal Composite Material Wall Panels.

F. Section 074243 – Wood Veneer Laminate Wall Panels.

G. Section 079200 – Joint Sealants: Perimeter sealant.

1.04 ADMINISTRATIVE REQUIREMENTS

A. Coordinate installation of continuous insulation sub-framing support system as indicated on drawings for proper drainage, flashing, trim, backup support, soffits, and other related Work.

1. Review and finalize construction schedule.

2. Verify availability of materials, installer's personnel, equipment, and facilities needed to meet established schedule.

3. Review means and methods related to installation in accordance with manufacturer's installation instructions.

4. Examine support conditions for compliance with installation requirements, including alignment and attachment to structural support system.

5. Review flashings, wall cladding details, wall penetrations, drainage plane, openings, and condition of other construction that is related to this Work.

6. Review temporary protection requirements for during and after installation of this Work.

1.05 SUBMITTALS

A. Product Data: Submit for each product being used and as indicated, including installation details, material descriptions, dimensions of individual components and profiles, and necessary accessories for a complete assembled system.

1. Continuous insulation (CI) support system attachment methods and required fasteners.

2. Wall-mounted items, including doors, windows, louvers, and light fixtures.

3. Wall penetrations, including pipes, electrical fixtures, and any other wall-mounted utilities.

B. Shop Drawings: Submit project specific shop drawings prepared by, or under supervision of, Structural Design Engineer as specified in Quality Assurance article below and including Structural Design Engineer's stamp or seal on all shop drawings including system attachments and anchors.

1. Include fabrication and installation layouts of system; project specific details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, accessories, and special details. Include details showing integration of metal composite material wall panel system with air barrier system.
2. Accessories: Include project specific details of flashing, trim, and anchorage, at a scale of not less than 1-1/2 inches per 12 inches (1:10).
3. Provide signed and sealed drawings, by a qualified design professional in Project jurisdiction, of system showing compliance with performance requirements and design criteria identified for this Project.

B. Test and Inspection Reports: Submit test and inspection reports on each type of wall cladding/veneer system based on evaluation of comprehensive tests performed by testing agency approved by authorities having jurisdiction.

C. Warranty: Submit manufacturer's warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

1.06 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with at least three years of documented experience.

B. Installer Qualifications: Company specializing in performing work as indicated in this section with at least three years of documented experience and approved by manufacturer.

C. Delegated Design Engineer Qualifications: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to site without damage or deformation in manufacturer's original unopened containers and with labels that clearly identify product name and manufacturer.

B. Storage: Store materials in clean, dry, and level interior or exterior areas for limited duration in accordance with manufacturer's written instructions.

C. Protect components during transportation, handling, and installation from moisture, excessive temperatures, and other construction operations in accordance with manufacturer's written instructions.

D. Handle components in accordance with manufacturer's written instructions and in a manner to prevent bending, warping, twisting, and surface, edge, or corner damage.

1.08 SITE CONDITIONS

A. Weather Limitations: Only proceed with installation when existing and forecasted weather conditions allow for assembly of this Work in accordance with manufacturer's written installation instructions.

1.09 WARRANTY

A. Manufacturer's Warranty: Provide 1-year manufacturer's warranty for composite metal hybrid (CMH) sub-framing support system commencing on the date of Substantial Completion.

PART 2- PRODUCTS

2.01 MANUFACTURER

A. Basis-of-Design Product: Subject to compliance with requirements, provide Advanced Architecural Products (A2P); GreenGirt CMH Sub-Framing System; SMART ci 1 in 1 System or comparable product by one of the following;

B. Armetherm Thermal Bridging Solutions; Armatherm Z Girt.

C. Strongwell; STRONGIRT.

2.02 DESCRIPTION (FRP FURG-1)

A. Attach CMH sub-framing support system components through exterior sheathing into metal stud framing as indicated on drawings.

B. Install CMH sub-framing support system components horizontally or vertically through exterior sheathing into stud support system as indicated on drawings in compliance with project requirements.

C. Install metal hat channel as indicated on drawings, mounted horizontally to vertical or vertically to horizontal CMH sub-framing support system, connecting adjacent supports in series to each other.

2.03 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide system tested in accordance with ASTM E330/E330M and certified to be without permanent deformation or failure of structural members in accordance with design wind velocities for project location and potential for occurance based on data from wind velocity maps and other provisions of ASCE 7 and as approved by authorities having jurisdiction (AHJ).

1. Design Loads: As indicated on Drawings.

Measure performance of assembly using test loads equal to 1-1/2 times design wind loads indicated and with 10-second duration at maximum pressure.

B. System Thermal Design: Ensure that installed continuous insulation and CMH sub-framing support system, and cladding attachment does not have thermal bridging of fasteners or framing that creates a continuous metal path from exterior surface of insulation to interior face of insulation.

1. Verify that system thermal design meets or exceeds thermal design requirements in accordance with ASHRAE 90.1 ASHRAE 189.1 IECC or IgCC energy code.

2. Thermal Resistance, Overall: Refer to Architectural Exterior Wall Types on Drawings.

3. Thermal Performance Test: Provide thermal resistance (R-value) indicated, in accordance with ASTM C1363, corrected to 15 mph wind outside and still air inside, with installed condition including fasteners and joints.

a. Provide efficiency of no less than 93 to 98 percent, with a maximum temperature differential of 18 degrees F from interior wall surface to interior wall cavity and node locations with a 70 degrees F exterior to interior wall temperature delta.

b. Provide test unit with at least one insulation panel horizontal and vertical joint length and height of test chamber area.

c. Provide finite element analysis of three-dimensional simulation of described wall assembly sealed by a professional engineer in compliance with code performance requirements and exceeding it by at least 3 percent.

C. Temperature Range: Comply with structural loading requirements within a temperature range of minus 55 degrees F to 180 degrees F.

D. Fire-Resistance Ratings: Provide CMH sub-framing support system with fire testing in accordance with ASTM E119 test methods and applied by approved testing agency acceptable to authorities having jurisdiction (AHJ).

1. Surface Burning Characteristics: Test in accordance with ASTM E84 test method for continuous insulation, composite metal hybrid (CMH) and interior surfaces as follows:

a. Flame Spread Index (FSI): 25 or less.

b. Smoke Developed Index (SDI): 450 or less.

Intermediate Scale Multistory Fire Test: Comply with NFPA 285 and/or IBC acceptance criteria for wall height above grade and fire separation distances when wall type and other noted conditions require such testing or compliance with requirements as indicated.

2.04 COMPOSITE METAL HYBRID (CMH) SUB-FRAMING SUPPORT SYSTEM

A. CMH Sub-Framing Support System: Provide CMH sub-framing support system consisting of polyester resin matrix with recycled materials, fire retardant additives and reinforced with integral continuous metal inserts the full length with pre-drilled holes to align with substrate fastening locations.

1. Length of CMH Support System: 96 inches long.
2. Depth of CMH Support System: Refer to Architectural Wall Types on Drawings.
3. Grid Spacing of CMH Sub-Framing Supports for Substrate Attachments: Refer to Architectural Wall Types on Drawings.
4. Fastener Retention System: Provide continuous galvanized steel insert for engagement of fasteners, at least 16 gauge thick, with G90 galvanized coating in accordance with ASTM A653/A653M.
   a. Fasten CMH sub-framing support and other wall cladding support accessories through steel insert located within top and bottom of CMH sub-framing.
   b. Provide at least 3 inch overlap of metal inserts between CMH supports with 3/16 inch wide gap; sealant is not required.
5. Provide integral compression seal within CMH sub-framing to ensure insulation will not dislodge.
6. Provide integral anti-siphon grooves on exterior and interior flanges of CMH sub-framing.
7. Provide force distribution zones integrally designed into profile of CMH sub-framing.
8. CMH sub-framing is self-extinguishing in accordance with ASTM D635.
9. Visual defects in CMH sub-framing is classified in accordance with ASTM D4385.
10. Tensile Properties: Engineered lengthwise and crosswise tensile properties of CMH sub-framing comply with performance loading criteria and specified safety factors in accordance with ASTM D638.

a. Lengthwise 50,000 psi and crosswise 40,000 psi, minimum.

11. Compressive Properties: Engineered lengthwise and crosswise compressive properties of CMH sub-framing comply with performance loading criteria and specified safety factors in accordance with ASTM D6641/D6641M.

    a. Lengthwise 50,000 psi and crosswise 30,000, minimum.

12. Flexural Properties: Engineered lengthwise and crosswise flexural properties of CMH sub-framing comply with performance loading criteria and specified safety factors in accordance with ASTM D790.

    a. Lengthwise 50,000 psi and crosswise 40,000 psi, minimum.

13. Modulus of Elasticity: CMH sub-framing is engineered to meet performance loading criteria and specified safety factors in accordance with ASTM D638.

    a. Lengthwise 29,000,000 psi and crosswise 3,300,000 psi, minimum.

14. Water Absorption: CMH sub-framing absorbs less than 0.46 percent by weight within 24 hours when tested in accordance with ASTM D570.

15. Relative Density: CMH sub-framing is within range of 0.062 to 0.070 lbs/cubic inch when tested in accordance with ASTM D792.

16. Coefficient of Linear Thermal Expansion: CMH sub-framing is at 7.0 x 10^{-6} inch/inch/degrees F when tested in accordance with ASTM D696.

17. Notched Izod Pendulum Impact Resistance, Lengthwise: CMH sub-framing is at 160 ft lbs/inch when tested in accordance with ASTM D256 within standard temperature range.

18. Notched Izod Pendulum Impact Resistance, Crosswise: CMH sub-framing is at 100 ft lbs/inch when tested in accordance with ASTM D256 within standard temperature range.

2.05 ASSEMBLY

A. Assemble CMH sub-framing support system in accordance with manufacturer's installation instructions and as necessary to comply with performance requirements indicated.

    1. Comply with CMH sub-framing support system dimensional and structural requirements as indicated on drawings.

    2. Install CMH sub-framing support system in acceptable sequence in accordance with manufacturer's written installation instructions.

    3. Install spray foam sealant on backside of cantilevered fasteners that completely puncture insulation layer.

2.06 ACCESSORIES

A. Provide necessary accessories for complete installation of CMH sub-framing support system including metal closure trim, transition angle, strapping, tie-in brackets, and other similar items.

B. Fasteners: Corrosion-resistant, self-tapping and self-drilling screws, bolts, nuts, and other fasteners as recommended by CMH sub-framing support system manufacturer for CMH materials and other project applications.

    1. Cladding to CMH: Use standard self-tapping metal screws.

2. CMH to Metal Stud Wall Framing: Use standard self-tapping metal screws.

3. CMH to Concrete or Concrete Masonry Units (CMU): Use standard masonry or concrete screw anchors in pre-drilled hole.

5. Use of powder, air, or gas-actuated fasteners or actuated fastener tools is not permitted.

6. Use of impact wrenches when fastening to or from CMH is not permitted.

PART 3- EXECUTION

3.01 EXAMINATION

A. Examine areas of this Work, substrates, and other project conditions with installer present to verify compliance with requirements for installation tolerances, substrates, CMH sub-framing support system conditions, and other conditions relating to this Work.

B. Examine structural wall framing to ensure that angles, channels, studs, and other structural support members have been installed within alignment tolerances in accordance with installation instructions of CMH sub-framing support system manufacturer.

C. Examine components and systems penetrating CMH sub-framing support system prior to installation during rough-in stage of construction to coordinate actual locations of penetrations relative to CMH sub-framing support systems joint locations.

D. Verify that mechanical and electrical-related installations for exterior walls have been completed, and verify that adjacent materials and finishes are dry and ready for insulation installation.

E. Proceed with installation of CMH sub-framing support system only after wall substrate surfaces have been properly prepared and unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare substrate surfaces using methods recommended in writing by CMH sub-framing support system manufacturer to achieve excellent results under project conditions.

C. Prepare sub-framing, base angles, sills, furring, and other CMH sub-framing support system components and provide anchorage in accordance with ASTM C754 for substrate and wall cladding types in accordance with manufacturer's installation instructions.

3.03 INSTALLATION

A. Install CMH sub-framing support system in accordance with manufacturer's written installation instructions, and in compliance with system orientations, sizes, and locations as indicated on drawings.

B. Install continuous insulation system without gaps or voids, provide insulation fill-in at necessary locations, and do not compress insulation panels.

C. Trim insulation neatly to tightly fit spaces within plane of continuous insulation.

D. Exterior wall continuous insulation is not intended to be left exposed for extended periods of time; protect exposed insulation from open flame.

3.04 TOLERANCES

A. Shim and align CMH sub-framing support system with installation tolerances of 1/4 inch in 20 feet, non-cumulative, level, plumb, and aligned with locations as indicated on drawings.

3.05 PROTECTION

A. Protect installed products from damage until Date of Substantial Completion.

B. Ensure that insulation panels are not exposed to moisture.

Remove wet insulation panels or allow them to completely dry prior to installation within CMH sub-framing support system.

C. Replace damaged insulation prior to Date of Substantial Completion.

END OF SECTION 070543.11

SECTION 071326 - SELF-ADHERING SHEET WATERPROOFING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Modified bituminous sheet waterproofing.
2. Molded-sheet drainage panels.
3. Insulation drainage panels.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review waterproofing requirements including surface preparation, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, inspection procedures, and protection and repairs.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, and tested physical and performance properties of waterproofing.
2. Include manufacturer's written instructions for evaluating, preparing, and treating substrate.

B. Sustainable Design Submittals:

1. Environmental Product Declaration (EPD): For each product.

C. Shop Drawings: Show locations and extent of waterproofing and project specific details of substrate joints and cracks, expansion joints, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.

1. Include setting drawings showing layout, sizes, sections, profiles, and joint details of pedestal-supported concrete pavers.

D. Samples: For each exposed product and for each color and texture specified, including the following products:

1. 8-by-8-inch (200-by-200-mm) square of waterproofing and flashing sheet.
2. 4-by-4-inch (100-by-100-mm) square of drainage panel.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Research Reports: For modified bituminous sheet waterproofing/termite barrier, showing compliance with ICC AC380.

C. Field quality-control reports.

D. Sample Warranties: For special warranties.

E. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by waterproofing manufacturer. Installer shall have 5 years of experience in applying the same or similar materials and shall be specifically approved in writing by the membrane manufacturer.

B. Mockups: Build mockups to verify selections made under Sample submittals and to set quality standards for installation.

1. Build for each typical waterproofing installation including accessories to demonstrate surface preparation, crack and joint treatments, inside and outside corner treatments, and protection.

    a. Size: 100 sq. ft. (9.3 sq. m) in area.
    b. Description: Each type of wall installation.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 FIELD CONDITIONS

A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended in writing by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.

1. Do not apply waterproofing in snow, rain, fog, or mist.

B. Maintain adequate ventilation during preparation and application of waterproofing materials.

1.8 WARRANTY

A. Manufacturer's Warranty:

1. Waterproofing Warranty: Manufacturer agrees to furnish replacement waterproofing material for waterproofing that does not comply with requirements or that fails to remain watertight within specified warranty period.

a. Warranty Period: Five years from date of Substantial Completion.

B. Installer's Special Warranty: Specified form, signed by Installer, covering Work of this Section, for warranty period of two years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations for Waterproofing System: Obtain waterproofing materials from single source from single manufacturer.

2.2 MODIFIED BITUMINOUS SHEET WATERPROOFING (WP-1)

A. Modified Bituminous Sheet Waterproofing: Minimum 60-mil (1.5-mm) nominal thickness, self-adhering sheet consisting of 56 mils (1.4 mm) of rubberized asphalt laminated on one side to a 4-mil- (0.10-mm-) thick, polyethylene-film reinforcement, and with release liner on adhesive side; formulated for application with primer or surface conditioner that complies with VOC limits of authorities having jurisdiction.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Carlisle Coatings & Waterproofing Inc ; CCW MiraDRI 860/861. or a comparable product by one of the following:

a. GCP Applied Technologies Inc.; Bituthane System 3000.
b. Henry Company; Blueskin WP 200.
c. W.R. Meadows, Inc.; MEL-ROL.

2. Physical Properties:

a. Tensile Strength, Membrane: 250 psi (1.7 MPa) minimum; ASTM D412, Die C, modified.
b. Ultimate Elongation: 300 percent minimum; ASTM D412, Die C, modified.
c. Low-Temperature Flexibility: Pass at minus 20 deg F (minus 29 deg C); ASTM D1970/D1970M.
d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch (3-mm) movement; ASTM C836/C836M.
e. Puncture Resistance: 40 lbf (180 N) minimum; ASTM E154/E154M.
f. Water Absorption: 0.2 percent weight-gain maximum after 48-hour immersion at 70 deg F (21 deg C); ASTM D570.

g. Water Vapor Permeance: 0.05 perm (2.9 ng/Pa x s x sq. m) maximum; ASTM E96/E96M, Water Method.
h. Hydrostatic-Head Resistance: 200 feet (60 m) minimum; ASTM D5385.

3. Sheet Strips: Self-adhering, rubberized-asphalt strips of same material and thickness as sheet waterproofing.

2.3 AUXILIARY MATERIALS

A. Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.

1. Furnish liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.

B. Primer: Liquid primer recommended for substrate by sheet waterproofing material manufacturer.

C. Surface Conditioner: Liquid, waterborne surface conditioner recommended for substrate by sheet waterproofing material manufacturer.

D. Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, of trowel grade or low viscosity.

E. Substrate Patching Membrane: Low-viscosity, two-component, modified asphalt coating.

F. Metal Termination Bars: Aluminum bars, approximately 1 by 1/8 inch (25 by 3 mm), predrilled at 9-inch (229-mm) centers.

2.4 MOLDED-SHEET DRAINAGE PANELS

A. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel without Polymeric Film: Composite subsurface drainage panel acceptable to waterproofing manufacturer and consisting of a studded, nonbiodegradable, molded-plastic-sheet drainage core; with a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 (0.21-mm) sieve laminated to one side of the core, without a polymeric film bonded to the other side; and with a vertical flow rate through the core of 9 to 21 gpm per ft. (112 to 261 L/min. per m).

1. Basis-of-Design Product: Subject to compliance with requirements, provide Carlisle Coatings & Waterproofing Inc; CCW MiraDRAIN 6000 or a comparable product by one of the following:

a. GCP Applied Technologies Inc.
b. Polyguard Products, Inc.
c. Soprema, Inc.
d. W.R. Meadows, Inc.

2.5 INSULATION DRAINAGE PANELS

A. Insulation: Comply with Section 072100 "Thermal Insulation" for general building insulation, including insulation drainage panels.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of waterproofing.

1. Verify that concrete has cured and aged for minimum time period recommended in writing by waterproofing manufacturer.
2. Verify that substrate is visibly dry and within the moisture limits recommended in writing by manufacturer. Test for capillary moisture by plastic sheet method according to ASTM D4263.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean, prepare, and treat substrates according to manufacturer's written instructions. Provide clean, dust-free, and dry substrates for waterproofing application.

B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.

C. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

D. Remove fins, ridges, mortar, and other projections.

E. Fill form tie holes, honeycomb, aggregate pockets, holes, and other voids.

F. Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D4258.

1. Install sheet strips of width according to manufacturer's written instructions and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch (1.6 mm).

G. Bridge and cover isolation joints, expansion joints, and discontinuous deck-to-wall and deck-to-deck joints with overlapping sheet strips of widths according to manufacturer's written instructions.

1. Invert and loosely lay first sheet strip over center of joint. Firmly adhere second sheet strip to first and overlap to substrate.

H. Corners: Prepare, prime, and treat inside and outside corners in accordance with manufacturer's instructions.

1. Install membrane strips centered over vertical inside corners. Install 3/4-inch (19-mm) fillets of liquid membrane on horizontal inside corners and as follows:

a. At footing-to-wall intersections, extend liquid membrane in each direction from corner or install membrane strip centered over corner.

I. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through waterproofing and at drains and protrusions.

3.3 INSTALLATION OF MODIFIED BITUMINOUS SHEET WATERPROOFING

A. Install modified bituminous sheets according to waterproofing manufacturer's written instructions.

B. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.

C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch- (64-mm-) minimum lap widths and end laps. Lap in the direction of the flow of water. Overlap and seal seams, and stagger end laps to ensure watertight installation.

1. When ambient and substrate temperatures range between 25 and 40 deg F (minus 4 and plus 5 deg C), install self-adhering, modified bituminous sheets produced for low-temperature application. Do not use low-temperature sheets if ambient or substrate temperature is higher than 60 deg F (16 deg C).

D. Two-Ply Application: Install sheets to form a membrane with lap widths not less than 50 percent of sheet widths, to provide a minimum of two thicknesses of sheet membrane over areas to receive waterproofing.

E. Apply continuous sheets over already-installed sheet strips, bridging substrate cracks, construction, and contraction joints.

F. Seal edges of sheet waterproofing terminations with mastic.

G. Install sheet waterproofing and auxiliary materials to tie into adjacent waterproofing.

H. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with sheet waterproofing extending 6 inches (150 mm) beyond repaired areas in all directions.

I. Immediately install protection course with butted joints over waterproofing membrane.

1. Insulation drainage panels may be used in place of a separate protection course to vertical applications when approved by waterproofing manufacturer and installed immediately.

3.4 INSTALLATION OF MOLDED-SHEET DRAINAGE PANELS

A. Place and secure molded-sheet drainage panels, with geotextile facing away from wall or deck substrate, according to manufacturer's written instructions. Use adhesive or another method that does not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction.

3.5 INSTALLATION OF INSULATION DRAINAGE PANELS

A. Install insulation drainage panels over waterproofed surfaces. Cut and fit to within 3/4 inch (19 mm) of projections and penetrations.

B. Ensure that drainage channels are aligned and free of obstructions.

C. On vertical surfaces, set insulation drainage panels in adhesive or tape applied according to manufacturer's written instructions.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a full-time site representative qualified by waterproofing membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components; and to furnish daily reports to Architect.

3.7 PROTECTION, REPAIR, AND CLEANING

A. Protect waterproofing from damage and wear during remainder of construction period.

B. Protect installed insulation drainage panels from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

C. Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.

D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended in writing by manufacturer of affected construction.

END OF SECTION 071326

SECTION 071413 - HOT FLUID-APPLIED RUBBERIZED ASPHALT WATERPROOFING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:

1. Rubberized-asphalt waterproofing membrane.
2. Insulation.

1.03 RELATED SECTIONS

A. DIVISION 32 - Exterior Improvements - Paving/Site Furnishings.

B. DIVISION 03 - Concrete - Roof Deck Surface/Substrate
The coordination of this section is necessary to facilitate the successful installation of the waterproofing membrane.

Cast in Place Concrete/Composite Deck

1. Strength/density: minimum 2,500 psi (17,235 kPa) compressive strength
   minimum 115 pcf (1842 kg/m^3) density
2. Finish: Wood-float or wood-troweled equivalent finish. Steel troweled finish is not desirable.
3. Concrete Hydration (Cure):
   a. Method of Cure: Water cure, wet coverings, paper sheets, plastic sheets or approved liquid curing compound (sodium silicate preferred).
   b. Duration of Cure/Dry:
      i. Structural Weight Concrete: recommend 28 days, minimum 14 days, prior to application of the membrane.
      ii. The above minimum cure/dry times are recommended based upon basic concrete fundamentals and experience. Depending on conditions (i.e., ambient temperature, humidity) the concrete may be dry enough to receive application of the membrane in less than the 14 day minimum recommendation. Consult Manufacturer for specifics when less than the minimum is desired.
   c. Form Release Agents: Contact Manufacturer.

1.04 REFERENCES

A. American Society for Testing and Materials (ASTM).

B. International Concrete Repair Institute (ICRI) Concrete Surface Profile (CSP) Scale.

1.05 SYSTEM DESCRIPTION

A. Furnish and install a completed vertical or horizontal waterproofing assembly including surface conditioner, Monolithic Membrane 6125EV-FR and related flashings, protection course, insulation, and drainage course.

1.06 SUBMITTALS

A. Certification from an approved independent testing laboratory experienced in testing this type material, that the material meets the CGSB-37.50-M89 standard for rubberized asphalt membranes, including applicable ASTM procedures.

B. Certification showing full time quality control of production facilities responsible for the manufacture of the rubberized asphalt and that each batch of material is tested to insure conformance with the manufacturer's published physical properties.

C. Certification showing that all waterproofing components are being supplied and warranted by a single-source manufacturer.

D. Evidence that extruded polystyrene insulation if used is free from CFC's.

E. The plant manufacturing this type material shall have ISO 9001-2000 approval as evidenced by a copy of the official certificate.

F. Shop Drawings: Project specific. Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions. Include integration with adjacent materials.

G. Product Data: For each type of product. Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.

H. Product samples.

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Field quality-control reports.

C. Sample Warranties: For special warranties.

D. Installation instructions.

1.08 QUALITY ASSURANCE

A. The Waterproofing Contractor shall demonstrate qualifications to perform the work of this Section by submitting the following documentation:

1. Certification or license by the membrane manufacturer as a locally based, authorized applicator of the product the installer intends to use, for a minimum of five (5) years.
2. List of at least three (3) projects, satisfactorily completed within the past five (5) years, of similar scope and complexity to this project. Previous experience submittal shall correspond to specific membrane system proposed for use by applicator.

B. Refer to Section 1.05 SYSTEM DESCRIPTION. Include single-source for all components from the manufacturer.

C. The rubberized asphalt membrane product shall contain an inert clay filler and crumb rubber to enable the product to be resistant to acids (fertilizers, building washes and acid rain) and maintain membrane thickness during application respectively.

D. Membrane Manufacturer shall have available an in-house technical staff to assist the contractor, when necessary, in application of the products and final inspection of the assembly.

E. Membrane Manufacturer Qualification: Manufacturer shall demonstrate qualifications to supply materials of this section by certifying the following:

1. Membrane Manufacturer shall show evidence that the specified rubberized asphalt has been manufactured by the same source for thirty five (35) years and successfully installed on a yearly basis for a minimum of thirty five (35) years on projects of similar scope and complexity.
2. Membrane Manufacturer shall not issue warranties for terms longer than they have been manufacturing their hot fluid rubberized asphalt membrane.

F. Pre-Construction Conferences. The manufacturer will meet with the necessary parties at the jobsite to review and discuss project conditions as it relates to the integrity of the waterproofing assembly.

1.09 DELIVERY, STORAGE AND HANDLING

A. Deliver materials in original unopened containers of packaging clearly labeled with manufacturer's name, brand name, instruction for use and all identifying numbers.

B. Materials shall be stored in a neat, safe manner, not to exceed the allowable structural capacity of the storage area.

C. Store materials in a clean, dry area protected from water and direct sunlight.

D. Store all adhesives at temperatures between 60°F (15.5°C) and 80°F (26.6°C). If exposed to lower temperatures, restore materials to 60°F (15.5°C) minimum temperature before using.

1.10 PROJECT CONDITIONS

A. Application of the membrane shall not commence nor proceed during inclement weather. All surfaces to receive the membrane shall be free of water, dew, frost, snow and ice.

B. Application of membrane shall not commence nor proceed when the ambient temperature is below 0°F (-17.7°C) or as required by manufacturer.

C. Preparation and application of membrane shall be conducted in well ventilated areas.

D. Over its service life, do not expose membrane or accessories to a constant temperature in excess of 180°F (82°C) (i.e., hot pipes and vents or direct steam venting, etc.).

E. Adhesives contain petroleum distillates and are extremely flammable. Do not breathe vapors or use near an open fire. Do not use in confined areas without adequate ventilation. Consult container or packaging labels and Material Safety Data Sheets (MSDS) for specific safety information.

F. Do not allow waste products (petroleum, grease, oil, solvents, vegetable or mineral oil, animal fat, etc.) to come in contact with the waterproofing membrane. Any exposure to foreign materials or chemical discharges shall be presented to membrane manufacturer or evaluation to determine any impact on the waterproof membrane assembly performance.

G. Concrete Deck/Wall Surface Condition. IMPORTANT - Refer to 1.03 Related Sections.

H. Deck/Wall Preparation; refer to Section 3.02 Preparation.

I. General contractor shall assure that adequate protection is provided after installation of the membrane and accessories to prevent damage from subsequent trade traffic.

1.11 WARRANTY

A. Upon completion of the work, the contractor shall supply the owner with a single-source warranty of U.S. origin direct from the manufacturer.

B. Each warranty varies in scope and terms. CONTACT Manufacturer for exact warranty terms and conditions to meet the specific project requirements.

C. Warranties available from the manufacturer:

1. Total System Warranties; covers components of the waterproofing assembly, including membrane, flashing, and insulation.

    a. 20-year (watertight condition) from Date of Substantial Completion. No dollar limit.

PART 2 - PRODUCTS

2.01 GENERAL

A. Refer to Section 1.05, SYSTEM DESCRIPTION. All components shall be obtained as a single-source from the membrane manufacturer to ensure total system compatibility and integrity.

Basis-of-Design Manufacturer: American Hydrotech, Inc.; 6125EV (WP-2)

Other approved Manufacturers/Products: Barrett Company; RamTough 250, Carlisle Coatings & Waterproofing, Inc.; CCW-500R, Henry Company; 790-11. Tremco Incorporated; TREMproof 6100.

2.02 MATERIALS

A. Membrane

1. Membrane shall be a hot, fluid applied, rubberized asphalt membrane meeting the CGSB-37.50-M89 standard and other pertinent physical properties:

a. American Hydrotech, Inc., Monolithic Membrane 6125®EV (up to 40% post consumer recycled content)

PROPERTY	TEST METHOD	TYPICAL RESULT
Flash point	ASTM D-92 CGSB-37.50-M89	502°F* <500°F (261°C) (260°C)
Penetration	ASTM D-5329 CGSB-37.50-M89	98 mm @77°F (25°C) 187 mm @122°F (50°C)
Flow	ASTM D-5329 CGSB-37.50-M89	1.0 mm @ 140°F (60°C)
Toughness	CGSB-37.50-M89	16.0 Joules
Ratio of Toughness to Peak Load	CGSB-37.50-M89	0.069
Water Vapor Permeability	ASTM E-96, PROCEDURE E CGSB-37.50-M89	0.3 ng/Pa(s)M^2
Water Absorption	CGSB-37.50-M89	.11 gram weight gain
Low Temperature Flexibility (-25°C)	CGSB-37.50-M89	No delamination, adhesion loss, or cracking

Low Temperature Crack Bridging Capability	CGSB-37.50-M89	No cracking, adhesion loss, or splitting
Heat Stability	CGSB-37.50-M89	No change in viscosity, penetration, flow or low temperature flexibility
Viscosity	CGSB-37.50-M89	11.0 seconds
Water Resistance (5 days/50°C)	CGSB-37.50-M89	No delamination, blistering, emulsification, or deterioration
Softening Point	ASTM D-36	180°F (82°C)
Elongation	ASTM D-5329	1000% minimum
Resiliency	ASTM D-5329	40% minimum
Bond to Concrete	ASTM D-5329	Pass 0°F (-18°C)
Acid Resistance	ASTM D-896 Procedure 7.1 (N-8)	Pass-50% Nitric Acid -50% Sulfuric Acid
Resistance to Hydrostatic Pressure	ASTM D-08.22 Draft 2 (developed: D5385)	100 psi (equals 231 foot of head water)
Resistance to Salt Water	ASTM D-896 similar 20% sodium chloride sodium carbonate calcium chloride	No delamination, blistering, emulsification or deterioration
Resistance to Fertilizer	ASTM D-896 similar undiluted, 15/5/5, nitrogen/phosphorus potash	No delamination, blistering, emulsification or deterioration
Resistance to Animal Waste	3-year exposure	No deterioration
Solids Content		100%-no solvents
Shelf Life		10 years (sealed)
Specific Gravity		1.15 + .02

*102°F more than the application temperature recommended by the manufacturer.

B. Surface Conditioner

1. Asphaltic surface conditioner for concrete surfaces.
   - American Hydrotech, Inc., Surface Conditioner

C. Flashing/Reinforcing

1. 60-mil (1.5 mm) thick, uncured neoprene flashing/(heavy duty) reinforcing sheet.
   - American Hydrotech, Inc., Flex Flash UN®
2. Spunbonded polyester fabric (standard duty) reinforcing sheet.
   - American Hydrotech, Inc., Flex Flash F®
3. Woven fiberglass fabric reinforcing sheet (vertical applications only)
   - American Hydrotech, Inc., Flex Flash FV® (vertical)

4. Two-component, liquid applied resin membrane flashing system.

   a. American Hydrotech, Inc., HydroSeal Resin
      - poly methyl-methacrylate (PMMA) resin

   b. American Hydrotech, Inc., HydroSeal Matrix
      - acrylic resin with integral chopped polymer fiber reinforcement

   c. American Hydrotech, Inc., HydroSeal Flashing Accessories
      - resin based primers, additives, reinforcing fleece, surfacing topcoats

D. Adhesives/Sealant

1. Contact adhesive to bond elastomeric flashing together.
   - American Hydrotech, Inc., Splicing Cement
2. Pressure sensitive butyl tape to bond elastomeric flashing together.
   - American Hydrotech, Inc., Splice Tape
3. Contact adhesive to bond elastomeric flashing to an approved substrate.
   - American Hydrotech, Inc., Bonding Adhesive
4. Sealant to seal elastomeric flashing seam edge.
   - American Hydrotech, Inc., Lap Sealant

E. Protection Course

1. Fiberglass reinforced rubberized asphalt sheet.
   - American Hydrotech, Inc., Hydroflex® 30

F. Prefabricated Drainage Course

1. Composite drainage system consisting of a three-dimensional, crush-proof, drainage core and a filter fabric meeting the following physical properties.
   - American Hydrotech, Inc., Hydrodrain® 300, 400, 700 or 1000 series

PROPERTY	TEST METHOD	VALUES
CORE:		
Compressive Strength	ASTM D-1621	300/302/1000 - 30,000 psf

		(14.66 kg/cm^2) 400/420 - 15,000 psf (7.32 kg/cm^2) 700 - 18,000 psf (8.79 kg/cm^2)
Thickness	ASTM D-1777	1000 - .25 in (.64 cm) 300/302 - .22 in (.56 cm) 400/420/700 - .40 in (1.016 cm)
Flow, Q @ 3600 psf & hydraulic gradient of 1	ASTM D-4716	300/1000 - 7 gpm/ft width (72.00 lpmin/m width) 302 - 5.5 gpm/ft width (68.30 lpmin/m width) 400/420 - 15 gpm/ft width (183.3 lpmin/m width) 700 - 18 gpm/ft width (223.52 lpmin/m width)
FABRIC:		
Flow	ASTM D-4491	300/302/1000 - 150 gpm/ft^2 (6105 lpmin/m^2) 400/420 - 150 gpm/ft^2 (6105 lpmin/m^2) 700 - 110 gpm/ft^2 (4475 lpmin/ft^2)
U.V. Resistance	ASTM D-4355	Fully Stabilized
Apparent Opening Size (EOS)	CW-02215	300/302/400/420/1000 – 70 (.212mm) 700 – 30 (.60 mm)
Grab Tensile	ASTM D-4632	300/302/400/420/1000 - 90 lbs. (0.4 kN) 700 – 360x260 lbs. (445x355 N)

F. Insulation

1. Insulation: Comply with Section 072100 “Thermal Insulation”.

PART 3 - EXECUTION

3.01 INSPECTION

A. The waterproofing contractor shall examine all surfaces to receive the waterproofing assembly to verify it is acceptable and proper for the application of the membrane.

1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.
2. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263 and use in-situ probes per ASTM F2170.

B. The waterproofing contractor shall not proceed with the installation of the waterproofing membrane assembly until all deck defects have been corrected.

3.02 PREPARATION

A. All surfaces shall be dry, smooth, free of depressions, voids, protrusions, clean and free of unapproved curing compounds, form release agents and other surface contaminants.

1. Cast in-place concrete (slab or wall)/Composite deck

a. Poured in place concrete shall be monolithic, smooth, free of voids, spalled areas, laitance, honeycombs, and sharp protrusions.
b. Refer to Section 1.02 of this specification, Division 3.

B. Substrate cleaning

1. Thoroughly sweep the substrate which is to receive the waterproofing membrane.
2. Substrate shall also be blown clean using an air compressor to remove any remaining loose debris.
3. Final check to determine if concrete has been properly cleaned is to apply a test patch of Monolithic Membrane 6125® to the surface and check its adhesion.

3.03 INSTALLATION

A. Surface conditioner application (to concrete)

1. Apply the surface conditioner to the concrete using a hand held sprayer evenly at a rate of 300 to 600 SF/gallon (7.4 - 14.7 m^2/L) depending on surface texture. Surface conditioner shall "tan" the surface, not blacken it.
2. Allow sufficient time for the surface conditioner to thoroughly dry prior to the membrane application.

B. Membrane preparation

1. The membrane shall be heated in double jacketed, oil bath or hot air melter with mechanical agitation, specifically designed for the preparation of a rubberized asphalt membrane.
2. Heat membrane until membrane can be drawn-free flowing at a temperature range between 350°F (176°C) and 375°F (190°C).

C. Detailing/Flashing

1. All detailing and flashing shall be done in accordance with the manufacturer's standard guideline details.
2. All detailing and flashing shall be completed before installing the membrane over the field of the substrate.

D. Membrane Application

1. Apply the rubberized asphalt membrane at a rate to provide a continuous, monolithic coat of 90 mil minimum (approximately 2.3 mm), into which is fully embedded a layer of the spunbonded polyester fabric reinforcing sheet, followed by another continuous monolithic coat of membrane at an average thickness of 125 mil (approx. 3.2 mm). Total membrane thickness shall be 215 mils average (approx. 5.5 mm).

2. Overlap fabric reinforcing sheet 1-2 inches (25.4 mm - 50.8 mm) with membrane between sheets.

3.04 SEPARATION/PROTECTION LAYER INSTALLATION

A. Protection layer shall be installed as follows:

1. Embed the protection sheet into the membrane while it is still warm to insure a good bond.
2. Overlap adjoining sheet edges a minimum of 2"-3" (50.8 mm - 76.2 mm) to insure complete coverage. Rigid insulation board materials shall not be overlapped.
3. The completed membrane/protection assembly shall be covered with subsequent topping materials as soon as possible, within 30 days of membrane installation.

3.05 MEMBRANE INTEGRITY TEST

A. The deck area or portions thereof shall be leak tested by means of electronic testing and by ponding water to check the integrity of the membrane installation. Include expansion joint assemblies in test.

1. VERIFY that the structure can support the dead load weight of a watertest before testing.
2. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing and protecting waterproofing but before overlaying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water. Testing agency shall observe flood testing.

    a. Flood to an average depth of 2 inches with a minimum depth of 1 inch (25 mm) and not exceeding a depth of 4 inches (100 mm). Maintain 2 inches (50 mm) of clearance from top of sheet flashings.
    b. Flood each area for 48 hours.
    c. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.

3. Electric Field Vector Mapping (EFVM): Testing agency shall survey entire waterproofing area for potential leaks using low voltage EFVM.

    a. The system shall be left in place as a permanent future leak detection system.
    b. NOTE: All penetrations through roof shall be flashed and sealed prior to EFVM testing.
    c. EFVM should be tested prior to and after overburden placement. All trades should be completed with work prior to any testing.

B. In the event of excessive damage to the membrane assembly, electronic breach detection testing shall be required prior to the placement of subsequent overburden materials.

3.06 DRAINAGE COURSE / INSULATION PLACEMENT

A. General

1. Contractor shall examine the deck area to be covered with subsequent topping materials in order to insure that all deck areas have received the membrane, the membrane is free of damage, it is properly protected, and all flashing has been properly installed, before placing the insulation.
2. The drainage course insulation and other subsequent topping materials shall be installed as each section is completed.

B. Prefabricated Drainage Course Placement

1. Install drainage course on horizontal and vertical surfaces in accordance with the manufacturer's recommendations.
2. Layout and position drainage course and allow to lay flat. Cut and fit drainage course to perimeter and penetrations.
3. The geotextile overlapped edges may be bonded to the adjacent drainage course geotextile with an appropriate adhesive to insure continuous geotextile integrity.
4. Place subsequent topping materials as soon as possible.

C. Insulation Placement

1. Loose lay (horizontal applications) in a staggered manner and tightly butt together all insulation boards. The maximum acceptable opening between insulation boards is 3/8" (9.5 mm). Insulation shall be installed within 3/4" (19 mm) of all projections, penetrations, etc.
2. When multi-layer insulation applications are involved the bottom layer of insulation shall be the thickest layer and shall be a minimum of 2" thick (50.8 mm). All layers shall be installed unadhered to each other and all joints staggered in relation to underlying layers.

3. Protect installed board insulation from damage due to ultraviolet light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
4. For vertical, multi-layer applications, second layer of insulation board shall be spot adhered to the protection layer with appropriate adhesive or additional rubberized asphalt membrane.

3.07 JOB COMPLETION

A. Contractor and a representative of the membrane manufacturer shall inspect the waterproofing assembly and notify the contractor of any defects. All defects shall be corrected.

B. Clean up all debris and equipment.

END OF SECTION 071413

SECTION 072100 - THERMAL INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Extruded polystyrene foam-plastic board insulation.
2. Polyisocyanurate foam-plastic board insulation.
3. Glass-fiber blanket insulation.
4. Mineral-wool blanket insulation.

B. Related Requirements:

1. Section 071326 "Self-Adhering Sheet Waterproofing"
2. Section 071413 "Hot Fluid-Applied Rubberized Asphalt Waterproofing" .
3. Section 075419 "Polyvinyl-Chloride (PVC) Roofing" for insulation specified as part of roofing construction.
4. Section 092900 "Gypsum Board" for sound attenuation blanket used as acoustic insulation.

1.3 ACTION SUBMITTALS

A. Product Data: For the following:

1. Extruded polystyrene foam-plastic board insulation.
2. Polyisocyanurate foam-plastic board insulation.
3. Glass-fiber blanket insulation.
4. Mineral-wool blanket insulation.

B. Manufacturer’s installation instructions.

C. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Product Data: For adhesives, indicating VOC content.
3. Laboratory Test Reports: For adhesives, indicating compliance with requirements for low-emitting materials.
4. Laboratory Test Reports: For insulation, indicating compliance with requirements for low-emitting materials.

1.4 INFORMATIONAL SUBMITTALS

A. Installer's Certification: Listing type, manufacturer, and R-value of insulation installed in each element of the building thermal envelope.

B. Product Test Reports: For each product, for tests performed by a qualified testing agency.

C. Research Reports: For foam-plastic insulation, from ICC-ES.

D. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect insulation materials from physical damage and from deterioration due to moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

B. Protect foam-plastic board insulation as follows:

1. Do not expose to sunlight except to necessary extent for period of installation and concealment.
2. Protect against ignition at all times. Do not deliver foam-plastic board materials to Project site until just before installation time.
3. Quickly complete installation and concealment of foam-plastic board insulation in each area of construction.

PART 2 - PRODUCTS

2.1 EXTRUDED POLYSTYRENE FOAM-PLASTIC BOARD INSULATION (XPS)

A. Extruded Polystyrene Board Insulation, Type IV, Drainage Panels (INSUL-1): ASTM C578, Type IV, 25-psi (173-kPa) minimum compressive strength; unfaced; fabricated with tongue-and-groove edges and with one side having grooved drainage channels and faced with manufacturer’s standard, nonwoven geotextile filter fabric.

1. Basis-of-Design Product: Subject to compliance with requirements, provide American Hydrotech, Inc.; ThermaFlo Type 750 or comparable product by one of the following:

   a. DuPont de Nemours, Inc.
   b. Owens Corning.
   c. Kingspan Group.

2. Flame-Spread Index: Not more than 25 when tested in accordance with ASTM E84.
3. Smoke-Developed Index: Not more than 450 when tested in accordance with ASTM E84.
4. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.

B. Extruded Polystyrene Board Insulation, Type VI (INSUL-4): ASTM C578, Type VI, 40-psi (276-kPa) minimum compressive strength.

1. Products: Subject to compliance with requirements, provide one of the following:

a. DuPont de Nemours, Inc.; Styrofoam Brand Highload Extruded Polystyrene Foam Insulation.
b. Owens Corning; Owens Corning FOAMULAR NGX 400 Extruded Polystyrene Insulation.
c. Kingspan Group; GreenGuard.

2. Flame-Spread Index: Not more than 25 when tested in accordance with ASTM E84.
3. Smoke-Developed Index: Not more than 450 when tested in accordance with ASTM E84.
4. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.

2.2 POLYISOCYANURATE FOAM-PLASTIC BOARD INSULATION

A. Polyisocyanurate Board Insulation, Foil Faced (INSUL-15): ASTM C1289, foil faced, Type I, Class 1 or 2. Use behind Brick and Exterior Cladding.

1. Products: Subject to compliance with requirements, provide one of the following:

a. DuPont de Nemours, Inc.; Thermax.
b. Hunter Panels; XCI Foil.
c. Johns Manville; a Berkshire Hathaway company; AP Foil-Faced.

2. Fire Propagation Characteristics: Passes NFPA 285 testing as part of an approved assembly.
3. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.

2.3 GLASS-FIBER BLANKET INSULATION

A. Verify insulation complies with the requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 35 percent.

C. Glass-Fiber Blanket Insulation, Unfaced (INSUL-40): ASTM C665, Type I; passing ASTM E136 for combustion characteristics.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed; SAINT-GOBAIN; CertaPRO AcoustaTherm Batts.
b. Johns Manville; a Berkshire Hathaway company; Formaldehyde-Free and Unfaced Sound Control Batts.
c. Owens Corning; Sound Attenuation Batts.

2. Flame-Spread Index: Not more than 25 when tested in accordance with ASTM E84.

3. Smoke-Developed Index: Not more than 50 when tested in accordance with ASTM E84.
4. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.

2.4 MINERAL-WOOL BLANKET INSULATION

A. Verify insulation complies with the requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 35 percent.

C. Mineral-Wool Blanket Insulation, Unfaced (INSUL-24): ASTM C665, Type I (blankets without membrane facing); consisting of fibers; passing ASTM E136 for combustion characteristics.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Johns Manville; a Berkshire Hathaway company.
    b. ROCKWOOL.
    c. Thermafiber Inc.; an Owens Corning company; FS-25.

2. Flame-Spread Index: Not more than 25 when tested in accordance with ASTM E84.
3. Smoke-Developed Index: Not more than 50 when tested in accordance with ASTM E84.
4. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.

D. Mineral-Wool Blanket Insulation, Reinforced-Foil Faced (INSUL-25): ASTM C665, Type III (reflective faced); Class A, faced with foil scrim, foil-scrim kraft, or foil-scrim polyethylene with a formed 0.063-inch thick minimum (or as engineered for span and wind load) aluminum backpan with insulation adhered to inner surface of pan. Pan shall be formed to fit spandrel opening and glazed into outer glazing channel behind 1-inch thick spandrel glass / glazed IMP2. Maintain a minimum of 2-inches from back face of glass and face of insulation. Flanges of pan shall be lapped, sealed with sealant and riveted to form interior moisture retarder, conforming to following:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Thermafiber, Inc.; an Owens Corning company; FireSpan 40 or comparable product by one of the following:

    a. Rockwool International; Curtainrock 40.
    b. Johns Manville; a Berkshire Hathaway company.

2. Density: 4 pcf.
3. Thickness: 4-inch, unless otherwise indicated.
4. R-Value: 15 at 4-inches (U-Value 0.06).
5. Flame-Spread Index: Not more than 25 when tested in accordance with ASTM E84.
6. Smoke-Developed Index: Not more than 50 when tested in accordance with ASTM E84.
7. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches (305 mm) and wider in width.
8. Fiber Color: Dark color, unless otherwise indicated.
9. Unless otherwise indicated, provide in 2” thickness.

2.5 ACCESSORIES

A. Insulation for Miscellaneous Voids:

1. Glass-Fiber Insulation: ASTM C764, Type II, loose fill; with maximum flame-spread and smoke-developed indexes of 5, per ASTM E84.
2. Two-Component Spray Polyurethane Foam Insulation (INSUL-30): Closed cell, with maximum flame-spread and smoke-developed indexes of 25 and 400, respectively, per ASTM E 84. For use at floor/roof and wall junctions and other gaps, cracks, or crevices in the building envelope.

    a. Basis-of-Design Product: DuPont; FROTH-PAK Foam Sealant or comparable product by one of the following;

        1) BASF Corporation.
        2) SWD Urethane; Quik-Shield 118.

3. One-Component Spray Polyurethane Foam Insulation (INSUL 31): Open cell, with maximum flame-spread and smoke-developed indexes of 10 and 20, respectively, per ASTM E 84. For use at sealing gaps around window/door frame and rough opening.

    a. Basis-of-Design Product: DuPont; Great Stuff Pro Window & Door Insulating Foam Sealant or comparable product by one of the following;

        1) BASF Corporation.
        2) SWD Urethane; Quik-Shield 108YM.

B. Adhesive for Bonding Insulation: Product compatible with insulation and air and water barrier materials, and with demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates.

1. Verify adhesives have a VOC content of 70 g/L or less.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean substrates of substances that are harmful to insulation, including removing projections capable of puncturing insulation or vapor retarders, or that interfere with insulation attachment.

3.2 INSTALLATION, GENERAL

A. Comply with insulation manufacturer's written instructions applicable to products and applications.

B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

C. Install insulation with manufacturer's R-value label exposed after insulation is installed.

D. Extend insulation to envelop entire area to be insulated. Fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

E. Provide sizes to fit applications and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units unless multiple layers are otherwise shown or required to make up total thickness or to achieve R-value.

3.3 INSTALLATION OF SLAB INSULATION

A. On vertical slab edge and foundation surfaces, set insulation units using manufacturer's recommended adhesive according to manufacturer's written instructions.

1. If not otherwise indicated, extend insulation a minimum of 36 inches (915 mm) below exterior grade line.

B. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

1. If not otherwise indicated, extend insulation a minimum of 36 inches (915 mm) in from exterior walls.

3.4 INSTALLATION OF FOUNDATION WALL INSULATION

A. Butt panels together for tight fit.

B. Adhesive Installation: Install with vertical beads of adhesive according to manufacturer's written instructions.

3.5 INSTALLATION OF CAVITY-WALL AND RAIN SCREEN INSULATION

A. Foam-Plastic Board Insulation: Install vertical beads of adhesive spaced approximately 24 inches (610 mm) o.c. on inside face and as recommended by manufacturer.

1. Fit courses of insulation between obstructions, with edges butted tightly in both directions, and with faces flush.
2. Press units firmly against inside substrates.
3. Supplement adhesive attachment of insulation by securing boards with two-piece wall ties designed for this purpose and specified in Section 042000 "Unit Masonry."

3.6 INSTALLATION OF INSULATION IN FRAMED CONSTRUCTION

A. Blanket Insulation: Install in cavities formed by framing members according to the following requirements:

1. Use insulation widths and lengths that fill the cavities formed by framing members. If more than one length is required to fill the cavities, provide lengths that will produce a snug fit between ends.
2. Place insulation in cavities formed by framing members to produce a friction fit between edges of insulation and adjoining framing members.

3. Maintain 3-inch (76-mm) clearance of insulation around recessed lighting fixtures not rated for or protected from contact with insulation.

B. Miscellaneous Voids: Install insulation in miscellaneous voids and cavity spaces where required to prevent gaps in insulation using the following materials:

1. Glass-Fiber Insulation: Compact to approximately 40 percent of normal maximum volume equaling a density of approximately 2.5 lb/cu. ft. (40 kg/cu. m).
2. Spray Polyurethane Insulation:

a. Install materials in strict compliance with manufacturer's written installation instructions. Provide thermal barrier as required.
b. Install materials in accordance with manufacturer's instructions and acceptable to authorities having jurisdiction and the Consultant to provide required air seal.
c. Apply sealants within recommended application temperature ranges. Consult manufacturer when sealants cannot be applied within specified ranges.
d. In low humidity, mist area with water to aid cure of one-component sealant.
e. Avoid overfilling restricted spaces.
f. Install foam sealants in accordance with authorities having jurisdiction and all other applicable regulations pertaining to sealing materials.
g. Provide continuity with the air barrier systems by sealing the following areas within the construction and construction assemblies. Please note that these areas are typical in nature and does not limit the application of these products to these noted areas but any and all details within the construction that present similar air leakage characteristics should receive similar applications. Please note the following:

1) Various roof locations including penetrations of all kinds and roof to fascia junctions.
2) Window head, jamb and sill areas at cavity wall.
3) Various roof areas including sloped roof/wall junctions, penetrations of all kinds and roof/wall junctions.
4) Junction of roof air/vapor barrier and wall air/vapor barrier.
5) In cavity wall construction at roof/wall junctions, window perimeters, exhaust vents and soffits.
6) Junctions at roof scuppers and other mechanical equipment located on the roof.
7) Window frame at columns.
8) Curtain wall systems at window and metal panels.
9) At intervals in the cavity wall to achieve compartmentalization.
10) Window frames, and parapets, in stucco wall construction.
11) Exterior soffit overhangs in cavity wall construction.
12) Wall/roof junctions at drain scuppers and other areas where mechanical equipment is located on the roof.
13) Provide reduced air leakage into and out of building (s) by sealing gaps, leaks and holes in interior and exterior construction
14) Ensure continuity of air and vapor seal between wall and window frame in accordance with the requirements of CSA A440.4 Windows standard.
15) Inspect roof perimeter for air leakage paths such as the fluted deck itself, truss and structural beam penetrations above and below the top of the wall, open mortar joints, and conduit and pipe penetrations. Use smoke tester kits to identify and locate leakage.
16) Where deck flutes run perpendicular to the wall, foam the open flutes completely out to the fascia.
17) Where closed flutes occur, punch flutes and inject foam through holes. Locate holes as close to wall as possible so that the plane of injected and

cured foam within the closed flute is level with the plane of the exposed foam in the open flutes.

18) Where the steel deck is parallel to the wall, fill the void.

3.7 INSTALLATION OF CURTAIN-WALL INSULATION

A. Install board insulation in curtain-wall construction according to curtain-wall manufacturer's written instructions.

1. Hold insulation in place by securing metal clips and straps or integral pockets within window frames, spaced at intervals recommended in writing by insulation manufacturer to hold insulation securely in place without touching spandrel glass.
2. Maintain cavity width of dimension indicated on Drawings between insulation and glass.
3. Install insulation to fit snugly without bowing.
4. Fully tape terminations and penetrations with manufacturer’s foil tape for air and vapor control.

3.8 PROTECTION

A. Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes.

B. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

END OF SECTION 072100

SECTION 072119 - FOAMED-IN-PLACE INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Closed-cell spray polyurethane foam insulation.
2. Accessories.

B. Related Requirements:

1. Section 072100 "Thermal Insulation" for foam-plastic board insulation.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.3 INFORMATIONAL SUBMITTALS

A. Test and Evaluation Reports:

1. Product Test Reports: For each product, for tests performed by qualified testing agency.
2. Research Reports: For spray-applied polyurethane foam-plastic insulation, from an agency acceptable to authorities having jurisdiction showing compliance with requirements.

B. Field Quality-Control Submittals:

1. Field quality-control reports.

C. Qualification Statements: For Installer.

D. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

PART 2 - PRODUCTS

2.1 CLOSED-CELL SPRAY POLYURETHANE FOAM INSULATION (SPF-1)

A. Closed-Cell Spray Polyurethane Foam: ASTM C1029, Type II, minimum density of 2.0 – 2.4 lb/cu. ft. and minimum aged R-value at 1-inch (25.4-mm) thickness of 7.4 deg F x h x sq. ft./Btu at 75 deg F.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Huntsman Building Solutions; HBS Heatlok HFO Pro or a comparable product by one of the following:

    a. BASF Corporation; WALLTITE LWP Series.
    b. Gaco; Holcim Building Envelope.
    c. NCFI Polyurethanes; a division of Barnhardt Manufacturing Company.

2. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

    a. Flame-Spread Index: 25 or less.
    b. Smoke-Developed Index: 450 or less.

3. Fire Propagation Characteristics: Passes NFPA 285 testing as part of an approved assembly.

2.2 ACCESSORIES

A. Primer: Material recommended by insulation manufacturer where required for adhesion of insulation to substrates.

B. Ignition Barrier: Material providing a 15-minute minimum fire-ignition barrier.

1. Ignition Barrier Coating: Fire-protective coating formulated for application over polyurethane foam plastics, compatible with insulation, and in compliance with ICC-ES AC377, Appendix X.

    a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

        1) Flame Seal Products, Inc.
        2) International Fireproof Technology Inc.
        3) No-Burn, Inc.
        4) SES Foam LLC.
        5) TPR2 Corporation.

2. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

    a. Flame-Spread Index: 25 or less.
    b. Smoke-Developed Index: 50 or less.

PART 3 - EXECUTION

3.1 PREPARATION

A. Verify that substrates are clean, dry, and free of substances that are harmful to insulation.

B. Priming: Prime substrates where recommended by insulation manufacturer. Apply primer to comply with insulation manufacturer's written instructions. Confine primers to areas to be insulated; do not allow spillage or migration onto adjoining surfaces.

3.2 INSTALLATION

A. Comply with insulation manufacturer's written instructions applicable to products and applications.

B. Spray insulation to envelop entire area to be insulated and fill voids.

C. Apply in multiple passes to not exceed maximum thicknesses recommended by manufacturer. Do not spray into rising foam.

D. Miscellaneous Voids: Apply according to manufacturer's written instructions.

E. Install ignition barrier material.

1. Do not cover insulation prior to any required spray foam insulation inspections.

F. Apply barrier coatings in accordance with manufacturer's written instructions and to comply with requirements for listing and labeling for fire-propagation characteristics and surface-burning characteristics specified.

1. Use equipment and techniques best suited for substrate and type of material applied as recommended by coating manufacturer.
2. Apply coatings to prepared surfaces as soon as practical after preparation and before subsequent surface soiling or deterioration.
3. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Produce sharp lines and color breaks.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect spray foam insulation installation, including accessories. Report results in writing.

3.4 PROTECTION

A. Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes.

END OF SECTION 072119

SECTION 072160 - STRUCTURAL THERMAL BREAK

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Structural thermal break locations:

1. Canopies.
2. Shelf angles.
3. Curtain wall mullions and anchors.
4. Façade and cladding connections.
5. Roof penetrations.
6. Fall arrest anchors.
7. Roof posts.
8. Wall to roof transitions.
9. Parapets.
10. Steel beam connections.
11. Steel column base/concrete footings.
12. Concrete slab to steel connections.
13. Window framing.
14. Door thresholds.
15. Foundation to wall transitions.

1.2 RELATED STANDARDS

A. Related Sections include the following:

1. Section 033000 – Cast-in-Place Concrete for coordination with concrete.
2. Section 042000 – Unit Masonry for coordination with masonry construction.
3. Section 051200 – Structural Steel for coordination with structural steel construction.

1.3 REFERENCE STANDARDS

A. American Institute of Steel Construction (AISC):

1. AISC 360 - Specification for Structural Steel Buildings

B. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE):

1. ASHRAE 90.1-2016 - Energy Standard for Buildings Except Low-Rise Residential Buildings.

C. ASTM International (ASTM) (www.astm.org):

1. ASTM C 177 – Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
2. ASTM D 638 – Standard Test Method for Tensile Properties of Plastics.
3. ASTM D 695 – Standard Test Method for Compressive Properties of Rigid Plastics.
4. ASTM D 696 – Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30°C and 30°C With a Vitreous Silica Dilatometer.

5. ASTM D 732 – Standard Test Method for Shear Strength of Plastics by Punch Tool.
6. ASTM D 790 – Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
7. ASTM D 2863 – Standard Test Method for Measuring the Minimum Oxygen Concentration to Support Candle-Like Combustion of Plastics (Oxygen Index).

D. Research Council on Structural Connections (RCSC):

1. Specification for Structural Joints Using High Strength Bolts, August 1, 2020.

E. United States Green Building Council (USGBC):

1. LEED v4.1 - Leadership in Energy and Environmental Design for Building Design and Construction.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's product data and installation instructions.

B. Schedule: Submit a list of locations where structural thermal breaks are to be used, and the specific product and thickness to be used at each location.

C. Manufacturer's Certification: Submit manufacturer's certification that structural thermal breaks comply with specified requirements and are suitable for intended application.

D. Shop Drawings: Submit shop drawings showing details of construction, and relationship of structural thermal break material with adjacent construction including fastening and/or anchorage connection details, thermal break material size and thickness. Submit drawings, indicating:

1. Dimensions, locations, and quantities of structural thermal break plates, structural thermal break washers, and bushings.
2. Size and location of holes in structural thermal break plates.
3. OD and ID for structural thermal break washers and bushings.
4. Connection details, including bolt/anchor and washer sizes.

E. Thermal Design: Wall assembly or interface detail shall meet the ASHRAE 90.1 requirements for continuous insulation and shall not have structural connections (beams, support framing, sub girts, clips) which create thermal bridging. Effective U values of wall, roof and foundation assemblies shall meet or exceed the design requirements per code. Effective U value calculation or modeling shall be performed in accordance with ASHRAE guidelines.

F. Structural Design: Design structural thermal break connections and/or façade attachment support framing using performance requirements and design criteria indicated. Provide comprehensive engineering analysis by a qualified professional engineer.

G. Samples: Submit manufacturer's samples of the following:

1. Structural thermal break: Minimum 2 inches by 2 inches.
2. Thermal break washers.
3. Thermal break bushings.

1.5 WARRANTY

A. Warranty Documentation: Submit manufacturer's standard warranty.

1.6 DESIGN REQUIREMENTS

A. Structural Design: Structural connections using structural thermal break products shall be designed to the applicable AISC, RCSC, ASCE, and local building design codes.

B. Thermal Design: Wall or roof assembly shall meet the prescriptive R-value or performance-based U-value as given in the ASHRAE 90.1 relevant code by state and climate zone. Wall assemblies shall meet the ASHRAE requirement for "continuous insulation" which prohibits thermal bridging.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver materials in manufacturer's original, unopened, undamaged containers and packing, with identification labels intact.

B. Storage and Handling:

1. Comply with manufacturer's recommendations for storage and handling.
2. Keep materials in manufacturer's original, unopened containers and packaging until installation.
3. Store materials in a clean, dry area indoors.
4. Do not store materials directly on the floor or ground.
5. Store materials out of direct sunlight.
6. Keep materials from freezing.
7. Protect materials during storage, handling, and installation to prevent damage.

PART 2 - PRODUCT

2.1 MANUFACTURERS

A. Basis-of-Design Manufacturer: Subject to compliance with requirements, provide Climaspec LLC or comparable product by one of the following;

1. Armatherm US.
2. Fabreeka International, Inc.

B. Single Source: Provide structural thermal breaks from single manufacturer.

2.2 STRUCTURAL THERMAL BREAKS (TBM-1)

A. Structural Thermal Break Material: ClimaSpec TB.

1. Description:

a. Structural thermal break material to prevent thermal bridging between building elements.

b. Minimizing energy loss while maintaining structural integrity.

2. Material: Reinforced laminate thermoset.

3. Thickness: As indicated on the Drawings.

4. Ultimate Mechanical Properties, Nominal:

a. Compressive Strength,	ASTM D695:	38,900 psi (268.2 MPa).
b. Tensile Strength,	ASTM D638:	9,400 psi (64.8 MPa).
c. Tensile Modulus,	ASTM D638:	1.7 x 10^6 psi (11,721.0 MPa).
d. Flexural Strength,	ASTM D790:	22,300 psi (153.7 MPa).
e. Shear Strength,	ASTM D732:	13,400 psi. (92.3 MPa).

5. Flame Resistance, Nominal:

a. Oxygen Index,	ASTM D 2863:	21.8 percent.

6. Thermal Properties, Nominal:

a. Thermal Conductivity, ASTM C177: 1.8 BTU/hr/ft^2/in/degree F (0.259 W/m* degree K).
b. Coefficient of Thermal Expansion, ASTM D696: 2.2 in/in/degree C x10^{-5}.

2.3 ACCESSORIES

A. Thermal Break Washers: “ClimaSpec Washers”.

1. Material: Same material as “ClimaSpec TB” structural thermal break.
2. Thickness 1/4 inch (6.4mm).
3. OD and ID: Determined by the bolt/anchor diameter. Refer to manufacturer’s washer and bushing size data.

B. Thermal Break Bushings: “ClimaSpec Bushings”

1. Material: Glass-reinforced laminate
2. Length: Determined by thickness of steel end plate.
3. OD and ID: Determined by the bolt/anchor diameter. Refer to manufacturer’s washer and bushing size data.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine locations to secure structural thermal breaks.

B. Confirm locations to receive structural thermal breaks are clean, dry, flat, and undamaged.

C. Notify the Architect of conditions that would adversely affect installation or subsequent use.

D. Do not begin installation until unacceptable conditions are corrected.

3.2 INSTALLATION

A. General:

1. Install structural thermal breaks in accordance with manufacturer's instructions at locations indicated in the approved design.
2. Identify correct structural thermal break as indicated on the Drawings.
3. Install correct sizes of structural thermal breaks, thermal break washers, and thermal break bushings as indicated on the Drawings.
4. When required install hardened USS Grade 8 flat washers on both sides of thermal break washers in accordance with Structural Engineer's instructions.

    1. Steel Washer OD: Greater than or equal to thermal break washer OD.

5. When required install thermal break bushings into oversized building element holes to accept OD of bushings.

B. Bolted Structural Steel Connections:

1. Install bolted structural steel connections as specified in Section 051200. 1. Bolt torque values are provided by the Structural Engineer and are determined by required clamping force, proper tension of bolts, and long-term creep.

3.3 ADJUSTING

A. Remove and replace with new material, damaged components that cannot be successfully repaired, as determined by the Architect or Structural Engineer.

3.4 PROTECTION

A. Protect installed structural thermal break connection from damage during construction.

END OF SECTION 072160

SECTION 072726.04 – FLUID-APPLIED MEMBRANE AIR BARRIERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes fluid-applied, vapor-impermeable membrane air barriers.

1.2 RELATED REQUIREMENTS

1. Division 01 Section "Sustainable Design Requirements" for additional requirements, including LEED documentation requirements.
2. Section 042000 "Unit Masonry" for air barrier substrates and compatibility with flashing components.
3. Section 061600 "Sheathing" for air barrier substrates and joint treatments.
4. Division 07 Roofing Sections for roof assembly air barriers and interface coordination.
5. Division 08 Exterior Openings sections for framing for aluminum-framed entrances, glazed aluminum curtain walls, and louvers receiving air barrier transition assembly specified in this Section.

1.3 REFERENCES

A. References, General: Versions of the following cited standards current as of the date of issue of the project apply to the Work of this Section.

B. ASTM International (ASTM): www.astm.org:

1. ASTM A 240/A 240M - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
2. ASTM C 920 - Standard Specification for Elastomeric Joint Sealants
3. ASTM C 1193 - Guide for Use of Joint Sealants
4. ASTM D 412 - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers - Tension
5. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials
6. ASTM E 96/E 96M - Standard Test Methods for Water Vapor Transmission of Materials
7. ASTM E 162 - Standard Test Method for Surface Flammability of Materials Using a Radiant Heat Energy Source
8. ASTM E 783 - Standard Test Method for Field Measurement of Air Leakage through Installed Exterior Windows and Doors
9. ASTM E 1186 - Practices for Air Leakage Site Detection in Building Envelopes and Air Barrier Systems
10. ASTM E 2178 - Standard Test Method for Air Permeance of Building Materials
11. ASTM E 2357 - Standard Test Method for Determining Air Leakage of Air Barrier Assemblies

F. US Green Building Council (USGBC): www.usgbc.org:

1. Leadership in Energy and Environmental Design (LEED) Green Building Rating System

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination: Coordinate installation of joint sealants with cleaning of joint sealant substrates and other operations that may impact installation or finished joint sealant work.

B. Preinstallation Conference: Conduct conference at Project Site.

1. Review requirements for air barrier products and installation, project and manufacturer's details, mockups, testing and inspection requirements, and coordination and sequencing of air barrier work with work of other Sections.
2. Review manufacturer's instructions for air barrier application meeting Project requirements for substrates specified, including three-dimensional video model demonstrating proper application of components at wall openings.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of air barrier product specified, including:

1. Technical data indicating compliance with requirements.
2. Substrate preparation instructions and recommendations.

B. LEED Submittals:

1. LEED NC Credit IEQ 4.1: Product data for air barrier components applied inside the weather envelope. Including statement of VOC content.

C. Shop Drawings: Project specific. Show locations for air barrier. Show details for each type of substrate, joints, and edge conditions, including flashings, counterflashings, penetrations, transitions, and terminations. Include transitions to adjacent exterior enclosure assemblies (e.g. windows/doors, roof, waterproofing, and below-grade waterproofing.

1. Show location of transition and accessory materials providing connectivity through out the assemblies.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and manufacturer.

1. Certification of manufacturer's approval of Installer.

B. Manufacturer's Product Compatibility Certificate: Certify compatibility of air barrier products with adjacent materials.

C. Fire Propagation Characteristics Certificate: From a qualified testing agency, documentation that air barrier system as a component of a wall assembly has been tested and passed NFPA 285. Include system classification number of testing agency on shop drawings.

D. Product Test Reports: Test data for air barrier products and air barrier assembly, by qualified testing agency, indicating proposed membrane air barrier meets performance requirements, when requested by Architect.

E. Warranty: Sample of unexecuted manufacturer and installer special warranties.

F. Field quality control reports.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A firm with minimum three years experience in installation of specified products in successful use on similar projects, employing workers trained by manufacturer, including a full-time on-site supervisor with a minimum of three years experience installing similar work, able to communicate verbally with Contractor, Architect, and employees.

B. Manufacturer Qualifications: A qualified manufacturer listed in this Section with minimum five years experience in manufacture of air barrier membrane as one of its principal products.

1. Manufacturer's product submitted has been in satisfactory operation on five similar installations for at least five years.

C. Mockups: Provide air barrier mockup application within mockups required in other sections, or if not specified, in an area of not less than 150 sq. ft. (14 sq. m) of wall surface where directed by Architect for each type of backup wall construction. Include examples of surface preparation, crack and joint treatment, air barrier application, and flashing, transition, and termination conditions, to set quality standards for execution.

1. Include intersection of wall air barrier with roof air barrier and with foundation wall intersection.

1.8 DELIVERY, STORAGE AND HANDLING

A. Accept materials on site in manufacturer's unopened original packaging.

B. Store products in weather protected environment, clear of ground and moisture, within temperature ranges recommended by air barrier manufacturer.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Environmental Limitations: Apply air barrier within the range of ambient and substrate temperatures recommended by air-barrier manufacturer.

1. Protect substrates from environmental conditions that affect air-barrier performance.
2. Do not apply air barrier to a damp or wet substrate or during snow, rain, fog, or mist.

1.10 SCHEDULING

A. Coordinate installation of membrane air barrier with completion of roofing and other work requiring interface with air barrier.

B. Schedule work so air barrier applications may be inspected prior to concealment.

C. Ensure air barrier materials are cured before covering with other materials.

1.11 WARRANTY

A. Special Manufacturer's Warranty: Manufacturer's standard form in which air barrier manufacturer agrees to furnish and install air barrier material to repair or replace those materials installed according to manufacturer's written instructions that exhibit material defects or otherwise fail to perform as specified under normal use within warranty period specified.

1. Access for Repair: Owner shall provide unimpeded access to the Project and the air barrier system for purposes of testing, leak investigation, and repair, and shall reinstall removed cladding materials upon completion of repair.
2. Cost Limitation: Manufacturer's obligation for repair or replacement shall be limited to the original installed cost of the work.
3. Warranty Period: Five years from date of Substantial Completion.

B. Special warranties specified in this article exclude deterioration or failure of air barrier materials from the following:

1. Movement of the structure caused by structural settlement or stresses on the air barrier exceeding manufacturer's written specifications for elongation.
2. Mechanical damage caused by outside agents.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Source Limitations: Obtain air-barrier materials from single source from single manufacturer.

B. VOC Content: 250 g/L maximum per 40 CFR 59, Subpart D (EPA Method 24) and complying with requirements of authorities having jurisdiction.

C. Compatibility: Provide membrane air barrier materials that are compatible with one another and with adjacent materials under conditions of service and application required, as demonstrated by membrane air barrier manufacturer based on testing and field experience.

2.2 PERFORMANCE REQUIREMENTS

A. General: Membrane air barrier shall be capable of performing as a continuous vapor-impermeable air barrier and as a moisture drainage plane transitioned to adjacent flashings and discharging water to the building exterior. Membrane air barriers shall accommodate substrate movement and seal expansion and control joints, construction material transitions, opening transitions, penetrations, and perimeter conditions without moisture deterioration and air leakage exceeding performance requirements.

B. Air-Barrier Assembly Air Leakage: Maximum 0.04 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft. (0.2 L/s x sq. m of surface area at 75 Pa), when tested according to ASTM E 2357.

C. Fire Propagation Characteristics: Provide air barrier system qualified as a component of a comparable wall assembly that has been tested and passed NFPA 285.

2.3 MEMBRANE AIR BARRIER (AB-1)

A. Fluid-Applied, Vapor-Impermeable Membrane Air Barrier: Elastomeric, UV-resistant, synthetic membrane, formulated for application in a range of 80 mils (wet), 40 mils (dry).

1. Basis of Design Product: Subject to compliance with requirements, provide Tremco, Inc., ExoAir 130 or a comparable product by one of the following;

   a. Carlisle Coatings & Waterproofing, Inc.; Fire Resist Barritech NP.
   b. GCP Applied Technologies, Inc.; PERM-A-BARRIER NPL 10.
   c. Henry Company; Air-Bloc ~~*32*~~*16MR*.
   d. W.R. Meadows, Inc; AIR-SHIELD LSR.

2. Air Permeance, ASTM E 2178: 0.004 cfm/sq. ft of surface area at 1.57-lbf/sq. ft. (0.02 L/s x sq. m of surface area at 75-Pa) pressure difference, maximum.
3. Vapor Permeance, ASTM E 96/E96M: Less than 0.1 perms (5.8 ng/Pa x s x sq. m).
4. Elongation, Ultimate, ASTM D 412, Die C: 200 percent, minimum.
5. UV Resistance, QUV-B: Over 160 cycles of UV and water spray with no observable deterioration.
6. VOC Content: Less than 50 g/L.

2.4 ACCESSORY MATERIALS

A. General: Accessory materials as described in manufacturer's written installation instructions, recommended to produce complete air barrier assembly meeting performance requirements, and compatible with air barrier membrane material and adjacent materials.

B. Primer: Liquid primer meeting VOC limitations, recommended for substrate by membrane air barrier manufacturer, when installing modified bituminous self-adhered membranes.

1. Basis of Design Product: Tremco, Inc., ExoAir Primer.

C. Transitions:

1. Counterflashing Strip: Modified bituminous, 40 mils (1.0 mm) thick self-adhering composite sheet consisting of 32 mils (0.8 mm) of SBS rubberized asphalt laminated to an 8 mils (0.2 mm) high-density, cross-laminated polyethylene film, for counterflashing of metal flashings and for substrate transitions and for termination of air barrier to bituminous roof membranes and to air barrier terminations at openings.

   a. Basis of Design Product: Tremco, Inc., ExoAir TWF Thru-Wall Flashing.

2. High Temperature Flashing Strip and Underlayment: Butyl, 24 mil thick self-adhering composite sheet consisting of 20 mils of butyl laminated to 4 mil polyethylene film; thermally stable under intermittent, non-continuous exposure up to 240 deg F (115 deg C).

   a. Basis of Design Product: Tremco, Inc., ExoAir 110AT.

3. Foil Flashing Strip: Butyl, 22 mil thick self-adhering composite sheet consisting of 16 mils of butyl laminated to 6 mil polyethylene film; thermally stable under intermittent, non-continuous exposure up to 240 deg F (115 deg C
4. Opening Transition Assembly: Cured low-modulus silicone extrusion, with reinforcing ribs, sized to fit opening widths, with the following characteristics:

a. Basis of Design Product: Tremco, Inc., Proglaze ETA Engineered Transition Assembly. Tear Strength: 110 lb/in (19.3 kN/m).

5. Preformed Silicone-Sealant Extrusion: Manufacturer's standard system consisting of cured low-modulus silicone extrusion, sized to fit opening widths, with manufacturer's recommended silicone sealant for bonding extrusions to substrates.

a. Basis of Design Product: Tremco, Inc.; Spectrem SimpleSeal.

D. Reinforcing Fabric: High strength mesh fabric consisting of open-weave glass fiber saturated with synthetic resins formulated for high moisture resistance, for reinforcing of liquid applications; not less than 2.5 oz/sq. yd (85 g/sq. m).

1. Basis of Design Product: Tremco, Inc., Tremco 2011.

E. Liquid Joint Sealants:

1. ASTM C 920, single-component polyurethane, approved by air barrier manufacturer for adhesion and compatibility with membrane air barrier and accessories.

a. Basis of Design Product: Tremco, Inc., Dymonic 100.

2. ASTM C 920, single-component, neutral-curing silicone, approved by air barrier manufacturer for adhesion and compatibility with membrane air barrier and accessories post installation of the membrane.

a. Basis of Design Product: Tremco, Inc., Spectrem 1.

F. Sprayed Polyurethane Foam Sealant: Sprayed Polyurethane Foam Sealant: Foamed-in-place, 1.5- to 2.0-lb/cu. ft. (24- to 32-kg/cu. m) density, with flame-spread index of 25 or less per ASTM E 162, for filling of gaps at openings and penetrations.

1. Basis of Design; Tremco Inc., Flexible Low Expanding Foam (LEF)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Surface Condition: Before applying air barrier materials, examine substrate and conditions to ensure substrates are fully cured, smooth, clean, dry, and free from high spots, depressions, loose and foreign particles and other deterrents to adhesion, and conditions comply with manufacturer's written recommendations.

1. Verify concrete and masonry surfaces are visibly dry, have cured for time period recommended by membrane air barrier manufacturer, and are free from release agents, curing agents, and other contaminates.
2. Test for capillary moisture by method recommended in writing by air barrier manufacturer.
3. Verify masonry joints are filled with mortar and struck flush.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INTERFACE WITH OTHER WORK

A. Commencement of Work: Commence work once air barrier substrates are adequately protected from weather and will remain protected during remainder of construction.

B. Sequencing of Work: Coordinate sequencing of air barrier work with work of other sections that form portions of building envelope air barrier to ensure that flashings and transition materials can be properly installed and inspected. Roofing systems shall be capped and sealed, or top of walls protected, in such a way as to eliminate the ability of water to saturate the wall or interior space, both before and after, air barrier system installation. Coordinate installation of EXOAIR® 230 with the roofing trade to ensure compatibility and continuity with the roofing system.

C. Subsequent Work: Coordinate air barrier work with work of other sections installed subsequent to air barrier to ensure complete inspection of installed air barrier and sealing of air barrier penetrations necessitated by subsequent work.

3.3 PREPARATION

A. Clean, prepare, and treat substrate in accordance with air barrier manufacturer's written instructions.

1. Mask adjacent finished surfaces.
2. Remove contaminants and film-forming coatings from substrates.
3. Remove projections and excess materials and fill voids with substrate patching material.
4. Prepare and treat joints and cracks in substrate per ASTM C 1193 and membrane air barrier manufacturer's written instructions.

3.4 APPLICATION OF ACCESSORY MATERIALS

A. General: Install strips, transition strips, and accessory materials according to air-barrier manufacturer's written instructions. Install transition materials and other accessories to form connect and seal membrane air barrier material to adjacent components of building air barrier system, including, but not limited to, roofing system air barrier, exterior fenestration systems, door framing, and other openings.

B. Primer: Apply primer to substrates when recommended by air barrier manufacturer at required rate for those substrates that will be receiving a modified bituminous self-adhered membrane. Reprime areas not covered within 24 hours.

C. Assembly Transitions: Connect and seal exterior wall air barrier material continuously to roofing-membrane air barrier, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings, using accessory materials.

1. Opening Transitions: Fill gaps at perimeter of openings with foam sealant and apply approved transition or accessory material
2. Penetrations: Fill gaps at perimeter of penetrations with foam sealant and level with approved sealant. or seal transition strips around penetrating objects and terminate with approved sealant.
3. Joints: Bridge and cover isolation joints, expansion joints, and discontinuous joints between separate assemblies utilizing approved transition or accessory materials.
4. Changes in Plane: Apply approved sealant beads at corners and edges to form smooth transition.

5. Substrate Gaps: Cover gaps with stainless steel sheet mechanically attached to substrate and providing continuous support for air barrier.

D. Flashings: Seal top of through-wall flashings to membrane air barrier with a continuous bead of approved sealant recommended by air barrier manufacturer.

E. Seal punctures, voids, and seams. Patch with approved transition and accessory materials following air barrier manufacturer's recommendations and extend repair beyond repaired areas to maintain continuity.

3.5 FLUID AIR-BARRIER MEMBRANE INSTALLATION

A. General: Apply fluid air-barrier material to form a seal with transition materials and accessories to achieve a continuous air barrier according to air-barrier manufacturer's written instructions. Apply fluid air-barrier material within manufacturer's recommended application temperature ranges.

B. Membrane Air Barrier: Apply fluid air barrier material in full contact with substrate to produce a continuous seal according to membrane air barrier manufacturers written instructions.

1. Vapor-Impermeable Membrane Air Barrier: Total dry film thickness as recommended in writing by manufacturer to meet performance requirements, 40 dry film thickness depending on substrate, applied in one or more equal coats, roller- or spray- applied.

C. Connect and seal exterior wall air-barrier membrane continuously to subsequently-installed roofing-membrane air barrier, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, wall openings, and other construction used in exterior wall openings, using approved transitions and accessory materials.

D. Wall Openings: Apply approved sealant to adhere silicone extrusion to perimeter of windows, curtain walls, storefronts, doors, and louvers. Apply opening transition assembly according to air barrier transition manufacturer's written instructions.

E. Seal punctures, voids, and seams. Patch with approved transition and accessory materials following air barrier manufacturer's recommendations and extend repair beyond repaired areas to maintain continuity.

F. Do not cover air barrier until it has been tested and inspected by Owner's testing agency.

G. Correct deficiencies in or remove air barrier that does not comply with requirements; repair substrates and reapply air-barrier components.

H. All cladding girts, anchors and similar items that penetrate the air/vapor barrier membrane must be sealed air/water tight per the manufacturer's requirements.

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Owner may engage a qualified testing agency to perform tests and inspections. Refer to Section 019117 "Building Enclosure Functional Performance Testing" for additional requirements.

B. Coordination of Testing: Cooperate with testing agency. Allow access to work areas and staging. Notify testing agency in writing of schedule for Work of this Section to allow sufficient time for testing and inspection.

1. Do not cover Work until testing and inspection is completed and accepted.

C. Reporting: Forward written inspection reports to the Architect within 10 working days of the inspection and test being performed.

D. Correction: Correct deficient applications not passing tests and inspections, make necessary repairs, and retest as required to demonstrate compliance with requirements.

3.7 CLEANING AND PROTECTING

A. Clean spills, stains, and overspray resulting application utilizing cleaning agents recommended by manufacturers of affected construction. Remove masking materials.

B. Protect membrane air barrier from damage from subsequent work. Protect membrane materials from exposure to UV light for period in excess of that acceptable to membrane air barrier manufacturer; replace overexposed materials and retest.

END OF SECTION 072726.04

SECTION 074213.13 – FORMED METAL WALL PANELS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Exposed fastener metal wall panels, as part of the assembly described in Section 2.1.

1.2 RELATED REQUIREMENTS

A. Division 01 Section "Sustainable Design Requirements" for related requirements.

B. Division 07 Section "Sheet Metal Flashing and Trim" for sheet metal copings, flashings, reglets and roof drainage items.

C. Division 07 Section "Joint Sealants" for field-applied joint sealants.

1.3 REFERENCES

A. American Architectural Manufacturer's Association (AAMA):

1. AAMA 620 - Voluntary Specification for High Performance Organic Coatings on Coil Coated Architectural Aluminum Substrates.

B. American Society of Civil Engineers (ASCE):

1. ASCE 7 - Minimum Design Loads for Buildings and Other Structures.

C. ASTM International (ASTM):

1. ASTM B 209 - Specification for Aluminum and Aluminum Alloy Sheet and Plate.
2. ASTM C 754 - Specification for Installation of Steel Framing Members to Receive Screw Attached Gypsum Panel Products.
3. ASTM C 920 - Specification for Elastomeric Joint Sealants.
4. ASTM E 72 - Standard Test Methods of Conducting Strength Tests of Panels for Building Construction.
5. ASTM E 283 - Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors under Specified Pressure Differences across the Specimen.
6. ASTM E 331 - Test Method for Water Penetration of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.

D. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA):

1. Architectural Sheet Metal Manual.

1.4 PERFORMANCE REQUIREMENTS

A. General: Provide metal wall panel assemblies meeting performance requirements as determined by application of specified tests by a qualified testing agency on manufacturer's standard assemblies.

B. Air Infiltration: When installed over Insulated Composite Backup Panels, maximum 0.06 cfm/sq. ft. (0.3 L/s per sq. m) per ASTM E 283 at a static-air-pressure difference of 1.57 lbf/sq. ft. (75 Pa), using minimum 10-by-10 foot (3050-by-3050 mm) test panel that includes side joints.

C. Water Penetration, Static Pressure: When installed over Insulated Composite Backup Panels, no uncontrolled water penetration per ASTM E 331 at a minimum static differential pressure of 6.24 lbf/sq. ft. (299 Pa), using minimum 10-by-10 foot (3050-by-3050 mm) test panel that includes side joints.

D. Maximum allowable deflection limitation.

1. Single Skin Panels greater than 1-inch (25-mm) in Depth: Limited to L/120 deflection of panel perimeter normal to plane of wall.

E. Secondary Metal Framing: Design secondary metal framing for metal wall panel assembly according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions."

F. Thermal Movements: Allow for thermal movements from variations in both ambient and internal temperatures. Accommodate movement of support structure caused by thermal expansion and contraction.

G. Wall systems that incorporate foam plastic insulation must be tested by the foam plastic supplier in accordance with NFPA-285.

1.5 QUALITY ASSURANCE

A. Manufacturer/Source: Provide metal wall panel and panel accessories from a single manufacturer.

B. Manufacturer Qualifications: Approved manufacturer listed in this Section with minimum 10 years experience in manufacture of similar products in successful use in similar applications.

C. Wall Systems Installer Qualifications: Experienced Installer with minimum of 5 years experience with successfully completed projects of a similar nature and scope.

1.6 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting: Conduct preinstallation meeting at site attended by Owner, Architect, manufacturer's representative, and other trade contractors.

1. Coordinate building framing in relation to metal wall panel assembly.
2. Coordinate installation of building air and water barrier behind metal wall panel assembly.
3. Coordinate window, door and louver, and other openings and penetrations of metal wall panel assembly.

1.7 ACTION SUBMITTALS

A. Product Data: Manufacturer’s data sheets, for specified products.

1. Include data indicating compliance with performance requirements.

B. Shop Drawings: Provide shop drawings prepared by manufacturer or manufacturer's authorized Installer. Include full elevations showing openings and penetrations. Include details

of each condition of installation and attachment. Provide details at a minimum scale 1-1/2-inch per foot (1:8) of all required trim and extrusions needed for a complete installation.

1. Indicate points of supporting structure that must coordinate with metal wall panel assembly installation.

C. Samples for Initial Selection: For each product specified. Provide representative color charts of manufacturer's full range of colors.

D. Samples for Verification: Provide 12-inch (300 mm) section of panel(s) showing finishes. Provide 12-inch (300 mm) long pieces of trim pieces and other exposed components.

1.8 INFORMATIONAL SUBMITTALS

A. Product Test Reports: Indicating compliance of products with requirements, from a qualified independent testing agency.

B. Qualification Information: For Installer firm.

C. Manufacturer's warranty: Submit sample warranty.

1.9 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Protect metal wall panel products during shipping, handling, and storage to prevent staining, denting, deterioration of components or other damage.

1. Deliver, unload, store, and erect metal wall panel products and accessory items without misshaping panels or exposing panels to surface damage from weather or construction operations.

1.11 WARRANTY

A. Special Manufacturer’s Warranty: On manufacturer’s standard form, in which manufacturer agrees to repair or replace components of metal wall panel assemblies that fail in materials and workmanship within two years from date of Substantial Completion.

B. Special Panel Finish Warranty: On manufacturer’s standard form, in which manufacturer agrees to repair or replace metal wall panels that display evidence of deterioration of finish within 20 years from the date of substantial completion.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Metal Wall Panels over Outside-Insulated Framed Wall System: Single-skin exposed fastener metal wall panels applied as exterior rainscreen cladding over wall framing specified in Division 05 Section "Cold-Formed Metal Framing" with exterior sheathing specified in Division 06 Section "Sheathing", an applied membrane that provides air, moisture, and water vapor control

specified in Division 07 Section "Fluid-Applied Membrane Air Barriers", and insulation applied outboard of the sheathing specified in Division 07 Section "Thermal Insulation." Metal wall panel installation specified in this Section includes secondary metal subgirt framing for panel attachment.

B. Metal Wall Panels over Uninsulated Framed Screen Wall System: Single-skin exposed fastener metal wall panels applied as exterior barrier cladding over wall framing specified in Division 05 Section "Cold-Formed Metal Framing". Metal wall panel installation specified in this Section may include secondary metal subgirt framing for panel attachment.

2.2 MANUFACTURERS

A. Basis of Design Product: Subject to compliance with requirements, provide CENTRIA, a Nucor Brand; Exposed Fastener Series Metal Wall Panels BR5-36 or comparable product approved by one of the following;

1. Elevate; Holcim Building Envelope.
2. PAC-CLAD; Petersen; a Carlisle company.

2.3 METAL WALL PANEL MATERIALS

A. Aluminum Face Sheet: Smooth surface coil-coated, ASTM B 209, 3003-H14 or 5052-H32 alloy.

1. Face Sheet: 0.050 inch (1.27 mm) nominal thickness.
2. Surface: Smooth.

2.4 EXPOSED FASTENER PROFILE METAL WALL PANELS

A. Metal Wall Panels, General: Factory-formed, Exposed fastener panels with interconnecting side joints, fastened to supports with exposed fasteners, with field-applied sealants in side laps when required to meet performance requirements.

B. Ribbed profile with lap joint (MP-4):

1. Basis of Design Product: CENTRIA, BR5-36.
2. Panel Coverage: 36 inches (914 mm).
3. Panel Height: 1.50 inches (38 mm).
4. Rib Spacing: 5 at 7.20 inches (183 mm) o.c.

A. Exposed Coil-Coated Finish System:

1. Fluoropolymer Three-Coat System: 0.8 mil primer with 0.8 mil 70 percent PVDF fluoropolymer color coat, and a 0.8 mil 70 percent PVDF fluoropolymer clear coat, AAMA 621 & 2605.

a. Basis of Design: CENTRIA Duragard Plus.

B. Color:

1. Exterior Surface: Custom color to match MP-2.

2.5 METAL WALL PANEL ACCESSORIES

A. Metal Wall Panel Accessories, General: Provide complete metal wall panel assembly incorporating trim, copings, fasciae, parapet caps, soffits, sills, inside and outside corners, and miscellaneous flashings. Fabricate accessories in accordance with SMACNA Manual. Provide manufacturer's factory-formed clips, shims, flashings, gaskets, lap strips, closure strips, and caps for a complete installation as required for the following:

1. Single-skin application over metal framing and secondary framing.
2. Single-skin application over insulated, sheathed frame wall with air and water resistant barrier.

B. Extruded Trim: Manufacturer's complementary aluminum extrusions for head, jamb, sill, base, flush, reveal, inside and outside corner, end wall, and expansion joint details. Finish to match metal wall panels.

1. Basis of Design: CENTRIA, Microline Extrusions.

C. Mitered Corners: Structurally-bonded horizontal interior and exterior trimless corners matching metal wall panel material, profile, and factory-applied finish, fabricated and finished by metal wall panel manufacturer.

1. Welded, riveted, fastened, or field- fabricated corners do not meet the requirements of this specification.
2. Basis of Design: CENTRIA, MicroSeam Corners.

D. Formed Flashing and Trim: Match material, thickness, and color of metal wall panel face sheets.

E. Sealants: Type recommended by metal wall panel manufacturer for application, meeting requirements of Division 07 Section "Joint Sealants."

F. Flashing Tape: 4-inch wide self-adhering butyl flashing tape.

G. Fasteners: Self-tapping screws, bolts, nuts, and other acceptable fasteners recommended by panel manufacturer. All exposed fasteners must be stainless steel with heads matching color of metal wall panels by means of factory-applied coating.

2.6 SECONDARY METAL FRAMING

A. Miscellaneous Framing Components, General: Cold-formed metallic-coated steel sheet, ASTM A 653/A 653M, G90 (Z180).

1. Hat Channels: 0.06 inch/16 ga. (1.52 mm) minimum – nominal thickness.
2. Sill Channels: 0.06 inch/16 ga. (1.52 mm) minimum – nominal thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine metal wall panel substrate with Installer present. Inspect for erection tolerances and other conditions that would adversely affect installation of metal wall panels.

B. Wall Substrate: Confirm that wall substrate is within tolerances acceptable to metal wall panel system manufacturer.

1. Maximum deviations acceptable:

a. 1/4-inch in 20 feet (6.4 mm in 6 m) vertically or horizontally from face plane of framing.
b. 1/2-inch (12.7 mm) across building elevation.
c. 1/8-inch in 5 feet (3.2 mm in 1.5 m).

C. Framing: Inspect framing that will support metal wall panels to determine if support components are installed as indicated on approved shop drawings. Confirm presence of acceptable framing members at recommended spacing to match installation requirements of metal wall panels.

D. Openings: Verify that windows, doors, louvers and other penetrations match layout on shop drawings.

E. Air/Moisture Barriers: Confirm that work has been completed, inspected, and tested as required.

F. Advise G.C, in writing, of out-of-tolerance work and other deficient conditions prior to proceeding with metal wall panel system installation.

G. Correct out of tolerance work and other deficient conditions prior to panel installation.

3.2 SECONDARY FRAMING INSTALLATION

A. Secondary Metal Framing: Install secondary metal framing components to tolerances indicated, as shown on approved shop drawings. Install secondary metal framing and other metal panel supports per ASTM C 1007 and metal wall panel manufacturer's recommendations.

3.3 METAL WALL PANEL INSTALLATION

A. General: Install metal wall panels in accordance with approved shop drawings and manufacturer's recommendations. Install metal wall panels in orientation, sizes, and locations indicated. Anchor metal wall panels and other components securely in place.

B. Attach panels to metal framing using recommended screws, fasteners, sealants, and adhesives indicated on approved shop drawings.

1. Fasteners for Steel Wall Panels: Stainless-steel for exterior locations and locations exposed to moisture; carbon steel for interior use only.
2. Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
3. Dissimilar Materials: Where elements of metal wall panel system will come into contact with dissimilar materials, treat faces and edges in contact with dissimilar materials as recommended by manufacturer.

C. Joint Sealers: Install joint sealants where indicated on approved shop drawings.

3.4 ACCESSORY INSTALLATION

A. General: Install metal wall panel accessories with positive anchorage to building. Coordinate installation with flashings and other components.

1. Install related flashings and sheet metal trim per requirements of Division 07 Section "Sheet Metal Flashing and Trim."
2. Install components required for a complete metal wall panel assembly, including trim, copings, corners, lap strips, flashings, sealants, fillers, closure strips, and similar items.
3. Comply with performance requirements and manufacturer's written installation instructions.
4. Set units true to line and level as indicated.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a service representative authorized by metal wall panel manufacturer to inspect completed installation. Submit written report.

B. Correct deficiencies noted in manufacturer's report.

3.6 CLEANING AND PROTECTION

A. Remove temporary protective films. Clean finished surfaces as recommended by metal wall panel manufacturer. Clear weep holes and drainage channels of obstructions, dirt, and sealant. Maintain in a clean condition during construction.

B. Replace damaged panels and accessories that cannot be repaired by finish touch-up or minor repair.

END OF SECTION 074213.13

SECTION 074213.23 - METAL COMPOSITE MATERIAL WALL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Metal composite material (MCM) panels.
2. Metal composite material (MCM) system.

B. Related Requirements:

1. Section 014339 "Mockups" for integrated exterior mockup requirements.
2. Section 070543.11 Composite Metal Hybrid (CMH) Continuous Insulation Sub-Framing Support Systems.
3. Section 019115 "Building Enclosure Commissioning."

1.3 DEFINITIONS

A. DBVC: Drained and back-ventilated cavity rainscreen system designed to drain and dry water entering cavity through drainage channels, weeps, and air ventilation.

B. MCM: Metal composite material; cladding material formed by joining two thin metal skins to polyethylene or fire-retardant core and bonded under precise temperature, pressure, and tension.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Meet with Owner, Architect, Owner's insurer if applicable, MCM system Installer, MCM system manufacturer's representative, and installers whose work interfaces with or affects MCM panels, including installers of doors, windows, and louvers.
2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
3. Review methods and procedures related to MCM system installation, including manufacturer's written instructions.
4. Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
5. Review flashings, special siding details, wall penetrations, openings, and condition of other construction that affect MCM system.

6. Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
7. Review temporary protection requirements for system assembly during and after installation.
8. Review procedures for repair of panels damaged after installation.
9. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.5 ACTION SUBMITTALS

A. Product Data: Include construction details, manufacturer's installation instructions, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel, system, and accessory.

1. Metal composite material (MCM) panels.
2. Metal composite material (MCM) system.

B. Shop Drawings: Submit project specific shop drawings prepared by, or under supervision of, Structural Design Engineer as specified in Quality Assurance article below and including Structural Design Engineer's stamp or seal on all shop drawings including system attachments and anchors.

1. Include fabrication and installation layouts of MCM system; project specific details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, accessories, and special details. Include details showing integration of metal composite material wall panel system with air barrier system such as back-sealing of fastener penetrations. Include integration with adjacent construction.
2. Accessories: Include project specific details of flashing, trim, and anchorage, at a scale of not less than 1-1/2 inches per 12 inches (1:10).
3. Provide signed and sealed drawings, by a qualified design professional in Project jurisdiction, of MCM system showing compliance with performance requirements and design criteria identified for this Project.

C. Samples for Initial Selection: For each type of MCM panel indicated, with factory-applied color finishes.

1. Size: Manufacturers' standard size.
2. Include Samples of trim and accessories involving color selection.

D. Samples for Verification: For each type of MCM panel and MCM system required, with factory-applied color finishes.

1. MCM Panel: Manufacturers' standard size.
2. MCM System: 12 inches (305 mm) long by actual panel width, fabricated into panel systems indicated. Include fasteners, closures, and other MCM panel accessories. Panel sample need not be provided in the specified color.

E. Delegated Design Submittals: For MCM system, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

F. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental Product Declaration: For each product.
3. Health Product Declaration: For each product.
4. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

1.6 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Exterior elevations, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Wall panels and attachments.
2. Girts.
3. Wall-mounted items including doors, windows, louvers, and lighting fixtures.
4. Penetrations of wall by pipes and utilities.

B. Test and Evaluation Reports:

1. Product Test Reports: For each MCM system, for tests performed by qualified testing agency.

    a. MCM Panel Manufacturer's Material Test Reports: Certified test reports showing compliance with specific performance or third-party listing documenting compliance in accordance with the IBC.
    b. Fabricator's MCM System Test Reports: Certified test reports showing system compliance with specific performance or third-party listing documenting compliance in accordance with the IBC.

        1) DBVC System: Tested to AAMA 509.

2. Research Reports: For MCM systems, from ICC-ES showing compliance with .

C. Field Quality-Control Submittals:

1. Field quality-control reports.

D. Qualification Statements: For manufacturer, fabricator, Installer and testing agency.

E. Delegated design engineer qualifications.

F. Sample warranties.

G. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For MCM panels.

B. Warranty Documentation:

1. Manufacturers' special warranties.
2. Installer's special warranties.

1.8 QUALITY ASSURANCE

A. Single Source Responsibility: Furnish each product from one manufacturer, unless otherwise acceptable to Architect.

B. Manufacturer Qualifications: Minimum 5 years' experience. Provide representation by manufacturer's field representative during construction and provide written acceptance of installer and fabricator.

C. Fabricator Qualifications: An entity specializing in fabrication of specified metal composite material wall panel components as indicated for installation as part of this project and who is acceptable to metal composite material wall panel manufacturer. Fabricator shall meet the standards of the Premium MCM Fabricator Certification program and be certified by Metal Construction Association (MCA) as a Premium MCM Fabricator.

D. Installer Qualifications: An entity specializing in installation of metal composite material wall panel systems that employs installers and supervisors who are trained, licensed, certified and approved by manufacturer.

E. Delegated Design Engineer Qualifications: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.

F. Testing Agency Qualifications: An agency acceptable to authorities having jurisdiction.

1.9 MOCKUPS

A. Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects and to set quality standards for fabrication and installation.

1. Build mockup as indicated on Drawings, including corner, soffits, supports, attachments, and accessories. Include integration with adjacent construction. Refer to Section 014339 "Mockups" for additional requirements.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Owner specifically approves such deviations by Change Order.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Deliver components, MCM panels, and other manufactured items so as not to be damaged or deformed. Package MCM panels for protection during transportation and handling.

B. Unload, store, and erect MCM panels in a manner to prevent bending, warping, twisting, and surface damage.

C. Stack MCM panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store MCM panels to ensure dryness, with positive slope for drainage of water. Do not store MCM panels in contact with other materials that might cause staining, denting, or other surface damage.

D. Retain strippable protective covering on MCM panels during installation.

E. Zinc Panels: Wear gloves and long sleeves when handling to prevent fingerprints and soiling of surface.

1.11 FIELD CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of MCM panels to be performed in accordance with manufacturers' written instructions and warranty requirements.

B. Field Measurements: Take field measurements prior to completion of shop fabrication of metal composite material wall panels. Coordinate panel fabrication schedule with construction progress schedule as established by Contractor to avoid delay in construction.

C. Field Modifications: Metal composite material wall panels may be modified in field as required to ensure proper fit as acceptable to panel manufacturer and Architect. Keep field modifications to absolute minimum, ensuring majority of fabrication accomplished under manufacturer and fabricator-controlled conditions.

1.12 COORDINATION

A. Coordinate MCM panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

B. Coordinate metal composite material panel system installation in manner to ensure integrity of air barrier system is not disrupted. Provide monitoring and inspection of metal composite material panel system installation by air barrier system installer and manufacturer’s representative.

1.13 WARRANTY

A. Panel Integrity Warranty: Manufacturer agrees to repair or replace components of MCM panels that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including rupturing, cracking, or puncturing.
b. Deterioration of metals and other materials beyond normal weathering.

2. Warranty Period: 10 years from date of Substantial Completion.

B. Panel Finish Warranty: Manufacturer agrees to repair finish or replace MCM panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Hunter units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

C. MCM System Warranty: System manufacturer's standard form in which manufacturer agrees to repair or replace components of MCM systems that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Metal-faced composite wall panel assemblies shall comply with performance requirements without failure due to defective manufacture, fabrication, installation, or other defects in construction.

B. Delegated Design: Design metal-faced composite wall panel assembly, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 15 percent.

D. Structural Performance: MCM systems to withstand the effects of the following loads, based on testing in accordance with ASTM E330/E330M:

1. Wind Loads: As indicated on Drawings.
2. Other Design Loads: As indicated on Drawings.
3. Deflection Limits: For wind loads, no greater than 1/180 of the span.

E. Provide DBVC system with V-axis classification number greater than or equal to W-axis classification number in accordance with AAMA 509.

F. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

G. Fire Propagation Characteristics: MCM system passes NFPA 285 testing.

H. Air and Vapor Barrier: Where penetrations are to be made in the air and vapor barrier, provide testing or demonstrate how this system will maintain the integrity of the air and vapor barrier.

2.2 METAL COMPOSITE MATERIAL (MCM) WALL PANELS

A. Metal Composite Material (MCM) Wall Panels: Provide MCM panels fabricated from two metal facings bonded to a solid, extruded thermoplastic core. Provide system where panels anchored to supporting construction without exposed fasteners.

1. Basis-of-Design Product (MP-1): Subject to compliance with requirements, provide ALPOLIC Materials; Mitsubishi Chemical Composites; ALPOLIC/fr Natural Metals Series or a comparable product by one of the following:

    a. ALUCOBOND; 3A Composites USA, Inc.; ALUCOBOND PLUS.
    b. Arconic; Reynobond.
    c. ACMpanelworx.

2. Basis-of-Design Product (MP-2, MP-3): Subject to compliance with requirements, provide ALUCOBOND; 3A Composites USA, Inc.; ALUCOBOND PLUS Route & Return or a comparable product by one of the following:

    a. Arconic; Reynobond.
    b. Mitsubishi Chemical Composites; ALPOLIC.
    c. ACMpanelworx.

3. Core: FR.
4. Panel Thickness: 0.157 inch (4 mm).
5. Bond Strength: 22.5 in-lb/in. (100 N x mm/mm) when tested for bond integrity in accordance with ASTM D1781.

B. MCM Panel Materials:

1. Zinc-Faced Panels (MP-1): ASTM B69 with 0.020-inch- (0.50-mm-) thick, zinc sheet facings.

    a. Exterior Finish: ALPOLIC Natural Metal Series, Zinc Metal Plate; VM ZINC Quartz Natural Zinc Finish.

2. Aluminum-Faced Panels (MP-2, MP-3): ASTM B209/B209M alloy as standard with manufacturer, temper as required to suit finish and forming operations with 0.020-inch- (0.50-mm-) thick, aluminum sheet facings.

    a. Exterior Finish: Two-coat metallic fluoropolymer.

        1) Color (MP-2): Light Gray, Beachstone Gray Metallic.
        2) Color (MP-3): Dark Gray, *Basalt Gray*.

2.3 METAL COMPOSITE MATERIAL (MCM) SYSTEM

A. DBVC MCM System: Provide factory-formed and -assembled, MCM panels formed into profile for DBVC system installation, drained at horizontal joints and at base of wall. Include attachment assembly components, panel stiffeners, and accessories required for weathertight system.

B. System Panel Depth: As indicated on drawings.

C. Attachment Assembly Components: Manufacturer's standard formed from material compatible with panel facing.

D. Labeling: Comply with labeling requirement of applicable building code.

2.4 ACCESSORIES

A. Metal Subframing and Furring: ASTM C955 cold-formed, metallic-coated steel sheet ASTM A653/A653M, G90 (Z275) hot-dip galvanized coating designation or ASTM A792/A792M, Class AZ50 (Class AZM150) aluminum-zinc-alloy coating designation unless otherwise indicated. Provide manufacturer's standard non-conductive sections as required for support and alignment of MCM system.

B. System Accessories: Provide components required for a complete, weathertight wall system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, backer plates and similar items. Match material and finish of MCM panels unless otherwise indicated.

C. Backer plates: Provide metal backing plates at panel edges, terminations, openings, splices, and where recommended by manufacturer, consisting of Zinc Plus or stainless steel sheet goods formed in configuration and thickness recommended by manufacturer.

D. Flashing and Trim: Provide flashing and trim formed from same material as MCM panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent MCM panels.

E. Panel Sealants: ASTM C920; silicone sealant; of type, grade, class, and use classifications required to seal joints at adjacent materials, flashings, copings, etc. and remain weathertight; and as recommended in writing by MCM system manufacturer. Color to match panel.

2.5 FABRICATION

A. Composite Panel Fabricators.

1. Approved Fabricators:

   a. Royalton Architectural Fabrication, Inc.
   b. Sobotec, Ltd., Ontario, Canada.
   c. East Coast Metal Systems.
   d. Universe Corporation.
   e. Architectural Metals North America (AMNA).
   f. Tremco CPG Inc.

B. Fabricate and finish MCM panels at the factory, by panel manufacturer's standard procedures and processes, as necessary to fulfill indicated panel performance requirements demonstrated by laboratory testing.

C. Shop-fabricate MCM systems and accessories by fabricator's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with requirements of MCM panel manufacturer, of indicated system profiles, and with dimensional and structural requirements.

1. Fabricate panels to dimensions indicated on Drawings based on an assumed design temperature of 70 deg F (21 deg C). Allow for ambient temperature range at time of fabrication.
2. Formed MCM panel lines, breaks, and angles to be sharp and straight, with surfaces free from warp or buckle.
3. Fabricate panels with sharply cut edges and no displacement of face sheet or protrusion of core.
4. Fabricate panels with panel stiffeners, as required to comply with deflection limits, attached to back of panels with structural silicone sealant or bond tape.
5. Fabricated Panel Tolerances: Shop-fabricate panels to sizes and joint configurations indicated on Drawings.

    a. Width: Plus or minus 0.079 inch (2 mm) at 70 deg F (21 deg C).
    b. Length: Plus or minus 0.079 inch (2 mm) at 70 deg F (21 deg C).
    c. Squareness: Plus or minus 0.079 inch (2 mm) at 70 deg F (21 deg C).
    d. Panel Bow: 0.8 percent maximum of panel length or width.

6. Fabricate MCM panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.
7. Attach routed-and-returned panel flanges to panel clips with manufacturer's standard fasteners.

D. Sheet Metal Flashing and Trim: Fabricate flashing and trim to comply with manufacturer's written instructions and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.

1. Form exposed sheet metal accessories that are without excessive oil-canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
2. Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
3. Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams.
4. Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate sealant and to comply with SMACNA standards.
5. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
6. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended in writing by metal manufacturer.

    a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal manufacturer for application, but not less than thickness of metal being secured.

2.6 FINISHES

A. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

C. Coil-Coated Metal Finish:

1. PVDF Fluoropolymer: AAMA 2605, two-coat metallic fluoropolymer finish containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

D. Zinc Finish: As noted above.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, MCM system supports, and other conditions affecting performance of the Work.

1. Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by MCM system manufacturer.
2. Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by MCM system manufacturer.

    a. Verify that air- or water-resistive barriers have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.

B. Examine roughing-in for components and assemblies penetrating MCM system to verify actual locations of penetrations relative to seam locations of MCM panels before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF MCM SYSTEM

A. General: Install MCM system in accordance with system manufacturer's written instructions in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to supports unless otherwise indicated. Anchor MCM system securely in place, with provisions for thermal and structural movement.

1. Shim or otherwise plumb substrates receiving MCM system.
2. Flash and seal MCM system at perimeter of all openings. Fasten with self-tapping screws.
3. Install screw fasteners in predrilled holes.
4. Locate and space fastenings in uniform vertical and horizontal alignment.
5. Install flashing and trim as MCM system work proceeds.
6. Align bottoms of MCM panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
7. Provide weathertight escutcheons for all items penetrating system.
8. Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by MCM system manufacturer.

9. Attach MCM panels to supports at locations, spacings, and with fasteners recommended by manufacturer to meet listed performance requirements.

B. Attachment Assembly, General: Install attachment assembly required to support MCM panels and to provide a complete weathertight wall system, including tracks, drainage channels, anchor channels, perimeter extrusions, and panel clips.

1. Install subframing, furring, and other panel support members and anchorages in accordance with ASTM C955.
2. Install support system at locations, at spacings, and with fasteners recommended by MCM system manufacturer to meet listed performance requirements.
3. Air Barrier: After installation of attachment assembly and prior to installing metal composite material wall panels and at no additional cost to owner, provide the following;

    a. In accordance with recommendations of air barrier manufacturer and as directed by air barrier installer, seal penetrations in air barrier created by screws used to secure wall panel system support structure as required to ensure air barrier warranty is not compromised.
    b. In accordance with recommendations of air barrier manufacturer and as directed by air barrier installer, seal holes or tears in air barrier created by installation of metal composite material wall panels as required to ensure air barrier warranty is not compromised.
    c. After repairs to air barrier system, retest air barrier system for air and water tightness in accordance with requirements in Specification Section where applicable air barrier is specified and submit field reports of all retesting demonstrating compliance with requirements specified in Specification Section where applicable air barrier is specified.
    d. Prior to proceeding with metal composite material wall panel installation:

        1) Repeat repair and testing process until testing results comply with requirements specified in Specification Section where applicable air barrier is specified as acceptable to Architect.
        2) Arrange for inspection of all repairs to air barrier by air barrier manufacturer and air barrier installer and obtain written acceptance of air barrier system with repairs.

C. DBVC MCM System: Install vertical tracks or drain channels and horizontal tracks or channels at locations, at spacings, and with fasteners recommended by system manufacturer.

1. Insert matching MCM spline into tracks at joint reveal locations.

D. Install panels to allow individual panels to "free float" and be installed and removed without disturbing adjacent panels.

E. Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.

1. Install accessory components required for a complete MCM system assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items. Provide types indicated by MCM system manufacturer.

F. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that are permanently watertight.

1. Install exposed flashing and trim that is without buckling and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install trim to fit substrates and to result in waterproof performance.
2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 ft. (3 m) with no joints allowed within 24 inches (605 mm) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with mastic sealant (concealed within joints).

G. Provide separation between zinc panels and aluminum.

3.3 INSTALLATION TOLERANCES

A. Shim and align MCM panels within installed tolerance of 1/4 inch in 20 ft. (6 mm in 6 m), non-accumulative, on level, plumb, and location lines as indicated, and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles. Locate shims on the surface of the girts where possible. If shims are required to be located on the surface of the AVB they must be solid shims to gasket the penetrations.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect completed MCM system installation, including accessories.

B. MCM system will be considered defective if it does not pass inspections.

C. Prepare inspection reports.

3.5 CLEANING

A. Remove temporary protective coverings and strippable films as MCM panels are installed unless otherwise indicated in manufacturer's written installation instructions. On completion of installation, clean finished surfaces as recommended by MCM panel manufacturer. Maintain in a clean condition during construction. Do not mark on protective film as this can stain zinc panels.

B. After installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.

3.6 PROTECTION

A. Replace MCM panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION 074213.23

SECTION 074243 – WOOD VENEER LAMINATE WALL PANELS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes

1. Exterior high pressure laminate composite panels at soffits.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Coordination Procedures:

1. Coordinate work results of this Section with other work.

B. Preinstallation Conference: Conduct conference at Project site.

1. Meet with Owner, Architect, Owner's insurer if applicable, panel system Installer, panel system manufacturer's representative, and installers whose work interfaces with or affects panels.
2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
3. Review methods and procedures related to panel system installation, including manufacturer's written instructions.
4. Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
5. Review flashings, special details, penetrations, openings, and condition of other construction that affect panel system.
6. Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
7. Review temporary protection requirements for system assembly during and after installation.
8. Review procedures for repair of panels damaged after installation.
9. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details, manufacturer’s installation instructions, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel, system, and accessory.

1. Initial selection color samples.

B. Shop Drawings: Submit project specific shop drawings prepared by, or under supervision of, Structural Design Engineer as specified in Quality Assurance article below and including

Structural Design Engineer's stamp or seal on all shop drawings including system attachments and anchors.

1. Include fabrication and installation layouts of panel system; project specific details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, accessories, and special details. Include details showing integration of panel system with air barrier system such as back-sealing of fastener penetrations.
2. Provide signed and sealed drawings, by a qualified design professional in Project jurisdiction, of panel system showing compliance with performance requirements and design criteria identified for this Project.

C. Samples:

1. Panels: Submit three 8.5 by 11 inches (22 by 28 cm) for each finish.
2. Accessories: 8 inch (20 cm) long section.
3. Assembly Samples: Assemble panel, 15 by 8 inches (38 by 20 cm) in size showing subframe and fasteners.

D. Delegated Design Submittals: For panel system, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Exterior elevations, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Soffit panels and attachments.
2. Soffit-mounted items including lighting fixtures.

B. Certificates:

1. Manufacturer Certificate: Intertek Code Compliance Research Report (CCRR) indicating compliance with IBC.

C. Installation instructions: Submit manufacturer instructions including surface preparation and installation procedures.

1.5 SUSTAINABLE DESIGN SUBMITTALS

A. Building Product Disclosure and Optimization: Environmental product declarations (EPD) and Health Product Declaration (HPD) documentation.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For panels.

B. Warranty Documentation: For panels.

1.7 QUALITY ASSURANCE

A. Manufacturers: Certified for chain of custody by an FSC-accredited certification body.

B. Manufacturer Qualifications: Minimum 5 years' experience. Provide representation by manufacturer's field representative during construction and provide written acceptance of installer and fabricator.

C. Installer Qualifications: An entity specializing in installation of panel systems that employs installers and supervisors who are trained, licensed, certified and approved by manufacturer.

D. Delegated Design Engineer Qualifications: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.

E. Mockups: Construct mockup, demonstrating product interfaces, intersections, and terminations.

1. Approved mockups establish work results standard.
2. Approved mockups may remain as a part of the Work.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Refer to manufacturer user manual.

1. Transport panels strapped down horizontally to avoid sliding; protect edges and corners.

B. Storage: Refer to manufacturer user manual.

1. Maintain in original protective package until use.
2. Store in a clean, dry, enclosed, and ventilated area.
    a. Temperature: 50 degrees F (10 degrees C), minimum, 80 degrees F (27 degrees C), maximum.
    b. Humidity: 30 percent, minimum, 70 percent, maximum.
3. Store horizontally on elevated platforms, with supports 24 inches (60 cm) apart, maximum.
4. Cover panels to match original packaged condition while not in use.

C. Handling: Lift and move panels evenly to avoid scratching the decorative surface.

1.9 FIELD CONDITIONS

A. Existing Conditions: Verify field measurements before fabrication. Show field measurements on Shop Drawings.

1.10 WARRANTY

A. Manufacturer Warranty:

1. Warrant against product failure. Failures include, but are not limited to, the following:

a. Structural failures including cracking, fading, and deforming.
b. Deterioration of materials beyond normal weathering.

2. Warranty Period: 10 years.

PART 2 - PRODUCTS

2.1 SOFFIT PANELS (SPP-1)

A. High Pressure Laminate Wood Veneer Soffit Panels: High density panels with natural wood veneers, fire-resistant thermoset phenolic resin core, and UV-resistant coating. Wood veneered solid phenolic panel system using open joint ventilated rain screen system with a subframe system designed to accommodate moisture, thermal and differential movement within the panel-frame system. Used with soffit suspension system at exterior canopy locations as indicated on Drawings.

1. Basis of Design Product: NATURCLAD-WF manufactured by PARKLEX PRODEMA.
2. Substitutions: Not permitted.
3. Thickness: 3/8 inch (10 mm).
4. Size: As indicated on Drawings.
5. Color: Rustik Matte.
6. Joint Width: As indicated on Drawings.
7. Installation Method: Concealed fastening.
8. Physical Properties:

a. Modulus of Elasticity: 1,500,000 psi minimum, ASTM D1037.
b. Flexural Strength: 9,000 psi minimum crossgrain, 15,000 psi minimum longgrain, ASTM D1037.
c. Freeze-Thaw Resistance: No change, ICC-ES AC92 Section 3.2.2
d. Water Resistance: No change, ASTM D2247.
e. Resistance to Weathering: No change after 2,000 hours, minimum, ASTM G155.
f. Salt Spray Resistance: No change after 300 hours, minimum, ASTM B117.

2.2 ACCESSORIES

A. Manufacturer standard components as required for complete installation.

B. Concealed Fastening with Hanging Hooks: Aluminum J channels, hanging rails, hanging hooks, clamping screws, levelling screws, fixing screws.

C. Acceptable manufacturer for metal panel framing system basis-of-design and quality;

1. PRODEMA proprietary corrosion-resistant aluminum framing and concealed fastening hanger attachment hardware.

D. Sealant: Silicone, color to match panel.

2.3 PERFORMANCE

A. Delegate support framing design to manufacturer licensed Professional Engineer.

B. Structural Design Criteria and Loads: See Structural Drawings.

C. PARKLEX PRODEMA products meeting ASTM E84.

D. Surface Burning Performance: ASTM E84 Class A.

1. Flame Spread Index: 25, maximum.
2. Smoke Developed Index: 450, maximum.

E. Environmental Performance:

1. Expansion and Contraction: Withstand 120 degree F (67 degree C) ambient and 180 degree F (100 degree C) surface thermal cycling without failure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Condition product per manufacturer recommendations.

3.3 INSTALLATION, GENERAL

A. Follow manufacturer instructions.

B. Anchor panels and sub-framing securely per engineering recommendations and approved Shop Drawings to allow for necessary movement and structural support.

C. Cut and drill panels, confirming fixed and floating points, and locate fastener hole spacing according to manufacturer recommendations.

D. Install plumb, level, and accurately spaced according to manufacturer recommendations and approved submittals and Shop Drawings.

E. Fasten panels with fasteners approved for use with supporting substrate.

F. Maintain 3/4 inch (20 mm) minimum air space behind panels.

G. Maintain base and head ventilation spaces of 3/4 inch (20 mm), minimum.

H. Fastener and hanging hooks to edge distance within manufacturer recommendation.

I. Replace damaged panels.

3.4 INSTALLATION, CONCEALED FASTENING SYSTEM

A. Install hanging rails over uninterrupted subframe components 3/4 inch (20 mm) deep minimum, spaced per manufacturer recommendations.

B. Install hooks on back of panels per manufacturer instructions.

C. Hang hooks on rails, adjust height for consistent joint spacing and lock panel in place horizontally with screw through top center hook.

D. Maintain gap between panels of 1/4 inch (6 mm), minimum.

E. Maintain distance from hanging hook to panel edge per manufacturer recommendations.

3.5 CLEANING

A. Follow manufacturer cleaning instructions.

B. Remove protection film immediately after installation.

C. Clean finished surfaces as recommended by panel manufacturer; do not use abrasive cleaners.

END OF SECTION 074243

SECTION 075419 - POLYVINYL-CHLORIDE (PVC) ROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Polyvinyl chloride (PVC) roofing system.
2. Accessory roofing materials.
3. Substrate board.
4. Vapor retarder.
5. Roof insulation.
6. Insulation accessories and cover board.
7. Asphalt materials.
8. Electronic leak detection (ELD) materials.
9. Walkways.
10. Safety stripping.

B. Related Requirements:

1. Section 061053 "Miscellaneous Rough Carpentry" for wood nailers, curbs, and blocking.
2. Section 072100 "Thermal Insulation" for insulation beneath the roof deck.
3. Section 076200 "Sheet Metal Flashing and Trim" for metal roof flashings and counterflashings.
4. Section 077100 "Roof Specialties" for premanufactured copings and roof edge flashings.
5. Section 077129 "Manufactured Roof Expansion Joints" for premanufactured roof expansion-joint assemblies.
6. Section 079200 "Joint Sealants" for joint sealants, joint fillers, and joint preparation.

1.2 DEFINITIONS

A. Roofing Terminology: Definitions in ASTM D1079 and glossary in NRCA's "The NRCA Roofing Manual: Membrane Roof Systems" apply to work of this Section.

1.3 PREINSTALLATION MEETINGS

A. Preliminary Roofing Conference: Before starting roof deck construction, conduct conference at Project site.

1. Meet with Owner, Architect, Construction Manager, Owner's insurer if applicable, testing and inspecting agency representative, roofing Installer, roofing system manufacturer's representative, deck Installer, air barrier Installer, and installers whose work interfaces with or affects roofing, including installers of roof accessories and roof-mounted equipment.
2. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
3. Review and finalize construction schedule, and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

4. Review deck substrate requirements for conditions and finishes, including flatness and fastening.
5. Review structural loading limitations of roof deck during and after roofing.
6. Review base flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that affects roofing system.
7. Review governing regulations and requirements for insurance and certificates if applicable.
8. Review temporary protection requirements for roofing system during and after installation.
9. Review roof observation and repair procedures after roofing installation.

B. Preinstallation Roofing Conference: Conduct conference at Project site.

1. Meet with Owner, Architect, Construction Manager, Owner's insurer if applicable, testing and inspecting agency representative, roofing Installer, roofing system manufacturer's representative, deck Installer, air barrier Installer, and installers whose work interfaces with or affects roofing, including installers of roof accessories and roof-mounted equipment.
2. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
3. Review and finalize construction schedule, and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
4. Examine deck substrate conditions and finishes for compliance with requirements, including flatness and fastening.
5. Review structural loading limitations of roof deck during and after roofing.
6. Review base flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that affects roofing system.
7. Review governing regulations and requirements for insurance and certificates if applicable.
8. Review temporary protection requirements for roofing system during and after installation.
9. Review roof observation and repair procedures after roofing installation.

1.4 ACTION SUBMITTALS

A. Product Data:

1. Polyvinyl chloride (PVC) roofing system.
2. Accessory roofing materials.
3. Substrate board.
4. Vapor retarder.
5. Roof insulation.
6. Insulation accessories and cover board.
7. Asphalt materials.
8. Electronic leak detection (ELD) materials.
9. Ballast.
10. Walkways.
11. For insulation and roof system component fasteners, include copy of FM Approvals' RoofNav listing.

B. Sustainable Design Submittals:

1. Product Test Reports: For roof materials, documentation indicating that roof materials comply with Solar Reflectance Index requirements.
2. Product Data: For adhesives and sealants, indicating VOC content.
3. Laboratory Test Reports: For adhesives and sealants, indicating compliance with requirements for low-emitting materials.
4. Environmental Product Declaration: For each product.
5. Health Product Declaration: For each product.
6. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings: Project specific. Include roof plans, sections, manufacturer's installation instructions, project specific details, transitions to other systems that comprise the air and water control layers, and attachments to other work, including the following:

1. Layout and thickness of insulation.
2. Base flashings and membrane terminations.
3. Flashing details at penetrations.
4. Tapered insulation thickness and slopes.
5. Roof plan showing orientation of steel roof deck and orientation of roof membrane, fastening spacings, and patterns for mechanically fastened roofing system.
6. Insulation fastening patterns for corner, perimeter, and field-of-roof locations.
7. Tie-in with air barrier.

D. Samples for Verification: For the following products:

1. Roof membrane and flashing, of color required.
2. Walkway pads or rolls, of color required.

E. Wind Uplift Resistance Submittal: For roofing system, indicating compliance with wind uplift performance requirements.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturer and testing agency.

B. Manufacturer Certificates:

1. Performance Requirement Certificate: Signed by roof membrane manufacturer, certifying that roofing system complies with requirements specified in "Performance Requirements" Article.

    a. Submit evidence of compliance with performance requirements.

2. Special Warranty Certificate: Signed by roof membrane manufacturer, certifying that all materials supplied under this Section are acceptable for special warranty.

C. Product Test Reports: For roof membrane and insulation, tests performed by independent qualified testing agency indicating compliance with specified requirements.

D. Evaluation Reports: For components of roofing system, from ICC-ES.

E. Field Test Reports:

1. Concrete internal relative humidity test reports.

2. Fastener-pullout test results and manufacturer's revised requirements for fastener patterns.

F. Field quality-control reports.

G. Sample Warranties: For manufacturer's special warranties.

H. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For roofing system to include in maintenance manuals.

1.7 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturers: A qualified manufacturer that is listed in FM Approvals' RoofNav for roofing system identical to that used for this Project.
2. Installers: A qualified firm that is approved, authorized, or licensed by roofing system manufacturer to install manufacturer's product and that is eligible to receive manufacturer's special warranty. Five years installation experience with specified roof system and specific manufacturer.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver roofing materials to Project site in original containers with seals unbroken and labeled with manufacturer's name, product brand name and type, date of manufacture, approval or listing agency markings, and directions for storing and mixing with other components.

B. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by roofing system manufacturer. Protect stored liquid material from direct sunlight.

1. Discard and legally dispose of liquid material that cannot be applied within its stated shelf life.

C. Protect roof insulation materials from physical damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location. Comply with insulation manufacturer's written instructions for handling, storing, and protecting during installation.

D. Handle and store roofing materials, and place equipment in a manner to avoid permanent deflection of deck.

1.9 FIELD CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit roofing system to be installed according to manufacturer's written instructions and warranty requirements.

B. Safety requirements:

1. All applications, material handling, and associated equipment shall conform to and be operated in conformance with OSHA safety requirements.
2. Comply with federal, state, local and owner fire and safety requirements
3. Advise owner when any work is expected to be hazardous to owner or employees
4. Maintain a crewman as a floor area guard whenever roof decking is being repaired or replaced.
5. Maintain fire extinguisher within easy access whenever power tools and torches are being used.

C. Environmental requirements:

1. Do not work in rain, snow, or in presence of water.
2. Do not work in temperatures below 40 F without permission from architect and roof manufacturer
3. Do not install materials marked “keep from freezing” when daily temperatures are scheduled to below 40 F.
4. Remove any work damaged by freezing
5. Advise the Owner when volatile materials are to be used near air ventilation intakes so that they can be shut down or blocked as owner requires.

1.10 WARRANTY

A. Special Manufacturer’s Warranty: Manufacturer agrees to repair or replace components of roofing system that fail in materials or workmanship within specified warranty period.

1. Special warranty includes roof membrane, base flashings, roof insulation, adhesives, fasteners, cover boards, vapor retarders, substrate boards, copings, walkway products, fascias, cants, nailers, blocking, as well as all metal work and other components of roofing system.
2. Warranty Period: 20 years from date of Substantial Completion. No dollar limit.

B. Special Project Warranty: Submit roofing Installer's warranty, on warranty form at end of this Section, signed by Installer, covering the Work of this Section, including all components of roofing system such as roof membrane, base flashings, roof insulation, adhesives, fasteners, cover boards, substrate boards, vapor retarders, copings, walkway products, fascias, cants, nailers, blocking as well as any metal work, and other components of roofing system for the following warranty period:

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Installed roofing and base flashings to withstand specified uplift pressures, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Roof system and flashings to remain watertight.

1. Accelerated Weathering: Roof membrane to withstand 2000 hours of exposure when tested according to ASTM G152, ASTM G154, or ASTM G155.
2. Impact Resistance: Roof membrane to resist impact damage when tested according to ASTM D3746, ASTM D4272/D4272M, or the "Resistance to Foot Traffic Test" in FM Approvals 4470.

B. Material Compatibility: Roofing materials to be compatible with one another and adjacent materials under conditions of service and application required, as demonstrated by roof membrane manufacturer based on testing and field experience.

C. Wind Uplift Resistance: Design roofing system to resist wind uplift pressures when tested according to FM Approvals 4474, UL 580, or UL 1897. Refer to Structural Drawings for design criteria.

D. FM Approvals' RoofNav Listing: Roof membrane, base flashings, and component materials comply with requirements in FM Approvals 4450 or FM Approvals 4470 as part of a roofing system, and are listed in FM Approvals' RoofNav for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals Certification markings.

1. Fire/Windstorm Classification: Class 1A-120.
2. Hail-Resistance Rating: FM Global Property Loss Prevention Data Sheet 1-34 SH.

E. Solar Reflectance Index (SRI): Three-year-aged SRI not less than 64 or initial SRI not less than 82 when calculated according to ASTM E 1980, based on testing identical products by a qualified testing agency.

F. Energy Performance: Roofing system to have an initial solar reflectance of not less than 0.70 and an emissivity of not less than 0.75 when tested in accordance with ANSI/CRRC S100.

G. Exterior Fire-Test Exposure: ASTM E108 or UL 790, Class A; for application and roof slopes indicated; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

H. Fire-Resistance Ratings: Comply with fire-resistance-rated assembly designs indicated. Identify products with appropriate markings of applicable testing agency.

2.2 POLYVINYL CHLORIDE (PVC) ROOFING SYSTEM (PVC-1 & PVC-2)

A. PVC Sheet Type III, Fabric Backed: ASTM D4434/D4434M, fabric reinforced and fabric backed.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Duro-Last Inc.; Duro-Fleece or a comparable product by one of the following:

a. Carlisle Syntec Systems.
b. Sika Corporation.
c. *Johns Manville: a Berkshire Hathaway company.*

2. Membrane Thickness: 80 mils (2.0 mm).
3. Exposed Face Color: PVC-1: White, PVC-2: Light Gray.

B. Source Limitations: Obtain components for roofing system from roof membrane manufacturer or manufacturers approved by roof membrane manufacturer.

2.3 ACCESSORY ROOFING MATERIALS

A. General: Accessory materials recommended by roofing system manufacturer for intended use and compatible with other roofing components.

1. Adhesives and Sealants: Comply with VOC limits of authorities having jurisdiction.
2. Verify adhesives and sealants comply with the following limits for VOC content:

a. Plastic Foam Adhesives: 50 g/L.
b. Gypsum Board and Panel Adhesives: 50 g/L.
c. Multipurpose Construction Adhesives: 70 g/L.
d. Fiberglass Adhesives: 80 g/L.
e. Contact Adhesives: 80 g/L.
f. PVC Welding Compounds: 510 g/L.
g. Other Adhesives: 250 g/L.
h. Single-Ply Roof Membrane Sealants: 450 g/L.
i. Nonmembrane Roof Sealants: 300 g/L.
j. Sealant Primers for Nonporous Substrates: 250 g/L.
k. Sealant Primers for Porous Substrates: 775 g/L.

B. Sheet Flashing: Manufacturer's standard sheet flashing of same material, type, reinforcement, thickness, and color as PVC sheet.

C. Prefabricated Pipe Flashings: As recommended by roof membrane manufacturer.

D. Bonding Adhesive: Manufacturer's standard.

E. Low-Rise, Urethane, Fabric-Backed Membrane Adhesive: Roof system manufacturer's standard spray-applied, low-rise, two-component urethane adhesive formulated for compatibility and use with fabric-backed membrane roofing.

F. Metal Termination Bars: Manufacturer's standard, predrilled stainless steel, approximately 1 by 1/8 inch (25 by 3 mm) thick; with anchors an integral caulk ledge.

G. Fasteners: Factory-coated steel fasteners and metal plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening roofing components to substrate, and acceptable to roofing system manufacturer.

H. Miscellaneous Accessories: Provide manufacturer recommended preformed cone and vent sheet flashings, preformed inside and outside corner sheet flashings, T-joint covers, lap sealants, termination reglets, and other accessories.

2.4 SUBSTRATE BOARD

A. Glass-Mat Gypsum Roof Substrate Board: ASTM C1177/C1177M, water-resistant gypsum board.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Certainteed; SAINT-GOBAIN; GlasRoc Sheathing Type X.
b. Georgia-Pacific Gypsum LLC; Dens Deck Prime.
c. National Gypsum Company; Gold Bond eXP Extended Exposure Sheathing.
d. USG Corporation; Securock Glass Mat Roof Board.

2. Thickness: Type X, 5/8 inch (16 mm).

B. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening substrate board to roof deck.

2.5 VAPOR RETARDER

A. Butyl-Rubber-Sheet Vapor Retarder, Self-Adhering: Polyethylene film laminated to layer of butyl rubber adhesive, minimum 30-mil (0.76-mm) total thickness; maximum permeance rating of 0.1 perm (6 ng/Pa x s x sq. m); cold applied, with slip-resisting surface and release paper backing. Provide primer when recommended by vapor retarder manufacturer.

1. Basis-of-Design Product: Duro-Last Inc.; Vapor Barrier (DL VB).

2.6 ROOF INSULATION

A. General: Preformed roof insulation boards manufactured or approved by PVC roof membrane manufacturer, approved for use in FM Approvals' RoofNav listed roof assemblies.

B. Polyisocyanurate Board Insulation: ASTM C1289, Type II, Class 1, Grade 3, felt or glass-fiber mat facer on both major surfaces.

1. Compressive Strength: 25 psi (172 kPa).
2. Size: 48 by 48 inches (1219 by 1219 mm).
3. Thickness:

a. Base Layer: 1-1/2 inches (38 mm).
b. Upper Layer: As indicated on Drawings.

C. Tapered Insulation: Provide factory-tapered insulation boards.

1. Material: Match roof insulation.
2. Minimum Thickness: 1/4 inch (6.35 mm).
3. Slope:

a. Roof Field: 1/4 inch per foot (1:48) unless otherwise indicated on Drawings.
b. Saddles and Crickets: 1/2 inch per foot (1:24) unless otherwise indicated on Drawings.

2.7 INSULATION ACCESSORIES AND COVER BOARD

A. General: Roof insulation accessories recommended by insulation manufacturer for intended use and compatibility with other roofing system components.

B. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening roof insulation and cover boards to substrate, and acceptable to roofing system manufacturer.

C. Insulation Adhesive: Insulation manufacturer's recommended adhesive formulated to attach roof insulation to substrate or to another insulation layer as follows:

1. As recommended by Manufacturer.
2. Verify adhesives and sealants comply with the following limits for VOC content:

    a. Plastic Foam Adhesives: 50 g/L.
    b. Gypsum Board and Panel Adhesives: 50 g/L.
    c. Multipurpose Construction Adhesives: 70 g/L.
    d. Fiberglass Adhesives: 80 g/L.
    e. Contact Adhesives: 80 g/L.
    f. PVC Welding Compounds: 510 g/L.
    g. Other Adhesives: 250 g/L.
    h. Single-Ply Roof Membrane Sealants: 450 g/L.
    i. Nonmembrane Roof Sealants: 300 g/L.
    j. Sealant Primers for Nonporous Substrates: 250 g/L.
    k. Sealant Primers for Porous Substrates: 775 g/L.

D. Glass-Mat Gypsum Cover Board: ASTM C1177/C1177M, water-resistant gypsum board.

1. Thickness: 1/2 inch (13 mm).

2.8 ELECTRONIC LEAK DETECTION (ELD) MATERIALS

A. Conductive Medium: Materials providing less than 10^4 ohms per square as determined in accordance with ASTM D4496 and approved by roof membrane manufacturer.

1. Electrically Conductive Primer: Water-based, non-flammable, nonmetallic, low-VOC primer, UL listed and FM Global approved.
2. Grounding Screen: Welded, stainless steel mesh, for use with vector mapping system, FM Global approved.

B. Leak Detection and Moisture-Monitoring System (where indicated on Drawings): Permanent, embedded leak detection and moisture-monitoring system.

1. Sensors measuring moisture content, placed below roof insulation and connected to a monitoring program, with a notification indicating location of breach.

2.9 WALKWAYS

A. Flexible Walkways: Factory-formed, nonporous, heavy-duty, slip-resisting, surface-textured walkway pads or rolls, approximately 3/16 inch (5 mm) thick and acceptable to roofing system manufacturer.

1. Color: As selected by Architect from manufacturer's full range of color selections.

2.10 SAFETY STRIPPING

A. Safety stripping: Safety Stripping composed of a laminated yellow PVC film on the top and a white PVC film on the bottom of a weft-inserted reinforcement fabric. The PVC film is a proprietary thermoplastic formulation that is resistant to ultraviolet rays, microorganisms, caustic chemicals, petroleum products, animal fats and acids. Install safety stripping to membrane per Manufacturer's written instructions using a hot-air welder. Refer to Drawings for location and extents.

1. Basis-of-Design Product: Duro-Last Safety Stripping.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.

1. Verify that roof openings and penetrations are in place, curbs are set and braced, and roof-drain bodies are securely clamped in place.
2. Verify that wood blocking, curbs, and nailers are securely anchored to roof deck at penetrations and terminations and that nailers match thicknesses of insulation.
3. Verify that surface plane flatness and fastening of steel roof deck complies with requirements in Section 053100 "Steel Decking."
4. Verify that minimum concrete drying period recommended by roofing system manufacturer has passed.
5. Verify that concrete substrate is visibly dry and free of moisture, and that minimum concrete internal relative humidity is not more than 75 percent, or as recommended by roofing system manufacturer, when tested according to ASTM F2170.

    a. Test Frequency: One test probe per each 1000 sq. ft. (93 sq. m), or portion thereof, of roof deck, with no fewer than three test probes.
    b. Submit test reports within 24 hours of performing tests.

6. Verify that concrete-curing compounds that will impair adhesion of roofing components to roof deck have been removed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean substrate of dust, debris, moisture, and other substances detrimental to roofing system installation according to roofing system manufacturer's written instructions. Remove sharp projections.

B. Prevent materials from entering and clogging roof drains and conductors and from spilling or migrating onto surfaces of other construction. Remove roof-drain plugs when no work is taking place or when rain is forecast.

3.3 INSTALLATION OF ROOFING, GENERAL

A. Install roofing system according to roofing system manufacturer's written instructions, FM Approvals' RoofNav listed roof assembly requirements, and FM Global Property Loss Prevention Data Sheet 1-29.

B. Complete terminations and base flashings and provide temporary seals to prevent water from entering completed sections of roofing system at end of workday or when rain is forecast. Remove and discard temporary seals before beginning work on adjoining roofing.

C. Coordinate installation and transition of roofing system component serving as an air barrier with air barrier specified under Section 072726.04 "Fluid-Applied Membrane Air Barriers."

3.4 INSTALLATION OF SUBSTRATE BOARD

A. Install substrate board with long joints in continuous straight lines, with end joints staggered not less than 24 inches (610 mm) in adjacent rows.

1. At steel roof decks, install substrate board at right angle to flutes of deck.

    a. Locate end joints over crests of steel roof deck.

2. Tightly butt substrate boards together.
3. Cut substrate board to fit tight around penetrations and projections, and to fit tight to intersecting sloping roof decks.
4. Fasten substrate board to top flanges of steel deck according to recommendations in FM Approvals' RoofNav listed roof assembly requirements for specified Windstorm Resistance Classification and FM Global Property Loss Prevention Data Sheet 1-29.
5. Fasten substrate board to top flanges of steel deck to resist uplift pressure at corners, perimeter, and field of roof according to roofing system manufacturers' written instructions.

3.5 INSTALLATION OF VAPOR RETARDER

A. Self-Adhering-Sheet Vapor Retarder: Prime substrate if required by manufacturer. Install self-adhering-sheet vapor retarder over area to receive vapor retarder, side and end lapping each sheet a minimum of 3-1/2 and 6 inches (90 and 150 mm), respectively.

1. Extend vertically up parapet walls and projections to a minimum height equal to height of insulation and cover board and to marry with the roofing membrane if the materials are compatible.
2. Seal laps by rolling.

B. Completely seal vapor retarder at terminations, obstructions, and penetrations to prevent air movement into roofing system.

3.6 INSTALLATION OF INSULATION

A. Coordinate installing roofing system components so insulation is not exposed to precipitation or left exposed at end of workday.

B. Comply with roofing system and insulation manufacturer's written instructions for installing roof insulation.

C. Installation Over Metal Decking:

1. Install base layer of insulation with joints staggered not less than 24 inches (610 mm) in adjacent rows or end joints staggered not less than 12 inches (305 mm) in adjacent rows and with long joints continuous at right angle to flutes of decking. Stagger board joints in each direction.

    a. Locate end joints over crests of decking.
    b. Where installing composite and noncomposite insulation in two or more layers, install noncomposite board insulation for bottom layer and intermediate layers, if applicable, and install composite board insulation for top layer.
    c. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
    d. Make joints between adjacent insulation boards not more than 1/4 inch (6 mm) in width.
    e. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches (610 mm).

        1) Trim insulation so that water flow is unrestricted.

    f. Fill gaps exceeding 1/4 inch (6 mm) with insulation.
    g. Cut and fit insulation within 1/4 inch (6 mm) of nailers, projections, and penetrations.
    h. Mechanically attach base layer of insulation and substrate board using mechanical fasteners specifically designed and sized for fastening specified board-type roof insulation to metal decks.

        1) Fasten insulation according to requirements in FM Approvals' RoofNav for specified Windstorm Resistance Classification.
        2) Fasten insulation to resist specified uplift pressure at corners, perimeter, and field of roof.

2. Install upper layers of insulation and tapered insulation with joints of each layer offset not less than 12 inches (305 mm) from previous layer of insulation.

    a. Staggered end joints within each layer not less than 24 inches (610 mm) in adjacent rows.
    b. Install with long joints continuous and with end joints staggered not less than 12 inches (305 mm) in adjacent rows.
    c. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
    d. Make joints between adjacent insulation boards not more than 1/4 inch (6 mm) in width.
    e. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches (610 mm).
    f. Trim insulation so that water flow is unrestricted.
    g. Fill gaps exceeding 1/4 inch (6 mm) with insulation.
    h. Cut and fit insulation within 1/4 inch (6 mm) of nailers, projections, and penetrations.
    i. Adhere each layer of insulation to substrate using adhesive according to FM Approvals' RoofNav listed roof assembly requirements for specified Windstorm

Resistance Classification and FM Global Property Loss Prevention Data Sheet 1-29, as follows:

1) Set each layer of insulation in a uniform coverage of full-spread insulation adhesive, firmly pressing and maintaining insulation in place.

D. Installation Over Concrete Decks:

1. Install base layer of insulation with joints staggered not less than 24 inches (610 mm) in adjacent rows or end joints staggered not less than 12 inches (305 mm) in adjacent rows.

a. Where installing composite and noncomposite insulation in two or more layers, install noncomposite board insulation for bottom layer and intermediate layers, if applicable, and install composite board insulation for top layer. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
b. Make joints between adjacent insulation boards not more than 1/4 inch (6 mm) in width.
c. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches (610 mm).

1) Trim insulation so that water flow is unrestricted.

d. Fill gaps exceeding 1/4 inch (6 mm) with insulation.
e. Cut and fit insulation within 1/4 inch (6 mm) of nailers, projections, and penetrations.
f. Adhere base layer of insulation to vapor retarder according to FM Approvals' RoofNav listed roof assembly requirements for specified Windstorm Resistance Classification and FM Global Property Loss Prevention Data Sheet 1-29, as follows:

1) Prime surface of concrete deck with primer at rate of 3/4 gal./100 sq. ft. (0.3 L/sq. m), and allow primer to dry.
2) Set insulation in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.

2. Install upper layers of insulation and tapered insulation with joints of each layer offset not less than 12 inches (305 mm) from previous layer of insulation.

a. Staggered end joints within each layer not less than 24 inches (610 mm) in adjacent rows.
b. Install with long joints continuous and with end joints staggered not less than 12 inches (305 mm) in adjacent rows.
c. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
d. Make joints between adjacent insulation boards not more than 1/4 inch (6 mm) in width.
e. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches (610 mm).

1) Trim insulation so that water flow is unrestricted.

f. Fill gaps exceeding 1/4 inch (6 mm) with insulation.

g. Cut and fit insulation within 1/4 inch (6 mm) of nailers, projections, and penetrations.
h. Adhere each layer of insulation to substrate using adhesive according to FM Approvals' RoofNav listed roof assembly requirements for specified Windstorm Resistance Classification and FM Global Property Loss Prevention Data Sheet 1-29, as follows:

1) Set each layer of insulation in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.

3.7 INSTALLATION OF COVER BOARDS

A. Install cover boards over insulation with long joints in continuous straight lines with end joints staggered between rows. Offset joints of insulation below a minimum of 6 inches (150 mm) in each direction.

1. Trim cover board neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
2. At internal roof drains, conform to slope of drain sump.

a. Trim cover board so that water flow is unrestricted.

3. Cut and fit cover board tight to nailers, projections, and penetrations.
4. Adhere cover board to substrate using adhesive according to FM Approvals' RoofNav listed roof assembly requirements for specified Windstorm Resistance Classification and FM Global Property Loss Prevention Data Sheet 1-29, as follows:

a. Set cover board in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.

3.8 INSTALLATION OF ELD COMPONENTS

A. Install conductive medium over cover board and on vertical locations to receive roof membrane in accordance with manufacturer's written instructions.

B. Install sensors, wire loop, connections, and accessory items required for complete system in accordance with manufacturer's written instructions.

3.9 INSTALLATION OF ADHERED ROOF MEMBRANE

A. Adhere roof membrane over area to receive roofing according to roofing system manufacturer's written instructions.

B. Unroll roof membrane and allow to relax before installing.

C. Start installation of roofing in presence of roofing system manufacturer's technical personnel Owner's testing and inspection agency.

D. Accurately align roof membrane, and maintain uniform side and end laps of minimum dimensions required by manufacturer. Stagger end laps.

E. Bonding Adhesive: Apply to substrate and underside of roof membrane at rate required by manufacturer, and allow to partially dry before installing roof membrane. Do not apply to splice area of roof membrane.

F. Fabric-Backed Roof Membrane Adhesive: Apply to substrate at rate required by manufacturer, and install fabric-backed roof membrane.

G. In addition to adhering, mechanically fasten roof membrane securely at terminations, penetrations, and perimeter of roofing.

H. Apply roof membrane with side laps shingled with slope of roof deck where possible.

I. Seams: Clean seam areas, overlap roofing, and hot-air weld side and end laps of roof membrane and sheet flashings to ensure a watertight seam installation.

1. Test lap edges with probe to verify seam weld continuity. Apply lap sealant to seal cut edges of roof membrane and sheet flashings.
2. Verify field strength of seams a minimum of twice daily, and repair seam sample areas.
3. Repair tears, voids, and lapped seams in roof membrane that do not comply with requirements.

J. Spread sealant bed over deck-drain flange at roof drains, and securely seal roof membrane in place with clamping ring.

3.10 INSTALLATION OF BASE FLASHING

A. Install sheet flashings and preformed flashing accessories, and adhere to substrates according to roofing system manufacturer's written instructions.

B. Apply bonding adhesive to substrate and underside of sheet flashing at required rate, and allow to partially dry. Do not apply to seam area of flashing.

C. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

D. Clean seam areas, overlap, and firmly roll sheet flashings into the adhesive. Hot-air weld side and end laps to ensure a watertight seam installation.

E. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars. Seal top of termination bar with sealant bead.

3.11 INSTALLATION OF WALKWAYS

A. Flexible Walkways: Install walkway products according to manufacturer's written instructions.

1. Install flexible walkways at the following locations: As indicated on Drawings.
2. Provide 1-inch clearance between adjoining pads.
3. Heat weld to substrate or adhere walkway products to substrate with compatible adhesive according to roofing system manufacturer's written instructions.

3.12 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to inspect substrate conditions, surface preparation, roof membrane application, sheet flashings, protection, and drainage components, and to furnish reports to Architect. Perform welded seam testing regularly to evaluate the seam integrity such as at the beginning of each work day, after substantial pauses in installation activities, and if notable changes in weather occur.

B. Perform the following tests:

1. Low-Voltage ELD Testing: Testing agency surveys entire roof area and flashings to locate discontinuities in the roof membrane using low-voltage horizontal membrane scanning platform membrane electric field vector mapping or vertical membrane scanning in accordance with ASTM D8231.

    a. Perform tests before overlying construction is placed.
    b. After testing, repair areas of discontinuities, repeat tests, and make further repairs until roofing and flashing installations are contiguous.

        1) Cost of retesting is Contractor's responsibility.

    c. Testing agency to prepare survey report indicating locations of initial discontinuities, if any.

C. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion, in presence of Architect, and to prepare inspection report.

D. Repair or remove and replace components of roofing system where inspections indicate that they do not comply with specified requirements.

E. Additional testing and inspecting, at Contractor's expense, will be performed to determine if replaced or additional work complies with specified requirements.

3.13 PROTECTING AND CLEANING

A. Protect roofing system from damage and wear during remainder of construction period. When remaining construction does not affect or endanger roofing, inspect roofing system for deterioration and damage, describing its nature and extent in a written report, with copies to Architect and Owner.

B. Correct deficiencies in or remove roofing system that does not comply with requirements, repair substrates, and repair or reinstall roofing system to a condition free of damage and deterioration at time of Substantial Completion and according to warranty requirements.

C. Clean overspray and spillage from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

3.14 ROOFING INSTALLER'S WARRANTY

A. WHEREAS _____ of _____, herein called the "Roofing Installer," has performed roofing and associated work ("work") on the following project:

1. Owner: <Insert name of Owner>.
2. Owner Address: <Insert address>.
3. Building Name/Type: <Insert information>.
4. Building Address: <Insert address>.
5. Area of Work: <Insert information>.
6. Acceptance Date: _____.
7. Warranty Period: <Insert time>.
8. Expiration Date: _____.

B. AND WHEREAS Roofing Installer has contracted (either directly with Owner or indirectly as a subcontractor) to warrant said work against leaks and faulty or defective materials and workmanship for designated Warranty Period,

C. NOW THEREFORE Roofing Installer hereby warrants, subject to terms and conditions herein set forth, that during Warranty Period Roofing Installer will, at Roofing Installer's own cost and expense, make or cause to be made such repairs to or replacements of said work as are necessary to correct faulty and defective work and as are necessary to maintain said work in a watertight condition.

D. This Warranty is made subject to the following terms and conditions:

1. Specifically excluded from this Warranty are damages to work and other parts of the building, and to building contents, caused by:

    a. lightning;
    b. peak gust wind speed exceeding <Insert mph (m/s)>;
    c. fire;
    d. failure of roofing system substrate, including cracking, settlement, excessive deflection, deterioration, and decomposition;
    e. faulty construction of parapet walls, copings, chimneys, skylights, vents, equipment supports, and other edge conditions and penetrations of the work;
    f. vapor condensation on bottom of roofing; and
    g. activity on roofing by others, including construction contractors, maintenance personnel, other persons, and animals, whether authorized or unauthorized by Owner.

2. When work has been damaged by any of foregoing causes, Warranty shall be null and void until such damage has been repaired by Roofing Installer and until cost and expense thereof have been paid by Owner or by another responsible party so designated.
3. Roofing Installer is responsible for damage to work covered by this Warranty but is not liable for consequential damages to building or building contents resulting from leaks or faults or defects of work.
4. During Warranty Period, if Owner allows alteration of work by anyone other than Roofing Installer, including cutting, patching, and maintenance in connection with penetrations, attachment of other work, and positioning of anything on roof, this Warranty shall become null and void on date of said alterations, but only to the extent said alterations affect work covered by this Warranty. If Owner engages Roofing Installer to perform said alterations, Warranty shall not become null and void unless Roofing Installer, before starting said work, shall have notified Owner in writing, showing reasonable cause for claim, that said alterations would likely damage or deteriorate work, thereby reasonably justifying a limitation or termination of this Warranty.
5. During Warranty Period, if original use of roof is changed and it becomes used for, but was not originally specified for, a promenade, work deck, spray-cooled surface, flooded basin, or other use or service more severe than originally specified, this Warranty shall

become null and void on date of said change, but only to the extent said change affects work covered by this Warranty.

6. Owner shall promptly notify Roofing Installer of observed, known, or suspected leaks, defects, or deterioration and shall afford reasonable opportunity for Roofing Installer to inspect work and to examine evidence of such leaks, defects, or deterioration.
7. This Warranty is recognized to be the only warranty of Roofing Installer on said work and shall not operate to restrict or cut off Owner from other remedies and resources lawfully available to Owner in cases of roofing failure. Specifically, this Warranty shall not operate to relieve Roofing Installer of responsibility for performance of original work according to requirements of the Contract Documents, regardless of whether Contract was a contract directly with Owner or a subcontract with Owner's General Contractor.

E. IN WITNESS THEREOF, this instrument has been duly executed this _____ day of _____, _____.

1. Authorized Signature: _____.
2. Name: _____.
3. Title: _____.

END OF SECTION 075419

SECTION 076200 - SHEET METAL FLASHING AND TRIM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Custom flashing and trim fabrications, made from the following:

1. Sheet metal materials.
2. Underlayment.
3. Miscellaneous materials.

B. Related Requirements:

1. Section 061053 "Miscellaneous Rough Carpentry" for wood nailers and blocking.
2. Section 042000 "Unit Masonry" for materials and installation of manufactured sheet metal through-wall flashing and trim integral with masonry.
3. Section 075419 "Polyvinyl-Chloride (PVC) Roofing" for materials and installation of sheet metal flashing and trim integral with roofing.
4. Section 074213.23 "Metal Composite Material Wall Panels" for sheet metal flashing and trim integral with metal wall panels.
5. Section 077100 "Roof Specialties" for manufactured copings, roof-edge specialties, reglets, and counterflashings.
6. Section 077200 "Roof Accessories" for roof hatches and other manufactured roof accessory units.
7. Section 079513.13 "Interior Expansion Joint Cover Assemblies" for manufactured expansion-joint cover assemblies for interior floors, walls, and ceilings.
8. Section 079513.16 "Exterior Expansion Joint Cover Assemblies" for manufactured expansion-joint cover assemblies for exterior building walls, soffits, and parapets.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review construction schedule. Verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
2. Review special roof details, roof drainage, roof-penetration flashing, equipment curbs, and condition of other construction that affect sheet metal flashing and trim.
3. Review requirements for insurance and certificates if applicable.
4. Review sheet metal flashing observation and repair procedures after flashing installation.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Project specific. For sheet metal flashing and trim.

1. Plans, elevations, sections, and attachment details.

2. Fabrication and installation layouts, expansion-joint locations, and keyed details. Distinguish between shop- and field-assembled Work.
3. Identification of material, thickness, weight, and finish for each item and location in Project.
4. Details for forming, including profiles, shapes, seams, and dimensions.
5. Details for joining, supporting, and securing, including layout and spacing of fasteners, cleats, clips, and other attachments. Include pattern of seams.
6. Details of termination points and assemblies.
7. Details of expansion joints and expansion-joint covers, including showing direction of expansion and contraction from fixed points.
8. Details of roof-penetration flashing.
9. Details of edge conditions, including eaves, ridges, valleys, rakes, crickets, flashings, and counterflashings.
10. Details of special conditions.
11. Details of connections to adjoining work.
12. Formed flashing and trim at scale of not less than 1-1/2 inches per 12 inches (1:10).

C. Samples: For each exposed product and for each color and texture specified, 12 inches (300 mm) long by actual width.

D. Sustainable Design Submittals:

1. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

1.4 INFORMATIONAL SUBMITTALS

A. Certificates: For each type of coping and roof edge flashing that is ANSI/SPRI/FM 4435/ES-1 tested and FM Approvals approved.

B. Product Test Reports: For each product, for tests performed by a qualified testing agency.

C. Qualification Statements: For fabricator and installer.

D. Sample warranties.

E. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For sheet metal flashing and trim, and its accessories.

1.6 QUALITY ASSURANCE

A. Fabricator Qualifications: Entity that employs skilled workers who custom fabricate sheet metal flashing and trim similar to that required for this Project and whose products have a record of successful in-service performance.

B. Installer Qualifications: Entity that employs a supervisor who is an NRCA ProCertified Roofing Foreman or installers who are NRCA ProCertified Architectural Metal Flashings and Accessories Installers.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Do not store sheet metal flashing and trim materials in contact with other materials that might cause staining, denting, or other surface damage. Protect during delivery.

1. Store sheet metal flashing and trim materials away from uncured concrete and masonry.
2. Protect stored sheet metal flashing and trim from contact with water.

B. Protect strippable protective covering on sheet metal flashing and trim from exposure to sunlight and high humidity, except to extent necessary for period of sheet metal flashing and trim installation.

1.8 COORDINATION

A. Coordinate sheet metal flashing and trim layout and seams with sizes and locations of penetrations to be flashed, and joints and seams in adjacent materials.

B. Coordinate sheet metal flashing and trim installation with adjoining roofing and wall materials, joints, and seams to provide leakproof, secure, and noncorrosive installation.

1.9 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of flashings and trims that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.
b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
c. Water leakage.

2. Warranty Period: Five years from date of Substantial Completion.

B. Special Warranty on Finishes: Manufacturer agrees to repair finish or replace sheet metal flashing and trim that shows evidence of deterioration of factory-applied finishes within specified warranty period.

1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Sheet metal flashing and trim assemblies, including cleats, anchors, and fasteners, are to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Completed sheet metal flashing and trim are not to rattle, leak, or loosen, and are to remain watertight.

B. Sheet Metal Standard for Flashing and Trim: Comply with NRCA's "The NRCA Roofing Manual: Architectural Metal Flashing, Condensation and Air Leakage Control, and Reroofing" and SMACNA's "Architectural Sheet Metal Manual" requirements for dimensions and profiles shown unless more stringent requirements are indicated.

C. SPRI Wind Design Standard: Manufacture and install roof edge flashings and copings tested in accordance with ANSI/SPRI/FM 4435/ES-1 and capable of resisting the following design pressure:

1. Design Pressure: As indicated on Drawings.

D. FM Approvals Listing: Manufacture and install roof edge flashings and copings that comply with requirements in FM Approvals 4471 as part of a roofing system and that are listed in FM Approvals' "Approval Guide" and approved for windstorm classification, Class 1A-120. Identify materials with name of fabricator and design approved by FM Approvals.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 SHEET METAL MATERIALS

A. Protect mechanical and other finishes on exposed surfaces from damage by applying strippable, temporary protective film before shipping.

B. Aluminum Sheet: Coil-coated sheet, ASTM B209/B209M, alloy as standard with manufacturer, with temper as required to suit forming operations and structural performance required.

1. Thickness: 0.063 inch (1.60 mm).
2. Surface: Smooth, flat.
3. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

4. Exposed Coil-Coated Finish:

    a. Mica Fluoropolymer: AAMA 2605. Two-coat fluoropolymer finish with suspended mica flakes containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

5. Color: Custom colors. Match Architect's samples.
6. Concealed Finish: Pretreat with manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with minimum total dry film thickness of 0.5 mil (0.013 mm).

C. Stainless Steel Sheet: ASTM A240/A240M, Type 316, dead soft, fully annealed.

1. Nominal Thickness: 0.0500 inch (1.270 mm).
2. Surface: Smooth, flat.
3. Exterior Finish: ASTM A480/A480M, No. 2D (dull, cold rolled).

    a. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
    b. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

        1) Run grain of directional finishes with long dimension of each piece.
        2) When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

4. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

2.3 UNDERLAYMENT

A. Synthetic Underlayment: Laminated or reinforced, woven polyethylene or polypropylene, synthetic roofing underlayment; bitumen free; slip resistant; suitable for high temperatures over 220 deg F (111 deg C); and complying with physical requirements of ASTM D226/D226M for Type I and Type II felts.

B. Self-Adhering, High-Temperature Sheet Underlayment: Provide self-adhering, cold-applied, sheet underlayment, a minimum of 30 mils (0.76 mm) thick, specifically designed to withstand high metal temperatures beneath metal roofing. Provide primer when recommended by underlayment manufacturer.

1. Thermal Stability: Stable after testing at 240 deg F (116 deg C); ASTM D1970/D1970M.
2. Low-Temperature Flexibility: Passes after testing at minus 20 deg F (minus 29 deg C) or lower; ASTM D1970/D1970M.

C. Felt: ASTM D226/D226M, Type II (No. 30), asphalt-saturated organic felt; nonperforated.

D. Slip Sheet: Rosin-sized building paper, 3 lb/100 sq. ft. (0.16 kg/sq. m) minimum, of type required for application.

2.4 MISCELLANEOUS MATERIALS

A. Provide materials and types of fasteners, solder, protective coatings, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and as recommended by manufacturer of primary sheet metal unless otherwise indicated.

B. Fasteners: Wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads and recommended by manufacturer of primary sheet metal.

1. General: Blind fasteners or self-drilling screws, gasketed, with hex-washer head.

a. Exposed Fasteners: Heads matching color of sheet metal using plastic caps or factory-applied coating. Provide metal-backed EPDM or PVC sealing washers under heads of exposed fasteners bearing on weather side of metal.
b. Blind Fasteners: High-strength aluminum or stainless steel rivets suitable for metal being fastened.

2. Fasteners for Aluminum Sheet: Aluminum or Series 300 stainless steel.
3. Fasteners for Stainless Steel Sheet: Series 300 stainless steel.

C. Solder:

1. For Stainless Steel: ASTM B32, Grade Sn60, with acid flux of type recommended by stainless steel sheet manufacturer.

D. Sealant Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch (13 mm) wide and 1/8 inch (3 mm) thick.

E. Elastomeric Sealant: ASTM C920, elastomeric silicone polymer sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.

F. Butyl Sealant: ASTM C1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.

G. Epoxy Seam Sealer: Two-part, noncorrosive, aluminum seam-cementing compound, recommended by aluminum manufacturer for exterior nonmoving joints, including riveted joints.

H. Bituminous Coating: Cold-applied asphalt emulsion in accordance with ASTM D1187/D1187M.

I. Asphalt Roofing Cement: ASTM D4586/D4586M, asbestos free, of consistency required for application.

2.5 FABRICATION, GENERAL

A. Custom fabricate sheet metal flashing and trim to comply with details indicated and recommendations in cited sheet metal standard that apply to design, dimensions, geometry, metal thickness, and other characteristics of item required.

1. Fabricate sheet metal flashing and trim in shop to greatest extent possible.

2. Fabricate sheet metal flashing and trim in thickness or weight needed to comply with performance requirements, but not less than that specified for each application and metal.
3. Verify shapes and dimensions of surfaces to be covered and obtain field measurements for accurate fit before shop fabrication.
4. Form sheet metal flashing and trim to fit substrates without excessive oil-canning, buckling, and tool marks; true to line, levels, and slopes; and with exposed edges folded back to form hems.
5. Conceal fasteners and expansion provisions where possible. Do not use exposed fasteners on faces exposed to view.

B. Fabrication Tolerances:

1. Fabricate sheet metal flashing and trim that is capable of installation to a tolerance of 1/4 inch in 20 ft. (6 mm in 6 m) on slope and location lines indicated on Drawings and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles.
2. Fabricate sheet metal flashing and trim that is capable of installation to tolerances specified.

C. Expansion Provisions: Form metal for thermal and building expansion and contraction of exposed flashing and trim. Laps and splices are to be fabricated and installed in accordance with SMACNA provisions.

1. Form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with butyl sealant concealed within joints.
2. Use lapped expansion joints only where indicated on Drawings.

D. Sealant Joints: Where movable, nonexpansion-type joints are required, form metal in accordance with cited sheet metal standard to provide for proper installation of elastomeric sealant.

E. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal.

F. Fabricate cleats and attachment devices of sizes as recommended by cited sheet metal standard and by FM Global Property Loss Prevention Data Sheet 1-49 for application, but not less than thickness of metal being secured.

G. Seams:

1. Fabricate nonmoving seams with flat-lock seams. Tin edges to be seamed, form seams, and solder.
2. Fabricate nonmoving seams with flat-lock seams. Form seams and seal with elastomeric sealant unless otherwise recommended by sealant manufacturer for intended use. Rivet joints where necessary for strength.
3. Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints where necessary for strength.

H. Do not use graphite pencils to mark metal surfaces.

2.6 LOW-SLOPE ROOF SHEET METAL FABRICATIONS

A. Counterflashing: Shop fabricate interior and exterior corners. Fabricate from the following materials:

1. Stainless Steel.

B. Flashing Receivers: Fabricate from the following materials:

1. Stainless Steel.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, substrates, and other conditions affecting performance of the Work.

1. Verify compliance with requirements for installation tolerances of substrates.
2. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.
3. Verify that air- or water-resistant barriers have been installed over substrate to prevent air infiltration or water penetration.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF UNDERLAYMENT

A. Synthetic Underlayment: Install synthetic underlayment, wrinkle free, in accordance with manufacturers' written instructions, and using adhesive where possible to minimize use of mechanical fasteners under sheet metal.

1. Lap horizontal joints not less than 4 inches (100 mm).
2. Lap end joints not less than 12 inches (300 mm).

B. Self-Adhering, High-Temperature Sheet Underlayment:

1. Install self-adhering, high-temperature sheet underlayment; wrinkle free.
2. Prime substrate if recommended by underlayment manufacturer.
3. Comply with temperature restrictions of underlayment manufacturer for installation; use primer for installing underlayment at low temperatures.
4. Apply in shingle fashion to shed water, with end laps of not less than 6 inches (150 mm) staggered 24 inches (600 mm) between courses.
5. Overlap side edges not less than 3-1/2 inches (90 mm). Roll laps and edges with roller.
6. Roll laps and edges with roller.
7. Cover underlayment within 14 days.

C. Felt Underlayment: Install felt underlayment, wrinkle free, using adhesive to minimize use of mechanical fasteners under sheet metal flashing and trim.

1. Install in shingle fashion to shed water.
2. Lap joints not less than 2 inches (50 mm).

D. Install slip sheet, wrinkle free, directly on substrate before installing sheet metal flashing and trim.

1. Install in shingle fashion to shed water.
2. Lapp joints not less than 4 inches (100 mm).

3.3 INSTALLATION OF SHEET METAL FLASHING AND TRIM, GENERAL

A. Install sheet metal flashing and trim to comply with details indicated and recommendations of cited sheet metal standard that apply to installation characteristics required unless otherwise indicated on Drawings.

1. Install fasteners, solder, protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system.
2. Install sheet metal flashing and trim true to line, levels, and slopes. Provide uniform, neat seams with minimum exposure of solder or sealant.
3. Anchor sheet metal flashing and trim and other components of the Work securely in place, with provisions for thermal and structural movement.
4. Install sheet metal flashing and trim to fit substrates and to result in watertight performance.
5. Install continuous cleats with fasteners spaced not more than 12 inches (300 mm) o.c.
6. Space individual cleats not more than 12 inches (300 mm) apart. Attach each cleat with at least two fasteners. Bend tabs over fasteners.
7. Install exposed sheet metal flashing and trim with limited oil-canning, and free of buckling and tool marks.
8. Do not field cut sheet metal flashing and trim by torch.
9. Do not use graphite pencils to mark metal surfaces.
10. Set metal drip edge flashings in continuous bed of sealant compatible with AVB membrane. Metal flashing splice plates are to overlap with continuous lines of sealant.

B. Metal Protection: Where dissimilar metals contact each other, or where metal contacts pressure-treated wood or other corrosive substrates, protect against galvanic action or corrosion by painting contact surfaces with bituminous coating or by other permanent separation as recommended by sheet metal manufacturer or cited sheet metal standard.

1. Coat concealed side of uncoated-aluminum and stainless steel sheet metal flashing and trim with bituminous coating where flashing and trim contact wood, ferrous metal, or cementitious construction.
2. Underlayment: Where installing sheet metal flashing and trim directly on cementitious substrates, install underlayment and cover with slip sheet.

C. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim.

1. Space movement joints at maximum of 10 ft. (3 m) with no joints within 24 inches (600 mm) of corner or intersection.
2. Form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with sealant concealed within joints.
3. Use lapped expansion joints only where indicated on Drawings.

D. Fasteners: Use fastener sizes that penetrate substrate not less than recommended by fastener manufacturer to achieve maximum pull-out resistance.

E. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.

F. Seal joints as required for watertight construction.

1. Use sealant-filled joints unless otherwise indicated.

a. Embed hooked flanges of joint members not less than 1 inch (25 mm) into sealant.
b. Form joints to completely conceal sealant.
c. When ambient temperature at time of installation is between 40 and 70 deg F (4 and 21 deg C), set joint members for 50 percent movement each way.
d. Adjust setting proportionately for installation at higher ambient temperatures.

1) Do not install sealant-type joints at temperatures below 40 deg F (4 deg C).

2. Prepare joints and apply sealants to comply with requirements in Section 079200 "Joint Sealants."

G. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter.

1. Pretin edges of sheets with solder to width of 1-1/2 inches (38 mm); however, reduce pretinning where pretinned surface would show in completed Work.
2. Do not solder aluminum sheet.
3. Do not use torches for soldering.
4. Heat surfaces to receive solder, and flow solder into joint.

a. Fill joint completely.
b. Completely remove flux and spatter from exposed surfaces.

5. Stainless Steel Soldering:

a. Tin edges of uncoated sheets, using solder for stainless steel and acid flux.
b. Promptly remove acid-flux residue from metal after tinning and soldering.
c. Comply with solder manufacturer's recommended methods for cleaning and neutralization.

H. Rivets: Rivet joints in uncoated aluminum where necessary for strength.

3.4 INSTALLATION OF SLOPED ROOF SHEET METAL FABRICATIONS

A. Install sheet metal flashing and trim to comply with performance requirements, sheet metal manufacturer's written installation instructions, and cited sheet metal standard.

1. Provide concealed fasteners where possible, and set units true to line, levels, and slopes.
2. Install work with laps, joints, and seams that are permanently watertight and weather resistant.

B. Pipe or Post Counterflashing: Install counterflashing umbrella with close-fitting collar with top edge flared for elastomeric sealant, extending minimum of 4 inches (100 mm) over base flashing. Install stainless steel draw band and tighten.

C. Counterflashing: Coordinate installation of counterflashing with installation of base flashing.

1. Insert counterflashing in reglets or receivers and fit tightly to base flashing.
2. Extend counterflashing 4 inches (100 mm) over base flashing.
3. Lap counterflashing joints minimum of 4 inches (100 mm).
4. Secure in waterproof manner by means of snap-in installation and sealant unless otherwise indicated.

3.5 INSTALLATION TOLERANCES

A. Shim and align sheet metal flashing and trim within installed tolerance of 1/4 inch in 20 ft. (6 mm in 6 m) on slope and location lines indicated on Drawings and within 1/8-inch (3-mm) offset of adjoining faces and of alignment of matching profiles.

3.6 CLEANING

A. Clean and neutralize flux materials. Clean off excess solder.

B. Clean off excess sealants.

3.7 PROTECTION

A. Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer's written installation instructions.

B. On completion of sheet metal flashing and trim installation, remove unused materials and clean finished surfaces as recommended in writing by sheet metal flashing and trim manufacturer.

C. Maintain sheet metal flashing and trim in clean condition during construction.

D. Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures, as determined by Architect.

END OF SECTION 076200

SECTION 077100 - ROOF SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Copings.
2. Roof-edge specialties.
3. *Roof-edge drainage systems.*
4. Counterflashings.

B. Related Requirements:

1. Section 061053 "Miscellaneous Rough Carpentry" for wood nailers, curbs, and blocking.
2. Section 076200 "Sheet Metal Flashing and Trim" for custom- and site-fabricated sheet metal flashing and trim.
3. Section 077129 "Manufactured Roof Expansion Joints" for manufactured roof expansion-joint cover assemblies.
4. Section 077200 "Roof Accessories" for roof hatches and other manufactured roof accessory units.
5. Section 079200 "Joint Sealants" for field-applied sealants between roof specialties and adjacent materials.

C. Preinstallation Conference: Conduct conference at Project site.

1. Meet with Owner, Architect, Owner's insurer if applicable, roofing-system testing and inspecting agency representative, roofing Installer, roofing-system manufacturer's representative, Installer, structural-support Installer, and installers whose work interfaces with or affects roof specialties, including installers of roofing materials and accessories.
2. Examine substrate conditions for compliance with requirements, including flatness and attachment to structural members.
3. Review special roof details, roof drainage, and condition of other construction that will affect roof specialties.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

C. Shop Drawings: For roof specialties.

1. Include project specific plans, elevations, expansion-joint locations, keyed details, and attachments to other work. Distinguish between plant- and field-assembled work.
2. Include details for expansion and contraction; locations of expansion joints, including direction of expansion and contraction.
3. Indicate profile and pattern of seams and layout of fasteners, cleats, clips, and other attachments.
4. Detail termination points and assemblies, including fixed points.
5. Include details of special conditions.
6. Include details for saddle flashings at roofing/coping terminations into adjacent walls.

D. Samples for Initial Selection: For each type of roof specialty indicated with factory-applied color finishes.

E. Samples for Verification:

1. Include Samples of each type of roof specialty to verify finish and color selection, in manufacturer's standard sizes.
2. Include copings, roof-edge specialties, *roof-edge drainage systems* and counterflashings made from 12-inch (300-mm) lengths of full-size components in specified material, and including fasteners, cover joints, accessories, and attachments.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For manufacturer.

B. Product Certificates: For each type of roof specialty.

C. Product Test Reports: For copings and roof-edge flashings, for tests performed by a qualified testing agency.

D. Sample Warranty: For manufacturer's special warranty.

E. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For roofing specialties to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer offering products meeting requirements that are FM Approvals listed for specified classand SPRI ES-1 tested to specified design pressure.

B. Source Limitations: Obtain roof specialties approved by manufacturer providing roofing-system warranty.

C. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and set quality standards for fabrication and installation.

1. Build mockup of typical roof edge and saddle flashing condition as shown on Drawings.
2. Build mockup of typical roof edge, including copings, gutters and downspouts, approximately 10 feet (3.0 m) long, including supporting construction, seams, attachments, underlayment, and accessories. Mockup to include transitions of primary air and water control layers with the exterior wall construction.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Do not store roof specialties in contact with other materials that might cause staining, denting, or other surface damage. Store roof specialties away from uncured concrete and masonry.

B. Protect strippable protective covering on roof specialties from exposure to sunlight and high humidity, except to extent necessary for the period of roof-specialty installation.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify profiles and tolerances of roof-specialty substrates by field measurements before fabrication, and indicate measurements on Shop Drawings.

B. Coordination: Coordinate roof specialties with flashing, trim, and construction of parapets, roof deck, roof and wall panels, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

1.9 WARRANTY

A. Roofing-System Warranty: Roof specialties are included in warranty provisions in Section 075419 "Polyvinyl-Chloride (PVC) Roofing."

B. Special Warranty on Painted Finishes: Manufacturer agrees to repair finish or replace roof specialties that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested according to ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Roof specialties shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

B. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

C. FM Approvals' Listing: Manufacture and install copings and roof-edge specialties that are listed in FM Approvals' "RoofNav" and approved for windstorm classification, Class 1-120. Identify materials with FM Approvals' markings.

D. SPRI Wind Design Standard: Manufacture and install copings and roof-edge specialties tested according to SPRI ES-1 and capable of resisting the following design pressures:

1. Design Pressure: As indicated on Drawings.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, hole elongation, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Provide clips that resist rotation and avoid shear stress as a result of thermal movements. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 COPINGS

A. Cantilevered Metal Copings (SMF-1): Manufactured coping system consisting of metal coping cap in section lengths not exceeding 12 feet (3.6 m), concealed anchorage; with corner units, end cap units, and concealed splice plates with finish matching coping caps.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Metal-Era, Inc.; Perma-Tite Cantilever Coping or a comparable product by one of the following:

a. Elevate; Holcim Building Envelope; Elevate Cantilever Coping
b. Hickman; an MTL Company; PermaSnap Cantilever Coping.
c. PAC-CLAD; Petersen; a Carlisle company.

2. Formed Aluminum Sheet Coping Caps: Aluminum sheet, 18 ga. or thickness as required to meet performance requirements.

a. Surface: Smooth, flat finish.
b. Finish: Two-coat mica fluoropolymer.
c. Color: Custom color to match MP-2.

3. Corners: Factory mitered and mechanically clinched and sealed watertight.
4. Special Fabrications: As indicated on Drawings.
5. Coping-Cap Attachment Method: Snap-on, fabricated from coping-cap material.

a. Snap-on Coping Anchor Plates: Concealed, galvanized-steel sheet, 12 inches (300 mm) wide, with integral cleats.

2.3 ROOF-EDGE SPECIALTIES

A. Roof-Edge Fascia (SMF-2, SMF-4, & SMF-6): Manufactured, two-piece, roof-edge fascia consisting of snap-on metal fascia cover in section lengths not exceeding 12 feet (3.6 m) and a continuous metal receiver with integral drip-edge cleat to engage fascia cover and secure single-ply roof membrane. Provide matching corner units.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Hickman; an MTL Company; TerminEdge EX Fascia or a comparable product by one of the following:

a. Elevate; Holcim Building Envelope; Elevate AnchorGard SP Fascia.
b. Metal-Era, Inc.
c. PAC-CLAD; Petersen; a Carlisle company; PAC-TITE Angular Fascia FA.

2. Formed Aluminum Sheet Fascia Covers: Aluminum sheet, 18 ga. or thickness as required to meet performance requirements.

a. Surface: Smooth, flat finish.
b. Finish: Two-coat mica fluoropolymer.
c. Color: Custom color to match MP-2 (@ SMF-1) & custom color to match MP-3 (@ SMF-6). Zinc finish to match MP-1 (@ SMF-4).

3. Corners: Factory mitered and mechanically clinched and sealed watertight.
4. Splice Plates: Concealed, of same material, finish, and shape as fascia cover.
5. Receiver: Extruded aluminum, 0.080 inch (2.03 mm) thick.
6. Special Fabrications: As indicated on Drawings.

2.4 ROOF-EDGE DRAINAGE SYSTEMS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Elevate; Holcim Building Envelope
2. Hickman; an MTL Company;
3. Metal-Era, Inc.
4. PAC-CLAD; Petersen Aluminum Corporation; a Carlisle company.

B. Gutters: Manufactured in uniform section lengths not exceeding 12 feet (3.6 m), with matching corner units, ends, outlet tubes, and other accessories. Elevate back edge at least 1 inch (25 mm) above front edge. Furnish flat-stock gutter straps, gutter brackets, expansion joints, and expansion-joint covers fabricated from same metal as gutters.

1. Aluminum Sheet: 0.050 inch (1.27 mm) thick.
2. Gutter Profile: As indicated on Drawings.
3. Corners: Factory mitered and mechanically clinched and sealed watertight.
4. Gutter Supports: Gutter brackets with finish matching the gutters.

C. Downspouts: Plain rectangular complete with mitered elbows, manufactured from the following exposed metal. Furnish with metal hangers, from same material as downspouts, and anchors.

1. Formed Aluminum: 0.050 inch (1.27 mm) thick.

2.5 COUNTERFLASHINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ATAS International, Inc.
2. Berridge Manufacturing Company.
3. Fry Reglet Corporation.
4. Heckmann Building Products, Inc.
5. Keystone Flashing Company, Inc.
6. Metal-Era, Inc.

B. Counterflashings: Manufactured units of heights to overlap top edges of base flashings by 4 inches (100 mm) and in lengths not exceeding 12 feet (3.6 m) designed to snap into through-wall-flashing receiver and compress against base flashings with joints lapped, from the following exposed metal:

1. Stainless Steel: 0.0250 inch (0.635 mm) thick.

C. Accessories:

1. Flexible-Flashing Retainer: Provide resilient plastic or rubber accessory to secure flexible flashing in reglet where clearance does not permit use of standard metal counterflashing or where reglet is provided separate from metal counterflashing.
2. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of counterflashing lower edge.

D. Stainless Steel Finish: ASTM A480/A480M No. 2B (bright, cold rolled, unpolished).

2.6 MATERIALS

A. Aluminum Sheet: ASTM B209 (ASTM B209M), alloy as standard with manufacturer for finish required, with temper to suit forming operations and performance required.

B. Stainless Steel Sheet: ASTM A240/A240M or ASTM A666, Type 304.

2.7 UNDERLAYMENT MATERIALS

A. Self-Adhering, High-Temperature Sheet: Minimum 30 to 40 mils (0.76 to 1.0 mm) thick, consisting of slip-resisting polyethylene-film top surface laminated to layer of butyl adhesive,

with release-paper backing; cold applied. Provide primer when recommended by underlayment manufacturer.

1. Thermal Stability: ASTM D1970/D1970M; stable after testing at 240 deg F (116 deg C).
2. Low-Temperature Flexibility: ASTM D1970/D1970M; passes after testing at minus 20 deg F (29 deg C).

2.8 MISCELLANEOUS MATERIALS

A. Fasteners: Manufacturer's recommended fasteners, suitable for application and designed to meet performance requirements. Furnish the following unless otherwise indicated:

1. Fasteners for Aluminum: Aluminum or Series 300 stainless steel.
2. Fasteners for Stainless Steel Sheet: Series 300 stainless steel.

B. Elastomeric Sealant: ASTM C920, elastomeric silicone polymer sealant of type, grade, class, and use classifications required by roofing-specialty manufacturer for each application.

C. Butyl Sealant: ASTM C1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type joints with limited movement.

D. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

E. Asphalt Roofing Cement: ASTM D4586, asbestos free, of consistency required for application.

2.9 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Coil-Coated Aluminum Sheet Finishes:

1. High-Performance Organic Finish: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

    a. Two-Coat Mica Fluoropolymer: AAMA 2605. Fluoropolymer finish with suspended mica flakes containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
    b. Concealed Surface Finish: Apply pretreatment and manufacturer's standard acrylic or polyester backer finish consisting of prime coat and wash coat with a minimum total dry film thickness of 0.5 mil (0.013 mm).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Examine walls, roof edges, and parapets for suitable conditions for roof specialties.

C. Verify that substrate is sound, dry, smooth, clean, sloped for drainage where applicable, and securely anchored.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF UNDERLAYMENT

A. Self-Adhering Sheet Underlayment: Apply primer if required by manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation. Apply wrinkle free, in shingle fashion to shed water, and with end laps of not less than 6 inches (152 mm) staggered 24 inches (610 mm) between courses. Overlap side edges not less than 3-1/2 inches (90 mm). Roll laps with roller. Cover underlayment within 14 days.

1. Apply continuously under copings, roof-edge specialties and counterflashings.
2. Coordinate application of self-adhering sheet underlayment under roof specialties with requirements for continuity with adjacent air barrier materials. Confirm compatibility of materials.

3.3 INSTALLATION, GENERAL

A. Install roof specialties according to manufacturer's written instructions. Anchor roof specialties securely in place, with provisions for thermal and structural movement. Use fasteners, solder, protective coatings, separators, underlayments, sealants, and other miscellaneous items as required to complete roof-specialty systems.

1. Install roof specialties level, plumb, true to line and elevation; with limited oil-canning and without warping, jogs in alignment, buckling, or tool marks.
2. Provide uniform, neat seams with minimum exposure of solder and sealant.
3. Install roof specialties to fit substrates and to result in weathertight performance. Verify shapes and dimensions of surfaces to be covered before manufacture.
4. Torch cutting of roof specialties is not permitted.
5. Do not use graphite pencils to mark metal surfaces.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

1. Coat concealed side of uncoated aluminum and stainless steel roof specialties with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
2. Bed flanges in thick coat of asphalt roofing cement where required by manufacturers of roof specialties for waterproof performance.

C. Expansion Provisions: Allow for thermal and building expansion and contraction of exposed roof specialties. Laps and splices are to be fabricated and installed in accordance with SMACNA provisions.

1. Space movement joints at a maximum of 10 feet with no joints within 18 inches (450 mm) of corners or intersections unless otherwise indicated on Drawings.
2. When ambient temperature at time of installation is between 40 and 70 deg F (4 and 21 deg C), set joint members for 50 percent movement each way. Adjust setting proportionately for installation at higher ambient temperatures.

D. Fastener Sizes: Use fasteners of sizes that penetrate substrate not less than recommended by fastener manufacturer to achieve maximum pull-out resistance.

E. Seal concealed joints with butyl sealant as required by roofing-specialty manufacturer.

F. Seal joints as required for weathertight construction. Place sealant to be completely concealed in joint. Do not install sealants at temperatures below 40 deg F (4 deg C).

G. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets to be soldered to a width of 1-1/2 inches (38 mm); however, reduce pre-tinning where pre-tinned surface would show in completed Work. Do not use torches for soldering. Heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.

3.4 INSTALLATION OF COPINGS

A. Install cleats, anchor plates, and other anchoring and attachment accessories and devices with concealed fasteners.

B. Anchor copings with manufacturer's required devices, fasteners, and fastener spacing to meet performance requirements.

1. Interlock face and back leg drip edges of snap-on coping cap into cleated anchor plates anchored to substrate at manufacturer's required spacing that meets performance requirements.

3.5 INSTALLATION OF ROOF-EDGE SPECIALITIES

A. Install cleats, cants, and other anchoring and attachment accessories and devices with concealed fasteners.

B. Anchor roof edgings with manufacturer's required devices, fasteners, and fastener spacing to meet performance requirements.

3.6 INSTALLATION OF ROOF-EDGE DRAINAGE-SYSTEM

A. Install components to produce a complete roof-edge drainage system according to manufacturer's written instructions. Coordinate installation of roof perimeter flashing with installation of roof-edge drainage system.

B. Gutters: Join and seal gutter lengths. Allow for thermal expansion. Attach gutters to firmly anchored gutter supports spaced not more than 24 inches (610 mm) apart. Attach ends with rivets and seal with sealant to make watertight. Slope to downspouts.

1. Install gutter with expansion joints at locations indicated but not exceeding 50 feet (15.2 m) apart. Install expansion-joint caps.

C. Downspouts: Join sections with manufacturer's standard telescoping joints. Provide hangers with fasteners designed to hold downspouts securely to walls and 1 inch (25 mm) away from walls; locate fasteners at top and bottom and at approximately 60 inches (1500 mm) o.c.

1. Provide elbows at base of downspouts at grade to direct water away from building.

3.7 INSTALLATION OF COUNTERFLASHINGS

A. Coordinate installation of counterflashings with installation of base flashings.

B. Counterflashings: Insert counterflashings into reglets or other indicated receivers; ensure that counterflashings overlap 4 inches (100 mm) over top edge of base flashings. Lap counterflashing joints a minimum of 4 inches (100 mm) and bed with butyl sealant. Fit counterflashings tightly to base flashings.

3.8 CLEANING AND PROTECTION

A. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

B. Clean and neutralize flux materials. Clean off excess solder and sealants.

C. Remove temporary protective coverings and strippable films as roof specialties are installed. On completion of installation, clean finished surfaces, including removing unused fasteners, metal filings, pop rivet stems, and pieces of flashing. Maintain roof specialties in a clean condition during construction.

D. Replace roof specialties that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

END OF SECTION 077100

SECTION 077129 - MANUFACTURED ROOF EXPANSION JOINTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Flanged bellows-type roof expansion joints.

B. Related Requirements:

1. Section 061000 "Rough Carpentry" for wooden curbs or cants for mounting roof expansion joints.
2. Section 076200 "Sheet Metal Flashing and Trim" for shop- and field-fabricated sheet metal expansion-joint systems, flashing, and other sheet metal items.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data:

1. Flanged bellows-type roof expansion joints.

B. Shop Drawings: Project specific. For roof expansion joints.

1. Include plans, elevations, sections, and attachment details.
2. Include details of splices, intersections, transitions, fittings, method of field assembly, and location and size of each field splice.
3. Provide isometric drawings of intersections, terminations, changes in joint direction or planes, and transition to other expansion joint systems depicting how components interconnect with each other and adjacent construction to allow movement and achieve waterproof continuity.

C. Samples: For each exposed product and for each color specified, 6 inches (150 mm) in size.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Product Test Reports: For each fire-barrier provided as part of a roof-expansion-joint assembly, for tests performed by a qualified testing agency.

C. Sample Warranties: For special warranties.

D. Field Quality-Control Reports.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Installer of roofing membrane.

1.6 WARRANTY

A. Special Warranty: Manufacturer and Installer agree to repair or replace roof expansion joints and components that leak, deteriorate beyond normal weathering, or otherwise fail in materials or workmanship within specified warranty period.

B. specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, hole elongation, overstressing of components, failure of joint seals, failure of connections, and other detrimental effects.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

B. Fire-Resistance Rating: Comply with ASTM E1966 or UL 2079; testing by a qualified testing agency to resist the spread of fire and to accommodate building thermal movements without impairing its ability to resist the passage of fire and hot gases. Identify products with appropriate markings of applicable testing agency.

1. Rating: Not less than fire-resistance rating of the roof assembly.
2. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

2.2 FLANGED BELLOWS-TYPE ROOF EXPANSION JOINTS

A. Flanged Bellows-Type Roof Expansion Joint (EXP JT-1 & EXP JT-3): Factory-fabricated, continuous, waterproof, joint cover with insulated vapor barrier consisting of exposed membrane bellows laminated to flexible, closed-cell support foam, and secured along each edge to 3- to 4-inch- (76- to 100-mm-) wide metal flange.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Construction Specialties, Inc.; BRJ-WC & BRJW-WC Series or a comparable product by one of the following:

a. Balco; a CSW Industrials Company.
b. Johns Manville; a Berkshire Hathaway company.

c. MM Systems Corporation.
d. Watson Bowman Acme Corp.
e. inpro Corporation.

2. Source Limitations: Obtain flanged bellows-type roof expansion joints approved by roofing manufacturer and that are part of roofing membrane warranty.
3. Joint Movement Capability: As indicated on Drawings.
4. Bellows: EPDM flexible membrane, nominal 60 mils (1.5 mm) thick.
5. Flanges: Stainless steel, 0.0188 inch (0.477 mm) thick.
6. Configuration: As indicated on Drawings.
7. Corner, Intersection, and Transition Units: Provide factory-fabricated units for corner and joint intersections and horizontal and vertical transitions including those to other building expansion joints.
8. Cover Membrane: EPDM flexible membrane, factory laminated to bellows and covering entire joint assembly and curbs.

   a. Color: Black.

9. Accessories: Provide splicing units, adhesives, and other components as recommended by roof-expansion-joint manufacturer for complete installation.
10. Secondary Seal: Continuous, waterproof membrane within joint and attached to substrate on sides of joint below the primary bellows assembly.

    a. Drain-Tube Assemblies: Equip secondary seal with drain tubes and seals to direct collected moisture as indicated on Drawings.
    b. Thermal Insulation: Fill space above secondary seal with manufacturer's standard, factory-installed mineral-fiber insulation; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E84.

11. Fire Barrier: Manufacturer's standard fire barrier for fire-resistance-rated expansion joint system.

B. Materials:

1. Stainless Steel Sheet: ASTM A240/A240M or ASTM A666, Type 304.
2. EPDM Membrane: ASTM D4637/D4637M, type standard with manufacturer for application.

2.3 MISCELLANEOUS MATERIALS

A. Adhesives: As recommended by roof-expansion-joint manufacturer.

1. Verify adhesives have a VOC content of 70 g/L or less.

B. Fasteners: Manufacturer's recommended fasteners, suitable for application and designed to withstand design loads.

1. Exposed Fasteners: Gasketed. Use screws with hex washer heads matching color of material being fastened.

C. Mineral-Fiber Blanket: ASTM C665.

D. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D1187.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joint openings, substrates, and expansion-control joint systems that interface with roof expansion joints, for suitable conditions where roof expansion joints will be installed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Comply with manufacturer's written instructions for handling and installing roof expansion joints.

1. Anchor roof expansion joints securely in place, with provisions for required movement. Use fasteners, protective coatings, sealants, and miscellaneous items as required to complete roof expansion joints.
2. Install roof expansion joints true to line and elevation; and without warping, jogs in alignment, buckling, or tool marks.
3. Provide for linear thermal expansion of roof-expansion-joint materials.
4. Provide uniform profile of roof expansion joint throughout its length; do not stretch or squeeze membranes.
5. Provide uniform, neat seams.
6. Install roof expansion joints to fit substrates and to result in watertight performance.

B. Directional Changes: Install factory-fabricated units at directional changes to provide continuous, uninterrupted, and watertight joints.

C. Transitions to Other Expansion-Control Joint Assemblies: Coordinate installation of roof expansion joints with other exterior expansion-control joint assemblies specified in Section 079513.16 "Exterior Expansion Joint Cover Assemblies" to result in watertight performance. Install factory-fabricated units at transitions between roof expansion joints and exterior expansion-control joint systems.

D. Splices: Splice roof expansion joints to provide continuous, uninterrupted, and waterproof joints.

1. Install waterproof splices and prefabricated end dams to prevent leakage of secondary-seal membrane.

E. Fire Barrier: Install fire barrier as required by manufacturer to provide continuous, uninterrupted fire resistance throughout length of roof expansion joint, including transitions and end joints.

F. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests.

B. Tests: Perform the following tests on representative areas roof expansion joints.

1. Field Water Penetration Test: Before installation of interior finishes has begun, areas designated by Architect to be tested in accordance with AAMA 501.2 and to not evidence water penetration.

    a. Perform a minimum of three tests in areas as directed by Architect.

2. Prepare test reports.

END OF SECTION 077129

SECTION 077200 - ROOF ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. *Roof curbs.*
2. Roof hatches.
3. Aluminum roof walkway system.

B. Related Requirements:

1. Section 055000 "Metal Fabrications" for metal vertical ladders, ships' ladders, and stairs for access to roof hatches.
2. Section 076200 "Sheet Metal Flashing and Trim" for shop- and field-formed metal flashing and miscellaneous sheet metal trim and accessories.
3. Section 077100 "Roof Specialties" for manufactured fasciae, copings, gravel stops, and counterflashing.
4. Section 077129 "Manufactured Roof Expansion Joints" for manufactured roof expansion-joint covers.

1.3 COORDINATION

A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.

B. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of roof accessory.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. Shop Drawings: For roof accessories.

1. Include project specific plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work. Include manufacturer's installation instructions.

C. Samples: For each exposed product and for each color and texture specified, prepared on Samples of size to adequately show color.

D. Delegated-Design Submittal: For *roof curbs and* roof walkway system indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail mounting, securing, and flashing of roof-mounted items to roof structure. Indicate coordinating requirements with roof membrane system.
2. Wind-Restraint Details: Detail fabrication and attachment of wind restraints. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:

1. Size and location of roof accessories specified in this Section.
2. Method of attaching roof accessories to roof or building structure.
3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
4. Required clearances.

B. Sample Warranties: For manufacturer's special warranties.

C. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For roof accessories to include in operation and maintenance manuals.

1.7 DELIVERY, STORAGE AND HANDLING

A. Deliver products in manufacturer's original packaging. Store materials in a dry, protected, well-vented area. Inspect product upon receipt and report damaged material immediately to delivering carrier and note such damage on the carrier's freight bill of lading.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Roof accessories shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

B. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design roof walkway system *and roof curbs* to comply with wind performance requirements, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Wind-Restraint Performance: As indicated on Drawings.

2.2 ROOF CURBS (RF ACC-2)

A. Roof Curbs: Internally reinforced roof-curb units capable of supporting superimposed live and dead loads, including equipment loads and other construction indicated on Drawings, bearing continuously on roof structure, and capable of meeting performance requirements; with welded or mechanically fastened and sealed corner joints, straight sides, and integrally formed deck-mounting flange at perimeter bottom.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. ATAS International, Inc.
b. Greenheck Fan Corporation.
c. Pate Company (The).
d. Roof Products, Inc.

B. Size: Custom size. Coordinate dimensions with roughing-in information or Shop Drawings of equipment to be supported.

C. Supported Load Capacity: Coordinate load capacity with information on Shop Drawings of equipment to be supported.

D. Material: Aluminum sheet, 0.125 inch (3.17 mm) thick.

1. Finish: Mill.

E. Construction:

1. Curb Profile: Profile as indicated on Drawings compatible with roofing system.
2. Fabricate curbs to minimum height of 12 inches (305 mm) above roofing surface unless otherwise indicated.
3. Top Surface: Level top of curb, with roof slope accommodated by sloping deck-mounting flange or by use of leveler frame.
4. Sloping Roofs: Where roof slope exceeds 1:48, fabricate curb with perimeter curb height tapered to accommodate roof slope so that top surface of perimeter curb is level. Equip unit with water diverter or cricket on side that obstructs water flow.
5. Insulation: Factory insulated with 1-1/2-inch- (38-mm-) thick glass-fiber board insulation.

6. *Liner: Same material as curb, of manufacturer's standard thickness and finish.*
7. *Nailer: Factory-installed wood nailer under top flange on side of curb, continuous around curb perimeter.*
8. *Wind Restraint Straps and Base Flange Attachment: Provide wind restraint straps, welded strap connectors, and base flange attachment to roof structure at perimeter of curb, of size and spacing required to meet wind uplift requirements.*
9. *Platform Cap: Where portion of roof curb is not covered by equipment, provide weathertight platform cap formed from 3/4-inch- (19-mm-) thick plywood covered with metal sheet of same type, thickness, and finish as required for curb. Delegated design for traffic-rated internal support structure.*
10. *Metal Counterflashing: Manufacturer's standard, removable, fabricated of same metal and finish as curb.*

2.3 ROOF HATCHES (RH-1 & RH-2)

A. Roof Hatches: Metal roof-hatch units with lids and insulated double-walled curbs, welded or mechanically fastened and sealed corner joints, continuous lid-to-curb counterflashing and weathertight perimeter gasketing, straight sides, and integrally formed deck-mounting flange at perimeter bottom.

1. Basis-of-Design Product: Subject to compliance with requirements, provide BILCO Company (The); TYPE SS-50TB Special Size, Single-Leaf, Thermally-Broken Aluminum Roof Hatch (RH-1) & TYPE D-50T Double-Leaf Aluminum Roof Hatch (RH-2) or a comparable product by one of the following:

    a. Activar Construction Products Group, Inc. - JL Industries.
    b. ACUDOR Products, Inc.
    c. Babcock-Davis.
    d. Milcor; a division of Hart & Cooley, Inc.
    e. O'Keeffe's Inc.
    f. Pate Company (The).

B. Type and Size: Single-leaf lid, 48 by ~~*96*~~*120* inches (RH-1) & Double-leaf lid, 60 by 60 inches (RH-2).

C. Loads: Minimum 40-lbf/sq. ft. (1.9-kPa) external live load and 20-lbf/sq. ft. (0.95-kPa) internal uplift load.

D. Hatch Material: Aluminum sheet.

1. Thickness: 11 ga.
2. Finish: Mill.

E. Construction:

1. Insulation: 3-inch- thick, polyisocyanurate board.
2. Hatch Lid: Opaque, insulated, and double walled, with manufacturer's standard metal liner of same material and finish as outer metal lid.
3. Curb Liner: Manufacturer's standard, of same material and finish as metal curb. Integral cap flashing.
4. On ribbed or fluted metal roofs, form flange at perimeter bottom to conform to roof profile.
5. Fabricate curbs to minimum height of 12 inches (305 mm) above roofing surface unless otherwise indicated.

6. Sloping Roofs: Where slope or roof deck exceeds 1:48, fabricate curb with perimeter curb height that is tapered to accommodate roof slope so that top surfaces of perimeter curb are level. Equip hatch with water diverter or cricket on side that obstructs water flow.

F. Hardware: Spring operators, hold-open arm, stainless steel spring latch with turn handles, stainless steel butt- or pintle-type hinge system, and padlock hasps inside and outside. Heavy-duty components.

1. Provide two-point latch on lids larger than 84 inches (2130 mm).
2. Cover hardware shall be bolted into heavy gauge channel reinforcing welded to the underside of the cover and concealed within the insulation space.

G. Safety Railing System: Roof-hatch manufacturer's standard system including rails, clamps, fasteners, safety barrier at railing opening, and accessories required for a complete installation; attached to roof hatch and complying with 29 CFR 1910.23 requirements and authorities having jurisdiction.

1. Height: 42 inches (1060 mm) above finished roof deck.
2. Posts and Rails: Galvanized-steel pipe, 1-1/4 inches (31 mm) in diameter or galvanized-steel tube, 1-5/8 inches (41 mm) in diameter.
3. Flat Bar: Galvanized steel, 2 inches (50 mm) high by 3/8 inch (9 mm) thick.
4. Maximum Opening Size: System constructed to prevent passage of a sphere 21 inches (533 mm) in diameter.
5. Chain Passway Barrier: Galvanized proof coil chain with quick link on fixed end.
6. Self-Latching Gate: Fabricated of same materials and rail spacing as safety railing system. Provide manufacturer's standard hinges and self-latching mechanism.
7. Post and Rail Tops and Ends: Weather resistant, closed or plugged with prefabricated end fittings.
8. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members.
9. Fabricate joints exposed to weather to be watertight.
10. Fasteners: Manufacturer's standard, finished to match railing system.
11. Finish: Manufacturer's standard.

a. Color: As selected by Architect from manufacturer's full range.

2.4 ALUMINUM ROOF WALKWAY SYSTEM (RF ACC-1)

A. Basis-of-Design Product: Subject to compliance with requirements, provide FixFast USA; KATT GW23 Walkway System or approved equal.

1. Walkway: 48” wide, mill finish, prefabricated high tensile expanded aluminum grating.

a. Working Load Limit; 1,000 pound industrial rated, suited for high frequency use.
b. Design and manufacture to meet applicable OSHA and ANSI regulations.
c. Provide structure to support walkway including, but not limited to, receiver track, support posts, toe boards, caps, bracing, and fasteners.
d. Provide rubber non-penetrating pads and aluminum outriggers as needed to accommodate roof slope.
e. Install in accordance with Manufacturers written instructions, recommendations and approved shop drawings. Provide protection board or membrane between baseplates and roof membrane (typical).
f. Refer to Drawings for location.

2.5 METAL MATERIALS

A. Aluminum Sheet: ASTM B209 (ASTM B209M), manufacturer's standard alloy for finish required, with temper to suit forming operations and performance required.

1. Mill Finish: As manufactured.
2. Concealed Finish: Pretreat with manufacturer's standard white or light-colored acrylic or polyester-backer finish consisting of prime coat and wash coat, with a minimum total dry film thickness of 0.5 mil (0.013 mm).

B. Aluminum Extrusions and Tubes: ASTM B221 (ASTM B221M), manufacturer's standard alloy and temper for type of use, finished to match assembly where used; otherwise mill finished.

C. Stainless Steel Sheet and Shapes: ASTM A240/A240M or ASTM A666, Type 304.

D. Steel Shapes: ASTM A36/A36M, hot-dip galvanized according to ASTM A123/A123M unless otherwise indicated.

E. Steel Tube: ASTM A500/A500M, round tube.

F. Galvanized-Steel Tube: ASTM A500/A500M, round tube, hot-dip galvanized according to ASTM A123/A123M.

G. Steel Pipe: ASTM A53/A53M, galvanized.

2.6 MISCELLANEOUS MATERIALS

A. Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.

B. Polyisocyanurate Board Insulation: ASTM C1289, thickness and thermal resistivity as indicated.

C. Underlayment:

1. Felt: ASTM D226/D226M, Type II (No. 30), asphalt-saturated organic felt, nonperforated.
2. Polyethylene Sheet: 6-mil- (0.15-mm-) thick polyethylene sheet complying with ASTM D4397.
3. Slip Sheet: Building paper, 3 lb/100 sq. ft. (0.16 kg/sq. m) minimum, rosin sized.
4. Self-Adhering, High-Temperature Sheet: Minimum 30 to 40 mils (0.76 to 1.0 mm) thick, consisting of slip-resisting polyethylene-film top surface laminated to layer of butyl or SBS-modified asphalt adhesive, with release-paper backing; cold applied. Provide primer when recommended by underlayment manufacturer.

D. Fasteners: Roof accessory manufacturer's recommended fasteners suitable for application and metals being fastened. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners. Furnish the following unless otherwise indicated:

1. Fasteners for Aluminum Sheet: Aluminum or Series 300 stainless steel.

E. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, PVC, or silicone or a flat design of foam rubber, sponge neoprene, or cork.

F. Elastomeric Sealant: ASTM C920, elastomeric silicone polymer sealant as recommended by roof accessory manufacturer for installation indicated; low modulus; of type, grade, class, and use classifications required to seal joints and remain watertight.

G. Butyl Sealant: ASTM C1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for expansion joints with limited movement.

H. Asphalt Roofing Cement: ASTM D4586/D4586M, asbestos free, of consistency required for application.

2.7 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

C. Verify dimensions of roof openings for roof accessories.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install roof accessories according to manufacturer's written instructions.

1. Install roof accessories level; plumb; true to line and elevation; and without warping, jogs in alignment, buckling, or tool marks.
2. Anchor roof accessories securely in place so they are capable of resisting indicated loads.
3. Use fasteners, separators, sealants, and other miscellaneous items as required to complete installation of roof accessories and fit them to substrates.
4. Install roof accessories to resist exposure to weather without failing, rattling, leaking, or loosening of fasteners and seals.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

1. Coat concealed side of uncoated aluminum roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
2. Underlayment: Where installing roof accessories directly on cementitious or wood substrates, install a course of underlayment and cover with manufacturer's recommended slip sheet.
3. Bed flanges in thick coat of asphalt roofing cement where required by manufacturers of roof accessories for waterproof performance.

C. *Roof Curb Installation: Install each roof curb so top surface is level.*

D. Roof-Hatch Installation:

1. Verify that roof hatch operates properly. Clean, lubricate, and adjust operating mechanism and hardware.
2. Attach safety railing system to roof-hatch curb.

E. Seal joints with elastomeric or butyl sealant as required by roof accessory manufacturer.

3.3 REPAIR AND CLEANING

A. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing according to ASTM A780/A780M.

B. Clean exposed surfaces according to manufacturer's written instructions.

C. Clean off excess sealants.

D. Replace roof accessories that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

END OF SECTION 077200

SECTION 077253 - SNOW GUARDS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Pad-type, flat-mounted metal snow guards.

1.2 ACTION SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

1. Pad-type, flat-mounted metal snow guards.

B. Shop Drawings: Include roof plans showing layouts and attachment details of snow guards.

C. Samples:

1. Pad-Type Snow Guards: Full-size unit with installation hardware.

a. For units with factory-applied finishes, submit specified color.

D. Delegated Design Submittals: For snow guards, include analysis reports signed and sealed by the qualified professional engineer responsible for their preparation.

1. Include calculation of number and location of snow guards.

1.3 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer's experience with providing delegated design engineering services of the kind indicated, including documentation that the engineer is licensed in the state in which the Project is located.

B. Product Test Reports: For each type of snow guard, for tests performed by a qualified testing agency, indicating load at failure of attachment to roof system identical to roof system used on this Project.

1.4 FIELD CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit adhesive-mounted snow guards to be installed, and adhesive cured, according to adhesive manufacturer's written instructions.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design snow guards, including attachment to roofing material and roof deck, as applicable for attachment method, based on the following:

1. Roof snow load.
2. Snow drifting
3. Roof slope.
4. Roof type.
5. Roof dimensions.
6. Roofing substrate type and thickness.
7. Snow guard type.
8. Snow guard fastening method and strength.
9. Snow guard spacing.
10. Coefficient of Friction Between Snow and Roof Surface: 0.
11. Factor of Safety: 3.

B. Performance Requirements: Provide snow guards that withstand exposure to weather and resist thermally induced movement without failure, rattling, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

C. Structural Performance: Snow guards to withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.

1. Snow Loads: As indicated on Drawings.

2.2 PAD-TYPE SNOW GUARDS (SG-1 & SG-2)

A. Pad-Type, Flat-Mounted Metal Snow Guards:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Alpine SnowGuards.
b. Berger; division of OmniMax International, Inc.
c. IceBlox Inc.
d. Levi's Building Components.
e. Polar Blox, Inc.
f. Zaleski Snow-Guards for Roofs, Inc.

2. Material:

a. Aluminum Sheet: ASTM B209 (ASTM B209M), not less than 0.050 inch (1.27 mm) thick.

1) Finish: High-performance organic two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

a) Color: Custom color to match Architect’s sample..

b. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792/A792M, Class AZ50 (Class AZM150), Grade 40 (Grade 275), not less than 0.022 inch (0.56 mmthick.

1) Finish: High-performance organic two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

a) Color: Custom color to match Architect’s sample.

3. Attachment: Manufacturer's tested system, capable of resisting design loads.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, snow guard attachment, and other conditions affecting performance of the Work.

1. Verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean and prepare substrates for bonding snow guards.

B. Prime substrates according to snow guard manufacturer's written instructions.

3.3 INSTALLATION

A. Install snow guards according to manufacturer's written instructions.

1. Space rows as recommended by manufacturer.

B. Attachment for Metal Roofing:

1. Do not use fasteners that will penetrate metal roofing or fastening methods that void metal roofing finish warranty.
2. Pad-Type, Flat-Mounted Snow Guards:

a. Adhere to metal roofing in accordance with manufacturer's written instructions.

END OF SECTION 077253

SECTION 077273 - VEGETATED ROOF SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Tray-type vegetated roof assembly.
2. Walkway pavers.

B. Related Requirements:

1. Section 075419 "Polyvinyl-Chloride (PVC) Roofing" for roofing membrane, roof thermal insulation and roofing system warranty.
2. Refer to Section 329500 "Garden Roof Assembly" for tray-type vegetated roof assemblies and pregrown sedum mats and additional requirements.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each vegetated roof assembly.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include material descriptions for each growing medium.

B. Sustainable Design Submittals:

C. Irrigation: Provide manufacturer's cut sheets and calculations on irrigation systems indicating water usage rates and system efficiency.

1. Irrigation Submetering: Provide manufacturer cut sheets for irrigation metering equipment.

D. Native Planting, Action Submittals: Provide plant information indicating compliance with native and adapted planting requirements for rain gardens for rainwater management.

E. Vegetated Roof, Action Submittals: Provide manufacturer's cut sheets indicating compliance with vegetated roof requirements for rainwater management.

F. Shop Drawings: Project specific. For each vegetated roof assembly.

1. Include plans, sections, slopes, and drain locations.
2. Indicate dimensions, weights, and loads.

3. Detail field assembly of components, depth of growing media, and attachments to other work.
4. Indicate walkway pavers, coordination with lighting and accessories.

G. Samples for Verification: For each of the following components of vegetated roof assembly:

1. Preplanted Vegetative Mat: 12 by 12 inches (300 by 300 mm).
2. Growing Media: 1-pint (0.5-liter) volume of each growing medium, in sealed plastic bags labeled with content and source. Each Sample to be typical of the lots of growing media to be furnished. Provide an accurate representation of texture and composition.
3. Walkway paver, manufacturer's standard size, in each color and texture required; include installation accessories to illustrate assembly.
4. Access Boxes: One in each size and color required.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Product Certificates: For each type of manufactured product.

1. Manufacturer's certified analysis of standard products.
2. Analysis of other materials by a recognized laboratory, in accordance with methods established by the Association of Official Analytical Chemists, where applicable.

C. Product Test Reports: For complete analysis of each growing medium, for tests performed by manufacturer and witnessed by a qualified testing agency or by a qualified testing agency.

D. Field quality-control reports.

E. Sample Warranty: For special warranties.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For vegetated roof assembly and plants, including a recommended maintenance plan with procedures for inspection and care during a calendar year. Submit before start of required warranty and maintenance periods.

B. Continuing Maintenance Proposal: From vegetated roof assembly Installer approved by roofing-membrane manufacturer to Owner, in the form of a standard two-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: A qualified vegetated roof assembly Installer, approved, authorized, or licensed by roofing-membrane manufacturer, whose work has resulted in successful establishment of vegetated roofs.

1. Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when vegetated roof assembly work is in progress.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and Federal laws if applicable.

B. Bulk Materials:

1. Do not dump or store bulk materials on or near structures, utilities, walkways and pavements, or existing roof areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of debris-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk materials with product certificates.

C. Handle and store materials, and place equipment in a manner to avoid overloading roof structure or damaging roofing membrane.

1.8 FIELD CONDITIONS

A. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when optimum results may be obtained. Apply products during favorable weather conditions in accordance with manufacturer's written instructions and warranty requirements.

1.9 WARRANTY

A. Refer to Section 329500 “Garden Roof Assembly”.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain vegetated roof assembly components, growing medium, plants accessories from single source from single manufacturer.

2.2 VEGETATED ROOF ASSEMBLIES

A. Refer to Section 329500 “Garden Roof Assembly”.

2.3 MANUFACTURED GROWING MEDIA

A. Refer to Section 329500 “Garden Roof Assembly”.

2.4 ACCESSORIES

A. Refer to Section 329500 “Garden Roof Assembly”.

B. Access Boxes: Manufacturer's standard stainless steel boxes with removable, rigid covers for accessing drains, valves, and switches beneath the finish elevation of growing medium; secure each cover with four noncorrosive screws.

1. Size: 12 inches (305 mm) in diameter by depth of vegetated roof assembly at each location.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine each area to receive vegetated roof assembly for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Verify that roof insulation over roofing membrane is in place, secure, and flush along all seams.
2. Verify that perimeter and other flashings are in place and secure along entire lengths where they will be covered by vegetated roof assembly.

B. Inspect growing medium.

1. Verify that no foreign or deleterious material or liquid, such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in growing medium within a planting area.
2. If growing medium is contaminated by foreign or deleterious material or liquid, remove growing medium and contamination and replace with new growing medium.

3.2 INSTALLATION, GENERAL

A. Protection Course: Cover roofing system with protection board with butted and fully taped joints before roofing system is subject to vegetated roof assembly installation work.

B. Install vegetated roof assembly in accordance with manufacturer's written instructions.

C. Access Boxes: Install access box at each drain, valve, and switch and at locations shown on Drawings. Install top of boxes 1 inch (25 mm) above the finish elevation of growing medium.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests.

B. Perform the following tests:

1. Electronic Leak-Detection Testing:

a. Testing agency will test each deck area for leaks using an electronic leak-detection method that locates discontinuities in the roofing membrane.
b. Testing agency will perform tests on abutting or overlapping smaller areas as necessary to cover entire test area.

c. Testing agency will create a conductive electronic field over the area of roofing to be tested and electronically determine locations of discontinuities or leaks, if any, in the roofing.
d. Testing agency will provide survey report indicating locations of discontinuities if any.

2. Proceed with installation of vegetated roof assembly only after unsatisfactory conditions have been corrected.

C. Manufacturer's Field Service: Engage roofing-membrane manufacturer's authorized service representative to provide inspection of vegetated roof assembly installation and prepare inspection reports.

D. Correct deficiencies in work that do not comply with requirements.

E. Prepare test and inspection reports.

3.4 PROTECTION

A. Protect vegetated roof assemblies from damage, including growing-medium contamination, due to operations of other contractors and trades. Repair or replace damaged vegetated roof assemblies.

3.5 MAINTENANCE SERVICE

A. Maintenance Service: Provide maintenance by skilled employees of vegetated roof assembly Installer approved by roofing-membrane manufacturer. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than the specified maintenance period.

1. Assembly and Plant Maintenance: During maintenance period, maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing devices, resetting plants to proper elevations or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.

a. Replace growing medium that becomes displaced or eroded because of settling or other processes.
b. Apply treatments as required to keep plant materials, planted areas, and growing medium free of pests and pathogens or disease. Use integrated past management practices whenever possible to minimize the use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.
c. Use only products and methods acceptable to roofing-membrane manufacturer.
d. Following maintenance period, instruct Owner and furnish written maintenance instructions as necessary for planting materials to develop and maintain healthy root structure.

2. Maintenance Period: 24 months from date of Planting Completion.

END OF SECTION 077273

SECTION 078100 - APPLIED FIRE PROTECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Sprayed fire-resistive materials.

B. Related Requirements:

1. Section 078123 "Intumescent Fire Protection" for mastic and intumescent fire-resistive coatings.

1.3 DEFINITIONS

A. SFRM: Sprayed fire-resistive materials.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review products, design ratings, restrained and unrestrained conditions, densities, thicknesses, bond strengths, and other performance requirements.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Sustainable Design Submittals:

1. Product Data: For paints and coatings, indicating VOC content.
2. Laboratory Test Reports: For paints and coatings, indicating compliance with requirements for low-emitting materials.

C. Shop Drawings: Project specific. Framing plans or schedules, or both, indicating the following:

1. Extent of fire protection for each construction and fire-resistance rating.
2. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.

3. Minimum sprayed fire-resistive material thicknesses needed to achieve required fire-resistance rating of each structural component and assembly.
4. Treatment of sprayed fire-resistive material after application.

D. Samples: For each exposed product and for each color and texture specified, in manufacturer's standard dimensions in size.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and testing agency.

B. Product Certificates: For each type of sprayed fire-resistive material.

C. Evaluation Reports: For sprayed fire-resistive material, from ICC-ES.

D. Preconstruction Test Reports: For fire protection.

E. Field quality-control reports.

F. Manufacturer’s Certificates:

1. Certification from manufacturer, stating that proposed material is free of asbestos, including actinolite, amosite, anthophyllite, chrysotile, crocidolite, tremolite and asbestos contaminated vermiculite.
2. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
3. Fireproofing Product Certificates: Provide certificates from fireproofing manufacturer, for each product required, indicating that;

    a. Steel to receive sprayed fireproofing should be unprimed; however, if it is primed, sprayed fireproofing manufacturer certify primers applied to steel in shop or field are compatible with sprayed-on fireproofing and will not impair its performance under fire exposure for applications indicated, as provided by ASTM E119 test. Include test and other data as evidence. Coordinate with structural steel Sections.
    b. Each fireproofing product complies with specified product requirements and is suitable for use indicated.
    c. Sprayed fireproofing has been completed in accordance with requirements to provide necessary fire resistance ratings. Provide Ratings Certificate.

4. Manufacturer Letter: Verifying that the UL Designs selected for the project are not load restricted.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by applied fire protection material manufacturer as experienced and with sufficient trained staff to install manufacturer's products in accordance with specified requirements.

B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution and for preconstruction testing.

1. Build mockup of each type of fire protection and different substrate and each required finish as shown on Drawings.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Owner will engage a qualified testing agency to perform preconstruction testing on field mockups of fire protection.

1. Provide test specimens and assemblies representative of proposed materials and construction.

B. Preconstruction Adhesion and Compatibility Testing: Test for compliance with requirements for specified performance and test methods.

1. Bond Strength: Test for cohesive and adhesive strength according to ASTM E736. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
2. Density: Test for density according to ASTM E605. Provide density indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
3. Verify that manufacturer, through its own laboratory testing or field experience, attests that primers or coatings are compatible with sprayed fire-resistive material.
4. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
5. For materials failing tests, obtain sprayed fire-resistive material manufacturer's written instructions for corrective measures including the use of specially formulated bonding agents or primers.

1.9 FIELD CONDITIONS

A. Environmental Limitations: Do not apply fire protection when ambient or substrate temperature is 44 deg F (7 deg C) or lower unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.

B. Ventilation: Ventilate building spaces during and after application of fire protection, providing complete air exchanges according to manufacturer's written instructions. Use natural means or, if they are inadequate, forced-air circulation until fire protection dries thoroughly.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Assemblies: Provide fire protection, including auxiliary materials, according to requirements of each fire-resistance design and manufacturer's written instructions.

B. Source Limitations: Obtain fire protection for each fire-resistance design from single source.

C. Fire-Resistance Design: Indicated on Drawings, tested according to ASTM E119 or UL 263; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Steel members are to be considered unrestrained unless specifically noted otherwise.

D. VOC Content: For field applications, verify coatings comply with VOC content limits of authorities having jurisdiction and the following VOC content limits:

1. Flat Paints and Coatings: 50 g/L.
2. Nonflat Paints and Coatings: 50 g/L.
3. Primers, Sealers, and Undercoaters: 100 g/L.

E. Asbestos: Provide products containing no detectable asbestos.

2.2 SPRAYED FIRE-RESISTIVE MATERIALS

A. Sprayed Fire-Resistive Material: Manufacturer's standard, factory-mixed, lightweight, dry formulation, complying with indicated fire-resistance design, and mixed with water at Project site to form a slurry or mortar before conveyance and application.

1. Medium Density Spray-Applied Fire Resistive Material Products (FP-1): For concealed locations and in plenum ceilings and above suspended ceilings. Subject to compliance with requirements, provide one of the following:

a. Carboline Company; a subsidiary of RPM International; Southwest Type 7GP
b. GCP Applied Technologies, Inc.; Monokote Z-106/HY.
c. Isolatek International; Cafco 400.

2. High Density Spray-Applied Fire Resistive Material Products (FP-3): For exposed locations on columns, beams, and roof deck in mechanical and electrical rooms, penthouses, data rooms, elevator rooms and shafts, non-ducted air shafts, equipment rooms, and other service type rooms and where indicated on Drawings. Subject to compliance with requirements, provide one of the following:

a. Carboline Company; a subsidiary of RPM International; Pyrocrete 40.
b. GCP Applied Technologies, Inc.; Monokote Z146.
c. Isolatek International; Fendolite M-II.

3. Bond Strength: Minimum 430-lbf/sq. ft. (20.59-kPa) cohesive and adhesive strength based on field testing according to ASTM E736.
4. Density: Not less than density specified in the approved fire-resistance design, according to ASTM E605.
5. Thickness: As required for fire-resistance design indicated, measured according to requirements of fire-resistance design or ASTM E605, whichever is thicker, but not less than 0.375 inch (9 mm).
6. Combustion Characteristics: ASTM E136.
7. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

a. Flame-Spread Index: 10 or less.
b. Smoke-Developed Index: 10 or less.

8. Corrosion Resistance: No evidence of corrosion according to ASTM E937.
9. Deflection: No cracking, spalling, or delamination according to ASTM E759.
10. Effect of Impact on Bonding: No cracking, spalling, or delamination according to ASTM E760.
11. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. (0.270 g/sq. m) in 24 hours according to ASTM E859.
12. Fungal Resistance: Treat products with manufacturer's standard antimicrobial formulation to result in no growth on specimens per ASTM G21.
13. Finish: As selected by Architect from manufacturer's standard finishes

    a. Color: As selected by Architect from manufacturer's full range.

2.3 AUXILIARY MATERIALS

A. Provide auxiliary materials that are compatible with sprayed fire-resistive material and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.

B. Substrate Primers: Primers approved by sprayed fire-resistive material manufacturer and complying with one or both of the following requirements:

1. Primer and substrate are identical to those tested in required fire-resistance design by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
2. Primer's bond strength in required fire-resistance design complies with specified bond strength for sprayed fire-resistive material and with requirements in UL's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction, based on a series of bond tests according to ASTM E736.

A. Bonding Agent: Product approved by sprayed fire-resistive material manufacturer and complying with requirements in UL's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction.

B. Reinforcing Fabric: Glass- or carbon-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated; approved and provided by sprayed fire-resistive material manufacturer.

C. Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance design indicated; approved and provided by sprayed fire-resistive material manufacturer. Include pins and attachment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of the Work and according to each fire-resistance design.

1. Verify that substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, paints, and encapsulants, or other foreign

substances capable of impairing bond of fire protection with substrates under conditions of normal use or fire exposure.

2. Verify that objects penetrating fire protection, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
3. Verify that substrates receiving fire protection are not obstructed by ducts, piping, equipment, or other suspended construction that will interfere with fire protection application.

B. Verify that concrete work on steel deck is complete before beginning Work.

C. Verify that roof construction, installation of rooftop HVAC equipment, and other related work are complete before beginning Work.

D. Conduct tests according to sprayed fire-resistive material manufacturer's written instructions to verify that substrates are free of substances capable of interfering with bond.

E. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Cover other work subject to damage from fallout or overspray of fire protection materials during application.

B. Clean substrates of substances that could impair bond of fire protection.

C. Prime substrates where included in fire-resistance design and where recommended in writing by sprayed fire-resistive material manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive fire protection.

D. For applications visible on completion of Project, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of fire protection. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

3.3 APPLICATION

A. Construct fire protection assemblies that are identical to fire-resistance design indicated and products as specified, tested, and substantiated by test reports; for thickness, primers, sealers, topcoats, finishing, and other materials and procedures affecting fire protection Work.

B. Comply with sprayed fire-resistive material manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and apply fire protection; as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.

C. Coordinate application of fire protection with other construction to minimize need to cut or remove fire protection.

1. Do not begin applying fire protection until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.
2. Defer installing ducts, piping, and other items that would interfere with applying fire protection until application of fire protection is completed.

D. Metal Decks:

1. Do not apply fire protection to underside of metal deck substrates until concrete topping, if any, is completed.
2. Do not apply fire protection to underside of metal roof deck until roofing is completed; prohibit roof traffic during application and drying of fire protection.

E. Install auxiliary materials as required, as detailed, and according to fire-resistance design and sprayed fire-resistive material manufacturer's written instructions for conditions of exposure and intended use. For auxiliary materials, use attachment and anchorage devices of type recommended in writing by sprayed fire-resistive material manufacturer.

F. Spray apply fire protection to maximum extent possible. After the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by sprayed fire-resistive material manufacturer.

G. Extend fire protection in full thickness over entire area of each substrate to be protected.

H. Install body of fire protection in a single course unless otherwise recommended in writing by sprayed fire-resistive material manufacturer.

I. Provide a uniform finish complying with description indicated for each type of fire protection material and matching finish approved for required mockups.

J. Cure fire protection according to sprayed fire-resistive material manufacturer's written instructions.

K. Do not install enclosing or concealing construction until after fire protection has been applied, inspected, and tested and corrections have been made to deficient applications.

L. Finishes: Where indicated, apply fire protection to produce the following finishes:

1. Manufacturer's Standard Finishes: Finish according to manufacturer's written instructions for each finish selected.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:

1. Test and inspect as required by the IBC, Subsection 1705.13, "Sprayed Fire-Resistant Materials.", as indicated on Schedule of Special Inspections.

B. Perform the tests and inspections of completed Work in successive stages. Do not proceed with application of fire protection for the next area until test results for previously completed applications of fire protection show compliance with requirements. Tested values must equal or exceed values as specified and as indicated and required for approved fire-resistance design.

C. Fire protection will be considered defective if it does not pass tests and inspections.

1. Remove and replace fire protection that does not pass tests and inspections, and retest.
2. Apply additional fire protection, per manufacturer's written instructions, where test results indicate insufficient thickness, and retest.

D. Prepare test and inspection reports.

3.5 CLEANING

A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.

3.6 PROTECTION

A. Protect fire protection, according to advice of manufacturer and Installer, from damage resulting from construction operations or other causes, so fire protection is without damage or deterioration at time of Substantial Completion.

3.7 REPAIRS

A. As installation of other construction proceeds, inspect fire protection and repair damaged areas and fire protection removed due to work of other trades.

B. Repair fire protection damaged by other work before concealing it with other construction.

C. Repair fire protection by reapplying it using same method as original installation or using manufacturer's recommended trowel-applied product.

END OF SECTION 078100

SECTION 078123 - INTUMESCENT FIRE PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Mastic and intumescent fire-resistive coatings.

B. Related Requirements:

1. Section 078100 "Applied Fire Protection" for sprayed fire-resistive materials (SFRM).

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review products, design ratings, restrained and unrestrained conditions, thicknesses, and other performance requirements.

1.3 ACTION SUBMITTALS

A. Product Data:

1. Mastic and intumescent fire-resistive coatings.
2. Substrate primers.
3. Topcoat.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.

C. Shop Drawings: Framing plans or schedules, or both, indicating the following:

1. Extent of fire protection for each construction and fire-resistance rating.
2. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
3. Minimum mastic and intumescent fire-resistive coating thicknesses needed to achieve required fire-resistance rating of each structural component and assembly.
4. Treatment of mastic and intumescent fire-resistive coating after application.

D. Samples: For each exposed product and for each color and texture specified, in manufacturer's standard dimensions in size.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and testing agency.

B. Product Certificates: For each type of mastic and intumescent fire-resistive coating.

C. Evaluation Reports: For mastic and intumescent fire-resistive coating, from ICC-ES.

D. Field quality-control reports.

E. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by mastic and intumescent fire-resistive coating manufacturer as experienced and with sufficient trained staff to install manufacturer's products in accordance with specified requirements.

B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution.

1. Build mockup of each type of fire protection and different substrate and each required finish as shown on Drawings.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.6 FIELD CONDITIONS

A. Environmental Limitations: Do not apply fire protection when ambient or substrate temperature is 50 deg F (10 deg C) or lower unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.

B. Ventilation: Ventilate building spaces during and after application of fire protection, providing complete air exchanges in accordance with manufacturer's written instructions. Use natural means or, if they are inadequate, forced-air circulation until fire protection dries thoroughly.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Assemblies: Provide fire protection, including auxiliary materials, in accordance with requirements of each fire-resistance design and manufacturer's written instructions.

B. Source Limitations: Obtain fire protection for each fire-resistance design from single source.

C. Fire-Resistance Design: Indicated on Drawings, tested in accordance with ASTM E119 or UL 263; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Steel members are to be considered unrestrained unless specifically noted otherwise.

D. VOC Content: For field applications, verify coatings comply with VOC content limits of authorities having jurisdiction and the following VOC content limits:

1. Flat Paints and Coatings: 50 g/L.
2. Nonflat Paints and Coatings: 50 g/L.
3. Primers, Sealers, and Undercoaters: 100 g/L.

E. Asbestos: Provide products containing no detectable asbestos.

2.2 MASTIC AND INTUMESCENT FIRE-RESISTIVE COATINGS (FP-2)

A. Mastic and Intumescent Fire-Resistive Coating: Manufacturer's standard, factory-mixed formulation, and complying with indicated fire-resistance design.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Isolatek International; CAFCO SprayFilm WB 5 or a comparable product by one of the following:

a. Albi Manufacturing; a division of StanChem, Inc.
b. Carboline Company; a subsidiary of RPM International.
c. Contego International, Inc.
d. Hilti, Inc.

2. Thickness: As required for fire-resistance design indicated, measured in accordance with requirements of fire-resistance design.
3. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

a. Flame-Spread Index: 25 or less.
b. Smoke-Developed Index: 50 or less.

4. Finish: Level 2, Smooth.

2.3 AUXILIARY MATERIALS

A. Provide auxiliary materials that are compatible with mastic and intumescent fire-resistive coating and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.

B. Substrate Primers: Primers approved by mastic and intumescent fire-resistive coating manufacturer and complying with required fire-resistance design by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.

C. Topcoat: Suitable for application over mastic and intumescent fire-resistive coating; of type recommended in writing by mastic and intumescent fire-resistive coating manufacturer for each fire-resistance design.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of the Work and in accordance with each fire-resistance design.

1. Verify that substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, paints, and encapsulants, or other foreign substances capable of impairing bond of fire protection with substrates under conditions of normal use or fire exposure.
2. Verify that objects penetrating fire protection, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
3. Verify that substrates receiving fire protection are not obstructed by ducts, piping, equipment, or other suspended construction that will interfere with fire protection application.

B. Conduct tests in accordance with mastic and intumescent fire-resistive coating manufacturer's written instructions to verify that substrates are free of substances capable of interfering with bond.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Cover other work subject to damage from fallout or overspray of fire protection materials during application.

B. Clean substrates of substances that could impair bond of fire protection.

C. Prime substrates where included in fire-resistance design and where recommended in writing by mastic and intumescent fire-resistive coating manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive fire protection.

D. For applications visible on completion of Project, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of fire protection. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

3.3 APPLICATION

A. Construct fire protection assemblies that are identical to fire-resistance design indicated and products as specified, tested, and substantiated by test reports; for thickness, primers, topcoats, finishing, and other materials and procedures affecting fire protection Work.

B. Comply with mastic and intumescent fire-resistive coating manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and apply fire protection; as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.

C. Coordinate application of fire protection with other construction to minimize need to cut or remove fire protection.

1. Do not begin applying fire protection until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.
2. Defer installing ducts, piping, and other items that would interfere with applying fire protection until application of fire protection is completed.

D. Install auxiliary materials as required, as detailed, and in accordance with fire-resistance design and mastic and intumescent fire-resistive coating manufacturer's written instructions for conditions of exposure and intended use. For auxiliary materials, use attachment and anchorage devices of type recommended in writing by mastic and intumescent fire-resistive coating manufacturer.

E. Spray apply fire protection to maximum extent possible. After the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by mastic and intumescent fire-resistive coating manufacturer.

F. Extend fire protection in full thickness over entire area of each substrate to be protected.

G. Install body of fire protection in a single course unless otherwise recommended in writing by mastic and intumescent fire-resistive coating manufacturer.

H. Provide a uniform finish complying with description indicated for each type of fire protection material and matching finish approved for required mockups.

I. Cure fire protection in accordance with mastic and intumescent fire-resistive coating manufacturer's written instructions.

J. Do not install enclosing or concealing construction until after fire protection has been applied, inspected, and tested and corrections have been made to deficient applications.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:

1. Test and inspect as required by the IBC, Subsection 1705.14, "Mastic and Intumescent Fire-Resistant Coatings."

B. Perform the tests and inspections of completed Work in successive stages. Do not proceed with application of fire protection for the next area until test results for previously completed applications of fire protection show compliance with requirements. Tested values must equal or exceed values as specified and as indicated and required for approved fire-resistance design.

C. Fire protection will be considered defective if it does not pass tests and inspections.

1. Remove and replace fire protection that does not pass tests and inspections, and retest.
2. Apply additional fire protection, per manufacturer's written instructions, where test results indicate insufficient thickness, and retest.

D. Prepare test and inspection reports.

3.5 CLEANING

A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.

3.6 PROTECTION

A. Protect fire protection, in accordance with advice of manufacturer and Installer, from damage resulting from construction operations or other causes, so fire protection is without damage or deterioration at time of Substantial Completion.

3.7 REPAIRS

A. As installation of other construction proceeds, inspect fire protection and repair damaged areas and fire protection removed due to work of other trades.

B. Repair fire protection damaged by other work before concealing it with other construction.

C. Repair fire protection by reapplying it using same method as original installation or using manufacturer's recommended trowel-applied product.

END OF SECTION 078123

SECTION 078413 - PENETRATION FIRESTOPPING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Penetrations in fire-resistance-rated walls.
2. Penetrations in horizontal assemblies.
3. Penetrations in smoke barriers.

B. Related Requirements:

1. Section 078443 "Joint Firestopping" for joints in or between fire-resistance-rated construction, at exterior curtain-wall/floor intersections, and in smoke barriers.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.

C. Product Schedule: For each penetration firestopping system. Include location, illustration of firestopping system, and design designation of qualified testing and inspecting agency.

1. Engineering Judgments: Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular penetration firestopping system, submit illustration, with modifications marked, approved by penetration firestopping system manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly developed in accordance with current International Firestop Council (IFC) guidelines. Obtain approval of authorities having jurisdiction prior to submittal.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Listed System Designs: For each penetration firestopping system, for tests performed by a qualified testing agency.

C. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Installer Certificates: From Installer indicating that penetration firestopping systems have been installed in compliance with requirements and manufacturer's written instructions.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: A third-party contractor which specializes in penetration firestopping and meets one of the following requirements:

1. FM Research approved in accordance with FM Standard 4991, or
2. UL Qualified Firestop Contractor, or
3. Meet all of the following requirements:

a. Installation personnel shall be trained by the approved firestop manufacturer.
b. The installation firm shall be experienced in installing firestop systems similar in material, design, and extent to that indicated for this project, whose work has resulted in construction with a record of successful performance
c. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified tested and listed system requirements.
d. Minimum of three (3) years of experience and shown to have successfully completed not less than five (5) comparable scale projects with available references.

B. Installer: Subject to compliance with requirements, shall be one of the following:

1. Firestop Solutions.
2. Life Safety Services.
3. Remedi8.
4. Strike Pro Tech.
5. Universal Firestop Services.
6. Other pre-approved Installer.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not install penetration firestopping system when ambient or substrate temperatures are outside limits permitted by penetration firestopping system manufacturers or when substrates are wet because of rain, frost, condensation, or other causes.

B. Install and cure penetration firestopping materials per manufacturer's written instructions using natural means of ventilations or, where this is inadequate, forced-air circulation.

1.8 COORDINATION

A. Coordinate construction of openings and penetrating items to ensure that penetration firestopping systems can be installed according to specified firestopping system design.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate penetration firestopping systems.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain joint firestop systems for each type of joint opening indicated from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics:

1. Perform penetration firestopping system tests by a qualified testing agency acceptable to authorities having jurisdiction.
2. Test per testing standards referenced in "Penetration Firestopping Systems" Article. Provide rated systems complying with the following requirements:

a. Penetration firestop systems installed with products bearing the classification marking of a qualified product certification agency in accordance with listed system designs published by a qualified testing agency.

1) UL in its online directory "Product iQ."
2) Intertek Group in its "Directory of Building Products."
3) FM Approvals in its "Approval Guide."

2.3 PENETRATION FIRESTOPPING SYSTEMS

A. Penetration Firestopping Systems: Systems that resist spread of fire, passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated. Penetration firestopping systems are to be compatible with one another, with the substrates forming openings, and with penetrating items if any. All firestopping shall be red in color. Firestopping shall not be used in non-fire-rated applications.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. 3M Fire Protection Products.
b. Hilti, Inc.
c. RectorSeal Firestop; a CSW Industrials Company.
d. Specified Technologies, Inc.
e. Tremco Incorporated.

B. Penetrations in Fire-Resistance-Rated Walls: Penetration firestopping systems with ratings determined per ASTM E814 or UL 1479.

1. F-Rating: Not less than the fire-resistance rating of the wall penetrated.
2. Membrane Penetrations: Install recessed fixtures such that the required fire resistance will not be reduced.

C. Penetrations in Horizontal Assemblies: Penetration firestopping systems with ratings determined per ASTM E814 or UL 1479.

1. F-Rating: At least one hour, but not less than the fire-resistance rating of the floor penetrated.
2. T-Rating: At least one hour, but not less than the fire-resistance rating of the floor. The following floor penetrations do not require a T-rating:

    a. Those within the cavity of a wall.
    b. Floor, tub, or shower drains within a concealed space.
    c. 4-inch (200-mm) or smaller metal conduit penetrating directly into metal-enclosed electrical switchgear.

3. W-Rating: Provide penetration firestopping systems with a Class 1 W-rating in accordance with UL 1479.

D. Penetrations in Smoke Barriers: Penetration firestopping systems with ratings determined per UL 1479.

1. L-Rating: Not exceeding 5.0 cfm/sq. ft. (0.025 cu. m/s per sq. m) of penetration opening and no more than 50-cfm (0.024-cu. m/s) cumulative total for any 100 sq. ft. (9.3 sq. m) at both ambient and elevated temperatures.

E. Exposed Penetration Firestopping Systems: Flame-spread and smoke-developed indexes of less than 25 and 450, respectively, per ASTM E84.

1. Verify sealant has a VOC content of 250 g/L or less.

F. Accessories: Provide components for each penetration firestopping system that are needed to install fill materials and to maintain ratings required. Use only those components specified by penetration firestopping system manufacturer and approved by qualified testing and inspecting agency for conditions indicated.

1. Permanent forming/damming/backing materials.
2. Substrate primers.
3. Collars.
4. Steel sleeves.

2.4 FILL MATERIALS

A. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer sleeve lined with an intumescent strip, a flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.

B. Latex Sealants: Single-component latex formulations that do not re-emulsify after cure during exposure to moisture.

C. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.

D. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced intumescent elastomeric sheet bonded to galvanized-steel sheet.

E. Intumescent Putties: Nonhardening, water-resistant, intumescent putties containing no solvents or inorganic fibers.

F. Intumescent Wrap Strips: Single-component intumescent elastomeric strips for use around combustible penetrants.

G. Mortars: Prepackaged dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.

H. Pillows/Bags: Compressible, removable, and reusable intumescent pillows encased in fire-retardant polyester or glass-fiber cloth. Where exposed, cover openings with steel-reinforcing wire mesh to protect pillows/bags from being easily removed.

I. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

J. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants.

K. Fire-Rated Cable Sleeve Kits: Complete kits designed for new or existing cable penetrations through walls to accept standard accessories.

L. Thermal Wrap: Flexible protective wrap tested and listed for up to 2-hour fire ratings in accordance with ASTM E814/UL 1479 for membrane penetrations or ASTM E1725/UL 1724 for thermal barrier and circuit integrity protection.

M. Fire-Rated Cable Pathways: Single or gangable device modules composed of a steel raceway with integral intumescent material and requiring no additional action in the form of plugs, twisting closure, putty, pillows, sealant, or otherwise to achieve fire and air-leakage ratings.

N. Retrofit Device for Cable Bundles: Factory-made, intumescent, collar-like device for firestopping existing over-filled cable sleeves and capable of being installed around projecting sleeves and cable bundles.

O. Wall-Opening Protective Materials: Intumescent, non-curing putty pads or self-adhesive inserts for protection of electrical switch and receptacle boxes.

P. Fire-Rated HVAC Retaining Angles: Steel angle system with integral intumescent firestop gasket for use around rectangular steel HVAC ducts without fire dampers.

Q. Firestop Plugs: Flexible, re-enterable, intumescent, foam-rubber plug for use in blank round openings and cable sleeves.

R. Fire-Rated Cable Grommet: Molded two-piece grommet made of plenum-grade polymer and foam inner core for sealing small cable penetrations in gypsum walls up to 1/2 inch (13 mm) diameter.

S. Closet Flange Gasket: Molded, single-component, flexible, intumescent gasket for use beneath a water closet (toilet) flange in floor applications.

T. Endothermic Wrap: Flexible, insulating, fire-resistant, endothermic wrap for protecting membrane penetrations of utility boxes, critical electrical circuits, communications lines, and fuel lines.

2.5 MIXING

A. Penetration Firestopping Materials: For those products requiring mixing before application, comply with penetration firestopping system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning: Before installing penetration firestopping systems, clean out openings immediately to comply with manufacturer's written instructions and with the following requirements:

1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of penetration firestopping materials.
2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with penetration firestopping materials. Remove loose particles remaining from cleaning operation.
3. Remove laitance and form-release agents from concrete.

B. Prime substrates where recommended in writing by manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

3.3 INSTALLATION OF PENETRATION FIRESTOPPING SYSTEMS

A. General: Install penetration firestopping systems to comply with manufacturer's written installation instructions and published drawings for products and applications.

B. Install forming materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings.

1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not forming permanent components of firestopping.

C. Install fill materials by proven techniques to produce the following results:

1. Fill voids and cavities formed by openings, forming materials, accessories and penetrating items to achieve required fire-resistance ratings.
2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
3. For fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 IDENTIFICATION

A. Wall Identification: Permanently label walls containing penetration firestopping systems with the words "FIRE AND/OR SMOKE BARRIER - PROTECT ALL OPENINGS," using lettering not less than 3 inches (76 mm) high and with minimum 0.375-inch (9.5-mm) strokes.

1. Locate in accessible concealed floor, floor-ceiling, or attic space at 15 feet (4.57 m) from end of wall and at intervals not exceeding 30 feet (9.14 m).

B. Penetration Identification: Identify each penetration firestopping system with legible metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches (150 mm) of penetration firestopping system edge so labels are visible to anyone seeking to remove penetrating items or firestopping systems. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:

1. The words "Warning - Penetration Firestopping - Do Not Disturb. Notify Building Management of Any Damage."
2. Contractor's name, address, and phone number.
3. Designation of applicable testing and inspecting agency.
4. Date of installation.
5. Manufacturer's name.
6. Installer's name.

3.5 FIELD QUALITY CONTROL

A. Owner will engage a qualified testing agency to perform tests and inspections according to ASTM E2174.

B. Where deficiencies are found or penetration firestopping system is damaged or removed because of testing, repair or replace penetration firestopping system to comply with requirements.

C. Proceed with enclosing penetration firestopping systems with other construction only after inspection reports are issued and installations comply with requirements.

3.6 CLEANING AND PROTECTION

A. Clean off excess fill materials adjacent to openings as the Work progresses by methods and with cleaning materials that are approved in writing by penetration firestopping system manufacturers and that do not damage materials in which openings occur.

B. Provide final protection and maintain conditions during and after installation that ensure that penetration firestopping systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, immediately cut out and remove damaged or deteriorated penetration firestopping material and install new materials to produce systems complying with specified requirements.

END OF SECTION 078413

SECTION 078443 - JOINT FIRESTOPPING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Joints in or between fire-resistance-rated constructions.
2. Joints at exterior curtain-wall/floor intersections.
3. Joints in smoke barriers.

B. Related Requirements:

1. Section 078413 "Penetration Firestopping" for penetrations in fire-resistance-rated walls, horizontal assemblies, and smoke barriers and for wall identification.
2. Section 079513.13 "Interior Expansion Joint Cover Assemblies" for fire-resistive manufactured expansion-joint cover assemblies for interior floors, walls, and ceilings.
3. Section 079513.16 "Exterior Expansion Joint Cover Assemblies" for fire-resistive manufactured expansion-joint cover assemblies for exterior building walls, soffits, and parapets.
4. Section 092216 "Non-Structural Metal Framing" for firestop tracks for metal-framed partition heads.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.

C. Product Schedule: For each joint firestopping system. Include location, illustration of firestopping system, and design designation of qualified testing agency.

1. Engineering Judgments: Where Project conditions require modification to a qualified testing agency's illustration for a particular joint firestopping system condition, submit illustration, with modifications marked, approved by joint firestopping system manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly developed in accordance with current International Firestop Council (IFC) guidelines.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Listed System Designs: For each joint firestopping system, for tests performed by a qualified testing agency.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Installer Certificates: From Installer indicating that joint firestopping systems have been installed in compliance with requirements and manufacturer's written instructions.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: A firm that has been approved by FM Approvals according to FM Approvals 4991, "Approval of Firestop Contractors," or been evaluated by UL and found to comply with UL's "Qualified Firestop Contractor Program Requirements."

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not install joint firestopping systems when ambient or substrate temperatures are outside limits permitted by joint firestopping system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Install and cure joint firestopping systems per manufacturer's written instructions using natural means of ventilation or, where this is inadequate, forced-air circulation.

1.8 COORDINATION

A. Coordinate construction of joints to ensure that joint firestopping systems can be installed according to specified firestopping system design.

B. Coordinate sizing of joints to accommodate joint firestopping systems.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain joint firestop systems for each type of joint opening indicated from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics:

1. Perform joint firestopping system tests by a qualified testing agency acceptable to authorities having jurisdiction.
2. Test per testing standards referenced in "Joint Firestopping Systems" Article. Provide rated systems complying with the following requirements:

    a. Joint firestop systems installed with products bearing the classification marking of a qualified product certification agency in accordance with Listed System Designs published by a qualified testing agency.

        1) UL in its online directory "Product iQ."
        2) Intertek Group in its "Directory of Building Products."

B. Rain/Water Resistance: For perimeter fire-barrier system applications, where inclement weather or greater-than-transient water exposure is expected, use products that dry rapidly and cure in the presence of atmospheric moisture sufficient to pass ASTM D6904 early rain-resistance test (24-hour exposure).

2.3 JOINT FIRESTOPPING SYSTEMS

A. Joint Firestopping Systems: Systems that resist spread of fire, passage of smoke and other gases, and maintain original fire-resistance rating of assemblies in or between which joint firestopping systems are installed. Joint firestopping systems must accommodate building movements without impairing their ability to resist the passage of fire and hot gases.

1. Joint firestopping systems that are compatible with one another, with the substrates forming openings, and with penetrating items, if any.
2. Provide products that, upon curing, do not re-emulsify, dissolve, leach, breakdown, or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture.
3. Provide firestop products that do not contain ethylene glycol.

B. Intumescent Gypsum Wall Framing Gaskets (Applied to Steel Tracks, Runners and Studs prior to Framing Installation): Provide products with fire, smoke, and acoustical ratings that allow movement up to 100 percent compression and/or extension in accordance with UL 2079 or ASTM E1966; have an L Rating less than 1 cfm/ft. (0.00115 cu. m/s x m) in accordance with UL 2079; and a minimum Sound Transmission Class (STC) rating of 56 in accordance with ASTM E90 or ASTM C919.

C. For aluminum curtain-wall assemblies with one- or two-piece rectangular mullions at least 2-1/2 by 5 inches (64 by 127 mm), provide perimeter fire-barrier system that does not require direct screw attachment to mullions and transoms to support and fasten curtain-wall insulation. System to be tested in accordance with ASTM E2307 for up to 2-hour fire resistance and with ASTM E1233 for wind cycling equivalent to 108 mph (174 km/h) wind for 500 cycles.

D. Joints in or between Fire-Resistance-Rated Construction: Provide joint firestopping systems with ratings determined per ASTM E1966 or UL 2079.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. 3M Fire Protection Products.
b. Hilti, Inc.
c. RectorSeal Firestop; a CSW Industrials Company.
d. Specified Technologies, Inc.
e. Tremco Incorporated.

2. Fire-Resistance Rating: Equal to or exceeding the fire-resistance rating of the wall, floor, or roof in or between which it is installed.

E. Joints at Exterior Curtain-Wall/Floor Intersections: Provide joint firestopping systems with rating determined per ASTM E2307.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. 3M Fire Protection Products.
b. Hilti, Inc.
c. RectorSeal Firestop; a CSW Industrials Company.
d. Specified Technologies, Inc.
e. Tremco Incorporated.

2. F-Rating: Equal to or exceeding the fire-resistance rating of the floor assembly.

F. Joints in Smoke Barriers: Provide joint firestopping systems with ratings determined per UL 2079 based on testing at a positive pressure differential of 0.30-inch wg (74.7 Pa).

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. 3M Fire Protection Products.
b. Hilti, Inc.
c. RectorSeal Firestop; a CSW Industrials Company.
d. Specified Technologies, Inc.
e. Tremco Incorporated.

2. L-Rating: Not exceeding 5.0 cfm/ft. (0.00775 cu. m/s x m) of joint at both ambient and elevated temperatures.

G. Exposed Joint Firestopping Systems: Flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E84.

1. Verify sealant has a VOC content of 250 g/L or less.

2.4 ACCESSORIES

A. Provide components of joint firestopping systems, including primers and forming materials, that are needed to install elastomeric fill materials and to maintain ratings required. Use only components specified by joint firestopping system manufacturer and approved by the qualified testing agency for conditions indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for joint configurations, substrates, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning: Before installing joint firestopping systems, clean joints immediately to comply with fire-resistive joint system manufacturer's written instructions and the following requirements:

1. Remove from surfaces of joint substrates foreign materials that could interfere with adhesion of elastomeric fill materials or compromise fire-resistive rating.
2. Clean joint substrates to produce clean, sound surfaces capable of developing optimum bond with elastomeric fill materials. Remove loose particles remaining from cleaning operation.
3. Remove laitance and form-release agents from concrete.

B. Prime substrates where recommended in writing by joint firestopping system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Apply a suitable bond-breaker to prevent three-sided adhesion in applications where this condition occurs, such as the intersection of a gypsum wall to floor or roof assembly where the joint is backed by a steel ceiling runner or track.

3.3 INSTALLATION

A. General: Install joint firestopping systems to comply with manufacturer's written installation instructions and published drawings for products and applications indicated.

B. Install forming materials and other accessories of types required to support elastomeric fill materials during their application and in position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

1. After installing elastomeric fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of fire-resistive joint system.

C. Install elastomeric fill materials for joint firestopping systems by proven techniques to produce the following results:

1. Elastomeric fill voids and cavities formed by joints and forming materials as required to achieve fire-resistance ratings indicated.
2. Apply elastomeric fill materials so they contact and adhere to substrates formed by joints.
3. For elastomeric fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 IDENTIFICATION

A. Wall Identification: Permanently label walls containing firestopping systems with the words "FIRE AND/OR SMOKE BARRIER - PROTECT ALL OPENINGS," using lettering not less than 3 inches (76 mm) high and with minimum 0.375-inch (9.5-mm) strokes.

1. Locate in accessible concealed floor, floor-ceiling, or attic space at 15 ft. (4.57 m) from end of wall and at intervals not exceeding 30 ft. (9.14 m).

B. Joint Identification: Identify joint firestopping systems with legible metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches (150 mm) of joint edge so labels are visible to anyone seeking to remove or joint firestopping system. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:

1. The words "Warning - Joint Firestopping - Do Not Disturb. Notify Building Management of Any Damage."
2. Contractor's name, address, and phone number.
3. Designation of applicable testing agency.
4. Date of installation.
5. Manufacturer's name.
6. Installer's name.

3.5 FIELD QUALITY CONTROL

A. Owner will engage a qualified testing agency to perform tests and inspections according to ASTM E2393.

B. Where deficiencies are found or joint firestopping systems are damaged or removed due to testing, repair or replace joint firestopping systems so they comply with requirements.

C. Proceed with enclosing joint firestopping systems with other construction only after inspection reports are issued and installations comply with requirements.

3.6 CLEANING AND PROTECTION

A. Clean off excess elastomeric fill materials adjacent to joints as the Work progresses by methods and with cleaning materials that are approved in writing by joint firestopping system manufacturers and that do not damage materials in which joints occur.

B. Provide final protection and maintain conditions during and after installation that ensure joint firestopping systems are without damage or deterioration at time of Substantial Completion. If damage or deterioration occurs despite such protection, cut out and remove damaged or deteriorated joint firestopping systems immediately and install new materials to produce joint firestopping systems complying with specified requirements.

3.7 JOINT FIRESTOPPING SYSTEM SCHEDULE

A. Where UL-classified systems are indicated, they refer to system numbers in UL's online directory "Product iQ" under product Category XHBN or Category XHDG.

B. Where Intertek Group-listed systems are indicated, they refer to design numbers in Intertek Group's "Directory of Building Products" under product category Expansion/Seismic Joints or Firestop Systems.

C. Floor-to-Floor, Joint Firestopping Systems:

1. UL-Classified Systems: FF-D 0000-0999.
2. Assembly Rating: As indicated on Drawings.
3. Nominal Joint Width: As indicated on Drawings.
4. W-Rating: No leakage of water at completion of water leakage testing.

D. Wall-to-Wall, Joint Firestopping Systems:

1. UL-Classified Systems: WW-D0000-0999.
2. Assembly Rating: As indicated on Drawings.
3. Nominal Joint Width: As indicated on Drawings.

E. Floor-to-Wall, Joint Firestopping Systems:

1. UL-Classified Systems: FW-D0000-0999.
2. Assembly Rating: As indicated on Drawings.
3. Nominal Joint Width: As indicated on Drawings.

F. Head-of-Wall, Fire-Resistive Joint Firestopping Systems:

1. UL-Classified Systems: HW-D0000-0999.
2. Assembly Rating: As indicated on Drawings.
3. Nominal Joint Width: As indicated on Drawings.

G. Bottom-of-Wall, Joint Firestopping Systems:

1. UL-Classified Systems: BW-D0000-0999.
2. Assembly Rating: As indicated on Drawings.
3. Nominal Joint Width: As indicated on Drawings.

H. Perimeter Joint Firestopping Systems:

1. UL-Classified Perimeter Fire-Containment Systems: CW-D0000-0999.
2. Linear Opening Width: As indicated on Drawings.

END OF SECTION 078443

SECTION 079100 - PREFORMED JOINT SEALS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Preformed, foam joint seals.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data:

1. Preformed, foam joint seals.

B. Shop Drawings: Project specific details including, but not limited to, the following: terminations, transitions to waterproofing and roofing expansion joints, AWB transitions, typical exterior wall expansion joints, etc.

C. Samples for Initial Selection: Manufacturer's color sheets, showing full range of available colors for each type of exposed preformed joint seal.

D. Samples for Verification: Actual samples of each type and color of exposed preformed joint seal.

1. Size: 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of exposed surfaces adjacent to joint seals.

E. Preformed Joint Seal Schedule: Include the following information:

1. Joint seal location and designation.
2. Joint width and movement capability.
3. Joint seal manufacturer and product name.
4. Joint seal color.

F. Sustainable Design Submittals:

1. Product Data: For adhesives and sealants, indicating VOC content.
2. Laboratory Test Reports: For adhesives and sealants, indicating compliance with requirements for low-emitting materials.

1.4 INFORMATIONAL SUBMITTALS

A. Test and Evaluation Reports:

1. Product Test Reports: For each preformed joint seal, for tests performed by qualified testing agency.

B. Sample warranties.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 MOCKUPS

A. Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects and to set quality standards for materials and execution. Include a joint splice.

1. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Owner specifically approves such deviations by Change Order.
2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.6 WARRANTY

A. Special Installer's Warranty: Installer agrees to repair or replace preformed joint seals that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

B. Special Manufacturer's Warranty: Manufacturer agrees to furnish preformed joint seals to repair or replace those that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. For preformed joint seals, obtain each color, type, and variety of joint seal from single source with resources to provide products of consistent quality in appearance and physical properties.

2.2 PREFORMED, FOAM JOINT SEALS

A. Preformed, Foam Joint Seals (PFJS-1): Dual-sided, pick resistant, watertight, hardened flexible polyurethane sealing surfaces adhered to fire-retardant impregnated foam backing Factory produce them in precompressed sizes in roll or stick form to fit joint widths based on design criteria indicated, with factory- or field-applied adhesive for bonding to substrates.

1. Basis-of-Design Product: Subject to compliance with requirements, provide EMSEAL Joint Systems, Ltd, a Sika Company; Emshield SecuritySeal SSW2 or a comparable product by one of the following:

    a. BASF Corp. - Watson Bowman Acme Corp.
    b. MM Systems Corporation.
    c. Nystrom.
    d. Pecora Corporation.

2. Design Criteria:

    a. Nominal Joint Width: As indicated on Drawings.
    b. Minimum Joint Width: As indicated on Drawings.
    c. Maximum Joint Width: As indicated on Drawings.
    d. Movement Capability: As indicated on Drawings.

3. Joint Seal Color: As selected by Architect from full range of industry colors.

2.3 MISCELLANEOUS MATERIALS

A. VOC Content: Verify sealants and sealant primers comply with the following:

1. Architectural sealants have a VOC content of 250 g/L or less.
2. Sealants and sealant primers for nonporous substrates have a VOC content of 250 g/L or less.
3. Sealants and sealant primers for porous substrates have a VOC content of 775 g/L or less.

B. Primer: Material recommended by preformed joint seal manufacturer for joint substrates indicated.

C. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to preformed joint seal manufacturer, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces, and formulated to promote best adhesion to joint substrates.

D. Masking Tape: Nonstaining, nonabsorbent material compatible with preformed joint seals and surfaces adjacent to joints.

E. Transitions and Terminations: Provide manufacturer standard items such as Universal 90’s and Roof to Wall Closures that ensure continuity of seal where expansion joints change plane.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive preformed joint seals, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting preformed joint seal performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing preformed joint seals to comply with preformed joint seal manufacturer's written instructions and the following requirements:

1. Remove all foreign material from joint substrates that could interfere with adhesion of preformed joint seal, including dust, paints (except for permanent protective coatings tested and approved for seal adhesion and compatibility by seal manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
2. Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimal bond with preformed joint seals. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:

    a. Concrete.
    b. Masonry.

3. Remove laitance and form-release agents from concrete.
4. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint seals. Nonporous joint substrates include the following:

    a. Metal.
    b. Glass.

B. Joint Priming: Prime joint substrates where recommended by preformed joint seal manufacturer or as indicated by tests or prior experience. Apply primer to comply with joint seal manufacturer's written instructions. Confine primers to areas of joint seal bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of adhesive or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove smears. Remove tape immediately after tooling without disturbing joint seal.

3.3 INSTALLATION

A. General: Comply with preformed joint seal manufacturer's written installation instructions for products and applications indicated unless more stringent requirements apply.

B. Installation of Preformed, Foam Joint Seals:

1. Install each length of seal immediately after removing protective wrapping.
2. Firmly secure compressed joint seals to joint gap side to obtain full bond using exposed pressure-sensitive adhesive or field-applied adhesive as recommended by manufacturer.
3. Do not pull or stretch material. Produce seal continuity at splices, ends, turns, and intersections of joints.
4. For applications at low ambient temperatures, heat foam joint seal material in compliance with manufacturer's written instructions.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests.

B. Tests: Perform the following tests on representative areas preformed joint seals.

1. Field Water Penetration Test: Before installation of interior finishes has begun, areas designated by Architect to be tested in accordance with AAMA 501.2 and to not evidence water penetration.

a. Perform a minimum of three tests in areas as directed by Architect.

2. Prepare test reports.

3.5 PROTECTION

A. Protect preformed joint seals from damage resulting from construction operations or other causes so seals are without deterioration or damage at time of Substantial Completion.

B. Cut out, remove, and repair damaged or deteriorated seals so repaired areas are indistinguishable from original work.

END OF SECTION 079100

SECTION 079200 - JOINT SEALANTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Nonstaining silicone joint sealants.
2. Urethane joint sealants.
3. Mildew-resistant joint sealants.
4. Latex joint sealants.

B. Related Requirements:

1. Section 079100 "Preformed Joint Seals" for preformed compressible foam and precured joint seals.
2. Section 079219 "Acoustical Joint Sealants" for sealing joints in sound-rated construction.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Discussion topics shall include;

a. Schedule.
b. Sequence.
c. Coordination of trades.
d. Substrate review and acceptance.
e. Protection
f. Shop drawings and submittals.
g. Interface condition and details.
h. Environmental constraints.
i. Mockups.
j. Testing requirements.
k. Field quality control efforts.

1.3 ACTION SUBMITTALS

A. Product Data:

1. Joint sealants.
2. Joint-sealant backing materials.

B. Samples for Initial Selection: Manufacturer's standard color charts consisting of strips of cured sealants showing the full range of colors available for each product exposed to view.

C. Samples for Verification: For each type and color of joint sealant required, provide Samples with joint sealants in 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.

D. Joint-Sealant Schedule: Include the following information:

1. Joint-sealant application, joint location, and designation.
2. Joint-sealant manufacturer and product name.
3. Joint-sealant formulation.
4. Joint-sealant color.

E. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.

1.4 INFORMATIONAL SUBMITTALS

A. Preconstruction Field-Adhesion-Test Reports: Indicate which sealants and joint preparation methods resulted in optimum adhesion to joint substrates based on testing specified in "Preconstruction Testing" Article.

B. Field Quality-Control Reports: For field-adhesion-test reports, for each sealant application tested.

C. Sample warranties.

D. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Manufacturers' special warranties.

B. Installer's special warranties.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Authorized representative who is trained and approved by manufacturer.

B. Testing Agency Qualifications: Qualified in accordance with ASTM C1021 to conduct the testing indicated.

1.7 MOCKUPS

A. Install sealant in mockups of assemblies specified in other Sections that are indicated to receive joint sealants specified in this Section. Use materials and installation methods specified in this Section. Perform adhesion testing in mockups.

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Field-Adhesion Testing: Before installing sealants, field test their adhesion to Project joint substrates as follows:

1. Locate test joints where indicated on Project or, if not indicated, as directed by Architect.
2. Conduct field tests for each kind of sealant and joint substrate. Perform preconstruction testing for staining on stone substrates.
3. Notify Architect seven days in advance of dates and times when test joints will be erected.
4. Arrange for tests to take place with joint-sealant manufacturer's technical representative present.
5. Test Method: Test joint sealants in accordance with Method A or method B, Tail Procedure and Flap Procedure, in ASTM C1521.

    a. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.

6. Report whether sealant failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. For sealants that fail adhesively, Contractor is responsible for retest until satisfactory adhesion is obtained.
7. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.

1.9 FIELD CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 40 deg F (5 deg C).
2. When joint substrates are wet.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

1.10 WARRANTY

A. Special Installer's Warranty: Installer agrees to repair or replace joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

B. Special Manufacturer's Warranty: Manufacturer agrees to furnish joint sealants to repair or replace those joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

C. Special warranties specified in this article exclude deterioration or failure of joint sealants from the following:

1. Movement of the structure caused by stresses on the sealant exceeding sealant manufacturer's written specifications for sealant elongation and compression.
2. Disintegration of joint substrates from causes exceeding design specifications.
3. Mechanical damage caused by individuals, tools, or other outside agents.
4. Changes in sealant appearance caused by accumulation of dirt or other atmospheric contaminants.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain joint sealants from single manufacturer for each sealant type.

2.2 JOINT SEALANTS, GENERAL

A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.

B. VOC Content: Verify sealants and sealant primers comply with the following:

1. Architectural sealants have a VOC content of 250 g/L or less.
2. Sealants and sealant primers for nonporous substrates have a VOC content of 250 g/L or less.
3. Sealants and sealant primers for porous substrates have a VOC content of 775 g/L or less.

C. Colors of Exposed Joint Sealants: As selected by Architect from manufacturer’s full range except at the following locations:

1. Metal wall panels, wood veneered composite panels, curtain wall, aluminum framed storefront, and stone: exposed sealant to be custom color to match Architect’s sample. Submit sample(s) for approval.

2.3 NONSTAINING SILICONE JOINT SEALANTS

A. Nonstaining Joint Sealants: No staining of substrates when tested in accordance with ASTM C1248.

B. Silicone, Nonstaining, S, NS, 50, NT: Nonstaining, single-component, nonsag, plus 50 percent and minus 50 percent movement capability, nontraffic-use, neutral-curing silicone joint sealant; ASTM C920, Type S, Grade NS, Class 50, Use NT.

1. Products: Subject to compliance with requirements, provide one of the following:

a. GE Construction Sealants; Momentive Performance Materials Inc.; Silpruf NB.
b. Pecora Corporation; Pecora 864NST.
c. Sika Corporation; Sikasil WS-295.
d. The Dow Chemical Company; DOW CORNING 756 SMS BUILDING SEALANT.
e. Tremco Incorporated; Spectrem 3.

2.4 URETHANE JOINT SEALANTS

A. Urethane, S, NS, 25, NT: Single-component, nonsag, plus 25 percent and minus 25 percent movement capability, nontraffic-use, urethane joint sealant; ASTM C920, Type S, Grade NS, Class 25, Use NT.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Bostik; Arkema.
b. Master Builders Solutions.
c. Pecora Corporation.
d. Sherwin-Williams Company (The).
e. Sika Corporation.
f. Tremco Incorporated.

B. Urethane, S, P, 25, T, NT: Single-component, pourable, plus 25 percent and minus 25 percent movement capability, traffic- and nontraffic-use, urethane joint sealant; ASTM C920, Type S, Grade P, Class 25, Uses T and NT.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Bostik; Arkema.
b. Master Builders Solutions.
c. Pecora Corporation.
d. Sherwin-Williams Company (The).
e. Sika Corporation.
f. Tremco Incorporated.

2.5 MILDEW-RESISTANT JOINT SEALANTS

A. Mildew-Resistant Joint Sealants: Formulated for prolonged exposure to humidity with fungicide to prevent mold and mildew growth.

B. Silicone, Mildew Resistant, Acid Curing, S, NS, 25, NT: Mildew-resistant, single-component, nonsag, plus 25 percent and minus 25 percent movement capability, nontraffic-use, acid-curing silicone joint sealant; ASTM C920, Type S, Grade NS, Class 25, Use NT.

1. Products: Subject to compliance with requirements, provide one of the following:

a. GE Construction Sealants; Momentive Performance Materials Inc.; SCS1700 Sanitary.
b. Pecora Corporation; Pecora 860.
c. The Dow Chemical Company; DOW CORNING 786 SILICONE SEALANT.
d. Tremco Incorporated; Tremsil 200.

2.6 LATEX JOINT SEALANTS

A. Acrylic Latex: Acrylic latex or siliconized acrylic latex, ASTM C834, Type OP, Grade NF.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Pecora Corporation; AC-20.
b. Sherwin-Williams Company (The); 850A Siliconized Acrylic Latex Caulk.
c. Tremco Incorporated; Tremflex 834.

2.7 JOINT-SEALANT BACKING

A. Sealant Backing Material, General: Nonstaining; compatible with joint substrates, sealants, primers, and other joint fillers; and approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

B. Cylindrical Sealant Backings: ASTM C1330, Type B (bicellular material with a surface skin), and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

C. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint. Provide self-adhesive tape where applicable.

2.8 MISCELLANEOUS MATERIALS

A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.

C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:

1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
2. Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:

    a. Concrete.
    b. Masonry.
    c. Unglazed surfaces of ceramic tile.

3. Remove laitance and form-release agents from concrete.
4. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:

    a. Metal.
    b. Glass.
    c. Porcelain enamel.
    d. Glazed surfaces of ceramic tile.

B. Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated by preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.3 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install sealant backings of type indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of sealant backings.
2. Do not stretch, twist, puncture, or tear sealant backings.
3. Remove absorbent sealant backings that have become wet before sealant application, and replace them with dry materials.

D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place sealants so they directly contact and fully wet joint substrates.
2. Completely fill recesses in each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

F. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.

1. Remove excess sealant from surfaces adjacent to joints.
2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
3. Provide concave joint profile in accordance with Figure 8A in ASTM C1193 unless otherwise indicated.
4. Provide flush joint profile at locations indicated on Drawings in accordance with Figure 8B in ASTM C1193.
5. Provide recessed joint configuration of recess depth and at locations indicated on Drawings in accordance with Figure 8C in ASTM C1193.

    a. Use masking tape to protect surfaces adjacent to recessed tooled joints.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Tests and Inspections:

1. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:

a. Extent of Testing: Test completed and cured sealant joints as follows:

1) Perform 10 tests for the first 1000 ft. (300 m) of joint length for each kind of sealant and joint substrate.
2) Perform one test for each 1000 ft. (300 m) of joint length thereafter or one test per each floor per elevation.

b. Test Method: Test joint sealants in accordance with Method A or Method B, Tail Procedure and Flap Procedure, in ASTM C1521.

1) For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.

c. Inspect tested joints and report on the following:

1) Whether sealants filled joint cavities and are free of voids.
2) Whether sealant dimensions and configurations comply with specified requirements.
3) Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. Compare these results to determine if adhesion complies with sealant manufacturer's field-adhesion hand-pull test criteria.

d. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant material, sealant configuration, and sealant dimensions.
e. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

2. Evaluation of Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Contractor is responsible for retesting of failed applications until test results prove sealants comply with indicated requirements.

C. Prepare test and inspection reports.

3.5 CLEANING

A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.6 PROTECTION

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage

or deterioration occurs, cut out, remove, and repair damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

3.7 JOINT-SEALANT SCHEDULE (SLNT)

A. Exterior joints in vertical surfaces and horizontal nontraffic surfaces:

1. Joint Locations:

   a. Construction joints in cast-in-place concrete.
   b. Control and expansion joints in unit masonry.
   c. Joints in dimension stone cladding.
   d. Joints between metal panels.
   e. Joints between different materials listed above.
   f. Perimeter joints between materials listed above and frames of doors, windows and louvers.
   g. Control and expansion joints in ceilings and other overhead surfaces.
   h. Other joints as indicated on Drawings.

2. Joint Sealant: Silicone, nonstaining, S, NS, 50, NT.
3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors unless noted otherwise. Provide sanded sealant joints at stone.

B. Interior joints in horizontal traffic surfaces:

1. Joint Locations:

   a. Isolation joints in cast-in-place concrete slabs.
   b. Control and expansion joints in tile flooring.
   c. Other joints as indicated on Drawings.

2. Joint Sealant: Urethane, S, P, 25, T, NT.
3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

C. Interior joints in vertical surfaces and horizontal nontraffic surfaces:

1. Joint Locations:

   a. Control and expansion joints on exposed interior surfaces of exterior walls.
   b. Tile control and expansion joints.
   c. Vertical joints on exposed surfaces of unit masonry, concrete walls and partitions.
   d. Other joints as indicated on Drawings.

2. Joint Sealant: Urethane, S, NS, 25, NT.
3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors, including custom colors.

D. Interior joints in vertical surfaces and horizontal nontraffic surfaces not subject to significant movement:

1. Joint Locations:

   a. Control joints on exposed interior surfaces of exterior walls.

b. Perimeter joints between interior wall surfaces and frames of interior doors, windows, and elevator entrances.
c. Other joints as indicated on Drawings.

2. Joint Sealant: Acrylic latex.
3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

E. Mildew-resistant interior joints in vertical surfaces and horizontal nontraffic surfaces:

1. Joint Locations:

a. Joints between plumbing fixtures and adjoining walls, floors, and counters.
b. Tile control and expansion joints where indicated.
c. Other joints as indicated on Drawings.

2. Joint Sealant: Silicone, mildew resistant, acid curing, S, NS, 25, NT.
3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

END OF SECTION 079200

SECTION 079513.16 - EXTERIOR EXPANSION JOINT COVER ASSEMBLIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Exterior expansion joint covers.

B. Related Requirements:

1. Section 077129 "Manufactured Roof Expansion Joints" for factory-fabricated roof expansion joint cover assemblies.
2. Section 079100 "Preformed Joint Seals" for preformed foam and extruded-silicone joint seals.

1.2 ACTION SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for expansion joint cover assemblies.

1. Exterior expansion joint covers.

B. Shop Drawings: Project specific. For each expansion joint cover assembly.

1. Include plans, elevations, sections, details, splices, block-out requirement, attachments to other work, and line diagrams showing entire route of each expansion joint.
2. Where expansion joint cover assemblies change planes, provide isometric or clearly detailed drawing depicting how components interconnect.

C. Samples: For each exposed expansion joint cover assembly and for each color and texture specified, full width by 6 inches (150 mm) long in size.

D. Expansion Joint Cover Assembly Schedule: Prepared by or under the supervision of the supplier. Include the following information in tabular form:

1. Manufacturer and model number for each expansion joint cover assembly.
2. Expansion joint cover assembly location cross-referenced to Drawings.
3. Nominal, minimum, and maximum joint width.
4. Movement direction.
5. Materials, colors, and finishes.
6. Product options.
7. Fire-resistance ratings.

1.3 INFORMATIONAL SUBMITTALS

A. Product Test Reports: For each fire-resistance-rated expansion joint cover assembly, for tests performed by a qualified testing agency.

1.4 MOCKUPS

A. Build mockups to demonstrate aesthetic effects and to set quality standards for materials and execution.

1. Build mockup of typical expansion joint cover assembly as shown on Drawings.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

PART 2 - PRODUCTS

2.1 ASSEMBLY DESCRIPTION

A. Furnish units in longest practicable lengths to minimize field splicing.

B. Include factory-fabricated closure materials and transition pieces, T-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous expansion joint cover assemblies.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Resistance Ratings: Provide expansion joint cover assemblies with fire barriers identical to those of systems tested for fire resistance according to UL 2079 or ASTM E1966 by a qualified testing agency.

1. Hose Stream Test: Wall-to-wall and wall-to-soffit assemblies shall be subjected to hose stream testing.

B. Expansion Joint Design Criteria:

1. Type of Movement: Thermal Wind sway.

a. Nominal Joint Width: As indicated on Drawings.
b. Minimum Joint Width: As indicated on Drawings.
c. Maximum Joint Width: As indicated on Drawings.

2.3 EXTERIOR EXPANSION JOINT COVERS

A. Exterior Elastomeric-Seal Joint Cover (EXP JT-2): Assembly consisting of elastomeric seal anchored to surface-mounted frames fixed to sides of joint gap.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Construction Specialties, Inc.; Model SC Series or a comparable product by one of the following:

a. Architectural Art Manufacturing; a division of Pittcon Architectural Metals, LLC.
b. Balco; a CSW Industrials Company.
c. MM Systems Corporation.

d. Watson Bowman Acme Corp.
e. inpro Corporation.

2. Application: Wall to wall.
3. Type: Accordion.
4. Installation: Recessed.
5. Fire-Resistance Rating: Not less than that indicated on Drawings.
6. Exposed Metal:

a. Aluminum: Manufacturer's standard.

7. Seal Material: Santoprene.

a. Color: Two (2) custom colors to match Architect’s samples.

8. Secondary Seal: Manufacturer’s standard extruded-elastomeric seal designed to prevent water and vapor infiltration.

2.4 MATERIALS

A. Aluminum: ASTM B221 (ASTM B221M), Alloy 6063-T5 for extrusions; ASTM B209 (ASTM B209M), Alloy 6061-T6 for sheet and plate.

1. Apply manufacturer's standard protective coating on aluminum surfaces to be placed in contact with cementitious materials.

B. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist the passage of flame and hot gases through a movement joint and to comply with performance criteria for required fire-resistance rating.

C. Moisture Barrier: Manufacturer's standard, flexible elastomeric material.

2.5 ACCESSORIES

A. Moisture Barriers: Manufacturer's standard continuous, waterproof membrane within joint and attached to substrate on sides of joint.

1. Provide where indicated on Drawings.

B. Manufacturer's standard attachment devices. Include anchors, clips, fasteners, set screws, spacers, and other accessories compatible with material in contact, as indicated or required for complete installations.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces where expansion joint cover assemblies will be installed for installation tolerances and other conditions affecting performance of the Work.

B. Notify Architect where discrepancies occur that will affect proper expansion joint cover assembly installation and performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to expansion joint cover assembly manufacturer's written instructions.

B. Coordinate and furnish anchorages, setting drawings, and instructions for installing expansion joint cover assemblies. Provide fasteners of metal, type, and size to suit type of construction indicated and to provide for secure attachment of expansion joint cover assemblies.

3.3 INSTALLATION

A. Comply with manufacturer's written instructions for storing, handling, and installing expansion joint cover assemblies and materials unless more stringent requirements are indicated.

B. Metal Frames: Perform cutting, drilling, and fitting required to install expansion joint cover assemblies.

1. Install in true alignment and proper relationship to joints and adjoining finished surfaces measured from established lines and levels.
2. Adjust for differences between actual structural gap and nominal design gap due to ambient temperature at time of installation.
3. Cut and fit ends to accommodate thermal expansion and contraction of metal without buckling of frames.
4. Install frames in continuous contact with adjacent surfaces.

    a. Shimming is not permitted.

5. Locate anchors at interval recommended by manufacturer, but not less than 3 inches (75 mm) from each end and not more than 24 inches (600 mm) o.c.

C. Elastomeric Seals: Install elastomeric seals and membranes in frames to comply with manufacturer's written instructions. Install with minimum number of end joints.

1. Provide in continuous lengths for straight sections.
2. Seal transitions. Vulcanize or heat-weld field-spliced joints as recommended by manufacturer.
3. Mechanically lock seals into frames or adhere to frames with adhesive or pressure-sensitive tape as recommended by manufacturer.

D. Install with hairline mitered corners where expansion joint cover assemblies change direction or abut other materials.

E. Terminate exposed ends of expansion joint cover assemblies with field- or factory-fabricated termination devices.

F. Fire-Resistance-Rated Assemblies: Coordinate installation of expansion joint cover assembly materials and associated work so complete assemblies comply with performance requirements.

1. Fire Barriers: Install fire barriers to provide continuous, uninterrupted fire resistance throughout length of joint, including transitions and field splices.

G. Moisture Barrier Drainage: If indicated, provide drainage fitting and connect to drains.

3.4 CONNECTIONS

A. Transition to Roof Expansion Joint Covers: Coordinate installation of exterior wall and soffit expansion joint covers with roof expansion joint covers specified in Section 077129 "Manufactured Roof Expansion Joints." Install factory-fabricated units at transition between exterior walls and soffits and roof expansion joint cover assemblies.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests.

B. Tests: Perform the following tests on representative areas of exterior expansion joints.

1. Field Water Penetration Test: Before installation of interior finishes has begun, areas designated by Architect to be tested in accordance with AAMA 501.2 and to not evidence water penetration.

a. Perform a minimum of three tests in areas as directed by Architect.

2. Prepare test reports.

3.6 PROTECTION

A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's written instructions.

B. Protect the installation from damage by work of other Sections.

END OF SECTION 079513.16

SECTION 081113 - HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:

1. Interior standard steel doors and frames.
2. Exterior standard steel doors and frames.

B. Related Requirements:

1. Section 087100 "Door Hardware" for door hardware for hollow-metal doors.
2. Section 134900 "Radiation Protection" for lead-lined, hollow-metal doors and frames.

1.2 DEFINITIONS

A. Minimum Thickness: Minimum thickness of base metal without coatings in accordance with NAAMM-HMMA 803 or ANSI/SDI A250.8.

1.3 COORDINATION

A. Coordinate anchorage installation for hollow-metal frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

B. Coordinate requirements for installation of door hardware, electrified door hardware, and access control and security systems.

C. Building Information Modeling (BIM) Support: Utilize designated BIM software tools and obtain training needed to successfully participate in the Project BIM processes. All technical disciplines are responsible for the product data integration and data reliability of their Work into the coordinated BIM applications.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, core descriptions, fire-resistance ratings, temperature-rise ratings, and finishes.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental Product Declaration: For each product.
3. Health Product Declaration: For each product.
4. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings: Project specific. Include the following:

1. Elevations of each door type.
2. Details of doors, including vertical- and horizontal-edge details and metal thicknesses.
3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
4. Locations of reinforcement and preparations for hardware.
5. Details of each different wall opening condition.
6. Details of electrical raceway and preparation for electrified hardware, access control systems, and security systems.
7. Details of anchorages, joints, field splices, and connections.
8. Details of accessories.
9. Details of moldings, removable stops, and glazing.
10. Project specific details for exterior hollow metal doors and frames showing continuity with AWB and cladding (typ).
11. Floor anchorage to be coordinated with threshold installation and detailed in shop drawings. At exterior doors with no elevation change from the interior to exterior, the threshold seal is the primary seal keeping uncontrolled bulk water from entering the building. Having a continuous seal from the threshold to the weather barriers is integral to a performing enclosure.

D. Samples for Verification:

1. Finishes: For each type of exposed finish required, prepared on Samples of not less than 3 by 5 inches (75 by 127 mm).
2. Fabrication: Prepare Samples approximately 12 by 12 inches (305 by 305 mm) to demonstrate compliance with requirements for quality of materials and construction:

    a. Doors: Show vertical-edge, top, and bottom construction; core construction; and hinge and other applied hardware reinforcement. Include separate section showing glazing if applicable.
    b. Frames: Show profile, corner joint, floor and wall anchors, and silencers. Include separate section showing fixed hollow-metal panels and glazing if applicable.

E. Product Schedule: For hollow-metal doors and frames, prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with final door hardware schedule.

1.6 INFORMATIONAL SUBMITTALS

A. Product Test Reports: For each type of fire-rated hollow-metal door and frame assembly, fire-rated borrowed-lite assembly and thermally rated door assemblies for tests performed by a qualified testing agency indicating compliance with performance requirements.

B. Oversize Construction Certification: For assemblies required to be fire-rated and exceeding limitations of labeled assemblies.

C. Field quality control reports.

D. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.7 CLOSEOUT SUBMITTALS

A. Record Documents: For fire-rated doors, list of door numbers and applicable room name and number to which door accesses.

1.8 QUALITY ASSURANCE

A. Source Limitations: Obtain hollow metal doors and frames through one source from a single manufacturer wherever possible.

B. Quality Standard: In addition to requirements specified, furnish SDI-Certified manufacturer products that comply with ANSI/SDI A250.8, latest edition, "Recommended Specifications for Standard Steel Doors and Frames".

C. Energy Efficient Exterior Openings: Comply with minimum thermal ratings, based on ASTM C1363. Openings to be fabricated and tested as fully operable, thermal insulating door and frame assemblies.

1. Thermal Performance (Exterior Openings): Independent testing laboratory certification for exterior door assemblies being tested in accordance with ASTM C1363 and meet or exceed the following requirements:

a. Door Assembly Operable U-Factor and R-Value Ratings: U-Factor 0.37, R-Value 2.7, including insulated door, thermal-break frame and threshold.

2. Air Infiltration (Exterior Openings): Independent testing laboratory certification for exterior door assemblies being tested in accordance with ASTM E283 to meet or exceed the following requirements:

a. Rate of leakage of the door assembly shall not exceed 0.25 cfm per square foot of static differential air pressure of 1.567 psf (equivalent to 25 mph wind velocity).

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver hollow-metal doors and frames palletized, packaged, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic.

B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.

C. Store hollow-metal doors and frames vertically under cover at Project site with head up. Place on minimum 4-inch- (102-mm-) high wood blocking. Provide minimum 1/4-inch (6-mm) space between each stacked door to permit air circulation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Ceco Door; AADG, Inc.; ASSA ABLOY.
2. Curries, AADG, Inc.; ASSA ABLOY Group.
3. MPI Group, LLC (The).
4. Steelcraft; Allegion plc.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction for fire-protection ratings and temperature-rise limits indicated on Drawings, based on testing at positive pressure in accordance with NFPA 252 or UL 10C.

1. Smoke- and Draft-Control Door Assemblies: Listed and labeled for smoke and draft control by a qualified testing agency acceptable to authorities having jurisdiction, based on testing in accordance with UL 1784 and installed in compliance with NFPA 105.
2. Oversize Fire-Rated Door Assemblies: For units exceeding sizes of tested assemblies, provide certification by a qualified testing agency that doors comply with standard construction requirements for tested and labeled fire-rated door assemblies except for size.
3. Temperature-Rise Limit: At vertical exit enclosures and exit passageways, provide doors that have a maximum transmitted temperature end point of not more than 450 deg F (250 deg C) above ambient after 30 minutes of standard fire-test exposure.

B. Fire-Rated, Borrowed-Lite Assemblies: Assemblies complying with NFPA 80 and listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing in accordance with NFPA 257 or UL 9.

C. Thermally Rated Door Assemblies: Provide door assemblies with U-factor of not more than 0.37 deg Btu/F x h x sq. ft. (2.16 W/K x sq. m) when tested in accordance with ASTM C518.

2.3 INTERIOR STANDARD STEEL DOORS AND FRAMES

A. Construct hollow-metal doors and frames to comply with standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

B. Extra-Heavy-Duty Doors and Frames: ANSI/SDI A250.8, Level 3; ANSI/SDI A250.4, Level A.

1. Doors:

a. Type: As indicated in the Door and Frame Schedule.
b. Thickness: 1-3/4 inches (44.5 mm).
c. Face: Uncoated steel sheet, 16 ga.
d. Edge Construction: Model 1, Full Flush. Fully welded flush faces, welded and ground smooth.

e. Core: Polyurethane.
f. Fire-Rated Core: Manufacturer's standard core for fire-rated and temperature-rise-rated doors.

2. Frames:

a. Materials: 16 ga. (1.5-mm-) thick steel sheet, except door leafs 4’-0” and wider shall be 14 ga. (1.9-mm-) thick sheet steel.
b. Sidelite Frames: Fabricated from same thickness material as adjacent door frame.
c. Construction: Full profile welded.

3. Exposed Finish: Prime.

2.4 EXTERIOR STANDARD STEEL DOORS AND FRAMES

A. Construct hollow-metal doors and frames to comply with standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified. Provide closure at jambs and head of door frame in order to provide a substrate for perimeter sealant.

B. Extra-Heavy-Duty Doors and Frames: ANSI/SDI A250.8, Level 3; ANSI/SDI A250.4, Level A.

1. Doors:

a. Type: As indicated in the Door and Frame Schedule.
b. Thickness: 1-3/4 inches (44.5 mm).
c. Face: Metallic-coated steel sheet, 16 ga, with minimum A40 (ZF120) coating.
d. Edge Construction: Model 1, Full Flush. Fill seams with filler and grind smooth before finishing.
e. Edge Bevel: Bevel lock and hinge edges 1/8 inch in 2 inches (3.2 mm in 51 mm).
f. Top Edge Closures: Close top edges of doors with flush closures of same material as face sheets. Seal joints against water penetration.
g. Bottom Edges: Close bottom edges of doors with end closures or channels of same material as face sheets. Provide weep-hole openings in bottoms of exterior doors to permit moisture to escape.
h. Core: Polyurethane.
i. Fire-Rated Core: Manufacturer's standard core for fire-rated doors.

2. Frames:

a. Materials: Metallic-coated steel sheet, 14 ga, with minimum A60 (ZF180) coating.
b. Construction: Full profile welded.
c. Thermal Break Frames: Subject to the same compliance standards and requirements as standard hollow metal frames. Tested for thermal performance in accordance with NFRC 102, and resistance to air infiltration in accordance with NFRC 400. Where indicated provide thermally broken frame profiles available for use in both masonry and drywall construction. Fabricate with 1/16” positive thermal break and integral vinyl weatherstripping.

3. Exposed Finish: Prime.

2.5 BORROWED LITES

A. Fabricate of uncoated steel sheet, minimum thickness of 16 ga.

B. Construction: Full profile welded.

C. Fabricate in one piece except where handling and shipping limitations require multiple sections. Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of metal of same or greater thickness as metal as frames.

D. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.

2.6 FRAME ANCHORS

A. Jamb Anchors:

1. Type: Anchors of minimum size and type required by applicable door and frame standard, and suitable for performance level indicated.
2. Quantity: Minimum of three anchors per jamb, with one additional anchor for frames with no floor anchor. Provide one additional anchor for each 24 inches (610 mm) of frame height above 7 feet (2.1 m).
3. Postinstalled Expansion Anchor: Minimum 3/8-inch- (9.5-mm-) diameter bolts with expansion shields or inserts, with manufacturer's standard pipe spacer.

B. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor.

C. Material: ASTM A879/A879M, Commercial Steel (CS), 04Z (12G) coating designation; mill phosphatized.

1. For anchors built into exterior walls, steel sheet complying with ASTM A1008/A1008M or ASTM A1011/A1011M; hot-dip galvanized in accordance with ASTM A153/A153M, Class B.

2.7 MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Cold-Rolled Steel Sheet: ASTM A1008/A1008M, Commercial Steel (CS), Type B; suitable for exposed applications.

C. Hot-Rolled Steel Sheet: ASTM A1011/A1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

D. Metallic-Coated Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B.

E. Inserts, Bolts, and Fasteners: Hot-dip galvanized in accordance with ASTM A153/A153M.

F. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hollow-metal frames of type indicated.

G. Mineral-Fiber Insulation: ASTM C665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively; passing ASTM E136 for combustion characteristics.

H. Glazing: Comply with requirements in Section 088000 "Glazing."

I. Bituminous Coating: Cold-applied asphalt mastic, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.8 FABRICATION

A. Door Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4 inch (19 mm) beyond edge of door on which astragal is mounted or as required to comply with published listing of qualified testing agency.

B. Hollow-Metal Frames: Fabricate in one piece except where handling and shipping limitations require multiple sections. Where frames are fabricated in sections, provide alignment plates or angles at each joint, fabricated of metal of same or greater thickness as frames.

1. Sidelite Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by welding.
2. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.
3. Door Silencers: Except on weather-stripped frames, drill stops to receive door silencers as follows. Keep holes clear during construction.

    a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
    b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.

4. Electrical Knock Out Boxes: Factory weld 18 gauge electrical knock out boxes to frame for electrical hardware preps; including but not limited to, electric through wire transfer hardware, electrical raceways and wiring harnesses, door position switches, electric strikes, magnetic locks, and jamb mounted card readers as specified in hardware sets in Division 08 Sections "Door Hardware" and "Access Control Hardware".

    a. Provide electrical knock out boxes with a dual 1/2-inch and 3/4-inch knockouts.
    b. Conduit to be coordinated and installed in the field (Division 26) from middle hinge box and strike box to door position box.
    c. Electrical knock out boxes to comply with NFPA requirements and fit electrical door hardware as specified in hardware sets in Division 08 Section "Door Hardware".
    d. Electrical knock out boxes for continuous hinges should be located in the center of the vertical dimension on the hinge jamb.

C. Hardware Preparation: Factory prepare hollow-metal doors and frames to receive templated mortised hardware, and electrical wiring; include cutouts, reinforcement, mortising, drilling, and tapping in accordance with ANSI/SDI A250.6, the Door Hardware Schedule, and templates.

1. Reinforce doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.
2. Comply with BHMA A156.115 for preparing hollow-metal doors and frames for hardware.
3. Provisions for Electrical Devices: Provide steel conduit, boxes and other necessary devices required for the installation of electrical hardware in doors and frames.

D. Glazed Lites: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints.

1. Provide stops and moldings flush with face of door, and with beveled stops unless otherwise indicated.
2. Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite is capable of being removed independently.
3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames. Provide loose stops and moldings on inside of hollow-metal doors and frames.
4. Coordinate rabbet width between fixed and removable stops with glazing and installation types indicated.
5. Provide stops for installation with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches (230 mm) o.c. and not more than 2 inches (51 mm) o.c. from each corner.

E. Grout Guards: Formed from same material as frames, not less than 0.016 inch thick.

F. Hardware Reinforcement: Fabricate reinforcement plates from same material as frames to comply with the following minimum sizes:

1. Hinges: Minimum 9 ga. (3.8 mm) thick by 1-1/2 inches (38 mm) wide by 6 inches (152 mm) longer than hinge, secured by not less than 6 spot welds.
2. Lock Face, Flush Bolts, Closers, and Concealed Holders: Minimum 12 ga (2.6 mm) thick.
3. All Other Surface-Mounted Hardware: Minimum 14 ga. (1.9 mm) thick.
4. Provide overlapping hinge reinforcing full height of door.

G. Electrical Raceways: Provide hollow metal doors to receive electrified hardware with concealed wiring harness and standardized Molex™ plug connectors on both ends to accommodate up to twelve wires. Coordinate connectors on end of the wiring harness to plug directly into the electrified hardware and the through-wire transfer hardware or wiring harness specified in hardware sets in Division 08 Sections "Door Hardware" and "Access Control Hardware". Wire nut connections are not acceptable.

2.9 STEEL FINISHES

A. Prime Finish: Clean, pretreat, and apply manufacturer's standard primer.

1. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with ANSI/SDI A250.10; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for embedded and built-in anchors to verify actual locations before frame installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove welded-in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.

B. Drill and tap doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.

3.3 INSTALLATION

A. Install hollow-metal doors and frames plumb, rigid, properly aligned, and securely fastened in place. Comply with approved Shop Drawings and with manufacturer's written instructions.

B. Hollow-Metal Frames: Comply with ANSI/SDI A250.11 or NAAMM-HMMA 840.

1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces without damage to completed Work. All hollow metal frames shall be slushed full of grout.

    a. Where frames are fabricated in sections, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.
    b. Install frames with removable stops located on secure side of opening.
    c. Install door silencers in frames before grouting.
    d. Remove temporary braces necessary for installation only after frames have been properly set and secured.

2. Fire-Rated Openings: Install frames in accordance with NFPA 80.
3. Floor Anchors: Secure with postinstalled expansion anchors.

    a. Floor anchors may be set with power-actuated fasteners instead of postinstalled expansion anchors if so indicated and approved on Shop Drawings.

4. Solidly pack mineral-fiber insulation inside frames.

5. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with grout or mortar. Field apply bituminous coating to backs of frames that are filled with grout containing antifreezing agents.
6. Installation Tolerances: Adjust hollow-metal frames to the following tolerances:

    a. Squareness: Plus or minus 1/16 inch (1.6 mm), measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
    b. Alignment: Plus or minus 1/16 inch (1.6 mm), measured at jambs on a horizontal line parallel to plane of wall.
    c. Twist: Plus or minus 1/16 inch (1.6 mm), measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
    d. Plumbness: Plus or minus 1/16 inch (1.6 mm), measured at jambs at floor.

C. Hollow-Metal Doors: Fit and adjust hollow-metal doors accurately in frames, within clearances specified below.

1. Non-Fire-Rated Steel Doors: Comply with ANSI/SDI A250.8.
2. Fire-Rated Doors: Install doors with clearances in accordance with NFPA 80.
3. Smoke-Control Doors: Install doors in accordance with NFPA 105.

D. Glazing: Comply with installation requirements in Section 088000 "Glazing" and with hollow-metal manufacturer's written instructions.

3.4 REPAIR

A. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying, rust-inhibitive primer.

B. Metallic-Coated Surface Touchup: Clean abraded areas and repair with galvanizing repair paint according to manufacturer's written instructions.

END OF SECTION 081113

SECTION 081416 - FLUSH WOOD DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Five-ply flush wood veneer-faced doors for transparent finish.
2. Factory finishing flush wood doors.
3. Factory fitting flush wood doors to frames and factory machining for hardware.

B. Related Requirements:

1. Section 088000 "Glazing" for glass view panels in flush wood doors.
2. Section 134900 "Radiation Protection" for lead-lined flush wood doors.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:

1. Door core materials and construction.
2. Door edge construction
3. Door face type and characteristics.
4. Door trim for openings.
5. Factory-machining criteria.
6. Factory-finishing specifications.

B. Sustainable Design Submittals:

1. Environmental Product Declaration (EPD): For each product.
2. Health Product Declaration: For each product.
3. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.
4. Regional Materials: Manufacture wood doors within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.
5. Chain-of-Custody Certificates: For certified wood products. Include statement of costs.
6. Chain-of-Custody Qualification Data: For manufacturer and vendor.
7. Laboratory Test Reports: For adhesives, indicating compliance with requirements for low-emitting materials.
8. Laboratory Test Reports: For composite wood products, indicating compliance with requirements for low-emitting materials.

C. Shop Drawings: Project specific. Indicate location, size, and hand of each door; elevation of each type of door; construction details not covered in Product Data; and the following:

1. Door schedule indicating door location, type, size, fire protection rating, and swing.
2. Door elevations, dimension and locations of hardware, lite and louver cutouts, and glazing thicknesses.
3. Details of electrical raceway and preparation for electrified hardware, access control systems, and security systems.
4. Dimensions and locations of blocking for hardware attachment.
5. Dimensions and locations of mortises and holes for hardware.
6. Clearances and undercuts.
7. Requirements for veneer matching.
8. Doors to be factory finished and application requirements.

D. Samples for Verification:

1. Factory finishes applied to actual door face materials, approximately 8 by 10 inches (200 by 250 mm), for each material and finish. For each wood species and transparent finish, provide set of three Samples showing typical range of color and grain to be expected in finished Work.
2. Plastic laminate, 6 inches (150 mm) square, for each color, texture, and pattern selected.
3. Corner sections of doors, approximately 8 by 10 inches (200 by 250 mm), with door faces and edges representing actual materials to be used.
4. Frames for light openings, 6 inches (150 mm) long, for each material, type, and finish required.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Sample Warranty: For special warranty.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Special warranties.

B. Record Documents: For fire-rated doors, list of door numbers and applicable room name and number to which door accesses.

1.6 QUALITY ASSURANCE

A. Certified Wood: Provide an invoice including vendor's chain-of-custody number, product cost, and entity being invoiced.

B. Vendor Qualifications: A vendor that is certified for chain of custody by an FSC-accredited certification body.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with requirements of referenced standard and manufacturer's written instructions.

B. Package doors individually in plastic bags or cardboard cartons.

C. Mark each door on bottom rail with opening number used on Shop Drawings.

1.8 FIELD CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install doors until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, and HVAC system is operating and maintaining temperature and relative humidity at levels designed for building occupants for the remainder of construction period.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace doors that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Delamination of veneer.
b. Warping (bow, cup, or twist) more than 1/4 inch (6.4 mm) in a 42-by-84-inch (1067-by-2134-mm) section.
c. Telegraphing of core construction in face veneers exceeding 0.01 inch in a 3-inch (0.25 mm in a 76.2-mm) span.

2. Warranty also includes installation and finishing that may be required due to repair or replacement of defective doors.
3. Warranty Period for Solid-Core Interior Doors: Life of installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain flush wood doors from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Rated Wood Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated on Drawings, based on testing at positive pressure in accordance with UL 10C or NFPA 252.

1. Oversize Fire-Rated Door Assemblies: For units exceeding sizes of tested assemblies, provide certification by a qualified testing agency that doors comply with standard

construction requirements for tested and labeled fire-rated door assemblies except for size.

B. Smoke- and Draft-Control Door Assemblies: Listed and labeled for smoke and draft control by a qualified testing agency acceptable to authorities having jurisdiction, based on testing in accordance with UL 1784 and installed in compliance with NFPA 105.

2.3 FLUSH WOOD DOORS, GENERAL

A. Quality Standard: In addition to requirements specified, comply with AWI/AWMAC/WI's "Architectural Woodwork Standards."

B. Doors are to be manufactured and certified by the manufacturer that they meet AWS Quality Standards.

C. Regional Materials: Manufacture wood doors within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

D. Certified Wood: Certify wood doors as "FSC Pure" or "FSC Mixed Credit" in accordance with FSC STD-01-001 and FSC STD-40-004.

E. Adhesives: Use adhesives that meet the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

F. Composite Wood Products: Verify products are made using ultra-low-emitting formaldehyde resins, as defined in the California Air Resources Board's "Airborne Toxic Control Measure to Reduce Formaldehyde Emissions from Composite Wood Products," or are made with no added formaldehyde.

2.4 SOLID-CORE FIVE-PLY FLUSH WOOD VENEER-FACED DOORS FOR TRANSPARENT FINISH

A. Interior Doors, Solid-Core Five-Ply Veneer-Faced:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Masonite Architectural.
    b. Oshkosh Door Company.
    c. VT Industries, Inc.

2. Performance Grade: ANSI/WDMA I.S. 1A Heavy Duty.
3. ANSI/WDMA I.S. 1A Grade: Premium.
4. Faces: Single-ply wood veneer not less than 1/50 inch (0.508 mm) thick. Veneer shall have uniform color within each face.

    a. Species: As indicated on Drawings.
    b. Cut: As indicated on Drawings.
    c. Match between Veneer Leaves: Slip match.
    d. Assembly of Veneer Leaves on Door Faces: Center-balance match.

e. Pair and Set Match: Provide for doors hung in same opening or separated only by mullions.
f. Room Match:

1) Match door faces within each separate room or area of building. Corridor-door faces do not need to match where they are separated by 20 feet (6 m) or more.
2) Provide door faces of compatible color and grain within each separate room or area of building.

5. Exposed Vertical Edges: Same species as faces.

a. Fire-Rated Single Doors: Provide edge construction with intumescent seals concealed by outer stile. Comply with specified requirements for exposed vertical edges.
b. Fire-Rated Pairs of Doors:

1) Provide fire-retardant stiles that are listed and labeled for applications indicated without formed-steel edges and astragals. Provide stiles with concealed intumescent seals. Comply with specified requirements for exposed edges.

c. Mineral-Core Doors: At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

1) Screw-Holding Capability: 475 lbf (2110 N) in accordance with WDMA T.M. 10.

d. Provide wood doors that have been tested for positive pressure by recognized independent testing laboratory, according to the applicable code requirements. Provide Category A Positive Pressure doors with the intumescent required for compliance contained within the door and require no additional installation of intumescent strips.

6. Core for Non-Fire-Rated Doors:

a. ANSI A208.1, Grade LD-1 particleboard.

1) Blocking: Provide wood blocking in particleboard-core doors as needed to eliminate through-bolting hardware.
2) Provide doors with glued-wood-stave or WDMA I.S. 10 structural-composite-lumber cores instead of particleboard cores for doors scheduled to receive exit devices in Section 087100 "Door Hardware."

7. Core for Fire-Rated Doors: As required to achieve fire-protection rating indicated on Drawings.

a. Blocking for Mineral-Core Doors: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated on Drawings as needed to eliminate through-bolting hardware.

8. Construction: Five plies, hot-pressed bonded (vertical and horizontal edging is bonded to core), with entire unit abrasive planed before veneering.

2.5 LIGHT FRAMES AND LOUVERS

A. Wood Beads for Light Openings in Wood Doors: Provide manufacturer's standard wood beads unless otherwise indicated.

1. Wood Species: Same species as door faces.
2. Profile: Flush rectangular beads.
3. At wood-core doors with 20-minute fire-protection ratings, provide wood beads and metal glazing clips approved for such use.

B. Wood-Veneered Beads for Light Openings in Fire-Rated Doors: Manufacturer's standard wood-veneered noncombustible beads matching veneer species of door faces and approved for use in doors of fire-protection rating indicated on Drawings. Include concealed metal glazing clips where required for opening size and fire-protection rating indicated.

2.6 FABRICATION

A. Factory fit doors to suit frame-opening sizes indicated.

1. Comply with clearance requirements of referenced quality standard for fitting unless otherwise indicated.
2. Comply with NFPA 80 requirements for fire-rated doors.

B. Factory machine doors for hardware that is not surface applied.

1. Locate hardware to comply with DHI-WDHS-3.
2. Comply with final hardware schedules, door frame Shop Drawings, ANSI/BHMA-156.115-W, and hardware templates.
3. Coordinate with hardware mortises in metal frames, to verify dimensions and alignment before factory machining.
4. For doors scheduled to receive electrified locksets, provide factory-installed raceway and wiring to accommodate specified hardware.

C. Openings: Factory cut and trim openings through doors.

1. Light Openings: Trim openings with moldings of material and profile indicated.
2. Glazing: Factory install glazing in doors indicated to be factory finished. Comply with applicable requirements in Section 088000 "Glazing."

2.7 FACTORY FINISHING

A. Comply with referenced quality standard for factory finishing.

1. Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.
2. Finish faces, all four edges, edges of cutouts, and mortises.
3. Stains and fillers may be omitted on bottom edges, edges of cutouts, and mortises.

B. Factory finish doors. Doors to be factory finished to meet or exceed WDMA I.S. 1-A-13 specifications for a TR-8 UV cured acrylated urethane finish system or AWS section 5 specifications for a UV curable polyester urethane finish system. Factory finish to be water based stain and UV curable polyester urethane finish system that complies with all applicable

Federal and State regulations for Volatile Organic Compounds (VOC) and Hazardous Air Pollutants (HAP) emission limitations per the EPA Clean Air Act.

C. Transparent Finish:

1. ANSI/WDMA I.S. 1A Grade: Premium.
2. Staining: Match Architect's sample.
3. Sheen: Match Architect’s sample.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine doors and installed door frames, with Installer present, before hanging doors.

1. Verify that installed frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
2. Reject doors with defects.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Hardware: For installation, see Section 087100 "Door Hardware."

B. Install doors to comply with manufacturer's written instructions and referenced quality standard, and as indicated.

1. Install fire-rated doors and frames in accordance with NFPA 80.
2. Install smoke- and draft-control doors in accordance with NFPA 105.

C. Job-Fitted Doors:

1. Align and fit doors in frames with uniform clearances and bevels as indicated below.

a. Do not trim stiles and rails in excess of limits set by manufacturer or permitted for fire-rated doors.

2. Machine doors for hardware.
3. Seal edges of doors, edges of cutouts, and mortises after fitting and machining.
4. Clearances:

a. Provide 1/8 inch (3.2 mm) at heads, jambs, and between pairs of doors.
b. Provide 1/8 inch (3.2 mm) from bottom of door to top of decorative floor finish or covering unless otherwise indicated on Drawings.
c. Where threshold is shown or scheduled, provide 1/4 inch (6.4 mm) from bottom of door to top of threshold unless otherwise indicated.
d. Comply with NFPA 80 for fire-rated doors.

5. Bevel non-fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) at lock and hinge edges.

6. Bevel fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) at lock edge; trim stiles and rails only to extent permitted by labeling agency.

D. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.

E. Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

3.3 ADJUSTING

A. Operation: Rehang or replace doors that do not swing or operate freely.

B. Finished Doors: Replace doors that are damaged or that do not comply with requirements. Doors may be repaired or refinished if Work complies with requirements and shows no evidence of repair or refinishing.

END OF SECTION 081416

SECTION 083323 - OVERHEAD COILING DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Insulated service doors.

B. Related Requirements:

1. Section 055000 "Metal Fabrications" for miscellaneous steel supports, door-opening framing, corner guards, and bollards.

1.3 ACTION SUBMITTALS

A. Product Data: For each type and size of overhead coiling door and accessory.

1. Include construction details, material descriptions, dimensions of individual components, profiles for slats, and finishes.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.
3. Include description of automatic-closing device and testing and resetting instructions.

B. Shop Drawings: Project specific. For each installation and for special components not dimensioned or detailed in manufacturer's product data.

1. Include plans, elevations, sections, and mounting details.
2. Include details of equipment assemblies, and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include points of attachment and their corresponding static and dynamic loads imposed on structure.
4. For exterior components, include details of provisions for assembly expansion and contraction and for excluding and draining moisture to the exterior.
5. Show locations of controls, locking devices, and other accessories.
6. Include diagrams for power, signal, and control wiring.

C. Samples for Initial Selection: Manufacturer's finish charts showing full range of colors and textures available for units with factory-applied finishes.

1. Include similar Samples of accessories involving color selection.

D. Samples for Verification: For each type of exposed finish on the following components, in manufacturer's standard sizes:

1. Curtain slats.
2. Bottom bar with sensor edge.
3. Guides.
4. Brackets.
5. Hood.
6. Locking device(s).
7. Include similar Samples of accessories involving color selection.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Sample Warranty: For special warranty.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Special warranty.

B. Maintenance Data: For overhead coiling doors to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer for both installation and maintenance of units required for this Project.

1. Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of doors that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain overhead coiling doors from single source from single manufacturer.

1. Obtain operators and controls from overhead coiling-door manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Accessibility Standard: Comply with applicable provisions in the USDOJ's "2010 ADA Standards for Accessible Design" and ICC A117.1.

B. Structural Performance, Exterior Doors: Capable of withstanding the following design wind loads:

1. Design Wind Load: As indicated on Drawings.
2. Testing: According to ASTM E330/E330M.
3. Deflection Limits: Design overhead coiling doors to withstand design wind load without evidencing permanent deformation or disengagement of door components.
4. Operability under Wind Load: Design overhead coiling doors to remain operable under design wind load, acting inward and outward.

2.3 DOOR ASSEMBLY (CD-1)

A. Insulated Service Door: Overhead coiling door formed with curtain of interlocking metal slats.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Overhead Door Corporation; Stormtite AP Model 627 or a comparable product by one of the following:

a. Cookson; a CornellCookson company; ESD30.
b. Cornell; a CornellCookson company; ESD30 Thermiser Max.
c. McKeon Rolling Steel Door Company, Inc.
d. Raynor Garage Doors.
e. Wayne-Dalton Corp.

B. Operation Cycles: Door components and operators capable of operating for not less than 20,000. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position.

1. Include tamperproof cycle counter.

C. Air Infiltration: Maximum rate of 1.0 cfm/sq. ft. (5.1 L/s per sq. m) at 15 and 25 mph (24.1 and 40.2 km/h) when tested according to ASTM E283 or DASMA 105.

D. STC Rating: 28.

E. Insulated Door Curtain R-Value: 10.9 deg F x h x sq. ft./Btu.

F. Insulated Door Assembly U-Factor: 0.09 Btu/deg F x h x sq. ft.

G. Door Curtain Material: Galvanized steel.

H. Door Curtain Slats: Flat profile slats of 2-5/8-inch (67-mm) center-to-center height.

I. Bottom Bar: Two angles, each not less than 1-1/2 by 1-1/2 by 1/8 inch (38 by 38 by 3 mm) thick; fabricated from hot-dip galvanized steel and finished to match door.

J. Curtain Jamb Guides: Galvanized steel with exposed finish matching curtain slats.

K. Hood: Match curtain material and finish.

1. Shape: As indicated on Drawings.
2. Mounting: Face of wall.

L. Locking Devices: Equip door with locking device assembly and chain lock keeper.

1. Locking Device Assembly: Cremone-type, both jamb sides locking bars, operable from inside with thumbturn, outside with cylinder.

M. Electric Door Operator:

1. Usage Classification: Standard duty, up to 25 cycles per hour and up to 90 cycles per day.
2. Operator Location: Wall.
3. Safety: Listed according to UL 325 by a qualified testing agency for commercial or industrial use; moving parts of operator enclosed or guarded if exposed and mounted at 8 ft. (2.44 m) or lower.
4. Motor Exposure: Interior.
5. Motor Electrical Characteristics:

    a. Horsepower: As indicated on Drawings.
    b. Voltage: As indicated on Drawings.

6. Emergency Manual Operation: Chain type.
7. Obstruction-Detection Device: Automatic electric sensor edge on bottom bar ; self-monitoring type.

    a. Sensor Edge Bulb Color: As selected by Architect from manufacturer's full range.

8. Control Station(s): Interior mounted.

N. Curtain Accessories: Equip door with weatherseals.

O. Door Finish:

1. Baked-Enamel or Powder-Coated Finish: Custom color matching Architect's sample.
2. Interior Curtain-Slat Facing: Finish as selected by Architect from manufacturer's full range.

2.4 DOOR CURTAIN MATERIALS AND CONSTRUCTION

A. Door Curtains: Fabricate overhead coiling-door curtain of interlocking metal slats, designed to withstand wind loading indicated, in a continuous length for width of door without splices. Unless

otherwise indicated, provide slats of thickness and mechanical properties recommended by door manufacturer for performance, size, and type of door indicated, and as follows:

1. Steel Door Curtain Slats: Zinc-coated (galvanized), cold-rolled structural-steel sheet; complying with ASTM A653/A653M, with G90 (Z275) zinc coating; nominal sheet thickness (coated) of 0.028 inch (0.71 mm); and as required.
2. Insulation: Fill slats for insulated doors with manufacturer's standard thermal insulation complying with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, according to ASTM E84 or UL 723. Enclose insulation completely within slat faces.
3. Metal Interior Curtain-Slat Facing: Match metal of exterior curtain-slat face, with minimum steel thickness of 0.010 inch (0.25 mm).

B. Curtain Jamb Guides: Manufacturer's standard angles or channels and angles of same material and finish as curtain slats unless otherwise indicated, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain, and a continuous bar for holding windlocks.

2.5 HOODS

A. General: Form sheet metal hood to entirely enclose coiled curtain and operating mechanism at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Form closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting that projects beyond wall face. Equip hood with intermediate support brackets as required to prevent sagging.

1. Galvanized Steel: Nominal 0.028-inch- (0.71-mm-) thick, hot-dip galvanized-steel sheet with G90 (Z275) zinc coating, complying with ASTM A653/A653M.
2. No wording or illustrations allowed on hood where exposed to view unless required by the building code.

2.6 LOCKING DEVICES

A. Locking Device Assembly: Fabricate with cylinder lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bars to engage through slots in tracks.

1. Lock Cylinders: As standard with manufacturer and keyed to building keying system.
2. Keys: Three for each cylinder.

B. Chain Lock Keeper: Suitable for padlock.

C. Safety Interlock Switch: Equip power-operated doors with safety interlock switch to disengage power supply when door is locked.

2.7 CURTAIN ACCESSORIES

A. Weatherseals for Exterior Doors: Equip each exterior door with weather-stripping gaskets fitted to entire exterior perimeter of door for a weather-resistant installation unless otherwise indicated.

1. At door head, use 1/8-inch- (3-mm-) thick, replaceable, continuous-sheet baffle secured to inside of hood or field-installed on the header.
2. At door jambs, use replaceable, adjustable, continuous, flexible, 1/8-inch- (3-mm-) thick seals of flexible vinyl, rubber, or neoprene.

2.8 COUNTERBALANCE MECHANISM

A. General: Counterbalance doors by means of manufacturer's standard mechanism with an adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to top of curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.

B. Counterbalance Barrel: Fabricate spring barrel of manufacturer's standard hot-formed, structural-quality, seamless or welded carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of slats and to limit barrel deflection to not more than 0.03 in./ft. (2.5 mm/m) of span under full load.

C. Counterbalance Spring: One or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Secure ends of springs to barrel and shaft with cast-steel barrel plugs.

D. Torsion Rod for Counterbalance Shaft: Fabricate of manufacturer's standard cold-rolled steel, sized to hold fixed spring ends and carry torsional load.

E. Brackets: Manufacturer's standard mounting brackets of either cast iron or cold-rolled steel plate.

2.9 ELECTRIC DOOR OPERATORS

A. General: Electric door operator assembly of size and capacity recommended and provided by door manufacturer for door and operation-cycles requirement specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, control stations, control devices, integral gearing for locking door, and accessories required for proper operation.

1. Comply with NFPA 70.
2. Control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V ac or dc.

B. Usage Classification: Electric operator and components capable of operating for not less than number of cycles per hour indicated for each door.

C. Door Operator Location(s): Operator location indicated for each door.

1. Wall Mounted: Operator is mounted to the inside front wall on the left or right side of door and connected to door drive shaft with drive chain and sprockets. Side room is required for this type of mounting. Wall-mounted operator can also be mounted above or below shaft; if above shaft, headroom is required.
2. above or below shaft; if above shaft, headroom is required.

D. Motors: Reversible-type motor with controller (disconnect switch) for motor exposure indicated for each door assembly.

1. Electrical Characteristics: Minimum as indicated for each door assembly. If not indicated, large enough to start, accelerate, and operate door in either direction from any position, at a speed not less than 8 in./sec. (203 mm/s) and not more than 12 in./sec. (305 mm/s), without exceeding nameplate ratings or service factor.
2. Operating Controls, Controllers, Disconnect Switches, Wiring Devices, and Wiring: Manufacturer's standard unless otherwise indicated.
3. er's standard unless otherwise indicated.
4. Coordinate wiring requirements and electrical characteristics of motors and other electrical devices with building electrical system and each location where installed.

E. Limit Switches: Equip each motorized door with adjustable switches interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.

F. Obstruction-Detection Devices: External entrapment protection consisting of indicated automatic safety sensor capable of protecting full width of door opening. For non-fire-rated doors, activation of device immediately stops and reverses downward door travel.

1. Electric Sensor Edge: Automatic safety sensor edge, located within astragal or weather stripping mounted to bottom bar. Contact with sensor activates device. Connect to control circuit using manufacturer's standard take-up reel or self-coiling cable.

a. Self-Monitoring Type: Four-wire-configured device designed to interface with door operator control circuit to detect damage to or disconnection of sensor edge.

G. Control Station: Three-button control station in fixed location with momentary-contact push-button controls labeled "Open" and "Stop" and sustained- or constant-pressure push-button control labeled "Close."

1. Interior-Mounted Units: Full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.

H. Emergency Manual Operation: Equip each electrically powered door with capability for emergency manual operation. Design manual mechanism so required force for door operation does not exceed 25 lbf (111 N).

I. Emergency Operation Disconnect Device: Equip operator with hand-operated disconnect mechanism for automatically engaging manual operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit switch. Mount mechanism so it is accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.

J. Motor Removal: Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency manual operation.

2.10 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM/NOMMA 500 for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.11 STEEL AND GALVANIZED-STEEL FINISHES

A. Baked-Enamel or Powder-Coat Finish: Manufacturer's standard baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates areas and conditions, with Installer present, for compliance with requirements for substrate construction and other conditions affecting performance of the Work.

B. Examine locations of electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install overhead coiling doors and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports; according to manufacturer's written instructions and as specified.

B. Install overhead coiling doors, hoods, controls, and operators at the mounting locations indicated for each door.

C. Accessibility: Install overhead coiling doors, switches, and controls along accessible routes in compliance with the accessibility standard.

D. Power-Operated Doors: Install according to UL 325.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and to furnish reports to Architect.

B. Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.

C. Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. After electrical circuitry has been energized, operate doors to confirm proper motor rotation and door performance.

3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

3.5 ADJUSTING

A. Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.

1. Adjust exterior doors and components to be weather resistant.

B. Lubricate bearings and sliding parts as recommended by manufacturer.

C. Adjust seals to provide tight fit around entire perimeter.

3.6 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of coiling-door Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper door operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

1. Perform maintenance, including emergency callback service, during normal working hours.
2. Include 24-hour-per-day, seven-day-per-week, emergency callback service.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling doors.

END OF SECTION 083323

SECTION 083343 - OVERHEAD COILING SMOKE CURTAINS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Smoke-protective curtain assemblies for elevator entrances.
2. Smoke- and fire-protective curtain assemblies for elevator entrances.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 COORDINATION

A. Coordinate smoke curtain assemblies with power, signal, fire-alarm, and smoke-detection systems specified in Division 26 and Division 28.

B. Coordinate elevator smoke-protective curtain assemblies with elevator hoistway door frames specified in Division 14.

C. Coordinate smoke-protective curtain assemblies with ceilings for operational clearances and maintenance access requirements.

D. Coordinate smoke-protective curtain assemblies with walls for support requirements, rating continuity above ceilings, and recessed wall switches.

E. Coordinate requirements for metal supports required for smoke-protective curtain assemblies.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of smoke-protective curtain assembly and draft curtain.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for smoke curtains.
2. Include points of attachment and their corresponding static and dynamic loads imposed on structure.
3. Include ratings, operating components, electrical characteristics, control systems, and furnished specialties and accessories.

B. Shop Drawings: Project specific. For each installation and for special components not dimensioned or detailed in manufacturer's product data.

1. Include plans, elevations, sections, and attachment details.
2. Include details of smoke curtain assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location of each field connection.
3. Include points of attachment and their corresponding static and dynamic loads imposed on structure.
4. Detail fabrication and assembly of fire-protective curtain assemblies.
5. Show locations of controls, detectors, and other accessories.
6. Include diagrams for power, signal, and control wiring.

C. Samples: For each exposed product and for each color and texture specified, 6 inches (152 mm) in length.

D. Product Schedule: For smoke curtain assemblies. Use same designations indicated on Drawings.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturer, testing agency, and factory-authorized service representative.

B. Evaluation Reports: For curtain assemblies, from ICC-ES or another qualified testing agency.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For smoke curtain assemblies to include in emergency, operation, and maintenance manuals.

B. Field quality-control reports for required testing.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: An entity experienced in manufacturing smoke-and-draft-control curtain assemblies that have been successfully installed in compliance with requirements of authorities having jurisdiction.

B. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer for both installation and maintenance of units required for this Project.

C. Smoke-Protective Curtain Assembly Inspector Qualifications: Inspector for field quality control inspections of smoke-protective curtain assemblies complying with NFPA 105.

1.9 FIELD CONDITIONS

A. Field Measurements: Field-verify and coordinate dimensions and indicate measurements on Shop Drawings.

1.10 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of curtain assemblies that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS, GENERAL

A. Source Limitations: Obtain smoke-protective curtains from single source from single manufacturer.

1. Obtain operators and controls from smoke-protective curtain manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Smoke Protective Curtain Assemblies: Provide smoke-protective curtains that are listed and labeled with the letter "S" on the rating label by a qualified testing agency for smoke- and draft-control based on testing in accordance with UL 1784; with maximum air-leakage rate of 3.0 cfm/sq. ft. (0.01524 cu. m/s x sq. m) of opening at 0.10 inch wg (24.9 Pa) for both ambient and elevated temperature tests.

B. Smoke- and Fire-Protective Curtain Assemblies: Complying with NFPA 80; listed and labeled by qualified testing agency, for fire-protection ratings indicated, based on testing at as close to neutral pressure as possible in accordance with UL 10D.

1. Oversize Rated Curtain Assemblies: For units exceeding sizes of tested assemblies, provide certification by a qualified testing agency that curtain assemblies comply with standard construction requirements for tested and labeled fire-rated curtain assemblies, except for size.
2. Smoke Control: Provide smoke-protective curtains that are listed and labeled with the letter "S" on the rating label by a qualified testing agency for smoke- and draft-control based on testing in accordance with UL 1784; with maximum air-leakage rate of 3.0 cfm/sq. ft. (0.01524 cu. m/s x sq. m) of opening at 0.10 inch wg (24.9 Pa) for both ambient and elevated temperature tests.

C. Curtain Fabric Fire-Test-Response Characteristics: Provide products that pass NFPA 701, as determined by testing of fabrics that were treated using treatment-application method intended for use for this Project by a testing and inspecting agency acceptable to authorities having jurisdiction.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 SMOKE-PROTECTIVE CURTAIN ASSEMBLIES FOR ELEVATOR ENTRANCES (SMKC-2)

A. Alarm-activated transparent-film smoke curtain assembly complying with ICC-ES AC77.

B. Basis-of-Design Product: Subject to compliance with requirements, provide Smoke Guard, a CSW Industrials Company; Elevator Smoke Curtain: M400 or a comparable product by one of the following:

1. CornellCookson, LLC.
2. Fire Curtain Technologies.
3. Stoebich
4. U.S. Smoke & Fire.

C. Smoke Containment: Assemblies complying with UL 1784 for air leakage and requirements of ASME 17.1/CSA B44.

D. Transparent-Film Curtain: Manufacturer's standard transparent film with flame-spread and smoke-developed indexes of 25 and 450, respectively, when tested in accordance with ASTM E84.

E. Operation: Controlled descent automatically by fail-safe motor-driven deployment and motorized rewind.

F. Curtain Attachment: Curtain shall form a pressure-resisting seal by one of the following methods:

1. Magnetic Adhesion: With Type 430 ferritic stainless steel elevator door frames, use magnets for closure with door frame.
2. Auxiliary Rails: With magnetic closure of curtain with incompatible elevator door frame material, provide magnetic stainless steel cladding for door frame, formed from ASTM A240/A240M, Type 430 ferritic stainless steel.

    a. Finish: Match stainless steel elevator door frame.

G. Control System: Provide factory-assembled control unit as required for assembly specified.

1. Fail-safe device deploys on activation of local smoke detector and building fire alarm or testing key switch in compliance with UL 864.
2. Curtain Rewind Switch: Include switch to rewind screen into housing.
3. Motor Operator: Provide factory-assembled electric operation system of size and capacity recommended in writing by curtain manufacturer for assembly specified, with electric motors and factory-prewired motor controls, control devices, and accessories required for proper operation.
4. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Housing Type: Sheet metal housings containing support rollers and associated electronics.

1. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

2.4 SMOKE- AND FIRE-PROTECTIVE CURTAIN ASSEMBLIES FOR ELEVATOR ENTRANCES (SMKC-1)

A. Alarm-activated flame-resistant fabric smoke curtain assembly complying with ICC-ES AC77.

B. Basis-of-Design Product: Subject to compliance with requirements, provide McKeon Door Company; FireFighter Series Model D200E or a comparable product by one of the following:

1. CornellCookson, LLC.
2. Fire Curtain Technologies.
3. Smoke Guard, Inc.
4. Stoebich
5. U.S. Smoke & Fire.

C. Smoke Containment: Assemblies complying with UL 1784 for air leakage and requirements of ASME 17.1/CSA B44.

D. Fire-Resistance Rating of Fabric: Comply with UL 10D; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Rating: As indicated on Drawings.

E. Operation: Motorized automatic operation with controlled descent.

F. Automatic-Closing Device: Equip each deployable curtain assembly with fail-safe, gravity-closing device or holder-release mechanism and governor unit complying with UL 864 and NFPA 105, and an easily tested and reset release mechanism. Automatic-closing device shall be designed for activation by the following:

1. Manufacturer's standard UL-labeled smoke detector and holder-release devices.
2. Manufacturer's standard UL-labeled heat detector and holder-release devices.
3. Building fire-detection, smoke-detection, and fire-alarm systems.

G. Hood/Head Box: Manufactured from galvanized steel in accordance with ASTM A653/A653M; rated at the same temperature as the curtain fabric.

H. Curtain: Manufacturer's standard multilayer glass-fiber fabric woven-coated on one or both sides with egress.

1. Fire Rating: UL-listed fabric tested in accordance with UL 10D and ASTM E119 for fire resistance.

I. Roller: Manufacturer's standard curtain roller assembly to contain motor.

J. Weighted Bottom Bar: Provide weighted bottom bar to ensure smooth operation and hold curtain taut.

K. Curtain Guides: As selected by Architect from manufacturer's available standard materials and finishes.

L. Motor Operator: Provide factory-assembled electric operation system of size and capacity recommended by curtain manufacturer for assembly specified, with electric motors and factory-prewired motor controls, control devices, and accessories required for proper operation.

1. Include wiring from control stations to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.
2. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, by a qualified testing agency, and marked for intended location and application.
3. Battery Backup: Manufacturer's standard battery backup sized for motor power requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrate areas and conditions, with Installer present, for compliance with requirements for substrate construction and other conditions affecting performance of the Work.

B. Examine locations of electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Smoke- and Fire-Protective Curtains: Install in accordance with manufacturer's written installation instructions, NFPA 80, and NFPA 105.

B. Smoke-Protective Curtains: Install smoke-protective curtain assemblies in accordance with manufacturer's written installation instructions and NFPA 105.

1. Install smoke-protective curtain assemblies for elevator entrances in accordance with ASME 17.1/CSA B44.

C. Power-Operated Curtains: Install in accordance with UL 864.

D. Install anchorage devices to securely fasten assembly to substrate and building framing without distortion or stress.

E. Securely brace components suspended from structure.

F. Fit and align assembly, including vertical guides, level and plumb, to provide smooth operation.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified opening protective assembly inspector to perform tests and inspections and to furnish reports to Architect.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Test release mechanism, closing, and alarm operations when activated by smoke detector or building's fire-alarm system. Test manual operation of closed curtain. Reset closing mechanism after successful test.

2. Inspections: Inspect each smoke-protective curtain assembly in accordance with NFPA 105.

C. Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.

D. Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.

E. Prepare and submit separate inspection report for each smoke-protective curtain assembly indicating compliance with each item listed in NFPA 105.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling smoke curtains.

3.5 MAINTENANCE

A. Engage a manufacturer's authorized service representative to test, adjust, and maintain the smoke-protective assemblies once per year, as required by NFPA 105.

END OF SECTION 083343

SECTION 084213 - ALUMINUM-FRAMED ENTRANCES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Aluminum-framed entrance door systems.

B. Related Requirements:

1. Section 084413 "Glazed Aluminum Curtain Walls".

1.2 ACTION SUBMITTALS

A. Product Data:

1. Aluminum-framed entrance door systems.

B. Product Data Submittals: For each product.

1. Construction details, material descriptions, most current version of the manufacturer’s installation instructions, dimensions of individual components and profiles, and finishes.
2. Operating characteristics, electrical characteristics, and furnished accessories.

C. Shop Drawings: Project specific.

1. Plans, elevations, sections, full-size details, and attachments to other work.
2. Details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
3. Full-size isometric details of each type of vertical-to-horizontal intersection of aluminum-framed entrance door systems, showing the following:

    a. Joinery, including concealed welds.
    b. Anchorage.
    c. Expansion provisions.
    d. Glazing.
    e. Flashing and drainage.

4. Connection to and continuity with adjacent thermal, weather, air, and vapor barriers and adjacent construction.
5. Point-to-point wiring diagrams showing the following:

    a. Power requirements for each electrically operated door hardware.
    b. Location and types of switches, signal device, conduit sizes, and number and size of wires.

6. Signed and sealed by the qualified professional engineer responsible for their preparation.

D. Samples for Verification: Actual sample of finished products for each type of exposed finish.

1. Size: Manufacturers' standard size.

E. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch (300-mm) lengths of full-size components and showing details of the following:

1. Joinery, including concealed welds.
2. Anchorage.
3. Expansion provisions.
4. Glazing.
5. Flashing and drainage.

F. Entrance Door Hardware Schedule: Prepared by or under supervision of supplier, detailing fabrication and assembly of entrance door hardware, as well as procedures and diagrams. Coordinate final entrance door hardware schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

G. Delegated Design Submittals: For aluminum-framed entrances and storefront systems, including analysis data signed and sealed by the qualified professional engineer licensed in the State of Kentucky responsible for their preparation.

H. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.
3. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
4. Environmental Product Declaration: For each product.
5. Health Product Declaration: For each product.
6. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

1.3 INFORMATIONAL SUBMITTALS

A. Energy Performance Certificates: For aluminum-framed entrance door systems, accessories, and components, from manufacturer.

1. Basis for Certification: NFRC-certified energy performance values for each aluminum-framed entrance.

B. Product Test Reports: For aluminum-framed entrance door systems, for tests performed by a qualified testing agency. Test reports shall be project specific and performed within the past 2 years.

C. Field Quality-Control Reports: For aluminum-framed entrance door systems.

D. Qualification Statements:

1. For Installer and field testing agency.

E. Delegated Design Engineer Qualifications: For aluminum-framed entrance and storefront systems.

F. Sample Warranties: For aluminum-framed entrance door systems.

G. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For aluminum-framed entrance door systems.

1.5 QUALITY ASSURANCE

A. Installer Qualifications:

1. Fabricator of products.
2. Entity that employs installers and supervisors who are trained and approved by manufacturer.
3. Authorized representative who is trained and approved by manufacturer.
4. Entity that is certified under the North American Contractor Certification Program (NACC) and that employs installers and supervisors who are trained and approved by manufacturer and who are certified under the Architectural Glass and Metal Technician (AGMT) certification program.

B. Delegated Design Engineer Qualifications: A professional engineer who is legally qualified to practice in state where Project is located and who is experienced in providing engineering services of the type indicated.

C. Testing Agency Qualifications: Qualified in accordance with ASTM E699 for testing indicated and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025 and acceptable to Owner and Architect.

D. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.

1. Do not change intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If changes are proposed, submit comprehensive explanatory data to Architect for review.

E. Accessible Entrances: Comply with the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

1.6 WARRANTY

A. Special Warranty: Manufacturer and Installer agree to repair or replace components of aluminum-framed entrance door systems that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures.
b. Faulty operation.
c. Deterioration of metals and other materials beyond normal weathering.

2. Warranty Period: 10 years from date of Substantial Completion.

B. Special Finish Warranty, Factory-Applied Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: 20 years from date of Substantial Completion.

C. Special Finish Warranty, Anodized Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of anodized finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D 2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D 4214.
c. Cracking, peeling, or chipping.

2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain all components of aluminum-framed entrance door systems, including framing and accessories, from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design aluminum-framed entrance door systems.

B. General Performance: Comply with performance requirements specified, as determined by testing of aluminum-framed entrance door systems representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.

C. Structural Loads:

1. Wind Loads: As indicated on Drawings.
2. Other Design Loads: As indicated on Drawings.

D. Structural: Test in accordance with ASTM E330/E330M as follows:

1. When tested at 150 percent of positive and negative wind-load design pressures, entrance doors, including anchorage, do not evidence material failures, structural distress, or permanent deformation of main framing members exceeding 0.2 percent of span.
2. Test Durations: As required by design wind velocity, but not less than 10 seconds.

E. Energy Performance: Certified and labeled by manufacturer for energy performance as follows:

1. Thermal Transmittance (U-factor):

a. Entrance Doors: U-factor of not more than 0.52 Btu/sq. ft. x h x deg F as determined in accordance with NFRC 100.

2. Air Leakage:

a. Entrance Doors: Air leakage of not more than 1.0 cfm/sq. ft. (5.08 L/s per sq. m) at a static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).

3. Condensation Resistance Factor (CRF):

a. Entrance Doors: CRF of not less than 49 frame and 68 glass as determined in accordance with AAMA 1503.

F. Noise Reduction: Test in accordance with ASTM E90, with ratings determined by ASTM E1332, as follows.

1. Outdoor-Indoor Transmission Class: Minimum 32.

G. Thermal Movements: Allow for thermal movements resulting from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.3 ALUMINUM-FRAMED ENTRANCE DOOR SYSTEMS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Kawneer Company, Inc.; Arconic Corporation; 350T Insulpour Thermal Entrance or a comparable product by one of the following:

1. EFCO Corporation.
2. Wausau Window and Wall Systems; Apogee Wausau Group, Inc.

B. Entrance Doors: Manufacturer's standard glazed entrance doors for manual-swing or automatic operation.

1. Door Construction: 2- to 2-1/4-inch (50.8- to 57.2-mm) overall thickness, with minimum 0.125-inch- (3.2-mm-) thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods.

    a. Thermal Construction: High-performance plastic connectors separate aluminum members exposed to the exterior from members exposed to the interior.

2. Door Design: Medium stile; 3-1/2-inch (88.9-mm) nominal width.
3. Glazing Stops and Gaskets: Snap-on, extruded-aluminum stops and preformed gaskets.

    a. Provide nonremovable glazing stops on outside of door.

4. Split finish: Custom anodized finish to match Architect’s sample (exterior) and custom color high-performance organic finish to match Architect’s sample (interior).

C. Framing Members: Manufacturer's standard extruded aluminum, minimum 0.125 inch (3.2 mm) thick and reinforced as required to support imposed loads.

1. Nominal Size: As indicated on Drawings.
2. Exterior Framing Construction: Thermally broken.
3. Finish: Match door finish.

D. Backer Plates: Manufacturer's standard, continuous backer plates for framing members, if not integral, where framing abuts adjacent construction.

E. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

F. Materials:

1. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

    a. Sheet and Plate: ASTM B209 (ASTM B209M).
    b. Extruded Bars, Rods, Profiles, and Tubes: ASTM B221 (ASTM B221M).
    c. Structural Profiles: ASTM B308/B308M.

2. Steel Reinforcement:

    a. Structural Shapes, Plates, and Bars: ASTM A36/A36M.
    b. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.

c. Hot-Rolled Sheet and Strip: ASTM A1011/A1011M.

3. Steel Reinforcement Primer: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods in accordance with recommendations in SSPC-SP COM, and prepare surfaces in accordance with applicable SSPC standard.
4. Recycled Content of Aluminum Components: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

G. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

1. Regional Materials: Fabricate products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered within 100 miles (160 km) of Project site.

2.4 ENTRANCE DOOR HARDWARE

A. Entrance Door Hardware: Hardware not specified in this Section is specified in Section 087100 "Door Hardware."

B. General: Provide entrance door hardware and entrance door hardware sets indicated in door and frame schedule for each entrance door, to comply with requirements in this Section.

1. Entrance Door Hardware Sets: Provide quantity, item, size, finish or color indicated, and products complying with BHMA standard referenced.
2. Sequence of Operation: Provide electrified door hardware function, sequence of operation, and interface with other building control systems indicated.
3. Opening-Force Requirements:

a. Egress Doors: Not more than 15 lbf (67 N) to release the latch and not more than 30 lbf (133 N) to set the door in motion and not more than 15 lbf (67 N) to open the door to its minimum required width.
b. Accessible Interior Doors: Not more than 5 lbf (22.2 N) to fully open door.

C. Designations: Requirements for design, grade, function, finish, quantity, size, and other distinctive qualities of each type of entrance door hardware are indicated in "Entrance Door Hardware Sets" Article. Products are identified by using entrance door hardware designations as follows:

1. References to BHMA Standards: Provide products complying with these standards and requirements for description, quality, and function.

D. Cylinders:

1. As specified in Section 087100 "Door Hardware."

E. Strikes: Provide strike with black-plastic dust box for each latch or lock bolt; fabricated for aluminum framing.

F. Weather Stripping: Manufacturer's standard replaceable components.

1. Compression Type: Made of ASTM D2000 molded neoprene or ASTM D2287 molded PVC.
2. Sliding Type: AAMA 701/702, made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.

G. Weather Sweeps: Manufacturer's standard exterior-door bottom sweep with concealed fasteners on mounting strip.

H. Thresholds: BHMA A156.21 raised thresholds beveled with a slope of not more than 1:2, with maximum height of 1/2 inch (12.7 mm).

I. Finger Guards: Manufacturer's standard collapsible neoprene or PVC gasket anchored to frame hinge-jamb at center-pivoted doors.

2.5 GLAZING

A. Glazing: Comply with Section 088000 "Glazing."

B. Glazing Gaskets: Comply with Section 088000 "Glazing."

C. Glazing Sealants: Comply with Section 088000 "Glazing."

1. Verify sealant has a VOC content of 250 g/L or less.

2.6 ACCESSORIES

A. Automatic Door Operators: Section 087113 "Power Door Operators."

B. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
2. Reinforce members as required to receive fastener threads.

C. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch (25.4 mm) that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.

1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A123/A123M or ASTM A153/A153M requirements.

D. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.

E. Bituminous Paint: Cold-applied asphalt-mastic paint containing no asbestos, formulated for 30-mil (0.762-mm) thickness per coat.

F. Rigid PVC filler.

2.7 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Entrance Door Frames: Reinforce as required to support loads imposed by door operation and for installing entrance door hardware.

1. At interior and exterior doors, provide compression weather stripping at fixed stops.

E. Entrance Doors: Reinforce doors as required for installing entrance door hardware.

1. At pairs of exterior doors, provide sliding-type weather stripping retained in adjustable strip and mortised into door edge.
2. At exterior doors, provide weather sweeps applied to door bottoms.

F. Entrance Door Hardware Installation: Factory install entrance door hardware to the greatest extent possible. Cut, drill, and tap for factory-installed entrance door hardware before applying finishes.

G. After fabrication, clearly mark components to identify their locations in Project in accordance with Shop Drawings.

2.8 ALUMINUM FINISHES

A. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.

1. Color: Custom color. Match Architect's sample.

B. High-Performance Organic Finish, Two-Coat PVDF: Fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

1. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
2. Color and Gloss: Custom color. Match Architect's sample.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF ALUMINUM-FRAMED ENTRANCE DOOR SYSTEMS

A. Comply with manufacturer's written instructions.

B. Do not install damaged components.

C. Fit joints to produce hairline joints free of burrs and distortion.

D. Rigidly secure nonmovement joints.

E. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.

F. Seal perimeter and other joints watertight unless otherwise indicated.

G. Metal Protection:

1. Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with materials recommended by manufacturer for this purpose or installing nonconductive spacers.
2. Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

H. Set continuous sill members and flashing in full sealant bed, as specified in Section 079200 "Joint Sealants," to produce weathertight installation.

I. Install joint filler behind sealant as recommended by sealant manufacturer.

J. Install components plumb and true in alignment with established lines and grades.

K. Install entrance doors to produce smooth operation and tight fit at contact points.

1. Exterior Doors: Install to produce weathertight enclosure and tight fit at weather stripping.
2. Field-Installed Entrance Door Hardware: Install surface-mounted entrance door hardware according to entrance door hardware manufacturers' written instructions using concealed fasteners to greatest extent possible.

L. Install glazing as specified in Section 088000 "Glazing."

3.3 FIELD QUALITY CONTROL

A. Refer to Section 084413 “Glazed Aluminum Curtain Walls”.

3.4 MAINTENANCE SERVICE

A. Entrance Door Hardware Maintenance:

1. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for Owner's continued adjustment, maintenance, and removal and replacement of entrance door hardware.
2. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of entrance door hardware Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper entrance door hardware operation at rated speed and capacity. Use parts and supplies that are the same as those used in the manufacture and installation of original equipment.

3.5 ENTRANCE DOOR HARDWARE SETS

A. Refer to Section 087100 “Door Hardware”.

END OF SECTION 084213

SECTION 084229.23 - SLIDING AUTOMATIC ENTRANCES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Sliding automatic entrances.

B. Related Requirements:

1. Section 087113 "Power Door Operators" for automatic door operators furnished separately from doors and frames.

1.2 DEFINITIONS

A. AAADM: American Association of Automatic Door Manufacturers.

B. Activation Device: A control that, when actuated, sends an electrical signal to the door operator to open the door.

C. Safety Device: A control that, to avoid injury, prevents a door from opening or closing.

D. For automatic door terminology, refer to BHMA A156.10 for definitions of terms.

1.3 COORDINATION

A. Templates: Distribute for doors, frames, and other work specified to be factory prepared for installing automatic entrances.

B. Coordinate hardware with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish. Coordinate hardware for automatic entrances with hardware required for rest of Project.

C. Electrical System Roughing-in: Coordinate layout and installation of automatic entrances with connections to power supplies and access-control system.

D. System Integration: Integrate sliding automatic entrances with other systems as required for a complete working installation.

1. Provide electrical interface control capability for activation of sliding automatic entrances by security access system on doors with electric locking.
2. Provide electrical interface to deactivate door operators on activation of fire alarm system.
3. Provide electrical interface to allow for remote monitoring of automatic entrance door panel status.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: Sliding automatic entrances.

B. Product Data Submittals: For each product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for automatic entrances.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental Product Declaration: For each product.
3. Health Product Declaration: For each product.
4. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

D. Shop Drawings: Project specific. For sliding automatic entrances.

1. Include plans, elevations, sections, hardware mounting heights, and attachment details.
2. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.
4. Indicate locations of activation and safety devices.
5. Include hardware schedule and indicate hardware types, functions, quantities, and locations.

E. Samples for Initial Selection: For units with factory-applied finishes.

1. Include Samples of hardware and accessories involving color or finish selection.

F. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

G. Delegated Design Submittals: For automatic entrances.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and manufacturer.

B. Product Certificates: For each type of automatic entrance. Include emergency-exit features of automatic entrances serving as a required means of egress.

C. Product Test Reports: For each type of automatic entrance, for tests performed by a qualified testing agency.

D. Field quality-control reports.

E. Sample Warranties: For manufacturer's special warranties.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For automatic entrances, safety devices, and control systems to include in operation and maintenance manuals.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer with Company Certificate issued by AAADM indicating that manufacturer has a Certified Inspector on staff.

B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation and maintenance of units required for this Project and who employs a Certified Inspector.

1. Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.

C. Certified Inspector Qualifications: Certified by AAADM.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of automatic entrances that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.
b. Faulty operation of operators, controls, and hardware.
c. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.

2. Warranty Period: Two years from date of Substantial Completion.

B. Special Finish Warranty: Manufacturer agrees to repair or replace components on which finishes fail in materials or workmanship within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Hunter units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain sliding automatic entrances from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Power-Operated Door Standard: BHMA A156.10.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design automatic entrances.

D. Structural Performance: Automatic entrances to withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated in accordance with ASCE/SEI 7.

1. Wind Loads: As indicated on Drawings.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

F. Operating Temperature Range: Automatic entrances to operate within minus 20 to plus 122 deg F (minus 29 to plus 50 deg C).

G. Energy Performance: Certified and labeled by manufacturer for energy performance as follows:

1. Thermal Transmittance (U-Factor):

a. Entrance Doors: U-factor of not more than 0.64 Btu/sq. ft. x h x deg F (3.58 W/sq. m x K) as determined in accordance with NFRC 100.

2. Solar Heat-Gain Coefficient (SHGC):

a. Entrance Doors: SHGC of not more than 0.28 as determined in accordance with NFRC 200.

3. Air Leakage:

a. Power-Operated Sliding Doors: Air leakage of not more than 1.0 cfm/sq. ft. (5.1 L/s per sq. m) at a static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).

4. Condensation Resistance:

a. Entrance Doors: CR of not less than 22.

H. Opening Force:

1. Power-Operated Doors: Not more than 50 lbf (222 N) required to manually set door in motion if power fails, and not more than 15 lbf (67 N) required to open door to minimum required width.
2. Breakaway Device for Power-Operated Doors: Not more than 50 lbf (222 N) required for a breakaway door or panel to open.

I. Entrapment-Prevention Force:

1. Power-Operated Sliding Doors: Not more than 30 lbf (133 N) required to prevent stopped door from closing.

2.3 SLIDING AUTOMATIC ENTRANCES (ASLD-1 & ASLD-2)

A. General: Provide manufacturer's standard automatic entrances, including doors, sidelites, framing, headers, carrier assemblies, roller tracks, door operators, controls, and accessories required for a complete installation.

B. Sliding, Power-Operated Automatic Entrances:

1. Basis-of-Design Product: Subject to compliance with requirements, provide STANLEY Access Technologies LLC; STANLEY Security Solutions, Inc.; Dura-Glide 3000 or a comparable product by one of the following:

   a. ASSA ABLOY Entrance Systems; ASSA ABLOY; SL500 EcoDoor.
   b. Horton Automatics; Overhead Door Corporation.
   c. dormakaba USA Inc.; ESA 300.

2. Configuration, Biparting-Sliding: Biparting-sliding doors with two sliding leaves and sidelites on each side.

   a. Traffic Pattern: Two way.
   b. Emergency Breakaway Capability: Sliding leaves and sidelites.
   c. Mounting: Between jambs.

3. Operator Features:

   a. Power opening and closing.
   b. Drive System: Belt.
   c. Adjustable opening and closing speeds.
   d. Adjustable hold-open time between zero and 30 seconds.
   e. Obstruction recycle.
   f. On-off/hold-open switch to control electric power to operator, key operated.

4. Sliding-Door Carrier Assemblies and Overhead Roller Tracks: Carrier assembly that allows vertical adjustment; consisting of nylon- or delrin-covered, ball-bearing-center steel wheels operating on a continuous roller track, or ball-bearing-center steel wheels operating on a nylon- or delrin-covered, continuous roller track. Support doors from carrier assembly by cantilever and pivot assembly.

   a. Rollers: Minimum of two ball-bearing roller wheels and two antirise rollers for each active leaf.

5. Sliding-Door Threshold: Threshold members and bottom-guide-track system with stainless steel, ball-bearing-center roller wheels.

    a. Configuration, Threshold: Saddle-type threshold across door opening and surface-mounted guide-track system at sidelites.

6. Controls: Activation and safety devices in accordance with BHMA standards.

    a. Activation Device, Motion Sensor: Mounted on each side of door header to detect pedestrians in activating zone and to open door.
    b. Safety Device, Photoelectric Beams: Two photoelectric beams mounted in sidelite jambs on each side of door to detect pedestrians in presence zone and to prevent door from closing.
    c. Safety Device, Presence Sensor on Sides of Door Header and Photoelectric Beams: Presence sensor mounted on each side of door header and two photoelectric beams mounted in sidelite jambs on one side of the door to detect pedestrians in presence zone and to prevent door from closing.
    d. Opening-Width Control: Two-position switch that in the normal position allows sliding doors to travel to full opening width and in the alternate position reduces opening to a selected partial opening width.

7. Finish (ASLD-1): Split Finish: Finish exterior framing, door(s), and header to match adjacent curtain wall (CW-1). Finish interior framing, door(s), and header with high-performance organic finish (two-coat fluoropolymer) in custom color to match Architect's sample.

8. Finish (ASLD-2): Finish framing, door(s), and header with high-performance organic finish (two-coat fluoropolymer) in custom color to match Architect's sample.

2.4 ENTRANCE COMPONENTS

A. Framing Members: Extruded aluminum, minimum 0.125 inch (3.2 mm) thick and reinforced as required to support imposed loads.

    1. Nominal Size: As indicated on Drawings.
    2. Extruded Glazing Stops and Applied Trim: Minimum 0.062-inch (1.6-mm) wall thickness.

B. Stile and Rail Doors: 1-3/4-inch- (45-mm-) thick, glazed doors with minimum 0.125-inch- (3.2-mm-) thick, extruded-aluminum tubular stile and rail members. Mechanically fasten corners with reinforcing brackets that are welded, or incorporate concealed tie-rods that span full length of top and bottom rails.

    1. Glazing Stops and Gaskets: Beveled, snap-on, extruded-aluminum stops and preformed gaskets.
    2. Stile Design: As indicated on Drawings.
    3. Rail Design: As indicated on Drawings.
    4. Muntin Bars: Horizontal tubular rail member for each door; match stile design and finish.

C. Sidelite(s): 1-3/4-inch- (45-mm-) deep sidelite(s) with minimum 0.125-inch- (3.2-mm-) thick, extruded-aluminum tubular stile and rail members matching door design.

    1. Glazing Stops and Gaskets: Same materials and design as for stile and rail door.
    2. Muntin Bars: Horizontal tubular rail members for each sidelite; match stile design.

D. Headers: Fabricated from minimum 0.125-inch- (3.2-mm-) thick extruded aluminum and extending full width of automatic entrance units to conceal door operators and controls. Provide hinged or removable access panels for service and adjustment of door operators and controls. Secure panels to prevent unauthorized access.

1. Mounting: Concealed, with one side of header flush with framing.
2. Capacity: Capable of supporting doors of up to 175 lb (79 kg) per leaf over spans of up to 14 feet (4.3 m) without intermediate supports.

a. Provide sag rods for spans exceeding 14 feet (4.3 m).

E. Brackets and Reinforcements: High-strength aluminum with nonstaining, nonferrous shims for aligning system components.

F. Signage: As required by cited BHMA standard.

1. Application Process: Door manufacturer's standard process.
2. Provide sign materials with instructions for field application after glazing is installed.

2.5 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Extrusions: ASTM B221 (ASTM B221M).
2. Sheet: ASTM B209 (ASTM B209M).

B. Steel Reinforcement: Reinforcement with corrosion-resistant primer complying with SSPC-PS Guide No. 12.00 applied immediately after surface preparation and pretreatment. Use surface preparation methods in accordance with recommendations in SSPC-SP COM and prepare surfaces in accordance with applicable SSPC standard.

C. Glazing: As specified in Section 088000 "Glazing."

D. Sealants and Joint Fillers: As specified in Section 079200 "Joint Sealants."

E. Nonmetallic, Shrinkage-Resistant Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout; complying with ASTM C1107/C1107M; of consistency suitable for application.

F. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

G. Fasteners and Accessories: Corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

H. Recycled Content of Aluminum Components: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

I. Regional Materials: Manufacture products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

2.6 DOOR OPERATORS AND CONTROLS

A. General: Provide operators and controls, which include activation and safety devices, in accordance with BHMA standards, for condition of exposure, and for long-term, maintenance-free operation under normal traffic load for type of occupancy indicated.

B. Door Operators: Provide door operators of size recommended by manufacturer for door size, weight, and movement.

1. Door Operator Performance: Door operators to open and close doors and maintain them in fully closed position when subjected to Project's design wind loads.
2. Electromechanical Operators: Concealed, self-contained, overhead units powered by fractional-horsepower, permanent-magnet dc motor; with closing speed controlled mechanically by gear train and dynamically by braking action of electric motor; with solid-state microprocessor controller; complying with UL 325; and with manual operation with power off.

C. Motion Sensors: Self-contained, K-band-frequency, microwave-scanner units; fully enclosed by their plastic housings; adjustable to provide detection-field sizes and functions required by BHMA A156.10.

1. Provide capability for switching between bi- and unidirectional detection.
2. For one-way traffic, sensor on egress side to not be active when doors are fully closed.

D. Presence Sensors: Self-contained, active-infrared scanner units; adjustable to provide detection-field sizes and functions required by BHMA A156.10. Sensors remain active at all times.

E. Photoelectric Beams: Pulsed infrared, sender-receiver assembly for recessed mounting. Beams to not be active when doors are fully closed.

F. Electrical Interlocks: Unless units are equipped with self-protecting devices or circuits, provide electrical interlocks to prevent activation of operator when door is locked, latched, or bolted.

2.7 HARDWARE

A. General: Provide units in sizes and types recommended by automatic entrance and hardware manufacturers for entrances and uses indicated. Finish exposed parts to match door finish unless otherwise indicated.

B. Breakaway Device for Power-Operated Doors: Device that allows door to swing out in direction of egress to full 90 degrees from any operating position. Maximum force to open door to be as stipulated in "Performance Requirements" Article. Interrupt powered operation of door operator while in breakaway mode.

1. Include two adjustable detent devices mounted in each breakaway panel; one top mounted and one bottom mounted to control breakaway force.

a. Panel Closer: Factory-installed concealed hydraulic door closer.
b. Limit Arms: Limit swing to 90 degrees, spring loaded with adjustable friction damping.

C. Access-Control Locking: Electrically controlled device mounted in header that automatically locks sliding door in closed position, preventing door panels from sliding manually. Provide fail-safe operation if power fails.

1. Include concealed, vertical-rod, tamper-proof exit devices, complying with UL 305, with latching into threshold and overhead carrier assembly and released by flush mounted and concealed within horizontal muntin bar, prohibiting manual breakout of door(s) from exterior.
2. Means of Egress: Vertical rod exit device.
3. Include locking devices for sidelites to prevent manual breakout.

D. Uninterrupted Power Supply: UL 1778, fully integrated unit mounted within header.

1. Power Interruption: Supply power to operator, controls, activation device, and safety systems of sliding automatic door for up to 1.5 hours of normal operation.
2. Include low-battery shutdown feature to safely open or close door prior to complete battery discharge.
3. Include audible battery replacement alarm to indicate that battery will no longer accept a charge and replacement is required.

E. Weather Stripping: Replaceable components.

1. Sliding Type: AAMA 701/702, made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.

2.8 FABRICATION

A. General: Factory fabricate automatic entrance components to designs, sizes, and thicknesses indicated and to comply with indicated standards.

1. Form aluminum shapes before finishing.
2. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
3. Use concealed fasteners to greatest extent possible. Where exposed fasteners are required, use countersunk Phillips flat-head machine screws, finished to match framing.

    a. Where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
    b. Reinforce members as required to receive fastener threads.

4. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.

B. Framing: Provide automatic entrances as prefabricated assemblies. Complete fabrication, assembly, finishing, hardware application, and other work before shipment to Project site.

1. Fabricate tubular and channel frame assemblies with welded or mechanical joints. Provide subframes and reinforcement as required for a complete system to support required loads.
2. Perform fabrication operations in manner that prevents damage to exposed finish surfaces.

3. Form profiles that are sharp, straight, and free of defects or deformations.
4. Provide components with concealed fasteners and anchor and connection devices.
5. Fabricate components with accurately fitted joints, with ends coped or mitered to produce hairline joints free of burrs and distortion.
6. Fabricate exterior components to drain water passing joints, condensation occurring within framing members, and moisture migrating within system to exterior. Provide anchorage and alignment brackets for concealed support of assembly from building structure.
7. Allow for thermal expansion of exterior units.

C. Doors: Factory fabricated and assembled in profiles indicated. Reinforce as required to support imposed loads and for installing hardware.

D. Door Operators: Factory fabricated and installed in headers, including adjusting and testing.

E. Glazing: Fabricate framing with minimum glazing edge clearances for thickness and type of glazing indicated, in accordance with NGA's "GANA Glazing Manual."

F. Hardware: Factory install hardware to greatest extent possible; remove only as required for final finishing operation and for delivery to and installation at Project site. Cut, drill, and tap for factory-installed hardware before applying finishes.

1. Provide sliding-type weather stripping, mortised into door, at perimeter of doors and breakaway sidelites.

G. Controls:

1. General: Factory install activation and safety devices in doors and headers as required by BHMA A156.10 for type of door and direction of travel.
2. Install photoelectric beams in vertical jambs of sidelites, with dimension above finished floor as follows:

a. Top Beam: 48 inches (1219 mm).
b. Bottom Beam: 24 inches (610 mm).

2.9 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Apply organic and anodic finishes to formed metal after fabrication unless otherwise indicated.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.10 ALUMINUM FINISHES

A. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.

1. Color: Custom color. Match Architect’s sample.

B. High-Performance Organic Finish, Two-Coat: Fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Color and Gloss: Custom color to match Architect's sample.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances, header support, and other conditions affecting performance of automatic entrances.

B. Examine roughing-in for electrical systems to verify actual locations of power connections before automatic entrance installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install automatic entrances in accordance with manufacturer's written instructions and cited BHMA A156.10 for direction of pedestrian travel, including signage, controls, wiring, and connection to the building's power supply.

1. Do not install damaged components. Fit frame joints to produce hairline joints free of burrs and distortion. Rigidly secure nonmovement joints. Seal joints watertight.
2. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
3. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous coating.

B. Entrances: Install automatic entrances plumb and true in alignment with established lines and grades without warp or rack of framing members and doors. Anchor securely in place.

1. Install surface-mounted hardware using concealed fasteners to greatest extent possible.
2. Set headers, carrier assemblies, tracks, operating brackets, and guides level and true to location with anchorage for permanent support.
3. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within system to exterior.
4. Level recesses for recessed thresholds using nonshrink grout.

C. Door Operators: Connect door operators to electrical power distribution system.

D. Access-Control Devices: Connect access-control devices to access-control system, as specified in Section 281300 "Access Control Software and Database Management."

E. Controls: Install and adjust activation and safety devices in accordance with manufacturer's written instructions and cited BHMA standard for direction of pedestrian travel. Connect control

wiring in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

F. Glazing: Install glazing as specified in Section 088000 "Glazing."

G. Sealants: Comply with requirements specified in Section 079200 "Joint Sealants" to provide weathertight installation.

1. Set thresholds, framing members and flashings in full sealant bed.
2. Seal perimeter of framing members with sealant.

H. Signage: Apply signage on both sides of each door and breakaway sidelite, as required by cited BHMA standard for direction of pedestrian travel.

I. Wiring within Automatic Entrance Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's written limitations on bending radii. Provide and use lacing bars and distribution spools.

3.3 FIELD QUALITY CONTROL

A. Certified Inspector: Engage a Certified Inspector to test and inspect components, assemblies, and installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Test and inspect each automatic entrance, using AAADM inspection forms, to determine compliance of installed systems with applicable BHMA standards.

C. Automatic entrances will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.4 ADJUSTING

A. Adjust hardware, moving parts, door operators, and controls to function smoothly, and lubricate as recommended by manufacturer; comply with requirements of applicable BHMA standards.

1. Adjust exterior doors for tight closure.

B. Readjust door operators and controls after repeated operation of completed installation equivalent to three days' use by normal traffic (100 to 300 cycles).

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.5 CLEANING

A. Clean glass and metal surfaces promptly after installation. Remove excess glazing and sealant compounds, dirt, and other substances. Repair damaged finish to match original finish.

1. Comply with requirements in Section 088000 "Glazing" for cleaning and maintaining glass.

3.6 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service to include 12 months' full maintenance by skilled employees of automatic entrance Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper automatic entrance operation. Parts and supplies to be manufacturer's authorized replacement parts and supplies.

1. Engage a Certified Inspector to perform safety inspection after each adjustment or repair and at end of maintenance period. Furnish completed inspection reports to Owner.
2. Perform maintenance, including emergency callback service, during normal working hours.
3. Include 24-hour-per-day, 7-day-per-week emergency callback service.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain automatic entrances.

END OF SECTION 084229.23

SECTION 084413 - GLAZED ALUMINUM CURTAIN WALLS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Glazed aluminum curtain wall systems:

    a. Conventionally glazed.
    b. Two-sided, structural-sealant-glazed.

B. Related Requirements:

1. Section 014339 "Mockups".
2. Section 019115 "Building Enclosure Commissioning."
3. *Section 019117 "Building Enclosure Functional Performance Testing."*
4. Section 072100 "Thermal Insulation" for insulation materials field installed with glazed aluminum curtain wall systems.
5. Section 078443 "Joint Firestopping" perimeter fire-containment systems field installed with glazed aluminum curtain walls.
6. Section 079200 "Joint Sealants" for installation of joint sealants installed with glazed aluminum curtain walls and for sealants to the extent not specified in this Section.
7. Section 084213 "Aluminum-Framed Entrances" for entrance systems installed with glazed aluminum curtain-wall systems.
8. Section 088000 "Glazing" for curtain wall glazing.
9. Section 089119 "Fixed Louvers" for louvers installed in glazed aluminum curtain wall systems.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site. Confirm participants with Construction Manager.

1. Discussion topics shall include;

    a. Schedule.
    b. Sequence.
    c. Coordination of trades.
    d. Substrate review and acceptance.
    e. Protection
    f. Shop drawings and submittals.
    g. Interface condition and details.
    h. Environmental constraints.
    i. Mockups.
    j. Testing requirements.
    k. Field quality control efforts.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, most current version of the manufacturer's installation instructions, dimensions of individual components and profiles, and finishes.

B. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.
3. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
4. Environmental Product Declaration (EPD): For each product.
5. Environmental Product Declaration: For each product.
6. Health Product Declaration: For each product.
7. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings: For glazed aluminum curtain walls, including sunshades. Include project specific plans, elevations, sections, full-size details, and attachments to other work. Prepared by or under the supervision of a qualified professional engineer licensed in the State of Kentucky detailing fabrication and assembly of glazed aluminum curtain-wall systems.

1. Include details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
2. Include full-size isometric details of each type of vertical-to-horizontal intersection of glazed aluminum curtain walls, showing the following:

    a. Joinery, including concealed welds.
    b. Anchorage.
    c. Expansion provisions.
    d. Glazing.
    e. Flashing and drainage.

3. Show connection to and continuity with adjacent thermal, weather, air, and vapor barriers and adjacent construction.

D. Samples for Initial Selection: For units with factory-applied color finishes.

E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

F. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch (300-mm) lengths of full-size components and showing details of the following:

1. Joinery, including concealed welds.
2. Anchorage.
3. Expansion provisions.
4. Glazing.
5. Flashing and drainage.

G. Delegated-Design Submittal: For glazed aluminum curtain walls and sunshades, including analysis data signed and sealed by the qualified professional engineer licensed in the State of Kentucky responsible for their preparation.

H. Provide THERM: Two-Dimensional Building Heat-Transfer Modeling at *thermally-broken sunshade connections and at* interfaces with adjacent opaque walls, roofs or slabs. Frame temperatures shall be confirmed to be maintained above the dew point temperature during design conditions.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data:

1. For Installer and field testing agency.
2. For professional engineer's experience with providing delegated-design engineering services of the kind indicated, including documentation that engineer is licensed in the state in which Project is located.

B. Energy Performance Certificates: For glazed aluminum curtain walls, accessories, and components from manufacturer.

1. Basis for Certification: NFRC-certified energy performance values for each glazed aluminum curtain wall.

C. Product Test Reports: For glazed aluminum curtain walls, for tests indicated in “Performance Requirements” section and performed by a qualified testing agency. Test reports shall be project specific and performed within the past 2 years.

D. Quality-Control Program: Developed specifically for Project, including fabrication and installation, in accordance with recommendations in ASTM C1401. Include periodic quality-control reports.

E. Source quality-control reports.

F. Field quality-control reports.

G. Sample Warranties: For special warranties.

H. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For glazed aluminum curtain walls to include in maintenance manuals.

B. Maintenance Data for Structural Sealant: For structural-sealant-glazed curtain walls to include in maintenance manuals. Include ASTM C1401 recommendations for post-installation-phase quality-control program.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer and that employs a qualified glazing contractor for this Project who is certified under the North American Contractor Certification Program (NACC) for Architectural Glass & Metal (AGM) contractors and that employs glazing technicians certified under the Architectural Glass and Metal Technician (AGMT) certification program.

B. Testing Agency Qualifications: Qualified in accordance with ASTM E699 for testing indicated and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025 and acceptable to Owner and Architect.

C. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.

1. Do not change intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If changes are proposed, submit comprehensive explanatory data to Architect for review.

D. Structural-Sealant Glazing: Comply with ASTM C1401 for design and installation of structural-sealant-glazed curtain wall assemblies.

E. Accessible Entrances: Comply with the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

1.7 MOCKUPS

A. Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation. Mockups will also be used to evaluate system installation and integration with the surrounding materials/systems.

1. Build mockup of typical wall area. ~~*Size of mockup to be determined by Architect and Construction Manager.*~~ *Refer to Section 014339 "Integrated Exterior Mockups" for additional requirements. Refer to Drawing A489 for scope of on-site standalone mockup.*
2. Testing shall be performed on mockups in accordance with requirements ~~*in "Field Quality Control" Article.*~~ *in Section 019117 "Building Enclosure Functional Performance Testing".*
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 WARRANTY

A. Special Assembly Warranty: Manufacturer agrees to repair or replace components of glazed aluminum curtain wall that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.
b. Noise or vibration created by wind and thermal and structural movements.
c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
d. Water penetration through fixed glazing and framing areas.
e. Failure of operating components.

2. Warranty Period: 10 years from date of Substantial Completion.

B. Special Finish Warranty, Factory-Applied Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of baked enamel, powder coat, or organic finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: 20 years from date of Substantial Completion.

C. Special Finish Warranty, Anodized Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of anodized finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, peeling, or chipping.

2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer licensed in the State of Kentucky, as defined in Section 014000 "Quality Requirements," to design glazed aluminum curtain walls.

B. General Performance: Comply with performance requirements specified, as determined by testing of glazed aluminum curtain walls representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.

1. Glazed aluminum curtain walls shall withstand movements of supporting structure, including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
2. Failure also includes the following:

a. Thermal stresses transferring to building structure.

b. Glass breakage.
c. Noise or vibration created by wind and thermal and structural movements.
d. Loosening or weakening of fasteners, attachments, and other components.
e. Failure of operating units.

C. Structural Loads:

1. Wind Loads: As indicated on Drawings.
2. Other Design Loads: As indicated on Drawings.

D. Deflection of Framing Members Supporting Glass: At design wind load, as follows:

1. Deflection Normal to Wall Plane: Limited to 1/175 of clear span for spans of up to 13 feet 6 inches (4.1 m) and to 1/240 of clear span plus 1/4 inch (6.35 mm) for spans of greater than 13 feet 6 inches (4.1 m).
2. Deflection Parallel to Glazing Plane: Limited to amount not exceeding that which reduces glazing bite to less than 75 percent of design dimension and that which reduces edge clearance between framing members and glazing or other fixed components to less than 1/8 inch (3.2 mm).

a. Operable Units: Provide a minimum 1/16-inch (1.6-mm) clearance between framing members and operable units.

3. Cantilever Deflection: Limited to 2l/175 at unsupported cantilevers.

E. Structural: Test in accordance with ASTM E330/E330M as follows:

1. When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
2. When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, or permanent deformation of main framing members exceeding 0.2 percent of span.
3. Test Durations: As required by design wind velocity, but not less than 10 seconds.

F. Water Penetration under Static Pressure: Test in accordance with ASTM E331 as follows:

1. No evidence of water penetration through fixed glazing and framing areas when tested in accordance with a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 15 lbf/sq. ft. (720 Pa).

G. Water Penetration under Dynamic Pressure: Test in accordance with AAMA 501.1 as follows:

1. No evidence of water penetration through fixed glazing and framing areas when tested at dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 15 lbf/sq. ft. (720 Pa).
2. Maximum Water Leakage: In accordance with AAMA 501.1 No uncontrolled water penetrating assemblies or water appearing on assemblies' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters or water that is drained to exterior.

H. Interstory Drift: Accommodate design displacement of adjacent stories indicated.

1. Design Displacement: H/500 with connections capable of not less than 1/2” between stories.

2. Test Performance: Complying with criteria for passing based on building occupancy type when tested in accordance with AAMA 501.4 at design displacement and 1.5 times the design displacement.

I. Energy Performance: Certified and labelled by manufacturer for energy performance as follows:

1. Base thermal movement on a minimum of temperature differential: 170 degrees to 4 ~~-25~~ with nominal at 74 ~~72~~ degrees and interior RH at 60 ~~30~~ percent.

2. Thermal Transmittance (U-factor):

   a. Fixed Glazing and Framing Areas: U-factor for the system of not more than 0.38 Btu/sq. ft. x h x deg F as determined in accordance with NFRC 100.
   b. Approximate calculated U Value of Basis-of-Design: 0.32. Refer to exterior glass types for additional information.

3. Solar Heat Gain Coefficient (SHGC):

   a. Fixed Glazing and Framing Areas: SHGC for the system of not more than 0.36 (South, East and West faces) and 0.48 (North face) as determined in accordance with NFRC 200.
   b. Approximate calculated SHGC of Basis-of-Design: 0.21. Refer to exterior glass types for additional information.

4. Air Leakage:

   a. Fixed Glazing and Framing Areas: Air leakage for the system of not more than 0.06 cfm/sq. ft. (0.30 L/s per sq. m) at a static-air-pressure differential of 6.24 lbf/sq. ft. (300 Pa) when tested in accordance with ASTM E283.

5. Condensation Resistance: When tested to AAMA Specification 1503, the Condensation Resistance Factor (CRF) shall not be less than: CRF glass 1-inch Double Glazed HP = 76, CRF frame = 79.

   a. All openings (vision glazing, spandrel glazing, glazed in IMP, etc.) shall be condensation free at 4 ~~-25~~ degrees F at interior conditions of 74 ~~72~~ degrees F and 60% ~~30%~~ RH.

6. Maintain continuous air and vapor retarder throughout assembly located in a line even with inside line of glass and heel bead of glazing sealant.

J. Thermal Movements: Allow for thermal movements resulting from ambient and surface temperature changes:

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
2. Thermal Cycling: No buckling; stress on glass; sealant failure; excess stress on framing, anchors, and fasteners; or reduction of performance when tested in accordance with AAMA 501.5.

   a. High Exterior Ambient-Air Temperature: That which produces an exterior metal-surface temperature of 180 deg F (82 deg C).
   b. Low Exterior Ambient-Air Temperature: 0 deg F (minus 18 deg C).

K. Structural-Sealant Joints:

1. Designed to carry gravity loads of glazing.

L. Structural Sealant: ASTM C1184. Capable of withstanding tensile and shear stresses imposed by structural-sealant-glazed curtain walls without failing adhesively or cohesively. When tested for preconstruction adhesion and compatibility, cohesive failure of sealant shall occur before adhesive failure.

1. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant material behind.
2. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate, because sealant-to-substrate bond strength exceeds sealant's internal strength.

2.2 SOURCE LIMITATIONS

A. Obtain all components of curtain-wall system and storefront system, including framing spandrel panels, venting windows, entrances, sun control, and accessories, from single manufacturer.

2.3 GLAZED ALUMINUM CURTAIN WALL SYSTEMS (CW-1 Unitized; Steel-reinforced, CW-2 Unitized)

A. Basis-of-Design Product: Subject to compliance with requirements, provide Kawneer Company, Inc.; Arconic Corporation; 2500 UT Unitwall System or a comparable product by one of the following:

1. EFCO Corporation; 8750XD Unitized Curtain Wall System.
2. Wausau Window and Wall Systems; Apogee Wausau Group, Inc.; 7250i-UW Unitized Curtain Wall System.
3. *Fabricator's proprietary systems will be considered if they are in compliance with requirements of this specification.*

B. Framing Members: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.

1. Construction: Ultra-thermally broken.
2. Glazing System: Retained mechanically with gaskets on two sides and structural sealant on two sides (horizontal and corners as indicated on Drawings).
3. Glazing Plane: Front.
4. Split finish: Custom anodized finish to match Architect's sample (exterior) and custom color high-performance organic finish to match Architect's sample (interior).
5. System: Unitized system.
6. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
7. Steel Reinforcement: As required by manufacturer.
8. Double gasketed and pressure equalized internal chambers with integrated continuous gutters at each floor.
9. Both vertical and horizontal mullion profiles are two piece design to accommodate differential movement within profile section and not within glazing pocket. Complete with thermally separated snap on custom profile mullion caps.

10. Energy efficient thermal separation between exterior and interior elements to reduce thermal transmission.
11. Face dimension of profile: As indicated on Drawings.
12. Panel Size: As Indicated on Drawings.
13. Anchorage: Adjustable system at each floor slab to allow for 1-inch tolerance in all directions (lateral, vertical, and orthogonal), plus up to 10 degrees out of plumb (vertical).
14. Mullion covers as selected by architect from the curtain wall Manufacturers profiles.

    a. Provide Custom thin-profile mullion extension cover profiles as indicated on Drawings.
    b. Provide custom jamb extension cover profiles as indicated on the drawings.

15. Curtain Wall (CW-1) will require some modification/customization as required to accommodate sunshade attachment, structural support and thermally-broken connections.
16. At Curtain Wall (CW-1) locations field fabricated (stick-built) systems are acceptable in lieu of unitized systems as long as the mullion sightlines are consistent between adjacent unitized and field-fabricated (stick built) systems and performance requirements are met.

C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

D. Venting Windows:

1. Manufacturer's standard units, complying with AAMA/WDMA/CSA 101/I.S.2/A440, with self-flashing mounting fins, and as follows:

    a. Window Type: Casement.
    b. Minimum Performance Class: AW.
    c. Minimum Performance Grade: 90.
    d. Hardware: Manufacturer's standard; of aluminum, stainless steel, die-cast steel, malleable iron, or bronze; including the following:

        1) Cam handle keyed locking system.
        2) Steel or bronze operating arms.

    e. Weather Stripping: Provide full-perimeter weather stripping for each operable sash unless otherwise indicated.
    f. Glazing: Same as adjacent glazed aluminum curtain-wall glazing.
    g. Finish: Match adjacent glazed aluminum curtain-wall finish.

E. Entrance Door Systems: Comply with Section 084213 "Aluminum-Framed Entrances".

2.4 SUN CONTROL (SCD-1)

A. Sunshades: Assemblies consisting of manufacturer's outrigger brackets and aluminum sunshade blades, designed for attachment to curtain wall with mechanical fasteners.

1. Orientation: As indicated on Drawings.
2. Projection from Wall: As indicated on Drawings.
3. Outriggers: As indicated on Drawings. Cantilevered aluminum plate outriggers to be delegated design by curtain wall manufacturer. Provide concealed aluminum splines and fasteners. *Provide thermally-broken connections.*

4. Finish: Custom color. Match Architect's sample.
5. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
6. Steel Reinforcement: As required by manufacturer.

2.5 GLAZING

A. Glazing: Comply with Section 088000 "Glazing."

B. Glazing Gaskets: ASTM C509 or ASTM C864. Comply with Section 088000 "Glazing.".

C. Flashing and sealant for perimeter of curtain wall:

1. Basis-of-Design Product: Tremco Proglaze ETA; 6-inch wide Extruded Silicone Rubber gasket with preformed corners; installed to curtain wall using extruded aluminum curtain wall glazing raceway or Tremco TR 15265 extruded aluminum adaptor, mechanically attached at 6-inch centers with Tremco 440 taped seal.
2. Gasket extends from curtain wall framing covering gap and sealing to moisture barrier using Tremco Spectrum 1 Silicone sealant. (Perform adhesion compatibility test prior to selection of sealant.)
3. *Color: As selected by Architect from Manufacturer's full range.*

D. Glazing Sealants: As recommended by manufacturer. Comply with Section 088000 "Glazing."

1. Verify sealant has a VOC content of 250 g/L or less.

E. Structural Glazing Sealants: ASTM C1184, chemically curing silicone formulation that is compatible with system components with which it comes into contact, specifically formulated and tested for use as structural sealant and approved by structural-sealant manufacturer for use in curtain-wall assembly indicated.

1. Color: Black.

F. Weatherseal Sealants: ASTM C920 for Type S; Grade NS; Class 25; Uses NT, G, A, and O; chemically curing silicone formulation that is compatible with structural sealant and other system components with which it comes into contact; recommended by structural-sealant, weatherseal-sealant, and structural-sealant-glazed curtain-wall manufacturers for this use.

1. Color: Match structural sealant.

2.6 MATERIALS

A. Sheet and Plate: ASTM B209 (ASTM B209M).

B. Extruded Bars, Rods, Profiles, and Tubes: ASTM B221 (ASTM B221M).

C. Structural Profiles: ASTM B308/B308M.

D. Steel Reinforcement:

1. Structural Shapes, Plates, and Bars: ASTM A36/A36M.
2. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.

3. Hot-Rolled Sheet and Strip: ASTM A1011/A1011M.

E. Steel Reinforcement Primer: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods in accordance with recommendations in SSPC-SP COM, and prepare surfaces in accordance with applicable SSPC standard.

F. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

G. Recycled Content of Aluminum Components: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

H. Regional Materials: Manufacture products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

2.7 ACCESSORIES

A. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
2. Reinforce members as required to receive fastener threads.
3. Use exposed fasteners with countersunk Phillips screw heads, finished to match framing system.

B. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch (25.4 mm) that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.

1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A123/A123M or ASTM A153/A153M requirements.

C. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.

D. Bituminous Paint: Cold-applied asphalt-mastic paint containing no asbestos, formulated for 30-mil (0.762-mm) thickness per coat.

2.8 FABRICATION

A. Curtain Wall Fabricators.

1. Approved Fabricators:

a. Advanced Glazing Contractors, Inc.
b. Pioneer Cladding & Glazing Systems, Inc.
c. Glass Solutions, Inc.

2. Other Fabricators will be considered. Fabricators shall have a minimum of seven (7) years' experience in the design, engineering, fabrication, and installation of curtain walls

of similar scale and complexity as this project and is subject to final approval by the Owner and the Architect.

B. Form or extrude aluminum shapes before finishing.

C. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

D. Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.
6. Components curved to indicated radii.

E. Fabricate components to resist water penetration as follows:

1. Internal guttering system or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within glazed aluminum curtain wall to exterior.
2. Pressure-equalized system or double barrier design with primary air and vapor barrier at interior side of glazed aluminum curtain wall and secondary seal weeped and vented to exterior.

F. Factory-Assembled Frame Units:

1. Rigidly secure nonmovement joints.
2. Prepare surfaces that are in contact with structural sealant in accordance with sealant manufacturer's written instructions, to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.
3. Seal joints watertight unless otherwise indicated.
4. Install glazing to comply with requirements in Section 088000 "Glazing."
5. Install structural glazing.

    a. Set glazing into framing in accordance with sealant manufacturer and framing manufacturer's written instructions and standard practice. Use a spacer or backer as recommended by manufacturer.
    b. Set glazing with proper orientation so that coatings face exterior or interior as specified.
    c. Apply structural silicone sealant to completely fill cavity, in accordance with sealant manufacturers written instructions with the framing and glazing in a fully supported position.
    d. Brace or stiffen framing and glazing in such a manner to prevent undue stresses on the glass edge seal and structural joints or movement of the glazing, until sealant is fully cured in accordance with manufacturer's recommendations.
    e. After structural sealant has completely cured, insert backer rod between lites of glass as recommended by sealant manufacturer.
    f. Install weatherseal sealant to completely fill cavity, in accordance with sealant manufacturer's written instructions, to produce weatherproof joints.
    g. Clean and protect glass as indicated in Section 088000 "Glazing."

h. Retain bracing or stiffening until erected to prevent racking of units during transportation and erection.

G. After fabrication, clearly mark components to identify their locations in Project in accordance with Shop Drawings.

2.9 ALUMINUM FINISHES

A. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.

1. Color: Custom color. Match Architect's sample.

B. High-Performance Organic Finish, Two-Coat PVDF: Fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

1. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
2. Color and Gloss: Custom color. Match Architect's sample.

2.10 SOURCE QUALITY CONTROL

A. Structural Sealant: Perform quality-control procedures complying with ASTM C1401 recommendations, including, but not limited to, assembly material qualification procedures, sealant testing, and assembly fabrication reviews and checks.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Comply with manufacturer's written instructions.

B. Do not install damaged components.

C. Fit joints to produce hairline joints free of burrs and distortion.

D. Rigidly secure nonmovement joints.

E. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.

F. Where welding is required, weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.

G. Seal joints watertight unless otherwise indicated. Overlap splice plates with continuous lines of sealant.

H. Metal Protection:

1. Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.
3. Curtain wall assemblies are to be protected during post-construction cleaning.

I. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within glazed aluminum curtain wall to exterior.

J. Install components plumb and true in alignment with established lines and grades.

3.3 INSTALLATION OF OPERABLE UNITS

A. Install operable units level and plumb, securely anchored, and without distortion. Adjust weather-stripping contact and hardware movement to produce proper operation.

3.4 INSTALLATION OF GLAZING

A. Install glazing as specified in Section 088000 "Glazing."

3.5 INSTALLATION OF STRUCTURAL GLAZING

A. Prepare surfaces that will contact structural sealant in accordance with sealant manufacturer's written instructions, to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.

B. Set glazing into framing in accordance with sealant manufacturer's and framing manufacturer's written instructions and standard practice. Use a spacer or backer as recommended by manufacturer.

C. Set glazing with proper orientation, so that coatings face exterior or interior as specified.

D. Hold glazing in place using temporary retainers of type and spacing recommended by manufacturer, until structural sealant joint has cured.

E. Apply structural sealant to completely fill cavity, in accordance with sealant manufacturer's and framing manufacturer's written instructions and in compliance with local codes.

F. Apply structural sealant at temperatures indicated by sealant manufacturer for type of sealant.

G. Allow structural sealant to cure in accordance with manufacturer's recommendations.

H. Clean and protect glass as indicated in Section 088000 "Glazing."

3.6 INSTALLATION OF WEATHERSEAL SEALANT

A. After structural sealant has completely cured, remove temporary retainers and insert backer rod between lites of glass, as recommended by sealant manufacturer.

B. Install weatherseal sealant to completely fill cavity, in accordance with sealant manufacturer's written instructions, to produce weatherproof joints.

3.7 ERECTION TOLERANCES

A. Install glazed aluminum curtain walls to comply with the following maximum tolerances:

1. Plumb: 1/8 inch in 10 feet (3.2 mm in 3 m); 1/4 inch in 40 feet (6.35 mm in 12.2 m).
2. Level: 1/8 inch in 20 feet (3.2 mm in 6 m); 1/4 inch in 40 feet (6.35 mm in 12.2 m).
3. Alignment:
    a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch (12.7 mm) wide, limit offset from true alignment to 1/16 inch (1.6 mm).
    b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch (12.7 to 25.4 mm) wide, limit offset from true alignment to 1/8 inch (3.2 mm).
    c. Where surfaces are separated by reveal or protruding element of 1 inch (25.4 mm) wide or more, limit offset from true alignment to 1/4 inch (6 mm).
4. Location: Limit variation from plane to 1/8 inch in 12 feet (3.2 mm in 3.6 m); 1/2 inch (12.7 mm) over total length.

3.8 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Refer to Section 019117 “Building Enclosure Functional Performance Testing” for mockup tests and field tests.

~~*C. Test Area: Perform tests on representative areas of glazed aluminum curtain walls.*~~

~~*D. Field Quality-Control Testing: Perform the following test on representative areas of glazed aluminum curtain walls.*~~

~~*1. Water Spray Test: Before installation of interior finishes has begun, areas designated by Architect shall be tested in accordance with AAMA 501.2 and shall not evidence water penetration.*~~

~~*a. Perform a minimum of three tests in areas as directed by Architect.*~~
~~*b. Perform tests in each test area as directed by Architect. Perform at least three tests each, prior to 10, 35, and 70 percent completion. Any uncontrolled water infiltration into the interior of the system that is not drained to the exterior is considered a failure.*~~

~~*2. Air Leakage: ASTM E783 at 1.5 times the rate specified for laboratory testing in "Performance Requirements" Article but not more than 0.09 cfm/sq. ft. (0.45 L/s per sq. m) at a static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).*~~

~~*a. Perform a minimum of three tests in areas as directed by Architect.*~~
~~*b. Perform tests in each test area as directed by Architect. Perform at least three tests each, prior to 10, 35, and 70 percent completion.*~~

~~*3. Water Penetration: ASTM E1105 at a minimum uniform and cyclic static-air-pressure differential of 0.67 times the static-air-pressure differential specified for laboratory testing in "Performance Requirements" Article, but not less than 10 lbf/sq. ft. (480 Pa), and shall not evidence water penetration. Any uncontrolled water infiltration into the interior of the system that is not drained to the exterior is considered a failure.*~~

E. Structural-Sealant Adhesion: Test structural sealant in accordance with recommendations in ASTM C1401, Destructive Test Method A, "Hand Pull Tab (Destructive)," Appendix X2.

1. Test a minimum of six areas on each building facade.
2. Repair installation areas damaged by testing.

~~*F. Glazed aluminum curtain walls will be considered defective if they do not pass tests and inspections.*~~

~~*G. Aluminum-framed curtain walls will be considered defective if they do not pass tests and inspections. If they do not pass tests and inspections, Contractor shall make any necessary corrections and re-test until it passes.*~~

~~*H. Prepare test and inspection reports.*~~

3.9 CLEANING AND PROTECTION

A. Cleaning: Contractor shall clean installed products in accordance with manufacturer's instructions prior to Owner's acceptance, and remove construction debris from project site. Legally dispose of debris.

B. Protection: Contractor shall protect the installed product's finish surfaces from damage during construction.

END OF SECTION 084413

SECTION 087100 - DOOR HARDWARE – CORE AND SHELL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes commercial door hardware for the following:

1. Swinging doors.
2. Other doors to the extent indicated.

B. Door hardware includes, but is not necessarily limited to, the following:

1. Mechanical door hardware.
2. Electromechanical door hardware.
3. Cylinders specified for doors in other sections.

C. Related Sections:

1. Division 08 Section “Hollow Metal Doors and Frames”.
2. Division 08 Section “Flush Wood Doors”.
3. Division 08 Section “Aluminum-Framed Entrances”.

D. Codes and References: Comply with the version year adopted by the Authority Having Jurisdiction.

1. ANSI A117.1 - Accessible and Usable Buildings and Facilities.
2. ICC/IBC - International Building Code.
3. NFPA 70 - National Electrical Code.
4. NFPA 80 - Fire Doors and Windows.
5. NFPA 101 - Life Safety Code.
6. NFPA 105 - Installation of Smoke Door Assemblies.
7. State Building Codes, Local Amendments.

E. Standards: All hardware specified herein shall comply with the following industry standards as applicable. Any undated reference to a standard shall be interpreted as referring to the latest edition of that standard:

1. ANSI/BHMA Certified Product Standards - A156 Series.
2. UL10C - Positive Pressure Fire Tests of Door Assemblies.
3. ANSI/UL 294 - Access Control System Units.
4. UL 305 - Panic Hardware.
5. ANSI/UL 437- Key Locks.

1.3 SUBMITTALS

A. Product Data: Manufacturer's product data sheets including installation details, material descriptions, dimensions of individual components and profiles, operational descriptions and finishes.

B. Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing, fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final Door Hardware Schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.

1. Format: Comply with scheduling sequence and vertical format in DHI's "Sequence and Format for the Hardware Schedule."
2. Organization: Organize the Door Hardware Schedule into door hardware sets indicating complete designations of every item required for each door or opening. Organize door hardware sets in same order as in the Door Hardware Sets at the end of Part 3. Submittals that do not follow the same format and order as the Door Hardware Sets will be rejected and subject to resubmission.
3. Content: Include the following information:

    a. Type, style, function, size, label, hand, and finish of each door hardware item.
    b. Manufacturer of each item.
    c. Fastenings and other pertinent information.
    d. Location of door hardware set, cross-referenced to Drawings, both on floor plans and in door and frame schedule.
    e. Explanation of abbreviations, symbols, and codes contained in schedule.
    f. Mounting locations for door hardware.
    g. Door and frame sizes and materials.
    h. Warranty information for each product.

4. Submittal Sequence: Submit the final Door Hardware Schedule at earliest possible date, particularly where approval of the Door Hardware Schedule must precede fabrication of other work that is critical in the Project construction schedule. Include Product Data, Samples, Shop Drawings of other work affected by door hardware, and other information essential to the coordinated review of the Door Hardware Schedule.

C. Shop Drawings: Details of electrified access control hardware indicating the following:

1. Wiring Diagrams: Upon receipt of approved schedules, submit detailed system wiring diagrams for power, signaling, monitoring, communication, and control of the access control system electrified hardware. Differentiate between manufacturer-installed and field-installed wiring. Include the following:

    a. Elevation diagram of each unique access controlled opening showing location and interconnection of major system components with respect to their placement in the respective door openings.
    b. Complete (risers, point-to-point) access control system block wiring diagrams.
    c. Wiring instructions for each electronic component scheduled herein.

2. Electrical Coordination: Coordinate with related sections the voltages and wiring details required at electrically controlled and operated hardware openings.

D. Keying Schedule: After a keying meeting with the owner has taken place prepare a separate keying schedule detailing final instructions. Submit the keying schedule in electronic format.

Include keying system explanation, door numbers, key set symbols, hardware set numbers and special instructions. Owner must approve submitted keying schedule prior to the ordering of permanent cylinders/cores.

E. Informational Submittals:

1. Product Test Reports: Indicating compliance with cycle testing requirements, based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified independent testing agency.

F. Operating and Maintenance Manuals: Provide manufacturers operating and maintenance manuals for each item comprising the complete door hardware installation in quantity as required in Division 01, Closeout Procedures.

1.4 QUALITY ASSURANCE

A. Manufacturers Qualifications: Engage qualified manufacturers with a minimum 5 years of documented experience in producing hardware and equipment similar to that indicated for this Project and that have a proven record of successful in-service performance.

B. Certified Products: Where specified, products must maintain a current listing in the Builders Hardware Manufacturers Association (BHMA) Certified Products Directory (CPD).

C. Installer Qualifications: A minimum 3 years documented experience installing both standard and electrified door hardware similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

D. Door Hardware Supplier Qualifications: Experienced commercial door hardware distributors with a minimum 5 years documented experience supplying both mechanical and electromechanical hardware installations comparable in material, design, and extent to that indicated for this Project. Supplier recognized as a factory direct distributor by the manufacturers of the primary materials with a warehousing facility in Project's vicinity. Supplier to have on staff a certified Architectural Hardware Consultant (AHC) available during the course of the Work to consult with Contractor, Architect, and Owner concerning both standard and electromechanical door hardware and keying.

E. Source Limitations: Obtain each type and variety of door hardware specified in this section from a single source unless otherwise indicated.

1. Electrified modifications or enhancements made to a source manufacturer's product line by a secondary or third party source will not be accepted.
2. Provide electromechanical door hardware from the same manufacturer as mechanical door hardware, unless otherwise indicated.

F. Each unit to bear third party permanent label indicating compliance with the referenced testing standards.

G. Keying Conference: Conduct conference to comply with requirements in Division 01 Section "Project Meetings." Keying conference to incorporate the following criteria into the final keying schedule document:

1. Function of building, purpose of each area and degree of security required.
2. Plans for existing and future key system expansion.

3. Requirements for key control storage and software.
4. Installation of permanent keys, cylinder cores and software.
5. Address and requirements for delivery of keys.

H. Pre-Submittal Conference: Conduct coordination conference in compliance with requirements in Division 01 Section "Project Meetings" with attendance by representatives of Supplier(s), Installer(s), and Contractor(s) to review proper methods and the procedures for receiving, handling, and installing door hardware.

1. Prior to installation of door hardware, conduct a project specific training meeting to instruct the installing contractors' personnel on the proper installation and adjustment of their respective products. Product training to be attended by installers of door hardware (including electromechanical hardware) for aluminum, hollow metal and wood doors. Training will include the use of installation manuals, hardware schedules, templates and physical product samples as required.
2. Inspect and discuss electrical roughing-in, power supply connections, and other preparatory work performed by other trades.
3. Review sequence of operation narratives for each unique access controlled opening.
4. Review and finalize construction schedule and verify availability of materials.
5. Review the required inspecting, testing, commissioning, and demonstration procedures

I. At completion of installation, provide written documentation that components were applied according to manufacturer's instructions and recommendations and according to approved schedule.

1.5 DELIVERY, STORAGE AND HANDLING

A. Inventory door hardware on receipt and provide secure lock-up and shelving for door hardware delivered to Project site. Do not store electronic access control hardware, software or accessories at Project site without prior authorization.

B. Tag each item or package separately with identification related to the final Door Hardware Schedule, and include basic installation instructions with each item or package.

C. Deliver, as applicable, permanent keys, cylinders, cores, access control credentials, software and related accessories directly to Owner via registered mail or overnight package service. Instructions for delivery to the Owner shall be established at the "Keying Conference".

1.6 COORDINATION

A. Templates: Obtain and distribute to the parties involved templates for doors, frames, and other work specified to be factory prepared for installing standard and electrified hardware. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing hardware to comply with indicated requirements.

B. Door Hardware and Electrical Connections: Coordinate the layout and installation of scheduled electrified door hardware and related access control equipment with required connections to source power junction boxes, low voltage power supplies, detection and monitoring hardware, and fire and detection alarm systems.

C. Door and Frame Preparation: Doors and corresponding frames are to be prepared, reinforced and pre-wired (if applicable) to receive the installation of the specified electrified, monitoring, signaling and access control system hardware without additional in-field modifications.

1.7 WARRANTY

A. General Warranty: Reference Division 01, General Requirements. Special warranties specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Warranty Period: Written warranty, executed by manufacturer(s), agreeing to repair or replace components of standard and electrified door hardware that fails in materials or workmanship within specified warranty period after final acceptance by the Owner. Failures include, but are not limited to, the following:

1. Structural failures including excessive deflection, cracking, or breakage.
2. Faulty operation of the hardware.
3. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
4. Electrical component defects and failures within the systems operation.

C. Warranty Period: Unless otherwise indicated, warranty shall be one year from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SCHEDULED DOOR HARDWARE

A. General: Provide door hardware for each door to comply with requirements in Door Hardware Sets and each referenced section that products are to be supplied under.

B. Designations: Requirements for quantity, item, size, finish or color, grade, function, and other distinctive qualities of each type of door hardware are indicated in the Door Hardware Sets at the end of Part 3. Products are identified by using door hardware designations, as follows:

1. Named Manufacturer's Products: Product designation and manufacturer are listed for each door hardware type required for the purpose of establishing requirements. Manufacturers' names are abbreviated in the Door Hardware Schedule.

C. Substitutions: Requests for substitution and product approval for inclusive mechanical and electromechanical door hardware in compliance with the specifications must be submitted in writing and in accordance with the procedures and time frames outlined in Division 01, Substitution Procedures. Approval of requests is at the discretion of the architect, owner, and their designated consultants.

2.2 BUTT HINGES

A. Hinges: ANSI/BHMA A156.1 butt hinges with number of hinge knuckles and other options as specified in the Door Hardware Sets.

1. Quantity: Provide the following hinge quantity:

a. Two Hinges: For doors with heights up to 60 inches.
b. Three Hinges: For doors with heights 61 to 90 inches.
c. Four Hinges: For doors with heights 91 to 120 inches.

d. For doors with heights more than 120 inches, provide 4 hinges, plus 1 hinge for every 30 inches of door height greater than 120 inches.

2. Hinge Size: Provide the following, unless otherwise indicated, with hinge widths sized for door thickness and clearances required:

a. Widths up to 3’0”: 4-1/2” standard or heavy weight as specified.
b. Sizes from 3’1” to 4’0”: 5” standard or heavy weight as specified.

3. Hinge Weight and Base Material: Unless otherwise indicated, provide the following:

a. Exterior Doors: Heavy weight, non-ferrous, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate standard weight.
b. Interior Doors: Standard weight, steel, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate heavy weight.

4. Hinge Options: Comply with the following:

a. Non-removable Pins: With the exception of electric through wire hinges, provide set screw in hinge barrel that, when tightened into a groove in hinge pin, prevents removal of pin while door is closed; for the all out-swinging lockable doors.

5. Manufacturers:

a. Hager Companies (HA) - BB Series, 5-knuckle.
b. Ives (IV) - 5BB Series, 5-knuckle.
c. McKinney (MK) - TA/T4A Series, 5-knuckle.

2.3 CONTINUOUS HINGES

A. Continuous Geared Hinges: ANSI/BHMA A156.26 Grade 1-600 continuous geared hinge. with minimum 0.120-inch thick extruded 6063-T6 aluminum alloy hinge leaves and a minimum overall width of 4 inches. Hinges are non-handed, reversible and fabricated to template screw locations. Factory trim hinges to suit door height and prepare for electrical cut-outs.

1. Manufacturers:.

a. Hager Companies (HA).
b. Pemko (PE).
c. Select Hinges (SL).

B. Pin and Barrel Continuous Hinges: ANSI/BHMA A156.26 Grade 1-600 pin and barrel continuous hinges with minimum 14 gauge Type 304 stainless steel hinge leaves, concealed stainless pin, and twin self-lubricated nylon bearings at each knuckle separation. Factory trim hinges to suit door height and prepare for electrical cut-outs.

1. Manufacturers:

a. Hager Companies (HA).
b. Markar Products; ASSA ABLOY Architectural Door Accessories (MR).
c. Pemko (PE).

2.4 POWER TRANSFER DEVICES

A. Electrified Quick Connect Transfer Hinges: Provide electrified transfer hinges with Molex™ standardized plug connectors and sufficient number of concealed wires (up to 12) to accommodate the electrified functions specified in the Door Hardware Sets with a 1-year warranty. Connectors plug directly to through-door wiring harnesses for connection to electric locking devices and power supplies. Wire nut connections are not acceptable.

1. Manufacturers:

    a. Hager Companies (HA) - ETW-QC (# wires) Option.
    b. Ives (IV) - Connect.
    c. McKinney (MK) - QC (# wires) Option.

B. Concealed Quick Connect Electric Power Transfers: Provide concealed wiring pathway housing mortised into the door and frame for low voltage electrified door hardware. Furnish with Molex™ standardized plug connectors and sufficient number of concealed wires (up to 12) to accommodate the electrified functions specified in the Door Hardware Sets. Connectors plug directly to through-door wiring harnesses for connection to electric locking devices and power supplies. Wire nut connections are not acceptable.

1. Manufacturers:

    a. Pemko (PE) - EL-CEPT Series.
    b. Securitron (SU) - EL-CEPT Series.
    c. Von Duprin (VD) - EPT-10 Series.

C. Electric Door Wire Harnesses: Provide electric/data transfer wiring harnesses with standardized plug connectors to accommodate up to twelve (12) wires. Connectors plug directly to through-door wiring harnesses for connection to electric locking devices and power supplies. Provide sufficient number and type of concealed wires to accommodate electric function of specified hardware. Provide a connector for through-door electronic locking devices and from hinge to junction box above the opening. Wire nut connections are not acceptable. Determine the length required for each electrified hardware component for the door type, size and construction, minimum of two per electrified opening.

1. Provide one each of the following tools as part of the base bid contract:

    a. McKinney (MK) - Electrical Connecting Kit: QC-R001.
    b. McKinney (MK) - Connector Hand Tool: QC-R003.

2. Manufacturers:

    a. Hager Companies (HA) - Quick Connect.
    b. McKinney (MK) - QC-C Series.
    c. Von Duprin (VD) - Connect.

2.5 DOOR OPERATING TRIM

A. Flush Bolts and Surface Bolts: Provide products conforming to ANSI/BHMA A156.3 and A156.16, Grade 1.

1. Flush bolts to be furnished with top rod of sufficient length to allow bolt retraction device location approximately six feet from the floor.
2. Furnish dust proof strikes for bottom bolts.
3. Surface bolts to be minimum 8” in length and U.L. listed for labeled fire doors and U.L. listed for windstorm components where applicable.
4. Provide related accessories (mounting brackets, strikes, coordinators, etc.) as required for appropriate installation and operation.
5. Manufacturers:

    a. Burns Manufacturing (BU).
    b. Rockwood (RO).
    c. Trimco (TC).

B. Coordinators: ANSI/BHMA A156.3 door coordinators consisting of active-leaf, hold-open lever and inactive-leaf release trigger. Model as indicated in hardware sets.

1. Manufacturers:

    a. Burns Manufacturing (BU).
    b. Rockwood (RO).
    c. Trimco (TC).

C. Door Push Plates and Pulls: ANSI/BHMA A156.6 door pushes and pull units of type and design specified in the Hardware Sets. Coordinate and provide proper width and height as required where conflicting hardware dictates.

1. Push/Pull Plates: Minimum .050 inch thick, size as indicated in hardware sets, with beveled edges, secured with exposed screws unless otherwise indicated.
2. Door Pull and Push Bar Design: Size, shape, and material as indicated in the hardware sets. Minimum clearance of 2 1/2-inches from face of door unless otherwise indicated.
3. Offset Pull Design: Size, shape, and material as indicated in the hardware sets. Minimum clearance of 2 1/2-inches from face of door and offset of 90 degrees unless otherwise indicated.
4. Pulls, where applicable, shall be provided with a 10” clearance from the finished floor on the push side to accommodate wheelchair accessibility.
5. Fasteners: Provide manufacturer's designated fastener type as indicated in Hardware Sets.
6. Manufacturers:

    a. Burns Manufacturing (BU).
    b. Hiawatha, Inc. (HI).
    c. Rockwood (RO).

2.6 CYLINDERS AND KEYING

A. General: Cylinder manufacturer to have minimum (10) years experience designing secured master key systems and have on record a published security keying system policy.

1. Manufacturers:

    a. Match Existing BEST Key System, Verify with Owner.

B. Cylinder Types: Original manufacturer cylinders able to supply the following cylinder formats and types:

1. Threaded mortise cylinders with rings and cams to suit hardware application.
2. Rim cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
3. Bored or cylindrical lock cylinders with tailpieces as required to suit locks.
4. Tubular deadlocks and other auxiliary locks.
5. Mortise and rim cylinder collars to be solid and recessed to allow the cylinder face to be flush and be free spinning with matching finishes.
6. Keyway: Match Facility Restricted Keyway.

C. Small Format Interchangeable BEST Cores: Provide small format interchangeable cores (SFIC) by Allowance, core insert, removable by use of a special key; usable with other manufacturers' cylinders.

D. Keying System: Each type of lock and cylinders to be factory keyed.

1. Supplier shall conduct a "Keying Conference" to define and document keying system instructions and requirements.
2. Furnish factory cut, nickel-silver large bow permanently inscribed with a visual key control number as directed by Owner.
3. Existing System: Field verify and key cylinders to match Owner's existing system.

E. Key Quantity: Provide the following minimum number of keys:

1. Change Keys per Cylinder: Two (2)
2. Master Keys (per Master Key Level/Group): Five (5).
3. Construction Keys (where required): Ten (10).
4. Construction Control Keys (where required): Two (2).
5. Permanent Control Keys (where required): Two (2).

F. Construction Keying: Provide construction master keyed cylinders.

G. Construction Keying: Provide temporary keyed construction cores.

H. Key Registration List (Bitting List):

1. Provide keying transcript list to Owner's representative in the proper format for importing into key control software.
2. Provide transcript list in writing or electronic file as directed by the Owner.

2.7 KEY CONTROL

A. Key Control Cabinet: Provide a key control system including envelopes, labels, and tags with self-locking key clips, receipt forms, 3-way visible card index, temporary markers, permanent markers, and standard metal cabinet. Key control cabinet shall have expansion capacity of 150% of the number of locks required for the project.

1. Manufacturers:

a. Lund Equipment (LU).
b. MMF Industries (MM).
c. Telkee (TK).

P. Electronic Key Management System: Provide an electronic key control system with Stand-alone Plug and Play features including advanced RFID technology. Touchscreen interface with PIN access for keys individually locked in place. Minimum 1,000 system users and 21 iFobs for locking receptors. System shall have a minimum 250,000 audit events screen displayed or ability to be exported via USB port.

1. Manufacturers:

a. Medeco (MC).

2.8 MORTISE LOCKS AND LATCHING DEVICES

A. Mortise Locksets, Grade 1 (Heavy Duty): Provide ANSI/BHMA A156.13, Series 1000, Operational Grade 1 Certified Products Directory (CPD) listed mortise locksets. Listed manufacturers shall meet all functions and features as specified herein.

1. Provide locksets with functions and features as follows:

a. Heavy duty 12-gauge wrought steel case.
b. Stainless steel 3/4" one-piece anti-friction reversible latchbolt with a one-piece hardened stainless steel 1” projection deadbolt.
c. Where required by code, provide knurling or abrasive coating on all levers leading to hazardous areas.
d. Meets UL and CUL Standard 10C Positive Pressure, Fire Test of Door Assemblies with levers that meet A117.1 Accessibility Code.
e. Meets UL Certification Directory ZHLL.R21744 for products used in windstorm rated assemblies.
f. Extended cycle test: Locks to have been cycle tested in ordinance with ANSI/BHMA 156.13 requirements to 16 million cycles or greater.
g. Status indicators inside, outside, or on both sides of doors as specified; available with wording for “locked/unlocked”, “vacant/occupied” or custom wording options. Indicator to be located above the cylinder with the inside thumb-turn not blocking the visibility of the indicator status.
h. Ten-year limited warranty for mechanical functions.

2. Electromechanical locksets shall have the following functions and features:

a. Universal Molex plug-in connectors that have standardized color-coded wiring and are available in fail safe or fail secure and operate from 12vdc to 24vdc regulated.
b. EcoFlex or equivalent technology that reduces energy consumption up to 92% as certified by GreenCircle.
c. Options to be available for request-to-exit or enter signaling, latchbolt and deadbolt monitoring.
d. Optional high security monitoring with internal end-of-line monitoring alongside deadbolt privacy and integrated door position monitoring.
e. Two-year limited warranty on electrified functions.

3. Manufacturers:

a. Corbin Russwin Hardware (RU) - ML2000 Series.
b. Sargent Manufacturing (SA) - 8200 Series.
c. Schlage (SC) - L9000 Series.
d. Dormakaba Best (BE) – 45H Series

2.9 DEADLOCKS AND LATCHES

A. Narrow Case Deadlocks and Deadlatches: ANSI/BHMA 156.13 Series 1000 Grade 1 narrow case deadlocks and deadlatches for swinging or sliding door applications. All functions shall be manufactured in a single sized case formed from 12 gauge minimum, corrosion resistant steel (option for fully stainless steel case and components). Provide minimum 2 7/8" throw laminated stainless steel bolt. Bottom rail deadlocks to have 3/8” diameter bolts.

1. Manufacturers:

    a. Adams Rite Manufacturing (AD) - MS1850S / MS1950 Series.

2.10 LOCK AND LATCH STRIKES

A. Strikes: Provide manufacturer's standard strike with strike box for each latch or lock bolt, with curved lip extended to protect frame, finished to match door hardware set, unless otherwise indicated, and as follows:

1. Flat-Lip Strikes: For locks with three-piece antifriction latchbolts, as recommended by manufacturer.
2. Extra-Long-Lip Strikes: For locks used on frames with applied wood casing trim.
3. Aluminum-Frame Strike Box: Provide manufacturer's special strike box fabricated for aluminum framing.
4. Double-lipped strikes: For locks at double acting doors. Furnish with retractable stop for rescue hardware applications.

B. Standards: Comply with the following:

1. Strikes for Mortise Locks and Latches: BHMA A156.13.
2. Strikes for Bored Locks and Latches: BHMA A156.2.
3. Strikes for Auxiliary Deadlocks: BHMA A156.36.
4. Dustproof Strikes: BHMA A156.16.

2.11 CONVENTIONAL EXIT DEVICES

A. General Requirements: All exit devices specified herein shall meet or exceed the following criteria:

1. Exit devices shall have a five-year warranty.
2. At doors not requiring a fire rating, provide devices complying with NFPA 101 and listed and labeled for "Panic Hardware" according to UL305. Provide proper fasteners as required by manufacturer including sex nuts and bolts at openings specified in the Hardware Sets.
3. Where exit devices are required on fire rated doors, provide devices complying with NFPA 80 and with UL labeling indicating "Fire Exit Hardware". Provide devices with the proper fasteners for installation as tested and listed by UL. Consult manufacturer’s catalog and template book for specific requirements.
4. Except on fire rated doors, provide exit devices with hex key dogging device to hold the pushbar and latch in a retracted position. Provide optional keyed cylinder dogging on devices where specified in Hardware Sets.
5. Devices must fit flat against the door face with no gap that permits unauthorized dogging of the push bar. The addition of filler strips is required in any case where the door light extends behind the device as in a full glass configuration.

6. Lever Operating Trim: Where exit devices require lever trim, furnish manufacturer's heavy duty escutcheon trim with threaded studs for thru-bolts.

    a. Lock Trim Design: As indicated in Hardware Sets, provide finishes and designs to match that of the specified locksets.
    b. Where function of exit device requires a cylinder, provide a cylinder (Rim or Mortise) as specified in Hardware Sets.

7. Vertical Rod Exit Devices: Where surface or concealed vertical rod exit devices are used at interior openings, provide as less bottom rod (LBR) unless otherwise indicated. Provide dust proof strikes where thermal pins are required to project into the floor.
8. Narrow Stile Applications: At doors constructed with narrow stiles, or as specified in Hardware Sets, provide devices designed for maximum 2” wide stiles.
9. Dummy Push Bar: Nonfunctioning push bar matching functional push bar.
10. Rail Sizing: Provide exit device rails factory sized for proper door width application.
11. Through Bolt Installation: For exit devices and trim as indicated in Door Hardware Sets.

B. Conventional Push Rail Exit Devices (Heavy Duty): ANSI/BHMA A156.3, Grade 1 Certified Products Directory (CPD) listed exit devices. Listed manufacturers shall meet all functions and features as specified herein.

1. Provide exit devices with functions and features as follows:

    a. Where required by code, provide knurling or abrasive coating on all levers leading to hazardous areas.
    b. Meets UL and CUL Standard 10C Positive Pressure, Fire Test of Door Assemblies with levers that meet A117.1 Accessibility Code.
    c. No catch points: addition of applied deflectors or other added components are not allowed.
    d. No visible plastic.
    e. Heavy duty end caps with flush and overlapping options made of stainless steel, brass, or bronze with architectural finishes.
    f. Constructed of all stainless steel.
    g. Stainless steel pullman type latch with deadlock feature.
    h. Narrow or wide style exterior trim as specified in the hardware sets.
    i. Center case adjustability on concealed vertical rod exit devices; single operation with hex key individually adjusts top or bottom latches. No retainer screws or clips required to maintain adjustment.
    j. Ten-year limited warranty for mechanical features.

2. Electromechanical exit devices shall have the following functions and features:

    a. Universal Molex plug-in connectors that have standardized color-coded wiring and are field configurable in fail safe or fail secure and operate from 12vdc to 24vdc regulated.
    b. Wire routing for all non-access control electromechanical functions and EcoFlex trim to be contained within the carrier of the device eliminating the need for cavities in doors to be drilled. Include a protective film so that wires don't get damaged if the rail needs to be removed.
    c. EcoFlex or equivalent technology that reduces energy consumption up to 92% as certified by GreenCircle.
    d. Options to be available for request-to-exit or enter signaling, latchbolt and touchbar monitoring.

e. Field configurable electrified trim to fail-safe or fail-secure that operates from 12-24VDC.

3. Manufacturers:

a. Corbin Russwin Hardware (RU) - PED4000 / PED5000 Series.
b. Sargent Manufacturing (SA) - PE80 Series.
c. Von Duprin (VD) - 35A/98 XP Series.

2.12 DOOR CLOSERS

A. All door closers specified herein shall meet or exceed the following criteria:

1. General: Door closers to be from one manufacturer, matching in design and style, with the same type door preparations and templates regardless of application or spring size. Closers to be non-handed with full sized covers.
2. Standards: Closers to comply with UL-10C for Positive Pressure Fire Test and be U.L. listed for use of fire rated doors.
3. Size of Units: Comply with manufacturer's written recommendations for sizing of door closers depending on size of door, exposure to weather, and anticipated frequency of use. Where closers are indicated for doors required to be accessible to the Americans with Disabilities Act, provide units complying with ANSI ICC/A117.1.
4. Closer Arms: Provide heavy duty, forged steel closer arms unless otherwise indicated in Hardware Sets.
5. Closers shall not be installed on exterior or corridor side of doors; where possible install closers on door for optimum aesthetics.
6. Closer Accessories: Provide door closer accessories including custom templates, special mounting brackets, spacers and drop plates as required for proper installation. Provide through-bolt and security type fasteners as specified in the hardware sets.

B. Door Closers, Surface Mounted (Heavy Duty): ANSI/BHMA A156.4, Grade 1 Certified Products Directory (CPD) listed surface mounted, heavy duty door closers with complete spring power adjustment, sizes 1 thru 6; and fully operational adjustable according to door size, frequency of use, and opening force. Closers to be rack and pinion type, one piece cast iron or aluminum alloy body construction, with adjustable backcheck and separate non-critical valves for closing sweep and latch speed control. Provide non-handed units standard.

1. Heavy duty surface mounted door closers shall have a 30-year warranty.

2. Manufacturers:

a. LCN Closers (LC) - 4040 Series.
b. Norton Rixson (NO) - 7500 Series.
c. Sargent Manufacturing (SA) - 351 Series.

2.13 SURFACE MOUNTED CLOSER HOLDERS

A. Electromagnetic Door Holders: ANSI A156.15 electromagnetic door holder/releases with a minimum 20 to 40 pounds holding power and single coil construction able to accommodate.12VDC, 24VAC, 24VDC and 120VAC. Coils to be independently wound, employing an integral fuse and armatures to include a positive release button.

1. Manufacturers:

    a. LCN Door Closers (LC) - SEM7800 Series.
    b. Norton Rixson (RF) - 980/990 Series.
    c. Sargent Manufacturing (SA) - 1560 Series.

2.14 ARCHITECTURAL TRIM

A. Door Protective Trim

1. General: Door protective trim units to be of type and design as specified below or in the Hardware Sets.
2. Size: Fabricate protection plates (kick, armor, or mop) not more than 2" less than door width (LDW) on stop side of single doors and 1” LDW on stop side of pairs of doors, and not more than 1" less than door width on pull side. Coordinate and provide proper width and height as required where conflicting hardware dictates. Height to be as specified in the Hardware Sets.
3. Where plates are applied to fire rated doors with the top of the plate more than 16” above the bottom of the door, provide plates complying with NFPA 80. Consult manufacturer’s catalog and template book for specific requirements for size and applications.
4. Protection Plates: ANSI/BHMA A156.6 protection plates (kick, armor, or mop), fabricated from the following:

    a. Stainless Steel: 300 grade, 050-inch thick.

5. Options and fasteners: Provide manufacturer's designated fastener type as specified in the Hardware Sets. Provide countersunk screw holes.
6. Manufacturers:

    a. Burns Manufacturing (BU).
    b. Hiawatha, Inc. (HI).
    c. Rockwood (RO).

2.15 DOOR STOPS AND HOLDERS

A. General: Door stops and holders to be of type and design as specified below or in the Hardware Sets.

B. Door Stops and Bumpers: ANSI/BHMA A156.16, Grade 1 door stops and wall bumpers. Provide wall bumpers, either convex or concave types with anchorage as indicated, unless floor or other types of door stops are specified in Hardware Sets. Do not mount floor stops where they will impede traffic. Where floor or wall bumpers are not appropriate, provide overhead type stops and holders.

1. Manufacturers:

    a. Burns Manufacturing (BU).
    b. Hiawatha, Inc. (HI).
    c. Rockwood (RO).

C. Overhead Door Stops and Holders: ANSI/BHMA A156.8, Grade 1 Certified Products Directory (CPD) listed overhead stops and holders to be surface or concealed types as indicated in Hardware Sets. Track, slide, arm and jamb bracket to be constructed of extruded bronze and

shock absorber spring of heavy tempered steel. Provide non-handed design with mounting brackets as required for proper operation and function.

1. Manufacturers:

    a. Norton Rixson (RF).
    b. Rockwood (RO).
    c. Sargent Manufacturing (SA).

2.16 ARCHITECTURAL SEALS

A. General: Thresholds, weatherstripping, and gasket seals to be of type and design as specified below or in the Hardware Sets. Provide continuous weatherstrip gasketing on exterior doors and provide smoke, light, or sound gasketing on interior doors where indicated. At exterior applications provide non-corrosive fasteners and elsewhere where indicated.

B. Smoke Labeled Gasketing: Assemblies complying with NFPA 105 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for smoke control ratings indicated, based on testing according to UL 1784.

    1. Provide smoke labeled perimeter gasketing at all smoke labeled openings.

C. Fire Labeled Gasketing: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to UL-10C.

    1. Provide intumescent seals as indicated to meet UL10C Standard for Positive Pressure Fire Tests of Door Assemblies, and NFPA 252, Standard Methods of Fire Tests of Door Assemblies.

D. Sound-Rated Gasketing: Assemblies that are listed and labeled by a testing and inspecting agency, for sound ratings indicated.

E. Replaceable Seal Strips: Provide only those units where resilient or flexible seal strips are easily replaceable and readily available from stocks maintained by manufacturer.

F. Manufacturers:

    1. National Guard Products (NG).
    2. Pemko (PE).
    3. Reese Enterprises, Inc. (RE).

2.17 ELECTRONIC ACCESSORIES

A. Door Position Switches: Door position magnetic reed contact switches specifically designed for use in commercial door applications. On recessed models the contact and magnetic housing snap-lock into a 1" diameter hole. Surface mounted models include wide gap distance design complete with armored flex cabling. Provide SPDT, N/O switches with optional Rare Earth Magnet installation on steel doors with flush top channels.

    1. Manufacturers:

a. Sargent Manufacturing (SA) - 3280 Series.
b. Security Door Controls (SD) - DPS Series.
c. Securitron (SU) - DPS Series.

B. Switching Power Supplies: Provide power supplies with either single or dual voltage configurations at 12 or 24VDC. Power supplies shall have battery backup function with an integrated battery charging circuit and shall provide capability for power distribution, direct lock control and Fire Alarm Interface (FAI) through add on modules. Power supplies shall be expandable up to 16 individually protected outputs. Output modules shall provide individually protected, continuous outputs and/or individually protected, relay controlled outputs.

1. Manufacturers:

a. Securitron (SU) - AQD Series.
b. Altronix (AS) - Maximal 3.

2.18 FABRICATION

A. Fasteners: Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. Provide screws according to manufacturers recognized installation standards for application intended.

2.19 FINISHES

A. Standard: Designations used in the Hardware Sets and elsewhere indicate hardware finishes complying with ANSI/BHMA A156.18, including coordination with traditional U.S. finishes indicated by certain manufacturers for their products.

B. Provide quality of finish, including thickness of plating or coating (if any), composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified by referenced standards for the applicable units of hardware

C. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine scheduled openings, with Installer present, for compliance with requirements for installation tolerances, labeled fire door assembly construction, wall and floor construction, and other conditions affecting performance.

B. Notify architect of any discrepancies or conflicts between the door schedule, door types, drawings and scheduled hardware. Proceed only after such discrepancies or conflicts have been resolved in writing.

3.2 PREPARATION

A. Hollow Metal Doors and Frames: Comply with ANSI/DHI A115 series.

B. Wood Doors: Comply with ANSI/DHI A115-W series.

3.3 INSTALLATION

A. Install each item of mechanical and electromechanical hardware and access control equipment to comply with manufacturer's written instructions and according to specifications.

1. Installers are to be trained and certified by the manufacturer on the proper installation and adjustment of fire, life safety, and security products including: hanging devices; locking devices; closing devices; and seals.

B. Mounting Heights: Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:

1. Standard Steel Doors and Frames: DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."
2. DHI TDH-007-20: Installation Guide for Doors and Hardware.
3. Where indicated to comply with accessibility requirements, comply with ANSI A117.1 "Accessibility Guidelines for Buildings and Facilities."
4. Provide blocking in drywall partitions where wall stops or other wall mounted hardware is located.

C. Retrofitting: Install door hardware to comply with manufacturer's published templates and written instructions. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Division 9 Sections. Do not install surface-mounted items until finishes have been completed on substrates involved.

D. Thresholds: Set thresholds for exterior and acoustical doors in full bed of sealant complying with requirements specified in Division 7 Section "Joint Sealants."

E. Storage: Provide a secure lock up for hardware delivered to the project but not yet installed. Control the handling and installation of hardware items so that the completion of the work will not be delayed by hardware losses before and after installation.

3.4 ADJUSTING

A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.

3.5 CLEANING AND PROTECTION

A. Protect all hardware stored on construction site in a covered and dry place. Protect exposed hardware installed on doors during the construction phase. Install any and all hardware at the latest possible time frame.

B. Clean adjacent surfaces soiled by door hardware installation.

C. Clean operating items as necessary to restore proper finish. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of owner occupancy.

3.6 DEMONSTRATION

A. Instruct Owner's maintenance personnel to adjust, operate, and maintain mechanical and electromechanical door hardware.

3.7 DOOR HARDWARE SETS

A. The hardware sets represent the design intent and direction of the owner and architect. They are a guideline only and should not be considered a detailed hardware schedule. Discrepancies, conflicting hardware and missing items should be brought to the attention of the architect with corrections made prior to the bidding process. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application and functionality.

1. Quantities listed are for each pair of doors, or for each single door.
2. The supplier is responsible for handing and sizing all products.
3. Where multiple options for a piece of hardware are given in a single line item, the supplier shall provide the appropriate application for the opening.

B. Manufacturer’s Abbreviations:

1. MK - McKinney
2. PE - Pemko
3. MR - Markar
4. SU - Securitron
5. RO - Rockwood
6. AD - Adams Rite
7. SA - SARGENT
8. RF - Rixson
9. OT - Other

Hardware Sets

Set: CS-1.0

Doors: A100E, A100F, C100A.2, ST00B1.1

1	Continuous Hinge	CFM_SLF-HD1 x Length Required		PE	087100

Notes: Coordinate all Wiring and conduit with electrical contractor.

Operation:
• Doors are normally closed and latched.
• Active leaf Exit Device has Nightlatch Function (Key will retract the exit device latch, door is latched when the key is removed).
• When an authorized card read is detected on the secured side of the door the access control system will momentarily retract the exit device latch and activate the auto operator actuator button on the secured side of the opening.
• Alternate Access after audio/video verification via the Intercom system (by Security) remotely releasing the exit device latch and activating the auto operator to allow authorized remote entry.
• When the actuator button on the secure is pressed (after the authorized card read) the auto operator will open the active leaf door of the pair.
• Egress can be achieved at any time by pushing the actuator button on the unsecured side of the opening to retract the exit device latch on the active leaf and activating the auto operator to open the door.
• Manual egress is always available by pressing either exit device push bar of the pair. Request to Exit Switch in Exit Device push bar will signal an authorized egress to access control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.
open the door.
• Manual egress is always available by pressing either exit device push bar of the pair. Request to Exit Switch in Exit Device push bar will signal an authorized egress to access control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.

• Active leaf Exit Device has Nightlatch Function (Key will retract the exit device latch, door is latched when the key is removed).
• When an authorized card read is detected on the secured side of the door the access control system will momentarily retract the exit device latch and activate the auto operator actuator button on the secured side of the opening.
• When the actuator button on the secure is pressed (after the authorized card read) the auto operator will open the active leaf door of the pair.
• Egress can be achieved at any time by pushing the actuator button on the unsecured side of the opening to retract the exit device latch on the active leaf and activating the auto operator to open the door.
• Manual egress is always available by pressing either exit device push bar of the pair. Request to Exit Switch in Exit Device push bar will signal an authorized egress to access control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.
control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.

Operation:
During Normal Business Hours:
• Exit Device Latches are electronically held (Dogged) to allow Push/Pull operation.
• When the actuator button on either side of the opening is pressed the auto operator will open the active leaf door of the pair.
• Manual entry or egress is always available by pushing or pulling either door of the pair.
• The exit devices are fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.

After Normal Business Hours:
• Doors are normally closed and latched.
• Active leaf Exit Device has Nightlatch Function (Key will retract the exit device latch, door is latched when the key is removed).
• When an authorized card read is detected on the secured side of the door the access control system will momentarily retract the exit device latch and activate the auto operator actuator button on the secured side of the opening.
• When the actuator button on the secure is pressed (after the authorized card read) the auto operator will open the active leaf door of the pair.
• Egress can be achieved at any time by pushing the actuator button on the unsecured side of the opening to retract the exit device latch on the active leaf and activating the auto operator to open the door.
• Manual egress is always available by pressing either exit device push bar of the pair. Request to Exit Switch in Exit Device push bar will signal an authorized egress to access control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.
l signal an authorized egress to access control system.
• The exit device is fail secure and will latch in the absence of power.
• Door position switches at each leaf will signal the doors OPEN/CLOSED status to the access control panel.

END OF SECTION 087100

SECTION 088000 – GLAZING - EXTERIOR

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Glass products.
2. Insulating glass.
3. Glazing sealants.
4. Glazing tapes.
5. Miscellaneous glazing materials.

B. Related Requirements:

1. Section 084413 "Glazed Aluminum Curtain Walls".

1.2 DEFINITIONS

A. Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.

B. Glass Thicknesses: Indicated by thickness designations in millimeters in accordance with ASTM C1036.

C. IBC: International Building Code.

D. Interspace: Space between lites of an insulating-glass unit.

1.3 COORDINATION

A. Coordinate glazing channel dimensions to provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances to achieve proper safety margins for glazing retention under each design load case, load case combination, and service condition.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
2. Review temporary protection requirements for glazing during and after installation.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product. Include sealant manufacturer's temperature and substrate requirements.

B. Sustainable Design Submittals:

1. Product Data: For sealants, indicating VOC content.
2. Laboratory Test Reports: For sealants, indicating compliance with requirements for low-emitting materials.

C. Glass Samples: For each type of glass product other than clear monolithic vision glass; 12 inches (300 mm) square. For insulating glass units, provide assemblies representative of units to be used in the finished work, including coatings, spacers, edge seals, and edge deletion. Include gaskets, setting blocks, shims, and other glazing accessories.

D. Glazing Accessory Samples: For sealants and colored spacers, in 12-inch (300-mm) lengths. Install sealant Samples between two strips of material representative in color of adjoining framing system.

E. Glazing Schedule: List glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings.

F. Delegated Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by qualified professional engineer responsible for their preparation.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturers of fabricated glass units, glass testing agency and sealant testing agency.

B. Product Certificates: For glass.

C. Product Test Reports: For fabricated glass and glazing sealants, for tests performed by a qualified testing agency.

1. For glazing sealants, provide test reports based on testing current sealant formulations within previous 36-month period.
2. Include the glass fabricator/manufacturer's calculations for wind pressure and thermal stress showing that the specified probabilities of breakage are not exceeded.

D. Preconstruction adhesion and compatibility test report.

E. Sample Warranties: For special warranties.

F. Manufacturer's Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.7 QUALITY ASSURANCE

A. Fabricated-Glass Manufacturer Qualifications: A qualified manufacturer of fabricated glass units who is approved and certified by primary glass manufacturer.

B. Installer Qualifications: A qualified glazing contractor for this Project who is certified under the North American Contractor Certification Program (NACC) for Architectural Glass & Metal (AG&M) contractors and who employs glazing technicians certified under the Architectural Glass and Metal Technician (AGMT) certification program.

C. Glass Testing Agency Qualifications: A qualified independent testing agency accredited according to the NFRC CAP 1 Certification Agency Program.

D. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.

E. Mockups: Build mockups to demonstrate aesthetic effects and to set quality standards for materials and execution.

1. Install glazing in mockups specified in Section 084413 "Glazed Aluminum Curtain Walls" to match glazing systems required for Project, including glazing methods.
2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Adhesion and Compatibility Testing: Test each glass product, tape sealant, gasket, glazing accessory, and glass-framing member for adhesion to and compatibility with elastomeric glazing sealants.

1. Testing is not required if data are submitted based on previous testing of current sealant products and glazing materials matching those submitted.
2. Use ASTM C1087 to determine whether priming and other specific joint-preparation techniques are required to obtain rapid, optimum adhesion of glazing sealants to glass, tape sealants, gaskets, and glazing channel substrates.
3. Test no fewer than eight Samples of each type of material, including joint substrates, shims, sealant backings, secondary seals, and miscellaneous materials.
4. Schedule enough time for testing and analyzing results to prevent delaying the Work.
5. For materials failing tests, submit sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Protect glazing materials in accordance with manufacturer's written instructions. Prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.

B. Comply with insulating-glass manufacturer's written instructions for venting and sealing units to avoid hermetic seal ruptures due to altitude change.

1.10 FIELD CONDITIONS

A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.

1. Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or are below 40 deg F (4.4 deg C).

1.11 WARRANTY

A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer agrees to replace coated-glass units that deteriorate within specified warranty period. Deterioration of coated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in coating.

1. Warranty Period: 10 years from date of Substantial Completion.

B. Manufacturer's Special Warranty for Insulating Glass: Manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is obstruction of vision by dust, moisture, or film on interior surfaces of glass.

1. Warranty Period: 10 years from date of Substantial Completion.

C. Manufacturer's Special Warranty for Heat-Soaked Tempered Glass: Manufacturer agrees to replace heat-soaked tempered glass units that spontaneously break due to nickel sulfide (NiS) inclusions at a rate exceeding 0.3 percent (3/1000) within specified warranty period. Coverage for any other cause is excluded.

1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cardinal Glass Industries.
2. Guardian Glass; SunGuard.
3. Pilkington North America.
4. Viracon, Inc.
5. Vitro Architectural Glass.

B. Source Limitations for Glass: Obtain coated glass from single source from single manufacturer.

C. Source Limitations for Glazing Accessories: For each product and installation method, obtain from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. General: Installed glazing systems shall withstand normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to defective manufacture, fabrication, or installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.

B. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design glazing.

C. Structural Performance: Glazing shall withstand the following design loads within limits and under conditions indicated determined in accordance with the IBC and ASTM E1300:

1. Design Wind Pressures: As indicated on Drawings Determine design wind pressures applicable to Project in accordance with ASCE/SEI 7, based on heights above grade indicated on Drawings.

    a. Wind Design Data: As indicated on Drawings.

2. Probability of Breakage for Vertical Glazing: 8 lites per 1000 for glass installed vertically or not more than 15 degrees from the vertical plane and under wind action.

    a. Load Duration: 60 seconds or less.

3. Maximum Lateral Deflection: For glass supported on all four edges, limit center-of-glass deflection at design wind pressure to not more than 1/50 times the short-side length or 1 inch (25 mm), whichever is less.
4. Thermal Loads: Design glazing to resist thermal stress breakage induced by differential temperature conditions and limited air circulation within individual glass lites and insulated glazing units.

D. Safety Glazing: Where safety glazing is indicated or required by code, provide glazing that complies with 16 CFR 1201, Category II.

E. Thermal and Optical Performance Properties: Provide glass with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below:

1. Performance requirements for glazing including, but not limited to, visible transmittance and sound requirements.
2. For monolithic-glass lites, properties are based on units with lites 6 mm thick.
3. For insulating-glass units, properties are based on units of thickness indicated for overall unit and for each lite.
4. U-Factors: Center-of-glazing values, in accordance with NFRC 100 and based on most current non-beta version of LBL's WINDOW computer program, expressed as Btu/sq. ft. x h x deg F (W/sq. m x K).
5. SHGC and Visible Transmittance: Center-of-glazing values, in accordance with NFRC 200 and based on most current non-beta version of LBL's WINDOW computer program.
6. Visible Reflectance: Center-of-glazing values, in accordance with NFRC 300.

2.3 GLASS PRODUCTS, GENERAL

A. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below unless more stringent requirements are indicated. See these publications for glazing terms not otherwise defined in this Section or in referenced standards.

1. NGA Publications: "Glazing Manual."
2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial and Residential Use."

B. Safety Glazing Labeling: Where safety glazing is indicated, permanently mark glazing with certification label of the SGCC or another certification agency acceptable to authorities having jurisdiction or manufacturer. Label shall indicate manufacturer's name, type of glass, thickness, and safety glazing standard with which glass complies.

C. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of the IGCC.

D. Thickness: Where glass thickness is indicated, it is a minimum. Provide glass that complies with performance requirements and is not less than thickness indicated.

1. Minimum Glass Thickness for Exterior Lites: 6 mm.

E. Strength: Where annealed float glass is indicated, provide annealed float glass, heat-strengthened float glass, or fully tempered float glass as needed to comply with "Performance Requirements" Article. Where heat-strengthened float glass is indicated, provide heat-strengthened float glass or fully tempered float glass as needed to comply with "Performance Requirements" Article. Where fully tempered float glass is indicated, provide fully tempered float glass.

2.4 GLASS PRODUCTS

A. Low-Iron Annealed Float Glass: ASTM C1036, Type I, Class I (clear), Quality-Q3; and with visible light transmission of not less than 91 percent and SHGC of not less than 0.87.

B. Fully Tempered Float Glass: ASTM C1048, Kind FT (fully tempered), Condition A (uncoated) unless otherwise indicated, Type I, Class 1 (clear) or Class 2 (tinted) as indicated, Quality-Q3.

1. Fabrication Process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed unless otherwise indicated. Roller distortion or ripples shall run in the same direction for the entire job. Roller distortion, measured peak to valley, shall not exceed 0.003 inches in the central area for 1/4 inch or thicker glass, or 0.008 inches within 10.5 inches of the leading or trailing edge for 1/4 inch or thicker glass. Clear or low-iron glass ¼” to 3/8” thick without ceramic frit or ink, maximum + or – 100 mD (millidiopter) over 95% of the glass surface. Local bow shall not exceed 1/32 inch in 12 inches.

2. Heat Soak Testing: Unless manufacturer’s standard procedures are more stringent, perform heat soak testing of all fully tempered glass lites by placing glass in an oven at temperatures of 550dF,+/-50dF for a two hour “Dwell Time” to reduce the potential for spontaneous breakage to 5 lites per 1000 (5/1000).

C. Heat-Strengthened Float Glass: ASTM C1048, Kind HS (heat strengthened), Type I, Condition A (uncoated) unless otherwise indicated, Type I, Class 1 (clear) or Class 2 (tinted) as indicated, Quality-Q3.

1. Fabrication Process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed unless otherwise indicated. Roller distortion or ripples shall run in the same direction for the entire job. Roller distortion, measured peak to valley, shall not exceed 0.003 inches in the central area for 1/4 inch or thicker glass, or 0.008 inches within 10.5 inches of the leading or trailing edge for 1/4 inch or thicker glass. Clear or low-iron glass ¼" to 3/8" thick without ceramic frit or ink, maximum + or – 100 mD (millidiopter) over 95% of the glass surface. Local bow shall not exceed 1/32 inch in 12 inches.

D. Pyrolytic-Coated Glass: Clear float glass with coating on first surface.

E. Reflective- and Low-E-Coated Vision Glass: ASTM C1376.

F. Silicone-Coated Spandrel Glass: ASTM C1048, Type I, Condition C, Quality-Q3.

G. Reflective- and Low-E-Coated Spandrel Glass: ASTM C1376, Kind CS.

2.5 INSULATING GLASS

A. Insulating-Glass Units: Factory-assembled units consisting of sealed lites of glass separated by a dehydrated interspace, qualified in accordance with ASTM E2190.

1. Sealing System: Dual seal, with polyisobutylene and silicone primary and secondary sealants.
2. Perimeter Spacer: Fabricators warm edge spacer. Color: Black.
3. Desiccant: Molecular sieve or silica gel, or a blend of both.

2.6 GLAZING GASKETS

A. Dense Compression Gaskets: Molded or extruded gaskets of profile and hardness required to maintain watertight seal, made from the following:

1. Neoprene complying with ASTM C 864.
2. EPDM complying with ASTM C 864.
3. Silicone complying with ASTM C 1115.
4. Thermoplastic polyolefin rubber complying with ASTM C 1115.

B. Soft Compression Gaskets: Extruded or molded, closed-cell, integral-skinned neoprene, EPDM, silicone or thermoplastic polyolefin rubber gaskets complying with ASTM C 509, Type II, black; of profile and hardness required to maintain watertight seal.

1. Application: Use where soft compression gaskets will be compressed by inserting dense compression gaskets on opposite side of glazing or pressure applied by means of pressure-glazing stops on opposite side of glazing.

2.7 GLAZING SEALANTS

A. General:

1. Compatibility: Compatible with one another and with other materials they contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.
2. Suitability: Comply with sealant and glass manufacturers' written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.
3. Colors of Exposed Glazing Sealants: As selected by Architect from manufacturer's full range of industry colors.

B. Neutral-Curing Silicone Glazing Sealant, Class 100/50: Complying with ASTM C920, Type S, Grade NS, Use NT.

2.8 GLAZING TAPES

A. Back-Bedding Mastic Glazing Tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C1281 and AAMA 800 for products indicated below:

1. AAMA 804.3 tape, where indicated.
2. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.
3. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.

B. Expanded Cellular Glazing Tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and complying with AAMA 800 for the following types:

1. AAMA 810.1, Type 1, for glazing applications in which tape acts as primary sealant.
2. AAMA 810.1, Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.

2.9 MISCELLANEOUS GLAZING MATERIALS

A. General: Provide products of material, size, and shape complying with referenced glazing standard, recommended in writing by manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.

B. Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.

C. Setting Blocks:

1. Type recommended in writing by sealant or glass manufacturer.

D. Spacers:

1. Type recommended in writing by sealant or glass manufacturer.

E. Edge Blocks:

1. Type recommended in writing by sealant or glass manufacturer.

F. Cylindrical Glazing Sealant Backing: ASTM C1330, Type O (open-cell material), of size and density to control glazing sealant depth and otherwise produce optimum glazing sealant performance.

2.10 FABRICATION OF GLAZING UNITS

A. Fabricate glazing units in sizes required to fit openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

1. Allow for thermal movements from ambient and surface temperature changes acting on glass framing members and glazing components.

a. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

B. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites to produce square edges with slight chamfers at junctions of edges and faces.

C. Grind smooth and polish exposed glass edges and corners.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine framing, glazing channels, and stops, with Installer present, for compliance with the following:

1. Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.
2. Presence and functioning of weep systems.
3. Minimum required face and edge clearances.
4. Effective sealing between joints of glass-framing members.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

B. Examine glazing units to locate exterior and interior surfaces. Label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that leave visible marks in the completed Work.

3.3 GLAZING, GENERAL

A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.

B. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass includes glass with edge damage or other imperfections that, when installed, could weaken glass, impair performance, or impair appearance.

C. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction testing.

D. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

E. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.

F. Provide spacers for glass lites where length plus width is larger than 50 inches (1270 mm).

1. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
2. Provide 1/8-inch- (3-mm-) minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.

G. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and in accordance with requirements in referenced glazing publications.

H. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.

I. Set glass lites with proper orientation so that coatings face exterior or interior as specified.

J. Where wedge-shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.

K. Square cut wedge-shaped gaskets at corners and install gaskets in a manner recommended by gasket manufacturer to prevent corners from pulling away; seal corner joints and butt joints with sealant recommended in writing by gasket manufacturer.

3.4 TAPE GLAZING

A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.

B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.

C. Cover vertical framing joints by applying tapes to heads and sills first, then to jambs. Cover horizontal framing joints by applying tapes to jambs, then to heads and sills.

D. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.

E. Do not remove release paper from tape until right before each glazing unit is installed.

F. Apply heel bead of elastomeric sealant.

G. Center glass lites in openings on setting blocks, and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.

H. Apply cap bead of elastomeric sealant over exposed edge of tape.

3.5 GASKET GLAZING (DRY)

A. Cut compression gaskets to lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.

B. Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.

C. Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks, and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended in writing by gasket manufacturer.

D. Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks, and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended in writing by gasket manufacturer.

E. Install gaskets so they protrude past face of glazing stops.

3.6 SEALANT GLAZING (WET)

A. Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers

and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.

B. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.

C. Tool exposed surfaces of sealants to provide a substantial wash away from glass.

3.7 CLEANING AND PROTECTION

A. Immediately after installation, remove nonpermanent labels and clean surfaces.

B. Protect glass from contact with contaminating substances resulting from construction operations. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains.

1. If, despite such protection, contaminating substances do contact with glass, remove substances immediately as recommended in writing by glass manufacturer. Remove and replace glass that cannot be cleaned without damage to coatings.

C. Remove and replace glass that is damaged during construction period.

D. Wash glass on both exposed surfaces not more than four days before date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended in writing by glass manufacturer.

3.8 INSULATING GLASS SCHEDULE

A. Low-E-Coated, Low-Iron Clear Insulating Glass Type (GL-21):

1. Basis-of-Design Product: Vitro Architectural Glass; Solarban 90 Acuity Series.
2. Overall Unit Thickness: 1 inch (25 mm).
3. Minimum Thickness of Each Glass Lite: 6 mm.
4. Outdoor Lite: Low-iron fully tempered float glass.
5. Interspace Content: Argon.
6. Indoor Lite: Low-iron fully tempered float glass.
7. Low-E Coating: Sputtered on second surface.
8. Winter Nighttime U-Factor: 0.24 maximum.
9. Visible Light Transmittance: 63 percent minimum.
10. SGHC: 0.23 maximum.
11. Safety glazing required.

B. Lightly Reflective Low-E-Coated, Low-Iron Clear Insulating Glass Type (GL-22):

1. Basis-of-Design Product: Vitro Architectural Glass; Solarban R100 Acuity Series.
2. Overall Unit Thickness: 1 inch (25 mm).
3. Minimum Thickness of Each Glass Lite: 6 mm.
4. Outdoor Lite: Low-iron fully tempered float glass.
5. Interspace Content: Argon.
6. Indoor Lite: Low-iron fully tempered float glass.
7. Low-E Coating: Sputtered on second surface. Color to match Architect’s sample.

8. Winter Nighttime U-Factor: 0.25 maximum.
9. Visible Light Transmittance: 43 percent minimum.
10. SGHC: 0.23 maximum.
11. Safety glazing required.

C. Low-E-Coated, Low-Iron Clear Insulating with Birdsafe UV Coating Glass Type (GL-23):

1. Basis-of-Design Product: Vitro Architectural Glass; Solarban 90 Acuity Series with Walker Glass AviProtek T Pattern 713 (vertical orientation) Bird Safe UV Coating.
2. Overall Unit Thickness: 1 inch (25 mm).
3. Minimum Thickness of Each Glass Lite: 6 mm.
4. Outdoor Lite: Bird safe pyrolytic UV coating on No. 1 surface, clear low-iron fully tempered float glass.
5. Interspace Content: Argon.
6. Indoor Lite: Low-iron fully tempered float glass.
7. Low-E Coating: Sputtered on second surface. Color to match Architect's sample.
8. Winter Nighttime U-Factor: 0.24 maximum.
9. Visible Light Transmittance: 63 percent minimum.
10. SGHC: 0.23 maximum.
11. Safety glazing required.

D. Silicone-Coated, Low-E, Insulating Spandrel Glass Type (GL-41):

1. Basis-of-Design Product: Vitro Architectural Glass; Solarban 90 Acuity Series.
2. Coating Color: OPACI-COAT-300, *2-3867LI Fields of Emerald.*
3. Overall Unit Thickness: 1 inch (25 mm).
4. Minimum Thickness of Each Glass Lite: 6 mm.
5. Outdoor Lite: Low-iron heat-strengthened float glass.
6. Interspace Content: Air.
7. Indoor Lite: Low-iron fully tempered float glass.
8. Low-E Coating: Sputtered on second surface.
9. Opaque Coating Location: Fourth surface.

E. Silicone-Coated, Lightly Reflective, Low-E, Insulating Spandrel Glass Type (GL-42):

1. Basis-of-Design Product: Vitro Architectural Glass; Solarban R100 Acuity Series.
2. Coating Color: OPACI-COAT-300, *6-4029LI Ocean Horizon.*
3. Overall Unit Thickness: 1 inch (25 mm).
4. Minimum Thickness of Each Glass Lite: 6 mm.
5. Outdoor Lite: Low-iron heat-strengthened float glass.
6. Interspace Content: Air.
7. Indoor Lite: Low-iron fully tempered float glass.
8. Low-E Coating: Sputtered on second surface.
9. Opaque Coating Location: Fourth surface.

END OF SECTION 088000

SECTION 089119 - FIXED LOUVERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fixed extruded-aluminum louvers.
2. Blank-off panels for louvers

1.2 DEFINITIONS

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

B. Horizontal Louver: Louver with horizontal blades (i.e., the axis of the blades are horizontal).

C. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.

B. Sustainable Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Environmental Product Declaration: For each product.
3. Health Product Declaration: For each product.
4. Sourcing of Raw Materials: Corporate sustainability report for each manufacturer.

C. Shop Drawings: Project specific. For louvers and accessories. Include plans, elevations, sections, details, integration with surrounding construction and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.

1. Show weep paths, gaskets, flashings, sealants, and other means of preventing water intrusion.
2. Show mullion profiles and locations.

D. Samples: For each type of metal finish required.

E. Delegated Design Submittal: For louvers indicated to comply with structural performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Product Test Reports: Based on evaluation of comprehensive tests performed in accordance with AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver and showing compliance with performance requirements specified.

B. Sample Warranties: For manufacturer's special warranties.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel in accordance with the following:

1. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

1.6 FIELD CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.7 WARRANTY

A. Special Finish Warranty, Factory-Applied Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of baked enamel, powder coat, or organic finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain fixed louvers from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural performance requirements and design criteria indicated.

B. Structural Performance: Louvers withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures are considered to act normal to the face of the building.

1. Wind Loads:

a. Determine loads based on pressures as indicated on Drawings.

C. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width in accordance with AMCA 500-L.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

E. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

2.3 FIXED EXTRUDED-ALUMINUM LOUVERS

A. Horizontal Drainable-Blade Louver, Extruded Aluminum: (LVR-1A, LVR-1B, *LVR-1C*, ~~*LVR-2*~~)

1. Basis-of-Design Product: Subject to compliance with requirements, provide Construction Specialties, Inc.; Model A6097 or a comparable product by one of the following:

a. Airolite Company, LLC (The); Model K6846.
b. Ruskin; Air Distribution Technologies, Inc.; Johnson Controls, Inc.; Model ELF6350DMP.

2. Louver Depth: 6 inches (150 mm).
3. Frame and Blade Nominal Thickness: Not less than 0.080 inch (2.03 mm).
4. Mullion Type: Continuous blade with concealed vertical and horizontal supports for seamless appearance.
5. Louver Performance Ratings:

a. Free Area: Not less than 8.34 sq. ft. (0.775 sq. m) for 48-inch- (1220-mm-) wide by 48-inch- (1220-mm-) high louver.
b. Point of Beginning Water Penetration: Not less than 1100 fpm (5.6 m/s).
c. Air Performance:

1) Not more than 0.10-inch wg (25-Pa) static pressure drop at 800-fpm (4.1-m/s) free-area intake velocity.
2) Not more than 0.15-inch wg (37-Pa) static pressure drop at 1000-fpm (5.1-m/s) free-area exhaust velocity.

6. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

B. Horizontal Drainable-Blade Louver, Extruded Aluminum (LVR-3 & LVR-2):

1. *Basis-of-Design Product: Subject to compliance with requirements, provide Construction Specialties, Inc.; Model A4097 or a comparable product by one of the following:*

    a. *Airolite Company, LLC (The).*
    b. *Ruskin; Air Distribution Technologies, Inc.; Johnson Controls, Inc.*

2. *Louver Depth: 4 inches (100 mm).*
3. *Frame and Blade Nominal Thickness: Not less than 0.068 inch (1.73 mm) for blades and 0.080 inch (2.03 mm) for frames.*
4. *Mullion Type: Continuous blade with concealed vertical and horizontal supports for seamless appearance.*
5. *Louver Performance Ratings:*

    a. *Free Area: Not less than 8.07 sq. ft. (0.750 sq. m) for 48-inch- (1220-mm-) wide by 48-inch- (1220-mm-) high louver.*
    b. *Point of Beginning Water Penetration: Not less than 1040 fpm (5.3 m/s).*
    c. *Air Performance:*

        1) *Not more than 0.20-inch wg static pressure drop at 1040-fpm (5.3-m/s) free-area intake velocity.*
        2) *Not more than 0.18-inch wg static pressure drop at 1000-fpm (5.1-m/s) free-area exhaust velocity.*

6. *AMCA Seal: Mark units with AMCA Certified Ratings Seal.*

2.4 LOUVER SCREENS

A. General: Provide screen at each exterior louver.

1. Screen Location for Fixed Louvers: Interior face.
2. Screening Type: Bird screening.

B. Secure screen frames to louver frames with stainless steel machine screws, spaced a maximum of 6 inches (150 mm) from each corner and at 12 inches (300 mm) o.c.

C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.

1. Metal: Same type and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
2. Finish: Same finish as louver frames to which louver screens are attached.
3. Type: Non-rewirable, U-shaped frames.

D. Louver Screening for Aluminum Louvers:

1. Bird Screening, Flattened, Expanded Aluminum: 5/8 by 0.055 inch (15.87 by 1.4 mm) thick.

2.5 BLANK-OFF PANELS

A. Insulated Blank-Off Panels: Laminated panels consisting of an insulating core surfaced on back and front with metal sheets and attached to back of louver.

1. Thickness: 3 inches (76.2 mm).
2. Metal Facing Sheets, Aluminum: Not less than 0.032-inch (0.81-mm) nominal thickness.
3. Insulating Core: Rigid, glass-fiber-board insulation or extruded-polystyrene foam.
4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames, not less than 0.080-inch (2.03-mm) nominal thickness, with corners mitered and with same finish as panels.
5. Seal perimeter joints between panel faces and louver frames with gaskets.
6. Panel Finish: Interior side: mill finish, exterior side: Kynar 500 Black.
7. Attach blank-off panels with clips or sheet metal screws.
8. Provide full blank-off panels as indicated on Drawings.

2.6 MATERIALS

A. Aluminum Extrusions: ASTM B221 (ASTM B221M), Alloy 6063-T5, T-52, or T6.

B. Aluminum Sheet: ASTM B209 (ASTM B209M), Alloy 3003 or 5005, with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Fasteners: Use types and sizes to suit unit installation conditions.

1. For fastening aluminum, use stainless steel fasteners.
2. For color-finished louvers, use fasteners with heads that match color of louvers.

D. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, fabricated from stainless steel components, with allowable load or strength design capacities calculated in accordance with ICC-ES AC193 and ACI 318 greater than or equal to the design load, as determined by testing in accordance with ASTM E488/E488M conducted by a qualified testing agency.

E. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

F. Recycled Content of Aluminum Components: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

G. Regional Materials: Manufacture products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

2.7 FABRICATION

A. Factory assemble louvers to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

1. Frame Type: Channel unless otherwise indicated.

2. Louvers to be supplied with 4-inch (101.6 mm) high by full depth sill flashing formed from minimum 0.050 inch (1.27 mm) thick aluminum.
3. Sill flashing to have welded side panels.
4. At LVR-2, provide glazing channel receiver(s) for integration into unitized curtain wall system.

D. Include supports, anchorages, and accessories required for complete assembly.

E. Provide vertical mullions of type and at spacings indicated, but not more than is recommended by manufacturer, or 72 inches (1830 mm) o.c., whichever is less.

1. Fully Recessed Mullions: Where indicated, provide mullions fully recessed behind louver blades for seamless appearance. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.

F. Provide subsills made of same material as louvers or extended sills for recessed louvers.

G. Join frame members to each other and to fixed louver blades with fillet welds concealed from view, threaded fasteners, or both, as standard with louver manufacturer unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.8 ALUMINUM FINISHES

A. Finish louvers after assembly.

B. High-Performance Organic Finish, Two-Coat PVDF: Fluoropolymer mica finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

1. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions .
2. Color and Gloss: Custom colors. Match Architect's samples. ~~*LVR-1B &*~~ LVR-2 ~~*& LVR-3*~~ to match CW-1, LVR-1A to match FBR-2, *LVR-1C to match FBR-1A,* *LVR-1B & LVR-3 to match MP-2*.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

A. Locate and place louvers level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Protect unpainted galvanized- and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

F. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Section 079200 "Joint Sealants" for sealants applied during louver installation.

3.4 ADJUSTING AND CLEANING

A. Clean exposed louver surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

C. Restore louvers damaged during installation and construction, so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.

1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION 089119

SECTION 092116.23 - GYPSUM BOARD SHAFT WALL ASSEMBLIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Gypsum board shaft wall assemblies.

1.3 ACTION SUBMITTALS

A. Product Data: For each component of gypsum board shaft wall assembly.

B. Sustainable Design Submittals:

1. Environmental Product Declaration (EPD): For each product.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and support them on risers on a flat platform to prevent sagging.

1.5 FIELD CONDITIONS

A. Environmental Limitations: Comply with gypsum-shaftliner-board manufacturer's written instructions.

B. Do not install finish panels until installation areas are enclosed and conditioned.

C. Do not install panels that are wet, moisture damaged, or mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, and irregular shape.

2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E119 by an independent testing agency.

B. STC-Rated Assemblies: Provide materials and construction identical to those of assemblies tested according to ASTM E90 and classified according to ASTM E413 by a testing and inspecting agency.

2.2 GYPSUM BOARD SHAFT WALL ASSEMBLIES

A. Fire-Resistance Rating: As indicated on Drawings.

B. STC Rating: As indicated on Drawings.

C. Gypsum Shaftliner Board (GYP BD-21):

1. Moisture- and Mold-Resistant Type X: ASTM C1396/C1396M; manufacturer's proprietary fire-resistive liner panels with ASTM D3273 mold-resistance score of 10 as rated according to ASTM D3274, 1 inch (25.4 mm) thick, and with double beveled long edges.

    a. Products: Subject to compliance with requirements, provide one of the following:

        1) CertainTeed Corporation; Saint-Gobain North America; GlasRoc Shaftliner Type X.
        2) Georgia-Pacific Gypsum LLC; DensGlass Shaftliner.
        3) National Gypsum Company; Gold Bond eXP Shaftliner.
        4) USG Corporation; Sheetrock Brand Glass-Mat Liner Panels.

D. Non-Load-Bearing Steel Framing, General: Complying with ASTM C645 requirements for metal unless otherwise indicated and complying with requirements for fire-resistance-rated assembly indicated.

1. Protective Coating: ASTM A653/A653M, G40 (Z120), hot-dip galvanized unless otherwise indicated.

E. Studs (MET STUD-2): Manufacturer's standard profile for repetitive, corner, and end members as follows:

1. Depth: As indicated on Drawings.
2. Minimum Base-Metal Thickness: As indicated on Drawings.

F. Runner Tracks: Manufacturer's standard J-profile track with manufacturer's standard long-leg length, but at least 2 inches (51 mm) long and matching studs in depth.

1. Minimum Base-Metal Thickness: Matching steel studs.

G. Firestop Tracks: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.

1. Products: Subject to compliance with requirements, provide one of the following:

a. ClarkDietrich; MaxTrak.
b. Fire Trak Corp; Fire Track System.
c. GCP Applied Technologies Inc.; FlameSafe FlowTrak System.
d. Metal-Lite; The System.
e. The Steel Network, Inc.; VertiTrack VTD.

H. Elevator-Hoistway-Entrance Struts: Manufacturer's standard J-profile jamb strut with long-leg length of 3 inches (76 mm), matching studs in depth, and not less than 0.033 inch (0.84 mm) thick.

I. Finish Panels: Gypsum board as specified in Section 092900 "Gypsum Board."

J. Sound Attenuation Blankets: As specified in Section 092900 "Gypsum Board."

2.3 AUXILIARY MATERIALS

A. Provide auxiliary materials that comply with shaft wall manufacturer's written instructions.

B. Trim Accessories: Cornerbead, edge trim, and control joints of material and shapes as specified in Section 092900 "Gypsum Board" that comply with gypsum board shaft wall assembly manufacturer's written instructions for application indicated.

C. Steel Drill Screws: ASTM C1002 unless otherwise indicated.

D. Track Fasteners: Power-driven fasteners of size and material required to withstand loading conditions imposed on shaft wall assemblies without exceeding allowable design stress of track, fasteners, or structural substrates in which anchors are embedded.

1. Expansion Anchors: Fabricated from corrosion-resistant materials, with allowable load or strength design capacities calculated according to ICC-ES AC193 and ACI 318 greater than or equal to the design load, as determined by testing per ASTM E488/E488M conducted by a qualified testing agency.
2. Power-Actuated Anchors: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with allowable load capacities calculated according to ICC-ES AC70, greater than or equal to the design load, as determined by testing per ASTM E1190 conducted by a qualified testing agency.

E. Reinforcing: Galvanized-steel reinforcing strips with 0.033-inch (0.84-mm) minimum thickness of base metal (uncoated).

F. Acoustical Sealant: Section 079219 "Acoustical Joint Sealants."

G. Gypsum Board Cants:

1. Gypsum Board Panels: As specified in Section 092900 "Gypsum Board," Type X, 1/2- or 5/8-inch (13- or 16-mm) panels.
2. Adhesive: Laminating adhesive as specified in Section 092900 "Gypsum Board."
3. Non-Load-Bearing Steel Framing: As specified in Section 092216 "Non-Structural Metal Framing."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine panels before installation. Reject panels that are wet, moisture damaged, or mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Sprayed Fire-Resistive Materials: Coordinate with gypsum board shaft wall assemblies so both elements of Work remain complete and undamaged. Patch or replace sprayed fire-resistive materials removed or damaged during installation of shaft wall assemblies to comply with requirements specified in Section 078100 "Applied Fire Protection."

B. After sprayed fire-resistive materials are applied, remove only to extent necessary for installation of gypsum board shaft wall assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.

3.3 INSTALLATION

A. General: Install gypsum board shaft wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated and manufacturer's written installation instructions.

B. Do not bridge building expansion joints with shaft wall assemblies; frame both sides of expansion joints with furring and other support.

C. Install supplementary framing in gypsum board shaft wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, wall-mounted door stops, and similar items that cannot be supported directly by shaft wall assembly framing.

1. Elevator Hoistway: At elevator hoistway-entrance door frames, provide jamb struts on each side of door frame.
2. Reinforcing: Provide where items attach directly to shaft wall assembly as indicated on Drawings; accurately position and secure behind at least one layer of face panel.

D. Penetrations: At penetrations in shaft wall, maintain fire-resistance rating of shaft wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection

behind boxes containing wiring devices, elevator call buttons and floor indicators, and similar items.

E. Isolate perimeter of gypsum panels from building structure to prevent cracking of panels while maintaining continuity of fire-rated construction.

F. Firestop Tracks: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.

G. Control Joints: Install control joints at locations indicated on Drawings and according to ASTM C840 and in specific locations approved by Architect while maintaining fire-resistance rating of gypsum board shaft wall assemblies.

H. Sound-Rated Shaft Wall Assemblies: Seal gypsum board shaft walls with acoustical sealant at perimeter of each assembly where it abuts other work and at joints and penetrations within each assembly.

I. Gypsum Board Cants: At projections into shaft exceeding 4 inches (102 mm), install gypsum board cants covering tops of projections.

1. Slope cant panels at least 75 degrees from horizontal. Set base edge of panels in adhesive and secure top edges to shaft walls at 24 inches (610 mm) o.c. with screws fastened to shaft wall framing.
2. Where non-load-bearing steel framing is required to support gypsum board cants, install framing at 24 inches (610 mm) o.c. and extend studs from the projection to shaft wall framing.

J. Installation Tolerance: Install each framing member so fastening surfaces vary not more than 1/8 inch (3 mm) from the plane formed by faces of adjacent framing.

3.4 PROTECTION

A. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

B. Remove and replace panels that are wet, moisture damaged, or mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, and irregular shape.
2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION 092116.23

SECTION 092216 - NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Non-load-bearing steel framing systems for interior partitions.
2. Suspension systems for interior ceilings and soffits.
3. Grid suspension systems for gypsum board ceilings.

B. Related Requirements:

1. Section 054000 "Cold-Formed Metal Framing" for exterior non-load-bearing wall studs.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.4 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of code-compliance certification for studs and tracks.

B. Evaluation Reports: For embossed, high-strength steel studs and tracks, firestop tracks, post-installed anchors and power-actuated fasteners, from ICC-ES or other qualified testing agency acceptable to authorities having jurisdiction.

C. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).
2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.5 QUALITY ASSURANCE

A. Code-Compliance Certification of Studs and Tracks: Provide documentation that framing members are certified according to the product-certification program of the Certified Steel Stud Association, the Steel Framing Industry Association or the Steel Stud Manufacturers Association.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: For fire-resistance-rated assemblies that incorporate non-load-bearing steel framing, provide materials and construction identical to those tested in assembly indicated, according to ASTM E119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated on Drawings, according to ASTM E90 and classified according to ASTM E413 by an independent testing agency.

C. Horizontal Deflection:

1. Typical Partitions: L/240 at 5 lb/sq ft (239 Pa) lateral load.
2. Elevator Shaft Partitions: L/240 at 7.5 lb/sq ft (359 Pa) lateral load.
3. Partitions with Tile Facing: L/360 at 7.5 lb/sq ft (359 Pa) lateral load.
4. Partitions supporting Lead Lined Doors and Frames: Provide delegated engineering to comply with L/480 at 10 lb/sq ft (479 Pa) lateral load.
5. Partitions supporting all other Concentrated Loads: Provide delegated engineering to comply with L/360 at 10 lb/sq ft (479 Pa) lateral load.

2.2 FRAMING SYSTEMS

A. Framing Members, General: Comply with ASTM C754 for conditions indicated.

1. Steel Sheet Components: Comply with ASTM C645 requirements for steel unless otherwise indicated.
2. Protective Coating: ASTM A653/A653M, G40 (Z120), hot-dip galvanized unless otherwise indicated. No equivalent coatings allowed.

B. Studs and Tracks (MET STUD-1): ASTM C645. Use either conventional steel studs and tracks or embossed, high-strength steel studs and tracks.

1. Steel Studs and Tracks:

a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1) JN Linrose.
2) MarinoWARE.
3) MBA Building Supplies.
4) MRI Steel Framing, LLC.
5) Telling Industries.
6) The Steel Network, Inc.

b. Minimum Base-Steel Thickness: As indicated on Drawings.
c. Depth: As indicated on Drawings.

2. Embossed, High Strength Steel Studs and Tracks: Roll-formed and embossed with surface deformations to stiffen the framing members so that they are structurally comparable to conventional ASTM C645 steel studs and tracks.

a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1) ClarkDietrich.
2) MarinoWARE.
3) MBA Building Supplies.
4) Steel Construction Systems.
5) Telling Industries.
6) The Steel Network, Inc.

b. Minimum Base-Steel Thickness: 0.0190 inch (0.483 mm).
c. Depth: As indicated on Drawings.

C. Slip-Type Head Joints: Where indicated, provide one of the following:

1. Single Long-Leg Track System: ASTM C645 top track with 2-inch- (51-mm-) deep flanges in thickness not less than indicated for studs, installed with studs friction fit into top track and with continuous bridging located within 12 inches (305 mm) of the top of studs to provide lateral bracing.
2. Double-Track System: ASTM C645 top outer tracks, inside track with 2-inch- (51-mm-) deep flanges in thickness not less than indicated for studs and fastened to studs, and outer track sized to friction-fit over inner track.
3. Deflection Track: Steel sheet top track manufactured to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above; in thickness not less than indicated for studs and in width to accommodate depth of studs.

a. Products: Subject to compliance with requirements, provide one of the following:

1) ClarkDietrich; MaxTrak Slotted Deflection Track.
2) MarinoWARE.
3) Metal-Lite.
4) Steel Construction Systems; Steel-Con Slotted Leg Track System.
5) Telling Industries; Vertical Slip Track.
6) The Steel Network, Inc.; VertiClip SLD.

D. Firestop Tracks: Top track manufactured to allow partition heads to expand and contract with movement of structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.

1. Products: Subject to compliance with requirements, provide one of the following:

a. ClarkDietrich; BlazeFrame.
b. Fire Trak Corp; Fire Trak System attached to studs with Fire Trak Posi Klip.
c. MarinoWARE.
d. Metal-Lite.
e. Steel Construction Systems; Steel-Con Slotted Leg Track System.
f. The Steel Network, Inc.; VertiTrack VT.

E. Cold-Rolled Channel Bridging: Steel, 0.0538-inch (1.367-mm) minimum base-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As indicated on Drawings.
2. Clip Angle: Not less than 1-1/2 by 1-1/2 inches (38 by 38 mm), 0.068-inch- (1.72-mm-) thick, galvanized steel.

F. Hat-Shaped, Rigid Furring Channels: ASTM C645.

1. Minimum Base-Steel Thickness: As indicated on Drawings.
2. Depth: As indicated on Drawings.

G. Resilient Furring Channels: 1/2-inch- (13-mm-) deep, steel sheet members designed to reduce sound transmission.

1. Configuration: Asymmetrical.

H. Cold-Rolled Furring Channels: 0.053-inch (1.34-mm) uncoated-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As indicated on Drawings.
2. Furring Brackets: Adjustable, corrugated-edge-type steel sheet with minimum uncoated-steel thickness of 0.0329 inch (0.8 mm).
3. Tie Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm-) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

I. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches (32 mm), wall attachment flange of 7/8 inch (22 mm), minimum uncoated-steel thickness of 0.0179 inch (0.455 mm), and depth required to fit insulation thickness indicated.

J. Radius Framing: Steel sheet runner for non-load-bearing curves, bends, variable radii, and arches.

1. Basis-of-Design Product: Subject to compliance with requirements, provide ClarkDietrich; 360TRAK or comparable product

2. Minimum Base-Steel Thickness: As indicated on Drawings.
3. Depth: As indicated on Drawings.

2.3 SUSPENSION SYSTEMS

A. Tie Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm-) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

B. Hanger Attachments to Concrete:

1. Post-Installed Anchors: Fastener systems with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC01 AC193 AC58 or AC308 as appropriate for the substrate.

a. Uses: Securing hangers to structure.
b. Type: Torque-controlled, expansion anchor torque-controlled, adhesive anchor or adhesive anchor.
c. Material for Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B633 or ASTM F1941 (ASTM F1941M), Class Fe/Zn 5, unless otherwise indicated.
d. Material for Exterior or Interior Locations and Where Stainless Steel Is Indicated: Alloy Group 2 (A4) stainless-steel bolts, ASTM F593 (ASTM F738M), and nuts, ASTM F594 (ASTM F836M).

2. Power-Actuated Anchors: Fastener systems with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC70.

C. Wire Hangers: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.16 inch (4.12 mm) in diameter.

D. Carrying Channels (Main Runners): Cold-rolled, commercial-steel sheet with a base-steel thickness of 0.0538 inch (1.367 mm) and minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As indicated on Drawings.

E. Furring Channels (Furring Members):

1. Cold-Rolled Channels: 0.0538-inch (1.367-mm) uncoated-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges, 3/4 inch (19 mm) deep.
2. Steel Studs and Tracks: ASTM C645.

a. Minimum Base-Steel Thickness: As indicated on Drawings.
b. Depth: As indicated on Drawings.

3. Embossed, High-Strength Steel Studs and Tracks: ASTM C645.

a. Minimum Base-Steel Thickness: As indicated on Drawings.
b. Depth: As indicated on Drawings.

4. Hat-Shaped, Rigid Furring Channels: ASTM C645, 7/8 inch (22 mm) deep.

a. Minimum Base-Steel Thickness: As indicated on Drawings.

5. Resilient Furring Channels: 1/2-inch- (13-mm-) deep members designed to reduce sound transmission.

a. Configuration: Asymmetrical.

F. Grid Suspension System for Gypsum Board Ceilings: ASTM C645, direct-hung system composed of main beams and cross-furring members that interlock.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Armstrong Ceiling & Wall Solutions; Drywall Grid Systems and QuikStix Drywall Soffit Framing System.
b. Rockfon (Rockwool International); 640/660 Drywall Ceiling Suspension.
c. USG Corporation; Drywall Suspension System.

G. Use stainless steel hanger wires in locations subject to moisture penetration or condensation. Other support brackets and framing shall be galvanized steel.

2.4 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards.

1. Fasteners for Steel Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

B. Isolation Strip at Exterior Walls: Provide one of the following:

1. Asphalt-Saturated Organic Felt: ASTM D226/D226M, Type I (No. 15 asphalt felt), nonperforated.
2. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch (3.2 mm) thick, in width to suit steel stud size.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.

1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.

B. Coordination with Sprayed Fire-Resistive Materials:

1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling tracks to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches (610 mm) o.c.
2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of non-load-bearing steel framing. Do not reduce thickness of fire-resistive materials below that are required for fire-resistance ratings indicated. Protect adjacent fire-resistive materials from damage.

3.3 INSTALLATION, GENERAL

A. Installation Standard: ASTM C754.

1. Gypsum Board Assemblies: Also comply with requirements in ASTM C840 that apply to framing installation.

B. Install framing and accessories plumb, square, and true to line, with connections securely fastened.

C. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.

D. Install bracing at terminations in assemblies.

E. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

3.4 INSTALLING FRAMED ASSEMBLIES

A. Install framing system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.

1. Single-Layer Application: 16 inches (406 mm) o.c. unless otherwise indicated.
2. Multilayer Application: 16 inches (406 mm) o.c. unless otherwise indicated.

B. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.

C. Install studs so flanges within framing system point in same direction.

D. Install tracks at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts that penetrate partitions above ceiling.

1. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
2. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install track section (for cripple studs) at head and secure to jamb studs.

    a. Install two studs at each jamb unless otherwise indicated.
    b. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch (13-mm) clearance from jamb stud to allow for installation of control joint in finished assembly.
    c. Extend jamb studs through suspended ceilings and attach to underside of overhead structure.

3. Other Framed Openings: Frame openings other than door openings the same as required for door openings unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
4. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.

    a. Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.

5. Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.
6. Curved Partitions:

    a. Bend track to uniform curve and locate straight lengths so they are tangent to arcs.

b. Begin and end each arc with a stud, and space intermediate studs equally along arcs. On straight lengths of no fewer than two studs at ends of arcs, place studs 6 inches (150 mm) o.c.

E. Z-Shaped Furring Members:

1. Erect insulation, specified in Section 072100 "Thermal Insulation," vertically and hold in place with Z-shaped furring members spaced 24 inches (610 mm) o.c.
2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches (610 mm) o.c.
3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 12 inches (305 mm) from corner and cut insulation to fit.

F. Installation Tolerance: Install each framing member so fastening surfaces vary not more than 1/8 inch (3 mm) from the plane formed by faces of adjacent framing.

3.5 INSTALLING CEILING SUSPENSION SYSTEMS

A. Install suspension system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.

1. Hangers: 48 inches (1219 mm) o.c.
2. Carrying Channels (Main Runners): 48 inches (1219 mm) o.c.
3. Furring Channels (Furring Members): 16 inches (406 mm) o.c.

B. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.

C. Suspend hangers from building structure as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.

a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.

a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards.

3. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
4. Do not attach hangers to steel roof deck.
5. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.

6. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
7. Do not connect or suspend steel framing from ducts, pipes, or conduit.
8. Locate hangers and supports where they will not interfere with access to mixing boxes, fire dampers, valves, and other appurtenances requiring service.

D. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.

E. Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

F. Installation Tolerances: Install suspension systems that are level to within 1/8 inch in 12 feet (3 mm in 3.6 m) measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

END OF SECTION 092216

SECTION 092900 - GYPSUM BOARD

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Interior gypsum board.

B. Related Requirements:

1. Section 061600 "Sheathing" for gypsum sheathing for exterior walls.
2. Section 092116.23 "Gypsum Board Shaft Wall Assemblies" for metal shaft-wall framing, gypsum shaft liners, and other components of shaft-wall assemblies.
3. Section 092216 "Non-Structural Metal Framing" for non-structural steel framing and suspension systems that support gypsum board panels.
4. Section 093013 "Ceramic Tiling" for cementitious backer units installed as substrates for ceramic tile.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Project specific. Show locations and installation of control and expansion joints, including plans, elevations, sections, details of components, and attachments to other work.

C. Samples: For the following products:

1. Trim Accessories: Full-size Sample in 12-inch- (300-mm-) long length for each trim accessory indicated.

D. Sustainable Design Submittals:

1. Recycled Content: Provide manufacturer documentation for recycled content, indicating postconsumer and preconsumer recycled content.
2. Health Product Declaration (HPD): Provide documentation indicating that manufacturer has screened and publicly provided ingredient disclosure to 1000 ppm, and has developed an action plan to mitigate known hazards.
3. Product Data: For adhesives and sealants, indicating VOC content.
4. Laboratory Test Reports: For adhesives and sealants, indicating compliance with requirements for low-emitting materials.
5. Laboratory Test Reports: For ceiling and wall materials, indicating compliance with requirements for low-emitting materials.

E. Manufacturer’s Certificates:

1. Certification from manufacturers that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

2. Provide certificates from manufacturer for each product required indicating that product complies with specified product requirements and is suitable for use indicated.

1.3 MOCKUPS

A. Build mockups of at least 100 sq. ft. (9 sq. m) in surface area to demonstrate aesthetic effects and to set quality standards for materials and execution.

1. Build mockups for the following:

a. Each level of gypsum board finish indicated for use in exposed locations, including Level 5 finish in areas of critical lighting.

2. Apply or install final decoration indicated, including painting and wallcoverings, on exposed surfaces for review of mockups.
3. Simulate finished lighting conditions for review of mockups.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 DELIVERY, STORAGE AND HANDLING

A. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and supported on risers on a flat platform to prevent sagging.

1.5 FIELD CONDITIONS

A. Environmental Limitations: Comply with ASTM C840 requirements or gypsum board manufacturer's written instructions, whichever are more stringent.

B. Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.

C. Do not install panels that are wet, moisture damaged, and mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.1 SOURCE LIMITATIONS

A. Obtain each type of gypsum panel and joint finishing material from single source with resources to provide products of consistent quality in appearance and physical properties.

2.2 PERFORMANCE REQUIREMENTS

A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E90 and classified according to ASTM E413 by an independent testing agency.

C. Verify ceiling and wall materials comply with the requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

2.3 GYPSUM BOARD, GENERAL

A. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Regional Materials: Manufacture products within 100 miles (160 km) of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 100 miles (160 km) of Project site.

C. Size: Provide maximum lengths and widths available that will minimize joints in each area and that correspond with support system indicated.

2.4 INTERIOR GYPSUM BOARD

1. Thickness: As indicated on Drawings.
2. Long Edges: Tapered.

B. Gypsum Board, Type X (GYP BD-1): ASTM C1396/C1396M.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. CertainTeed Corporation; Saint-Gobain North America.
    b. Georgia-Pacific Gypsum LLC.
    c. National Gypsum Company.
    d. USG Corporation.

2. Thickness: 5/8 inch (15.9 mm).
3. Long Edges: Tapered.

C. Impact-Resistant Gypsum Board (GYP BD-36): ASTM C1396/C1396M gypsum board, tested according to ASTM C1629/C1629M.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. CertainTeed Corporation; Saint-Gobain North America; CertainTeed Extreme Impact Resistant Type X Gypsum Board with M2Tech Mold and Moisture Technology.

b. Georgia-Pacific Gypsum LLC; DensArmorPlus Impact-Resistant Panels.
c. Gold Bond Building Products, LLC provide by National Gypsum Company; Gold Bond Brand XP Hi-Impact Gypsum Board.
d. USG Corporation; USG Sheetrock Brand Mold Tough VHI (Very High Impact) Firecode Core.

2. Core: 5/8 inch (15.9 mm), Type X.
3. Surface Abrasion: ASTM C1629/C1629M, meets or exceeds Level 3 requirements.
4. Indentation: ASTM C1629/C1629M, meets or exceeds Level 1 requirements.
5. Soft-Body Impact: ASTM C1629/C1629M, meets or exceeds Level 3 requirements.
6. Hard-Body Impact: ASTM C1629/C1629M, meets or exceeds Level 3 requirements according to test in Annex A1.
7. Long Edges: Tapered.
8. Mold Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.

D. Mold-Resistant Gypsum Board (GYP BD-2): ASTM C1396/C1396M. With moisture- and mold-resistant core and paper surfaces.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed Corporation; Saint-Gobain North America; M2Tech Drywall.
b. Georgia-Pacific Gypsum LLC; ToughRock Fireguard X Mold-Guard Gypsum Board.
c. Gold Bond Building Products, LLC provided by National Gypsum Company; Gold Bond XP Fire-Shield Gypsum Board.
d. USG Corporation; Sheetrock Brand Mold Tough Panels Firecode X.

2. Core: 5/8 inch (15.9 mm), Type X.
3. Long Edges: Tapered.
4. Mold Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.

2.5 TILE BACKING PANELS

A. Glass-Mat, Water-Resistant Backing Board (GYP BD-25): ASTM C1178/C1178M, with manufacturer's standard edges.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed; SAINT-GOBAIN; GlasRoc Tile Backer.
b. Georgia-Pacific Gypsum LLC; DensShield Fireguard Type X Tile Backer Board.
c. Gold Bond Building Products, LLC provided by National Gypsum Company; Gold Bond eXP Fire-Shield Tile Backer.
d. USG Corporation; USG Durock Glass-Mat Tile Backerboard.

2. Core: 5/8 inch (15.9 mm), Type X.
3. Mold Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.

2.6 TRIM ACCESSORIES

A. Interior Trim: ASTM C1047.

1. Material: Galvanized or aluminum-coated steel sheet, rolled zinc, plastic, or paper-faced galvanized-steel sheet.
2. Shapes:

    a. Cornerbead.
    b. L-Bead: L-shaped; exposed long flange receives joint compound.
    c. U-Bead: J-shaped; exposed short flange does not receive joint compound.
    d. Expansion (control) joint.
    e. Curved-Edge Cornerbead: With notched or flexible flanges.

B. Aluminum Trim: Extruded accessories of profiles and dimensions indicated.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Fry Reglet Corporation.
    b. Gordon, Inc.
    c. Pittcon Industries.

2. Aluminum: Alloy and temper with not less than the strength and durability properties of ASTM B221 (ASTM B221M), Alloy 6063-T5.

2.7 JOINT TREATMENT MATERIALS

A. General: Comply with ASTM C475/C475M.

B. Joint Tape:

1. Interior Gypsum Board: Paper.

C. Joint Compound for Interior Gypsum Board: For each coat, use formulation that is compatible with other compounds applied on previous or for successive coats.

1. Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use setting-type taping compound.
2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use drying-type, all-purpose compound.

    a. Use setting-type compound for installing paper-faced metal trim accessories.

3. Fill Coat: For second coat, use drying-type, all-purpose compound.
4. Finish Coat: For third coat, use drying-type, all-purpose compound.
5. Skim Coat: For final coat of Level 5 finish, use drying-type, all-purpose compound or high-build interior coating product designed for application by airless sprayer and to be used instead of skim coat to produce Level 5 finish.

D. Joint Compound for Tile Backing Panels:

1. Glass-Mat, Water-Resistant Backing Panel: As recommended by backing panel manufacturer.

2.8 AUXILIARY MATERIALS

A. Provide auxiliary materials that comply with referenced installation standards and manufacturer's written instructions.

B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.

1. Verify adhesives have a VOC content of 50 g/L or less.
2. Verify adhesive complies with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

C. Steel Drill Screws: ASTM C1002 unless otherwise indicated.

1. Use screws complying with ASTM C954 for fastening panels to steel members from 0.033 to 0.112 inch (0.84 to 2.84 mm) thick.

D. Sound-Attenuation Blankets: ASTM C665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.

1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
2. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 35 percent.

E. Acoustical Sealant: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Hilti, Inc.; CP 506 Smoke and Acoustical Sealant.
b. Pecora Corporation.
c. Specified Technologies, Inc.; Smoke N Sound Acoustical Sealant.
d. USG Corporation; SHEETROCK Acoustical Sealant.

2. Verify sealant has a VOC content of 250 g/L or less.
3. Verify sealant complies with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

F. Thermal Insulation: As specified in Section 072100 "Thermal Insulation."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and substrates including welded hollow-metal frames and support framing, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.

B. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION AND FINISHING OF PANELS, GENERAL

A. Comply with ASTM C840.

B. Install ceiling panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.

C. Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch (1.5 mm) of open space between panels. Do not force into place.

D. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.

E. Form control and expansion joints with space between edges of adjoining gypsum panels.

F. Cover both faces of support framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.

1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. (0.7 sq. m) in area.
2. Fit gypsum panels around ducts, pipes, and conduits.
3. Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow 1/4- to 3/8-inch- (6.4- to 9.5-mm-) wide joints to install sealant.

G. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments. Provide 1/4- to 1/2-inch- (6.4- to 12.7-mm-) wide spaces at these locations and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.

H. Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.

I. STC-Rated Assemblies: Seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both

faces of partitions at perimeters and through penetrations. Comply with ASTM C919 and with manufacturer's written instructions for locating edge trim and closing off sound-flanking paths around or through assemblies, including sealing partitions above acoustical ceilings.

J. Install sound attenuation blankets before installing gypsum panels unless blankets are readily installed after panels have been installed on one side.

3.3 INSTALLATION OF INTERIOR GYPSUM BOARD

A. Install interior gypsum board in the following locations:

1. Type X: Vertical surfaces unless otherwise indicated.
2. Impact-Resistant Type: As indicated on Drawings.
3. Mold-Resistant Type: As indicated on Drawings.

B. Single-Layer Application:

1. On ceilings, apply gypsum panels before wall/partition board application to greatest extent possible and at right angles to framing unless otherwise indicated.
2. On partitions/walls, apply gypsum panels vertically (parallel to framing) unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.

    a. Stagger abutting end joints not less than one framing member in alternate courses of panels.
    b. At stairwells and other high walls, install panels horizontally unless otherwise indicated or required by fire-resistance-rated assembly.

3. On Z-shaped furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
4. Fastening Methods: Apply gypsum panels to supports with steel drill screws.

C. Multilayer Application:

1. On ceilings, apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints one framing member, 16 inches (400 mm) minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.
2. On partitions/walls, apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
3. On Z-shaped furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
4. Fastening Methods: Fasten base layers and face layers separately to supports with screws.

D. Laminating to Substrate: Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum

board manufacturer's written instructions and temporarily brace or fasten gypsum panels until fastening adhesive has set.

E. Curved Surfaces:

1. Install panels horizontally (perpendicular to supports) and unbroken, to extent possible, across curved surface plus 12-inch- (300-mm-) long straight sections at ends of curves and tangent to them.
2. For double-layer construction, fasten base layer to studs with screws 16 inches (400 mm) o.c. Center gypsum board face layer over joints in base layer, and fasten to studs with screws spaced 12 inches (300 mm) o.c.

3.4 INSTALLATION OF TILE BACKING PANELS

A. Glass-Mat, Water-Resistant Backing Panels: Comply with manufacturer's written installation instructions and install where indicated on Drawings. Install with 1/4-inch (6.4-mm) gap where panels abut other construction or penetrations.

B. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.5 INSTALLATION OF TRIM ACCESSORIES

A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

B. Control Joints: Install control joints at locations indicated on Drawings and according to ASTM C840 and in specific locations approved by Architect for visual effect.

C. Interior Trim: Install in the following locations:

1. Cornerbead: Use at outside corners unless otherwise indicated.
2. L-Bead: Use where indicated on Drawings.
3. U-Bead: Use at exposed panel edges.
4. Curved-Edge Cornerbead: Use at curved openings.

D. Aluminum Trim: Install in locations indicated on Drawings.

3.6 FINISHING OF GYPSUM BOARD

A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.

B. Prefill open joints, rounded or beveled edges, and damaged surface areas.

C. Apply joint tape over gypsum board joints, except for trim products specifically indicated as not intended to receive tape.

D. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C840:

1. Level 1: Ceiling plenum areas, concealed areas, and where indicated.
2. Level 2: Panels that are substrate for tile.
3. Level 3: Where indicated on Drawings.
4. Level 4: At panel surfaces that will be exposed to view unless otherwise indicated.

    a. Primer and its application to surfaces are specified in Section 099123 "Interior Painting."

5. Level 5: Where recommended by latest publication of the Gypsum Association GA-214 “Recommended Levels of Finish for Gypsum Board, Glass Mat & Fiber-Reinforced Gypsum Panels” and/or where indicated on Drawings. Areas requiring high level of finish must have a pre-installation meeting to assure Contractor understands contract requirements/expectations.

    a. Primer and its application to surfaces are specified in Section 099123 "Interior Painting."

3.7 PROTECTION

A. Protect adjacent surfaces from drywall compound and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.

B. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

C. Remove and replace panels that are wet, moisture damaged, and mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION 092900

SECTION 101426 - POST AND PANEL SIGNAGE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Nonilluminated post and panel signs.

B. Related Sections include the following:
   1. Division 01 Section "Temporary Facilities and Controls" for temporary Project identification signs and for temporary informational and directional signs.
   2. Division 03 Section "Cast-in-Place Concrete" for concrete foundations and concrete fill.

1.3 DEFINITIONS

A. ADA-ABA Accessibility Guidelines: U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines."

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Show fabrication and installation details for post and panel signage.
   1. Include plans, elevations, sections, details, and attachments to other work.
   2. Provide message list, typestyles, graphic elements, and layout for each sign at least half size and full-size details of graphics.

C. Samples for Initial Selection: Manufacturer's color charts consisting of actual units or sections of units showing the full range of colors available for the following:
   1. Aluminum.

D. Sign Schedule: Use same designations indicated on Drawings.

E. Qualification Data: For fabricator.

F. Maintenance Data: For signs to include in maintenance manuals.

G. Warranty: Special warranty specified in this Section.

1.5 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate products similar to those required for this Project and whose products have a record of successful in-service performance.

B. Source Limitations for Signs: Obtain each sign type indicated from one source from a single manufacturer.

C. Regulatory Requirements: Comply with applicable provisions in ADA-ABA Accessibility Guidelines and ICC A117.1.

1.6 PROJECT CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit installation of signs to be performed according to manufacturers' written instructions and warranty requirements.

B. Field Measurements: Indicate measurements on Shop Drawings.

1.7 COORDINATION

A. Coordinate installation of anchorages for post and panel signage. Furnish setting drawings, templates, and directions for installing anchorages and other items that are to be embedded in concrete.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum Sheet and Plate: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 5005-H32.

2.2 POST AND PANEL SIGNS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Allen Industries Architectural Signage.
2. APCO Graphics, Inc.
3. ASI-Modulex, Inc.
4. Best Sign Systems Inc.
5. Bunting Graphics, Inc.
6. Charleston Industries, Inc.
7. Nelson-Harkins Industries.
8. Signature Signs, Incorporated.
9. Supersine Company (The).

10. Vomar Products, Inc.
11. Peachtree Business Products, Inc.

2.3 PANEL SIGNS

A. Sign Message Panels: Provide smooth sign panel surfaces constructed to remain flat under installed conditions within a tolerance of plus or minus 1/16 inch measured diagonally from corner to corner.
   1. Coordinate dimensions and attachment methods to produce message panels with closely fitting joints. Align edges and surfaces with one another in the relationship indicated.
   2. Increase metal thickness or reinforce with concealed stiffeners or backing materials as needed to produce surfaces without distortion, buckles, warp, or other surface deformations.
   3. Continuously weld joints and seams unless other methods are indicated; grind, fill, and dress welds to produce smooth, flush, exposed surfaces with welds invisible after final finishing.

B. Message Panel Materials:
   1. Aluminum Sheet: 0.080 inch thick.
      a. Panel Finish: Baked enamel.
      b. Color: As selected by Architect from manufacturer's full range.

2.4 POSTS

A. General: Fabricate posts to lengths required for mounting method indicated.
   1. Direct-Embed Method: Provide posts 36 inches longer than height of sign to permit direct embedment in concrete foundations.

B. Galvanized Steel Posts: Manufacturer's standard 0.125-inch- thick, galvanized steel tubing, with vertical slots to engage sign panels. Provide stop blocks in slots to hold panels in position. Include post caps, fillers, spacers, junction boxes, access panels, and related accessories required for complete installation.
   1. Square Posts: 2 inches.
   2. Post Finish: Baked enamel.
   3. Color: As selected by Architect from manufacturer's full range.

2.5 ACCESSORIES

A. Hardware, Anchors and Inserts: Provide type 316 stainless steel hardware, and galvanized steel anchors and inserts, for exterior installations and elsewhere as required for corrosion resistance. Furnish anchors and inserts, as required, to set posts into concrete footings.

2.6 FABRICATION

A. General: Provide manufacturer's standard post and panel signs of configurations indicated.
   1. Welded Connections: Comply with AWS standards for recommended practices in shop welding. Provide welds behind finished surfaces without distortion or discoloration of

exposed side. Clean exposed welded surfaces of welding flux and dress exposed and contact surfaces.

2. Mill joints to tight, hairline fit. Form joints exposed to weather to exclude water penetration.
3. Preassemble signs in the shop to greatest extent possible. Disassemble signs only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation, in location not exposed to view after final assembly.
4. Conceal fasteners if possible; otherwise, locate fasteners where they will be inconspicuous.

2.7 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.8 FINISHES

A. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's written instructions for cleaning, conversion coating, and painting.

1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 2603 except with a minimum dry film thickness of 1.5 mils, medium gloss.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Verify that items are sized and located to accommodate signs.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Excavation: Excavate for sign foundation to elevations and dimensions indicated. Reconstruct subgrade that is not firm, undisturbed, or compacted soil, or that is damaged by freezing temperatures, frost, rain, accumulated water, or construction activities by excavating a further 12 inches, backfilling with satisfactory soil, and compacting to original subgrade elevation.

B. Locate signs and accessories where indicated, using mounting methods of types described and complying with manufacturer's written instructions.
   1. Install signs level, plumb, and at heights indicated, with sign surfaces free of distortion and other defects in appearance.
   2. Mechanical Fasteners: Use nonremovable mechanical fasteners placed through predrilled holes. Attach signs with fasteners and anchors suitable for secure attachment to substrate as recommended in writing by sign manufacturer.

3.3 CLEANING AND PROTECTION

A. After installation, clean soiled sign surfaces according to manufacturer's written instructions. Protect signs from damage until acceptance by Owner.

END OF SECTION 101426

SECTION 107300 - CANOPIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Building supported, pre-engineered metal canopies including fascia channels, decking, and attachment hardware.

1.2 REFERENCES

A. American Society of Civil Engineers (ASCE) 7 - Minimum Design Loads for Buildings and Other Structures.

B. ASTM International (ASTM)

1. B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
2. B429 - Standard Specification for Aluminum-Alloy Extruded Pipe and Tube.
3. A36 Standard Mild Steel Specification
4. A50/A53 Standards for Structural steel

1.3 SYSTEM DESCRIPTION

A. Design Requirements: Design canopy system to withstand:

1. Standards for wind pressure, snow load, and drifting snow load in accordance with current adopted form of the Building Code or accepted requirements of local municipality.

1.4 SUBMITTALS

A. Submittals for Review:

1. Shop Drawings: Indicate system components, dimensions, attachments, and accessories.
2. Samples:

a. 3 x 3 inch coating samples in specified color.
b. 6 inch long fascia profile sample showing profile and standard finish.
c. 6 inch decking samples showing profile and standard finish.

B. LEED Project Submittals

1. Product Data for Credit MR 4: documentation indicating percentages by weight of post consumer and pre consumer recycled content. Include statement indicating cost for each product having recycled content.
2. Product Data for Credit MR 5: Indicate location of product manufacturer, distance from manufacturer to project site, and mill test report for origination of materials.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Minimum 5 years' experience in installation of MASA products.

PART 2 - PRODUCTS

2.1 CANOPY (CNPY-1)

A. Basis-of-Design Product: Subject to compliance with requirements, provide MASA Architectural Canopies; Extrudeck Extruded Aluminum Canopy System or comparable product by one of the following;

1. Architectural Shade Products.
2. Mapes Architectural Canopies.
3. Victory Awning, Inc.

2.2 MATERIALS

A. Aluminum Extrusions:

1. ASTM B221& ASTM B429 6063-T5 alloy and temper.

B. Hardware:

1. All fasteners shall be (stainless steel) or (zinc coated) for corrosion resistance.

2.3 COMPONENTS

A. Framing:

1. Type: (Extruded aluminum) (Mild/Structural steel A36 and A500)
2. Size: 8" x .125"

B. Cantilever mount. 6'-0" depth.

C. Decking: 3" x 6" x .090" Interlocking Extruded aluminum flat (flush) soffit decking with openings to accommodate light fixtures.

D. Attachment; As required to meet final conditions.

E. Fascia Profiles: 8" standard "J" fascia profile with integral gutters.

F. Other Components: other components as indicated or as required for system attachment and performance.

2.4 FABRICATION

A. Fabricate canopy system in accordance with approved Shop Drawings.

B. Canopies to be pre-assembled and welded by MASA approved personnel.
Where pre-assembled canopies are too large for transport mechanical field assembly will be accepted.

2.6 FINISHES

Aluminum:

1. AAMA 2605, Two-coat Fluoropolymer coating containing minimum 70% PVDF resins.
2. Source: Duranar by PPG Industries, Inc.
3. Color: Custom color to match Architect’s sample.

PART 3 - EXECUTION

3.1 FIELD DIMENSIONS

A. Field verify dimensions of supporting structure at site of installation prior to fabrication.

3.2 INSTALLATION

A. Install in accordance with manufacturer's instructions and approved Shop Drawings.

B. Install components plumb and level, in proper plane, free from warp and twist.

C. Anchor system to building components; provide adequate clearance for movement caused by thermal expansion and contraction and wind loads.

3.3 ADJUSTING

A. Touch up minor scratches and abrasions on finished surfaces to match original finish.

B. Clean with mild, non-abrasive solution and a cotton cloth under low pressure.

END OF SECTION 107300

SECTION 111300 - MISCELLANEOUS DOCK EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This section covers the following Dock Equipment:

1. Dock Lights
2. Dock Seals
3. Dock Bumper
4. Dock Truck Restraints
5. Bollard Mounted Loading Dock Safety Barrier

B. Related Documents:

1. The Conditions of the Tender Documents apply to this Section as fully as if repeated herein.

C. The Contractor is to provide all labor, services, material, and equipment, and the performance of all work as necessary to provide all equipment as indicated on the Drawings.

D. All equipment furnished under this tender shall meet all applicable local and national codes as well as all health and sanitary codes.

E. The tender drawings, equipment and system interfaces outline the general requirements for the equipment in this section. The Contractor is responsible for engineering the final equipment layout, equipment interfaces, and all other details specified herein. In addition, the Contractor shall be responsible for the complete coordination of their layout with all other building systems and system interfaces.

1.2 SUBMITTALS

A. Before executing any work under this section of specifications, furnish submittals in accordance with the Tender Documents, SUBMITTAL PROCEDURES, to show full compliance with the contract.

1. Product Data and Manufacturer’s Literature and Data:
    a. Brochures showing name and address of manufacturer, catalog or model number of each item incorporated into the work.
    b. Manufacturer’s illustration and detailed description.
    c. List of deviations from Specifications.
2. The manufacturer shall certify that the product offered meets the characteristics of the specified description and that the product conforms to the producer’s own drawings, specifications, standards, and quality assurance practices.
3. Provide certified equipment test reports on each type of equipment to be furnished. Reports shall include, but not be limited to, scale accuracy.
    a. Tests shall be conducted by the manufacturer in the manufacturer’s own facility and shall also be conducted on the same type of equipment to be furnished on thus Project.

b. Test records need not be re-certified providing no essential change in design has been made since tests were conducted.

4. Shop Drawings: Complete and detailed for each item specially fabricated. B.

Submittal procedures and quantities are specified in the Tender Documents.

C. Show dimensions method of assembly, installation, and conditions relating to adjoining work, which requires cutting or close fitting, reinforcement, anchorage, and other work required for complete installation for equipment detailed in this Section.

D. Submittals will be reviewed for general design only, and not for method of assembly, construction, or detailed compliance with Tender Documents.

E. No deviation from Tender Documents is permitted unless specifically so noted by the General Contractor and accepted by the General Contractor in writing.

F. General Contractor Responsibility:

1. Coordination with work of other trades.
2. Space coordination.
3. Assembly and installation techniques, including structural adequacy and suitable bracing.
4. Maintenance of installation safety.
5. Satisfactory performance of all work.

1.3 QUALITY ASSURANCE

A. Qualifications Manufacturer shall regularly and currently manufacture specified equipment as one of its principal products.

B. Manufacturer shall have technical qualifications, experience, trained personnel, and facilities to install specified items.

C. Manufacturer shall have equivalent product currently installed to installation and similar to this Project that has been in satisfactory and efficient operation.

D. There shall be a permanent service organization, maintained and trained by Equipment Manufacturer/Supplier, which will render emergency service

E. Unless specified, all materials and equipment to be permanently installed shall be new and of such quality to satisfy the standards of the Documents.

F. Workers skilled in their respective trades shall perform all labor; workmanship shall be of good quality so that first-class work is performed in accordance with the standards of construction.

G. The Contractor is solely responsible for the accurate installation of equipment / systems and shall correct any operational aspects and deficiencies.

H. If the Contractor performs any work which is contrary to any laws, ordinances, Codes, rules and regulations, the Contractor will make all necessary changes as required to comply therewith and bear all costs.

I. All parts of equipment shall be of design, size and material to satisfactorily function under all conditions within rated load and speed range.

J. All parts shall be built to definite standard dimensions and tolerances so that it will be possible to replace and/or adjust.

K. Mechanical fastenings used on parts subject to wear and replacement shall be key and seat, nut, screw, or other removable and replaceable types, which do not require physical deformation or field positioning.

1.4 MANUALS, DIAGRAMS, AND INSTRUCTIONS

A. Operating and maintenance manuals, including written instructions relative to the care, adjustment, and operation of the complete equipment together with photographs, equipment data and repair parts with numbers listed.

B. Legible schematic and field diagrams showing all electrical circuits shall be furnished. All symbols shall be listed, corresponding to the identification on the equipment furnished.

C. These items, except for final field diagrams shall be submitted with the shop drawings.

1.5 GUARANTEE

A. The warranties specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Tender Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under the requirements of the Tender Documents.

B. The equipment furnished is to be guaranteed from the date of acceptance and beneficial use or as detailed on the Documents.

C. All labor and materials furnished in connection with the installation of Equipment shall be subject to terms of “WARRANTY” articles of Section 01740, WARRANTIES AND GUARANTEES.

D. No device shall be acceptable that will not give satisfactory performance without excessive maintenance and attention. The period of guarantee shall start anew from the date of completion of each new installation performed in accordance with the preceding requirements.

1.6 EQUIPMENT MAINTENANCE

A. A Maintenance Training Program shall be provided to the Owner, at the Equipment Manufacturer's factory for training of additional Hospital technicians.

B. One month before the equipment guarantee is to expire; the Equipment Manufacturer/Supplier shall provide a review of the maintenance instruction program along with a review of the detailed parts list, individual replacement costs, descriptions and designations.

1.7 CONSTRUCTION CONDITIONS

C. Provide all necessary anchor bolts, shims, fastenings, recesses, cutouts, slots, holes, patching and the like to perform installation of equipment to code and regulations.

A. Coordinate installation with other trades.

1.8 ELECTRICAL EQUIPMENT

A. Electrical equipment shall be suitable for use with electrical system shown on the Drawings.

B. Provide all electrical wiring, conduit, and all electrical devices necessary for the installation and operation of systems and equipment furnished.

1.9 PROJECT CONDITIONS

A. Equipment Manufacturer/Supplier must review Tender Documents for compatibility with its product prior to bidding.

1. Review structural, architectural, electrical, mechanical, and plumbing drawings, and specifications.
2. Compliance with all provisions of the Tender Documents is assumed in the absence of written and approved exceptions.
3. The design of the structural, mechanical, and plumbing systems within the Project are fixed. The Equipment Manufacturer's equipment shall fit and operate within these fixed elements.

PART 2 - PRODUCTS

2.1 DOCK LIGHT

A. Products

1. Pentalift LED Dock Lights;
2. Or equivalent

B. Design Features

1. Dock light shall be mounted under the roof over-hang in the locations shown on the Project Drawings.
2. Dock light shall have a swivel-mounting bracket.
3. Light head shall fully support the enclosed lamp and be equipped with an integrated power switch.

C. Fabrication of Dock Light

1. Wiring: Three (3) -conductor cord.
2. Fixture: Shall be an incandescent / halogen PAR type.
    a. Be rated at 300 Watts, minimum.
3. Light Head: Housing shall be manufactured of steel.
    a. Shall have a safety yellow protective powder coating.
4. Wire lamp guard shall provide protection against lamp damage.
    a. Be hinged to facilitate ease of lamp replacement, using simple hand tools.

2.2 DOCK SEALS

A. Products

1. Rite-Hite FDS Series Foam Dock Seal
2. Or equivalent

B. Design Features

1. Dock Seal shall be sized by manufacturer to meet specific application requirements.
2. Beveled side pads shall provide a tight seal between the back of the trailer and the building wall.
3. Bottom of side pads shall have slit breathers.
4. Side pads shall be mounted on construction grade lumber.
5. Dock seal polyurethane foam shall be glued to wood backer.
6. Fabric shall be wrapped & attached to back of wood backer.
7. Dock seal shall have a stationary head pad.
8. Bottom of head pad shall have slit breathers.
9. Head pad shall be mounted on construction grade lumber.
10. Dock seal shall have overlapping wear pleats on ends of head pad face.

2.3 LOADING DOCK BUMPERS

A. Products

1. Durable Corp. Laminated Dock Bumper, Model # B4512-14;
2. Or equivalent

B. Design Features

1. Bumpers: Durable Laminated Rubber Dock Bumper; Fabric reinforced rubber pads laminated between structural steel angles and secured with 3/4 inch (19 mm) steel supporting rods.
    a. Projection from Wall: 114 mm
    b. Vertical Height: 305 mm; 102 mm bolt-hole centers
    c. Length: 356 mm

C. Installation

1. Install in accordance with manufacturer’s instructions.
2. Position bumpers spaced as indicated on drawings.
3. Secure angle end frames to dock face.

2.4 TRUCK RESTRAINT

A. Products

1. Provide one of the following acceptable products or approved equal product.

2. Design similar to:
    a. Rite Hite RHR-600 DOK-LOK
    b. Or equivalent

B. Design Features
1. Unit shall be designed to secure a semi-trailer to the Loading Dock by engaging the trailer ICC bumper with a large rotating hook.
2. A spring-loaded, structural steel housing shall automatically position the unit when contact is made by a backing truck.
3. The hook mechanism shall be controlled by an electric push-button station mounted onto the building.

C. Operation
1. As trailer backs into position, the ICC bumper shall contact the spring-loaded structural steel housing.
2. The housing shall ride down in its vertical channel, allowing the ICC bumper to move over the top of the housing.

D. Construction
1. Housing shall be fully enclosed, constructed of welded structural steel, designed to withstand impact from backing trailers.
2. Housing shall protect all components from damage by weather, dirt and debris. Mounting plate and rails shall be galvanized.

E. Installation
1. Truck Restraint shall be mounted above ground on a steel plate that is embedded in the dock face by anchor bolts plus welded to the dock curb angle.
2. Installation of Dock Restraint shall not require any modification to the Dock Leveler.

F. Electrical
1. All operator controls shall be mounted in a gasketed control panel.
2. The control panel shall be fully operational at all times, not requiring key turn-on, but contains solid state components.

2.5 BOLLARD MOUNTED LOADING DOCK SAFETY BARRIER

A. Design Description:
1. A bollard mounted loading dock safety net is a net that is mounted near the edge of a loading dock door to prevent materials and forklifts from falling off the edge. Bollards are often made of steel or cement and are used to protect dock door openings and other areas throughout a workplace. Bollard mounted loading dock safety nets can be wall mounted or bollard mounted and meet OSHA 1910.28 fall protection requirements.

B. Products
1. Provide one of the following acceptable products or approved equal product.

a. Rite-Hite Dok Guardian HD
b. Akon model SB-3000
c. Or equivalent

C. Design Features:
1. Curtain Height – 35.5” to 48”
2. Stopping Power – min. 13,500 lbs.
3. Deflection on Impact – 10” to 35”
4. All components must be designed/installed in accordance to the OSHA 1910.23 Protection requirement.

PART 3 - EXECUTION

3.1 MANUFACTURED PRODUCTS

A. Materials, fixtures, and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items.

B. Units shall be products of one manufacturer.

C. Manufacturer of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled units.

D. Components of an assembled unit need not be products of same manufacturer.

E. Constituent parts, which are alike, shall be the products of a single manufacturer.

F. Components shall be compatible with each other and with the total assembly for the intended service.

G. Nameplate:
1. Each piece of equipment shall bear a corrosion-resisting steel.
2. Nameplate shall be proportionate to size of equipment and bear the following:
a. Name of manufacturer.
b. Model number
c. Serial number
d. Electrical characteristics

H. Fasteners:
1. Rivets, bolts, nuts, studs, spacers, and metal used for welding shall be same kind of metal as materials joined.
2. Where corrosion-resisting metals are joined to each other, or to other metals, rivets, bolts, and materials used for welding shall be corrosion-resisting metal.

I. Welding:
1. Joints in fabricated equipment shall be welded by an accepted method.
2. Welds shall be strong and ductile, with exposed surfaces free of imperfections such as pits, runs, spatter, and cracks, and shall have same color as adjoining surfaces.

J. Steel Fabrication:

1. Steel shall be free from kinks and sharp bends.
2. All joints, openings, and doors shall be square and neat.
3. The surface of parts to be welded shall be free from rust, scale, paint, grease, or other foreign matter. Welds shall be continuous for all major joints and shall have the strength required to satisfy the design, use, and loading conditions. All outside corners of the containment body shall be of butt joint construction.
4. Castings shall be sound and free from patching, misplaced coring, warping, or other defects, which might render the casting unsound for use.

3.2 EXAMINATION

A. Examine surfaces to receive product before application to ensure that the following conditions are met:

1. Before shipment from manufacturer's plant and following installation at project site, finished articles stating equipment has been thoroughly inspected and tested.
2. Equipment Manufacturer/Supplier shall inspect the site and conditions for which the equipment is to be installed.
3. Do not start the work of this section until all deficiencies have been corrected.

3.3 PREPARATION

A. Protect equipment against dirt, water, and chemicals during installation.

3.4 INSTALLATION

A. The work under this Section of the Specification shall include all labor, services, materials and equipment and the performance of all work as necessary and required to furnish and install the equipment.

B. Delivery and installation of the equipment shall be so performed as to avoid delay on the work by other contractors. The Contractor shall be responsible for receiving, uncrating, setting in place all of the equipment, and providing all the proper utilities under the supervision of the Equipment Manufacturer/Supplier.

C. The Equipment Manufacturer/Supplier shall be responsible for all final connections of their equipment.

D. The equipment locations, as shown on the Drawings shall be checked by the Contractor and the Equipment Manufacturer/Supplier. The Contractor shall be solely responsible for the accurate installation and correct any operational aspects and deficiencies of his equipment.

E. The Contractor and the Equipment Manufacturer/Supplier shall consult the architectural and structural drawings for all dimensions, locations of partitions, locations of pipes and ductwork.

F. The Contractor and the Equipment Manufacturer/Supplier shall have a factory trained, field service technician on the premises to supervise the installation of all equipment.

3.5 WORK BY OTHER TRADES

A. The plumbing, heating, electrical and/or air handling contractors shall, within their specific areas of responsibilities, provide all labor, services, and materials required to complete the following work:

1. Electric power wiring services to motors and control panels, which will be provided by the Contractor, will be as shown on the electrical working drawings or approved equipment shop drawings. All other wiring not shown on these drawings shall be provided by the Equipment Manufacturer/Supplier.

2. Provide final mechanical and electrical connection to all equipment herein specified.

3.6 TESTS BY EQUIPMENT MANUFACTURER/SUPPLIER

A. Equipment Manufacturer/Supplier shall perform tests under operating conditions in the presence of the Owner.

B. Provide all equipment, instruments, and labor required for tests.

C. Evidence of malfunction in any tested system, piece of equipment, or component part thereof that occurs during, or as a result of tests, shall be corrected, repaired or replaced, and the test repeated.

3.7 OPERATING AND MAINTENANCE / REPAIR TRAINING BY EQUIPMENT MANUFACTURER/SUPPLIER

A. An orientation and continuing education program shall be presented to the Owner’s employees when the equipment is operational. The program is to be presented by a fulltime employee of the Equipment Manufacturer/Supplier, trained in the respective department functions.

B. A factory-trained representative shall provide equipment demonstrations to all of the appropriate employees, including proper daily and emergency equipment operational instructions with daily start-up and shutdown procedures.

1. To accommodate employees on all shifts, the Equipment Manufacturer/Supplier shall provide a minimum of two (2) days of education / orientation to all appropriate employees.

2. The Equipment Manufacturer/Supplier shall provide the Owner with an hourly rate for any educational programs beyond the specified time.

C. An instruction program shall be provided to the Owner's maintenance personnel, by fully trained and full-time instructors, on the maintenance, care, adjustment and operation of the Equipment as detailed above.

1. To accommodate employees on all shifts, the Equipment Manufacturer/Supplier shall provide a minimum of two (2) days of education / orientation for the Owner's maintenance personnel on all equipment specified in this Section.

2. The Equipment Manufacturer/Supplier shall provide the Owner with an hourly rate for any educational programs beyond the specified time.

D. All instruction shall include classroom hands-on training when the equipment is in operation, but before the Owner begins beneficial use. Training to consist of a minimum of 8-hours instruction and the Equipment Manufacturer/Supplier needs to provide the training schedule to the Owner.

3.8 EMERGENCY SERVICE

A. During the duration of the warranty, the Equipment Manufacturer/Supplier shall provide emergency service within four (4) hours of notification of trouble and return to operation any piece of equipment within twenty-four (24) hours of reported failure.

END OF SECTION 111300

SECTION 111310 - HYDRAULIC DOCK LEVELER

PART 1 – GENERAL

1.1 SUMMARY

A. This section covers the following Dock Equipment:
   1. Hydraulic Dock Leveler
   2. Dock Leveler Control

B. Related Documents:
   1. The Conditions of the Contract and DIVISION 1 apply to this Section as fully as if repeated herein.

C. The General Contractor is to provide all labor, services material, and equipment, and the performance of all work as necessary to provide all equipment as indicated on the Drawings, and as specified herein.

D. All equipment furnished under this contract shall meet all applicable local and national Codes, as well as all health and sanitary Codes.

E. The contract drawings, equipment and system interfaces outline the general requirements for the equipment specified in this section. The Equipment Manufacturer is responsible for engineering the final equipment layout, interfaces, and all other details specified herein. In addition, the Equipment Manufacturer shall be responsible for coordination of this layout with all other building systems and system interfaces.

1.2 REFERENCES

A. Electrical power, wiring and connections: DIVISION 16 – ELECTRICAL.

1.3 SUBMITTALS

A. Before executing any work under this section of specifications, furnish submittals in accordance with SUBMITTAL PROCEDURES, to show full compliance with contract requirements on items proposed to be furnished.
   1. Product Data and Manufacturer's Literature and Data:
      a. Brochures showing name and address of manufacturer, catalog or model number of each item incorporated into the work.
      b. Manufacturer's illustration and detailed description.
      c. List of deviations from Specifications.

   2. Certificates: The manufacturer shall certify that the product offered meets the characteristics of the specified description and that the product conforms to the producer's own drawings, specifications, standards, and quality assurance practices.
   3. Test Reports: Provide certified equipment test reports on each type of equipment to be furnished. Reports shall include, but not be limited to, scale accuracy.
      a. Tests shall be conducted by the manufacturer in the manufacturer's own facility and shall also be conducted on the same type of equipment to be furnished on this Project.

b. Test records need not be re-certified providing no essential change in design has been made since tests were conducted.

4. Shop Drawings: Complete and detailed for each item specially fabricated.

B. Closeout Submittals: Submittal procedures and quantities are specified in Section 01 77 00.

C. Installation Drawings: Show dimensions method of assembly, installation, and conditions relating to adjoining work which requires cutting or close fitting, reinforcement, anchorage, and other work required for complete installation for equipment detailed in this Section.

D. Review: Submittals will be reviewed for general design only, and not for method of assembly, construction, or detailed compliance with Contract Documents. One (1) major and one (1) minor review shall be performed. All additional submittal reviews shall be performed on an hourly basis (using reviewer's most current published rates) and billed to the Equipment Manufacturer.

E. No deviation from Contract Documents is permitted unless specifically so noted by the General Contractor and accepted by the General Contractor in writing.

F. General Contractor Responsibility:
1. Errors or omissions in submittals regardless of review status of submittals
2 Coordination with work of other trades.
3. Space coordination and code compliance.
4. Assembly and installation techniques, including structural adequacy and suitable bracing and / or anchoring for stability and seismic conditions.
5. Maintenance of installation safety.
6. Satisfactory performance of all work.

1.4 QUALITY ASSURANCE

A. Qualifications: Manufacturer shall regularly and currently manufacture specified equipment as one of its principal products.

B. Manufacturer shall have technical qualifications, experience, trained personnel, and facilities to install specified items.

C. Manufacturer shall have equivalent product currently installed at three (3) installations similar to this Project that has been in satisfactory and efficient operation for three (3) years.

D. There shall be a permanent service organization, maintained and trained by Equipment Manufacturer, which will render emergency service within four (4) hours of notification that service is needed.

E. All materials and equipment to be permanently installed shall be new and of such quality to satisfy the standards of the Documents. The Equipment Manufacturer, if required, shall furnish satisfactory evidence as to the kind and quality of all materials and equipment used.

F. Workers skilled in their respective trades shall perform all labor; workmanship shall be of good quality so that first-class work is performed in accordance with the standards of construction set for6th in the Documents.

G. The General Contractor and the Equipment Manufacturer are solely responsible for the accurate installation of equipment / systems and are to correct any operational aspects and deficiencies without recourse to the Owner.

H. If the Contactor performs any work which is contrary to any laws, ordinances, Codes, rules and regulations, the General Contractor will make all necessary changes as required to comply therewith and bear all costs arising there from without additional cost to the Owner.

I. All parts of equipment shall be of design, size and materials to satisfactorily function under all conditions within rated load and speed range; all with proper factors of safety, maximum and electrical efficiency and minimum wear on parts.

J. All parts shall be built to definite standard dimensions and tolerances so that it will be possible to replace and / or adjust any part without tooling or machining being required to install replacement parts.

K. Mechanical fastenings used on parts to wear and replacement shall be key and seat, nut screw, or other removable and replaceable types, which do not require physical deformation or field positioning. Rivets or similar devices are not permitted as mechanical fastenings for such parts.

1.5 MANUALS, DIAGRAMS AND INSTRUCTIONS

A. Three (3) copies of operating and maintenance manuals, including written instructions relative to the care, adjustment and operation of the complete equipment together with photographs, equipment data and repair parts with numbers listed. This shall be furnished and delivered to the Owner.

B. Three (3) sets of complete, legible schematic and field diagrams showing all electrical circuits shall be furnished. All symbols shall be listed, corresponding to the identification on the equipment furnished. Each set shall be neatly bound and delivered to the Owner.

C. These items, except for final field diagrams, shall be submitted with the shop drawings.

1.6 GUARANTEE

A. General Warranty: The warranties specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the General Contractor under the requirements of the Contract Documents.

B. Special Warranty: The equipment furnished is to be guaranteed for three (3) full years, from the date of acceptance and beneficial use or as detailed on the

Documents. This guarantee is to include all replacement parts, as necessary to keep the equipment operational in accordance with the performance specifications and to the Owner's satisfaction.

C. All labor and materials furnished in connection with the installation of equipment shall be subject to terms of “WARRANTY” articles of Section 00 70 00, GENERAL CONDITIONS. Upon receipt of notice from the Owner of failure of any portion of materials and workmanship furnished, the General Contractor shall promptly replace the affected part(s) with new part(s) at his own expense.

D. No device shall be acceptable that will not give satisfactory performance without excessive maintenance and attention. If it becomes evident during the guarantee period that the device is not functioning properly or in accordance with the Contract requirements, or if in the opinion of the Owner, excessive maintenance and attention must be employed to keep such device operating, the device must be removed. A new device meeting all requirements shall be installed as part of contractual work until satisfactory operation of installation is obtained. The period of guarantee shall start anew from the date of completion of each new installation performed in accordance with the preceding requirements.

1.7 EQUIPMENT MAINTENANCE

A. The Owner shall be provided with a formal Preventive Maintenance Contract with a detailed parts list, replacement costs, descriptions and designations. The Preventive Maintenance Contract, if accepted by the Owner, is not to go into effect until after the guarantee expires. The Owner has the option to accept or decline the Preventive Maintenance Contract.

B. A Maintenance Training Program shall be provided to the Owner, at the Equipment Manufacturer's factory, for training of additional Hospital technicians. Costs for this program shall be at the standard rate for this service.

C. One month before the equipment guarantee is to expire; the Equipment Manufacturer shall provide a review of the maintenance instruction program along with a review of the Preventive Maintenance Contract with its detailed parts list, individual replacement costs, descriptions and designations.

1.8 TOOLS

A. Provide one (1) complete set of special tools necessary to maintain and make adjustments on every part of the equipment, if such tools are required for the maintenance of the equipment.

1.9 CONSTRUCTION CONDITIONS

A. Provide all necessary anchor bolts, shims, fastenings, recesses, cutouts, slots, holes, patching and the like to perform installation of equipment to code and regulations.

B. Coordinate installation with other trades. Provide and obtain dimensions, clearances and similar data.

1.10 ELECTRICAL EQUIPMENT

A. Electrical equipment shall be suitable for use with electrical system shown on the Drawings.

B. Provide electrical components including motors, disconnect switches, motor controllers, motor control devices, and electrical circuits and connections which conform to requirements of NFPA 70 whether or not electrical components are furnished as part of equipment assemblies.

C. Provide all electrical wiring, conduit, and all electrical devices necessary for the installation and operation of systems and equipment furnished.

1.11 PROJECT CONDITIONS

A. In order to discover and resolve conflicts or lack of definition, which might create problems, the Equipment Manufacturer must review contract documents for compatibility with its product prior to bidding.
   1. Review structural, architectural, electrical, mechanical and plumbing drawings, and specifications.
   2. Compliance with all provisions of the contract documents is assumed in the absence of written and approved exceptions.
   3. The design of the structural, mechanical, and plumbing systems within the Project are fixed. The Equipment Manufacturer's equipment shall fit and operate within these fixed elements.

PART 2 – PRODUCTS

2.1 HYDRAULIC DOCK LEVELER

A. Manufacturers. Provide one of the following acceptable products or approved equal product.
   1. Design similar to:
      a. Manufactures: Kelly Atlantic HK Series;
      b. Blue Giant Hydraulic Dock Leveler; or equal.

B. Design Features:
   1. Hydraulic Dock Leveler shall be supplied assembled and ready for use. Unit shall be fully mechanical with no manual lifting required to operate.

   2. Platform Load Capacity:
      a. Moving or rollover load of 11,340 kg (25,000 lbs) when the front edge of the lip is resting on the floor or bed of a motor truck without permanent deflection or distortion.

      b. Gross load of 11,340 kg (25,000 lbs) when the platform is not engaging the floor bed of a motor truck.

   3. Platform Size:
      a. Approximately 1.83 m (6 feet) wide by 2.44 m (8 feet) long (nominal).

b. Include a minimum lip length of 406.4 mm (16 inches).

4. Flexible Leveler:
   a. Automatic compensation for an out-of-level vehicle condition of 101.6 mm (4 inches) maximum from side to side.

5. Vertical Adjustment:
   a. Minimum of 609.6 mm (24 inches).
   b. Travel of the front edge of the lip of the platform: 304.8 mm (12 inches) above or below the horizontal level of the stationary loading dock.

6. Fit into space and construction as shown.
   a. If deviations are required from space or pit construction shown, coordinate change showing changed conditions on submittal for dimensioned layout of leveler for installation.
   b. Obtain approval from Owner's Representative and Owner of proposed change.

7. Safety Device:
   a. In the event trailer or truck pulls away from the leveler platform, use a safety device to limit downward travel at the outer end of dock leveler.
   b. Safety device effective with a load on the platform up to 11,340 kg (25,000 lbs).

8. Dock Bumpers:
   a. Each Unit shall be supplied with one set of two (2) rubber dock bumpers.
   b. 224 mm (8.8 inches) high x 330.2 mm (13 inches) wide x 101.6 mm (4 inches) thick.
   c. Constructed of molded rubber (or similar) compressed between structural angle held in place by steel tie (or similar).
   d. Mounting: bumpers will be bolted or welded to face of dock.

C. Fabrication of Dock Leveler:
   1. Sub-frame Assembly:
      a. Fabricate frame assembly of structural steel shapes to receive operating components and platform assembly.
      b. Fabricate sub-frame to support not less than 1,814 kg (4,000 lbs.) on the hinge assembly.
      c. Weld assembly together except for mechanical components.
      d. Drill for bolted anchorage of mechanical components.

   2. Platform Assembly:
      a. Fabricate the platform section of not less than 6.1 mm (0.24 inches) thick non-skid steel floor plate.

   3. Hinges:
      a. Designed to safely withstand maximum moving or rollover load and impact load.

b. Use full length for lip plate to platform.
c. Use stainless steel hinge blots and hinge pin.

4. Remove burrs, sharp edges, or corners to prevent injury to personnel and tires.
5. Maintenance Safety Bar:
   a. Permanently mounted hinged steel strut capable of supporting platform in raised position including lip section.
   b. Provide retaining socket or device to prevent accidental release.

6. Welding shall be in accordance with AWS D1.1 and shall be continuous and ground smooth where exposed.

D. Hydraulic System
1. Consist of steel cylinder, steel plunger, oil connections, pressure relief value, fluid reservoirs, hydraulic valves, motor pump unit and accessories of size to assure against failure, provide maximum efficiency, and safety in operation.
2. Provide means to minimize leaking of any kind from the hydraulic system.
3. Cylinder and Plunger:
   a. Use seamless steel tubing.
   b. Turn and polish plunger and cylinder over contact surfaces.
   c. Provide positive stop ring to prevent from leaving cylinder.

4. Cylinder plunger mounting:
   a. Provide top and bottom mounting to unsure alignment and to eliminate any binding of the assembly, regardless of the position of the hydraulic cylinder, plunger, and leveler platform.
   b. Equip assembly with two bearings for vertical stability where bolted to platform or frame.

E. Power Unit
1. Power unit assembly; complete with electric motor operated pump, wiring, electric conduit, oil reservoir, and accessories.
2. Assemble on mounting bracket for bolting to sub-frame.
3. Direct-connect motor to hydraulic pump.

F. Hydraulic Flexible Hose:
1. Hydraulic hoses, connections, and piping capable of withstanding vibration and full motor pump pressure without leaking or failing.
2. Use fabric-reinforced chloroprene compound (neoprene) or other material unaffected by the hydraulic fluid.
3. Use copper alloy or cadmium plated steel hose connector.
4. Locate hose to prevent chafing or kinking and minimize bending and twisting during operation.

G. Hydraulic Fluid:
1. Hydraulic fluid shall not gum, clog, corrode the system, or injure the packing of seals.
2. Fill with sufficient fluid to operate the leveler.

H. Hydraulic System Fasteners:
1. Use key and seat, nut, screw, or other removable or replaceable types which do not require physical deformation or field positioning for mechanical fastenings used on parts subject to wear and replacement. Do not use rivets or similar devices as mechanical fastenings for such parts.
2. Bolts: fed spec. FF-B-588 or ASTM A307
3. Bolts, nuts, screws and washers coated with zinc or cadmium or made of corrosion resistant metal.

I. Electrical Requirements
1. In accordance with applicable portions of NEC (NEPA 70), NEMA ICS-1 and Electrical Section of Division 16.
2. Wire: Fed Spec. J-C-30 approved by Underwriter's Laboratories, Inc.
3. Motor and starter: 1 hp motor shall operate on 46~~8~~0 volts at the voltage supplied, wound for 3 phase, 60 cycle alternating current service. Use totally enclosed motor equipped with sealed or shielded, lubricated ball bearing.

J. Operating Station
1. Use wall mounted NEMA Type 4 enclosure for control station box.
2. Operating buttons: Provide "UP" and "Emergency Stop" buttons in a single box.
3. Recess buttons in control box or protect button by a projection peripheral collar.
4. Indelibly identify, push-button by means of cast or etched letters on the station.
5. Use constant pressure type buttons.

K. Install permanent tag or plate on each device to clearly indicate electrical characteristics and functions, as function, as necessary, to easily identify device from description of sequence of operation, and wiring diagrams required under "Shop Drawings and Manufacturer's Data".

L. Operation
1. Activation of the solenoids, motor and hydraulic pump through constant pressure on push button to raise of lower leveler platform.
2. Continuously operating pump while the platform is being positioned, except the down travel may be by gravity.

3. When "UP" push-button is depressed platform raised distance required to receive a vehicle, as soon as pressure is removed from the push-button, the lip extends, and platform lowers unless emergency stop button is depressed.
4. Emergency Stop Button: Motion of platform including lip to stop and remain in place without constant pressure. Release of emergency stop button allows leveler to operate.

M. Corrosion Protection and Painting
1. Ferrous metal surfaces including zinc coated ferrous and inaccessible ferrous surfaces (but not bearings, gear contact surfaces, part protected by lubrication, not usually painted or coated):
a. Clean, phosphate treat, and give two shop coats of rust inhibitive

paint.

b. Give two finished coats of manufacturer's standard coatings; allow coating to dry hard before shipment.

2. Separate by electrolytically inactive material dissimilar metals subject to electrolysis upon contact.

3. Protect nonferrous parts against corrosion.

2.2 HYDRAULIC DOCK LEVELER CONTROL

A. Manufacturers. Provide one of the following acceptable products or approved equal product.

1. Design similar to:

a. Kelly Atlantic HK Series;

b. Blue Giant Hydraulic Dock Leveler; or equal.

B. Design Features:

1. General: Provide Single panel to accommodate electronic function of all dock levelers. A dedicated button shall be provided for each of the Dock Leveler listed. Master control panel to be 100% UL and CSA approved (not just components).

2. Control panel to be NEMA 12, automatic motor starter, thermal overload, 2-amp control breaker with reset capability. All components to be individually circuit protected. S.A. and/or U.L. approved. The “Stop” button shall cease all dock devices when depressed and shall not require continuous pressure.

3. ~~208~~ 480-volt, 3 phase motor

PART 3 – EXECUTION

3.1 MANUFACTURED PRODUCTS

A. Materials, fixtures, and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items.

B. Units shall be products of one manufacturer.

C. Manufacturer of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled units.

D. Components of an assembled unit need not be products of same manufacturer.

E. Constituent parts, which are alike, shall be the products of a single manufacturer.

F. Components shall be compatible with each other and with the total assembly for the intended service.

G. Nameplate:

1. Each piece of equipment shall bear a corrosion-resisting steel, or deep-etched anodized aluminum nameplate located in a reasonably accessible position, permanently secured.
2. Nameplate shall be proportionate to size of equipment and bear the following:
   a. Name of manufacturer.
   b. Model number.
   c. Serial number.
   d. Electrical characteristics.

H. Fasteners:

1. Rivets, bolts, nuts, studs, spacers, and metal used for welding shall be same kind of metal as materials joined.
2. Where corrosion-resisting metals are joined to each other, or to other metals, rivets, bolts, and materials used for welding shall be corrosion-resisting metal.

I. Welding:

1. Joints in fabricated equipment shall be welded by an accepted method. Carbon arc welding is not acceptable, nor is any process permitting the pick-up of carbon acceptable.
2. Welds shall be strong and ductile, with exposed surfaces free of imperfections such as pits, runs, spatter, and cracks, and shall have same color as adjoining surfaces.

J. Steel Fabrication:

1. Steel shall be free from kinks and sharp bends. Shearing and shipping shall be done neatly and accurately. Flame cutting may be employed instead of shearing or sawing. Re-entrant cuts shall be made in the best possible manner. Burned surfaces or flame cut materials shall be ground or machined to remove ash and checks.
2. All joints, openings, and doors shall be square and neat. The finished equipment shall be free from sharp edges, fins, burrs, and sharp projections.
3. The surface of parts to be welded shall be free from rust, scale, paint, grease, or other foreign matter. Welds shall be continuous for all major joints, and shall have the strength required to satisfy the design, use, and loading conditions. Intermittent welds may be used for attaching reinforcement members provided such welds will satisfy the design. Members to be welded shall be positioned and held by jigs or fixtures when necessary to insure accurate alignment. All outside corners of the containment body shall be of butt joint construction.
4. Castings shall be sound and free from patching, misplaced coring, warping, or other defects, which might render the casting unsound for use. Forging shall be uniform in quality and condition, and shall be free from tears, cracks, seams, laps, internal ruptures, imbedded scale, segregation or other defects, which may detrimentally affect the suitability for the purpose intended.

3.2 EXAMINATION

A. Examine surfaces to receive product before application to ensure that the following conditions are met:
   1. Before shipment from manufacturer's plant and following installation at project site, finished articles shall be thoroughly inspected and tested for compliance with specifications.
   2. Equipment Manufacturer shall inspect the site and conditions for which the equipment is to be installed and advise the General Contractor and General Contractor, in writing, of any conditions detrimental to the proper installation and operation of the equipment.

B. Do not start the work of this section until all deficiencies have been corrected. Commencement of work constitutes acceptance of the surfaces.

3.3 PREPARATION

A. Protect equipment against dirt, water, and chemicals during installation. Thoroughly clean equipment at the completion of work.

3.4 INSTALLATION

A. The work under this Section of the Specification shall include all labor, services, materials and equipment and the performance of all work as necessary and required to furnish and install the equipment as indicated on the Drawings and as specified above.

B. Delivery and installation of the equipment shall be so performed as to avoid delay on the work by other contractors. The General Contractor shall be responsible for receiving, uncrating, setting in place all of the equipment, and providing all the proper utilities, under the supervision of the Equipment Manufacturers.

C. The Equipment Manufacturer shall be responsible for all final connections of their equipment.

D. The equipment locations, as shown on the Drawings shall be checked by the General Contractor and the Equipment Manufacturers. All exact locations shall be determined by the dimensions of the equipment approved, and the layout drawing before an apparatus is installed. The General Contractor shall be solely responsible for the accurate installation and correct any operational aspects and deficiencies of his equipment without any recourse to the Owner.

E. The General Contractor and the Equipment Manufacturer shall consult the architectural and structural drawings for all dimensions, locations of partitions, locations of pipes and ductwork.

F. The General Contractor and the Equipment Manufacturer shall have a factory trained, field service technician on the premises to supervise the installation of all equipment. This service shall be at no additional cost to the Owner.

3.5 WORK BY OTHER TRADES

A. The electrical contractors shall, within their specific areas of responsibilities, provide all labor, services, and materials required to complete the following work:
   1. Electric power wiring services to motors and control panels, which will be provided by the General Contractor, will be as shown on the electrical working drawings or approved equipment shop drawings. All other wiring not shown on these drawings shall be provided by the Equipment Manufacturer.
   2. Provide final mechanical and electrical connection to all equipment herein specified.

B All labor and materials furnished in connection with the installation shall meet all applicable local, state and Federal Codes, including OSHA, and shall be subject to terms of "General Conditions".

3.6 TESTS BY EQUIPMENT MANUFACTURER

A. Equipment Manufacturer shall perform tests under operating conditions in presence of the Owner.

B. Provide all equipment, instruments, and labor required for tests.

C. Evidence of malfunction in any tested system, piece of equipment, or component part thereof that occurs during, or as a result of tests, shall be corrected, repaired or replaced, and the test repeated.

3.7 OPERATING AND MAINTENANCE / REPAIR TRAINING BY EQUIPMENT MANUFACTURER

A. An orientation and continuing education program shall be presented to the Country employees when the equipment is operational. The program is to be presented by a full-time employee of the Equipment Manufacturer, trained in the respective department functions. The program is to be based on the department operations and employee responsibilities with audio-visual aid equipment and tape programs including operating manuals. The audio-visual programs shall be provided to the Owner at no cost for future use.

B. A factory trained representative shall provide equipment demonstration to all of the appropriate employees, including proper daily and emergency equipment operational instructions with daily start-up and shutdown procedures. Owner shall determine schedule and number of meetings to provide to all staff.

C. An instruction program shall be provided to the Owner's maintenance personnel, by fully trained and full-time instructors, on the maintenance, care, adjustment and operation of the Equipment as detailed above.

D. All instruction shall include classroom and "hands on" training when the equipment is in operation, but before the Owner begins beneficial use. The program is to include a review of equipment operation and characteristics, maintenance manuals, schematics and spare part recommendations.

3.8 EMERGENCY SERVICE

A. During the duration of the warranty, the Equipment Manufacturer must provide emergency service within four (4) hours of notification of trouble and return to operation any piece of equipment within twenty-four (24) hours of reported failure. This service is to be performed by the Equipment Manufacturer at no additional cost to the Owner.

END OF SECTION 111310

SECTION 112424 – FALL PROTECTION SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: This Section specifies design, supply and installation of Fall Protection systems.

4. OSHA 1910.66 Subpart F, Powered Platforms.

1.03 ACTION SUBMITTALS

A. Shop Drawings: Project specific. Indicate information on shop drawings as follows:

1. Submit shop drawings showing complete layout and configuration of fall protection equipment including components and accessories.
2. Indicate design and fabrication details, hardware, and installation details.
3. Include installation and rigging instructions and:

    a. Required restrictive working usage and general safety notes.
    b. Non-restrictive working usage and general safety notes.

4. Ensure Shop Drawings are reviewed by Engineer licensed in State of Kentucky and submit calculations and test reports to Architect.

B. Submit product data, including manufacturer’s technical data sheet, for specified products.

1.04 INFORMATION SUBMITTALS

A. Quality Assurance:

1. Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
2. Certificates: Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
3. Manufacturer’s installation instructions.

B. Manufacturer’s field reports specified.

1.05 CLOSEOUT SUBMITTALS

A. Submit 1-year standard manufacturer warranty documents specified.

B. Operation and Maintenance Data: Submit Operation and Maintenance data for installed products.
1. Include:

    a. Manufacturer’s instructions covering maintenance requirements and parts catalog giving complete list of repair and replacement parts with cuts and identifying numbers.
    b. 1 copy of system Equipment Manual & Inspection Log Book, with "Initial Inspection - Certification for Use" and "Inspection Sign-Off" forms completed.
    c. 2 copies of reduced, “as-built shop drawing” showing equipment locations and details. Ensure drawing is posted adjacent exits to roof.

1.06 QUALITY ASSURANCE

A. Qualifications:

1. Installer experienced in performing work of this section who has specialized in installation of work similar to that required for this project.
2. Manufacturer Qualifications: Manufacturer capable of providing field service representation during construction and approving application method.

B. Regulatory Requirements.

1. Comply with International Building Code (IBC) and Building Code for State of Kentucky.
2. Comply with OSHA regulations as follows:

a. 1910, Subpart D, Walking and Working Surfaces.
b. Appendix C to 1910 Subpart F, Personal Fall Arrest Systems.
c. OSHA Ruling on Window Cleaning by Bosun's Chair.
d. 1910.66, Subpart F, Powered Platforms.

C. Pre-installation Meetings: Conduct pre-installation meeting to verify project requirements, manufacturer’s installation instructions and manufacturer’s warranty requirements.

1.07 DELIVERY, STORAGE AND HANDLING

A. Ordering: Comply with manufacturer’s ordering instructions and lead time requirements to avoid construction delays.

B. Delivery:

1. Deliver materials in manufacturer’s original packaging with identification labels intact and in sizes to suit project.

C. Storage and Protection:

1. Store materials protected from exposure to harmful weather conditions and at temperature conditions recommended by manufacturer.

1.08 PROJECT AMBIENT CONDITIONS

A. Installation Location: Assemble and erect components only when temperatures are above 40 degrees F (4 degrees C).

1.09 SEQUENCING

A. Sequence with other Work and comply with equipment manufacturer’s written recommendations for sequencing construction operations.

1.10 WARRANTY

A. Project Warranty: Refer to Contract Conditions for additional project warranty provisions.

B. Manufacturer’s Warranty: Submit, for Owner’s acceptance, manufacturer’s standard warranty document executed by authorized company official. Manufacturer’s warranty is in addition to, and does not limit, other rights Owner may have under Contract Documents.

C. Warranty: Commencing on date of substantial completion set by Owner.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Ensure manufacturer has minimum 10 years experience in manufacturing fall protection and suspended maintenance system components similar to or exceeding requirements of project.

2.02 PRODUCTS AND SYSTEMS

A. Basis-of-Design Manufacturer: Pro-Bel Group of Companies or approved equal.

2.03 DESIGN PERFORMANCE REQUIREMENTS

A. Design fall protection system to suit project requirements to AISC S342L and as indicated.

B. Locate anchorages to suit suspension equipment specified.

C. Design anchor components for cleaning and suspended maintenance equipment to ASME A120.1.

1. Ensure compatibility with industry standard equipment.
2. Anchorage and anchor components: Designed by Engineer qualified in design of window cleaning and suspended maintenance equipment and licensed in State of Kentucky.

D. Design system fall arrest safety anchors and equipment supports to AISC S342L (including supplement No.1) and ANSI/IWCA I-14.1, and as follows:

1. Comply with OSHA 1910, Subpart F, Appendix C.
2. Fall Arrest Safety Anchors:

a. Fall arresting force safety factor of 2 to 1 without permanent deformation: 1800 lbs (8.0 kN) minimum.
b. Fall arrest force against fracture or detachment: 5,400 lbs minimum.

2.04 EQUIPMENT

A. Anchors.

B. Double Lanyard Horizontal Lifeline Systems.

2.05 ANCHORS

A. Safety U-bars: Stainless steel to ASTM A276,Type 304 with 35 Ksi (240 MPa) minimum yield strength.

1. U-bar: 0.75 inches (19 mm) minimum diameter material with 1.5 inches (38 mm) eye opening.

B. Hollow Steel Section (HSS) Piers: Mild steel, Type 300W with 50 Ksi (350 MPa) minimum yield strength, hot dipped galvanized to ASTM A123/A123M

1. Wall thickness to suit application.

C. Plate and other sections: Mild steel, Type 300W with 44 Ksi (300 MPa) minimum yield strength, hot dipped galvanized to ASTM A123/A123M

1. Wall thickness to suit application

D. Seamless Spun Aluminum Flashing (for Roof Anchors): To AA ADM-1 Type 6061-T6 alloy and to ASTM B221.

1. Deck flange flashing: conformable mastic tape and torch applied heat-shrink rubber collar flashing or detachable watertight stainless steel cap.
2. Acceptable material: Pro-Bel Group, Aluminum Deck Flange Flashing.

E. Miscellaneous Bolts, Nuts and Washers: Stainless steel to ASTM A276, Type 304 with 5 Ksi (240 MPa) minimum yield strength.

2.06 DOUBLE LANYARD HORIZONTAL LIFELINE SYSTEM

A. Stainless steel to ASTM A492, Type 316, 0.3125 inches (8 mm) minimum diameter cable, 9127 lbs (40 kN) minimum breaking strength with permanently swedged cable ends.

B. Data plate: Ensure non-corrosive data plate stating Maximum Service Capacity of cable, Manufacturer's Name, Serial No., Manufacturing Date, rated load and other pertinent information is prominently displayed at cable system entry points.

C. Tensioner: Stainless steel turnbuckle to ASTM A167, Type 316.

D. Harness: Manufacturer's standard full body harness with double shock absorber lanyard.

E. Acceptable Material: Pro-Bel Group, Double Lanyard Horizontal Lifeline System.

2.07 SOURCE QUALITY CONTROL

A. Ensure Fall Protection equipment components and materials are from single manufacturer.

PART 3 - EXECUTION

3.01 INSTALLERS

A. Provide experienced and qualified technicians to carry out erection, assembly and installation of fall protection and suspended maintenance equipment system.

B. Do steel welding to AWS D1.2/D1.2M.

C. Do aluminum welding to AWS D1.1/D1.1M.

3.02 MANUFACTURERS INSTRUCTIONS

A. Compliance: Comply with manufacturer’s written data, including product technical bulletins, product catalog installation instructions and Pro-Bel Group technical data sheets.

3.03 EXAMINATION

A. Site Verification of Conditions:

1. Verify that substrate conditions which have been previously installed under other sections or contracts, are acceptable for product installation in accordance with manufacturer’s instructions prior to installation of window washing equipment.
2. Inform Architect of unacceptable conditions immediately upon discovery.
3. Proceed with installation only after unacceptable conditions have been remedied.

3.04 PREPARATION

A. Ensure structure or substrate is adequate to support complete window washing equipment system.

B. Ensure structural steel to receive safety anchors has adequate bearing surface as indicated on shop drawings and has 100% welds between anchors and structural steel.

3.05 INSTALLATION

A. Coordinate fall protection work with work of other trades, for proper time and sequence to avoid construction delays.

B. Install fall protection equipment plumb and level in accordance with manufacturer’s written instructions.

C. Mechanically fasten anchors in accordance with manufacturer’s recommendations

D. Accurately fit and align, securely fasten and install free from distortion or defects.

E. Deform threads of tail end of anchor studs after nuts have been tightened to prevent accidental removal and vandalism.

F. Mark anchorage points with bright/fluorescent paint and identify them with weatherproof tags/labels.

3.06 FIELD QUALITY CONTROL

A. When necessary have the manufacture assist in installation.

B. Manufacturer’s Field Services: Have manufacturer’s technical representative schedule site visits to review work as follows:

1. After delivery and storage of products.
2. When preparatory work for which work of this Section depends is complete, but before installation begins.
3. 2 times during progress of work at 25% and 60% of completion.
4. Upon completion of work, after cleaning is carried out.

C. Testing: Test on site 100% of anchors relying upon chemical adhesive fasteners using load cell test apparatus in accordance with manufacturer's written recommendations.

3.07 ADJUSTMENT

A. Lubricate moving parts to operate smoothly and fit accurately.

B. Complete "Initial Inspection - Certification for Use" form included in Equipment Manual and Inspection Log Book provided by manufacturer.

3.08 FINAL CLEANING

A. Upon completion, remove surplus and excess materials, rubbish, tools and equipment.

3.09 PROTECTION

A. Make good damage to adjacent materials caused by fall protection equipment installation.

3.10 MAINTENANCE

A. Regularly and systematically examine, clean, adjust and lubricate moving parts.

B. Repair or replace parts of fall protection equipment whenever required due to defect and normal wear and tear.

C. Use only standard parts of product line of manufacturer of window washing equipment.

D. Maintain locally adequate stock of parts for replacement or emergency purposes.

E. Provide personnel to perform work under supervision and in direct employ of window washing equipment system manufacturer or manufacturer's licensed agent.

F. Perform work during regular trade working hours satisfactory to Owner.

G. Provide emergency call-back at no extra cost and ensure fulfillment of maintenance and emergency service without undue loss of time to Owner.

H. Ensure that maintenance personnel register with designated building personnel at time of inspections and maintenance.

END OF SECTION 112424

SECTION 118226 - WASTE COMPACTORS AND DESTRUCTORS

PART 1 - GENERAL

1.1 SUMMARY

A. This section covers Self-Contained Waste Compactor / Containers.

B. The Owner is to provide all labor, services material, and equipment, and the performance of all work as necessary to provide all equipment as indicated on the Drawings, and as specified herein.

C. All equipment furnished under this contract shall meet all applicable local and national Codes, as well as all health and sanitary Codes.

D. The contract drawings, equipment and system interfaces outline the general requirements for the equipment specified in this section. The Equipment Manufacturer is responsible for engineering the final equipment layout, interfaces, and all other details specified herein. In addition, the Equipment Manufacturer shall be responsible for coordination of this layout with all other building systems and system interfaces.

1.2 REFERENCES

A. Electrical power, wiring and connections: DIVISION 16 – ELECTRICAL.

1.3 SUBMITTALS

A. Before executing any work under this section of specifications, furnish submittals to show full compliance with contract requirements on items proposed to be furnished.

1. Product Data and Manufacturer’s Literature and Data:

a. Brochures showing name and address of manufacturer, catalog or model number of each item incorporated into the work.

b. Manufacturer’s illustration and detailed description.

c. List of deviations from Specifications.

2. Certificates: The manufacturer shall certify that the product offered meets the characteristics of the specified description and that the product conforms to the producer’s own drawings, specifications, standards, and quality assurance practices.

3. Test Reports:

a. Provide certified equipment test reports on each type of equipment to be furnished. Reports shall include, but not be limited to, scale accuracy.

b. Tests shall be conducted by the manufacturer in the manufacturer’s own facility and shall also be conducted on the same type of equipment to be furnished on thus Project.

c. Test records need not be re-certified providing no essential change in design has been made since tests were conducted.

4. Shop Drawings: Complete and detailed for each item specially fabricated.

B. Installation Drawings: Show dimensions method of assembly, installation, and conditions relating to adjoining work which requires cutting or close fitting, reinforcement, anchorage, and other work required for complete installation for equipment detailed in this Section.

C. Review: Submittals will be reviewed for general design only, and not for method of assembly, construction, or detailed compliance with Contract Documents. One (1) major and one (1) minor review shall be performed. All additional submittal reviews shall be performed on an hourly basis (using reviewer's most current published rates) and billed to the Equipment Manufacturer.

D. No deviation from Contract Documents is permitted unless specifically so noted by the Owner and accepted by the Owner in writing.

E. Owner Responsibility:

1. Errors or omissions in submittals regardless of review status of submittals
2. Coordination with work of other trades.
3. Space coordination and code compliance.
4. Assembly and installation techniques, including structural adequacy and suitable bracing and / or anchoring for stability and seismic conditions.
5. Maintenance of installation safety.
6. Satisfactory performance of all work.

1.4 QUALITY ASSURANCE

A. Qualifications: Manufacturer shall regularly and currently manufacture specified equipment as one of its principal products.

B. Manufacturer shall have technical qualifications, experience, trained personnel, and facilities to install specified items.

C. Manufacturer shall have equivalent product currently installed at three (3) installations similar to this Project that has been in satisfactory and efficient operation for three (3) years.

D. There shall be a permanent service organization, maintained and trained by Equipment Manufacturer, which will render emergency service within four (4) hours of notification that service is needed.

E. All materials and equipment to be permanently installed shall be new and of such quality to satisfy the standards of the Documents. The Equipment Manufacturer, if required, shall furnish satisfactory evidence as to the kind and quality of all materials and equipment used.

F. Workers skilled in their respective trades shall perform all labor; workmanship shall be of good quality so that first-class work is performed in accordance with the standards of construction set for6th in the Documents.

G. The Owner and the Equipment Manufacturer are solely responsible for the accurate installation of equipment / systems and are to correct any operational aspects and deficiencies without recourse to the Owner.

H. If the Contactor performs any work which is contrary to any laws, ordinances, Codes, rules and regulations, the Owner will make all necessary changes as required to comply therewith and bear all costs arising there from without additional cost to the Owner.

I. All parts of equipment shall be of design, size and materials to satisfactorily function under all conditions within rated load and speed range; all with proper factors of safety, maximum and electrical efficiency and minimum wear on parts.

J. All parts shall be built to definite standard dimensions and tolerances so that it will be possible to replace and / or adjust any part without tooling or machining being required to install replacement parts.

K. Mechanical fastenings used on parts to wear and replacement shall be key and seat, nut screw, or other removable and replaceable types, which do not require physical deformation or field positioning. Rivets or similar devices are not permitted as mechanical fastenings for such parts.

1.5 MANUALS, DIAGRAMS, AND INSTRUCTIONS

A. Three (3) copies of operating and maintenance manuals, including written instructions relative to the care, adjustment, and operation of the complete equipment together with photographs, equipment data and repair parts with numbers listed. This shall be furnished and delivered to the Owner.

B. Three (3) sets of complete, legible schematic and field diagrams showing all electrical circuits shall be furnished. All symbols shall be listed, corresponding to the identification on the equipment furnished. Each set shall be neatly bound and delivered to the Owner.

C. These items, except for final field diagrams, shall be submitted with the shop drawings.

1.6 GUARANTEE

A. General Warranty: The warranties specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Owner under the requirements of the Contract Documents.

B. Special Warranty: The equipment furnished is to be guaranteed for three (3) full years, from the date of acceptance and beneficial use or as detailed on the Documents. This guarantee is to include all replacement parts, as necessary to keep the equipment operational in accordance with the performance specifications and to the Owner's satisfaction.

C. All labor and materials furnished in connection with the installation of equipment shall be subject to terms of “WARRANTY” articles of Section 00 70 00, GENERAL CONDITIONS. Upon receipt of notice from the Owner of failure of any portion of materials and workmanship furnished, the Owner shall promptly replace the affected part(s) with new part(s) at his own expense.

D. No device shall be acceptable that will not give satisfactory performance without excessive maintenance and attention. If it becomes evident during the guarantee period that the device is not functioning properly or in accordance with the Contract requirements, or if in the opinion of the Owner, excessive maintenance and attention must be employed to keep such device operating, the device must be removed. A new device meeting all requirements shall be installed as part of contractual work until satisfactory operation of installation is obtained. The period of guarantee shall start anew from the date of completion of each new installation performed in accordance with the preceding requirements.

1.7 EQUIPMENT MAINTENANCE

A. The Owner shall be provided with a formal Preventive Maintenance Contract with a detailed parts list, replacement costs, descriptions and designations. The Preventive Maintenance Contract, if accepted by the Owner, is not to go into effect until after the guarantee expires. The Owner has the option to accept or decline the Preventive Maintenance Contract.

B. A Maintenance Training Program shall be provided to the Owner on-site, or at the Equipment Manufacturer's factory if required, for training of additional Hospital technicians. Costs for this program shall be at the standard rate for this service.

C. One month before the equipment guarantee is to expire; the Equipment Manufacturer shall provide a review of the maintenance instruction program along with a review of the Preventive Maintenance Contract with its detailed parts list, individual replacement costs, descriptions, and designations.

1.8 TOOLS

A. Provide one (1) complete set of special tools necessary to maintain and make adjustments on every part of the equipment, if such tools are required for the maintenance of the equipment.

1.9 CONSTRUCTION CONDITIONS

A. Provide all necessary anchor bolts, shims, fastenings, recesses, cutouts, slots, holes, patching and the like to perform installation of equipment to code and regulations.

B. Coordinate installation with other trades. Provide and obtain dimensions, clearances, and similar data.

1.10 ELECTRICAL EQUIPMENT

A. Electrical equipment shall be suitable for use with electrical system shown on the Drawings.

B. Provide electrical components including motors, disconnect switches, motor controllers, motor control devices, and electrical circuits and connections which conform to requirements of NFPA 70 whether or not electrical components are furnished as part of equipment assemblies.

C. Provide all electrical wiring, conduit, and all electrical devices necessary for the installation and operation of systems and equipment furnished.

1.11 PROJECT CONDITIONS

A. In order to discover and resolve conflicts or lack of definition, which might create problems, the Equipment Manufacturer must review contract documents for compatibility with its product prior to bidding.

i. Review structural, architectural, electrical, mechanical, and plumbing drawings, and specifications.

ii. Compliance with all provisions of the contract documents is assumed in the absence of written and approved exceptions.

iii. The design of the structural, mechanical, and plumbing systems within the Project are fixed. The Equipment Manufacturer’s equipment shall fit and operate within these fixed elements.

PART 2 - PRODUCTS

2.1 SELF-CONTAINED WASTE COMPACTOR / CONTAINER

A. Manufacturers. Provide the following acceptable products or approved equal product.

a. Design similar to:

1. Marathon Equipment Company (#RJ-250-SC)
2. Wastequip Corporation (#265X)
3. PTR Baler & Compactor, INC. (#PT-300); or equal

B. Design Features:

4. Container Capacity – Minimum 20 cubic yards.

C. Performance:

5. Cycle Time - Maximum 33 seconds.
6. Normal Ram Face Pressure – Normal @ 25.00 psi. Max. @ 31.73 psi.

D. Electrical Equipment:

7. Electric Motor (3 phase-208/230/460v) – Minimum 10 hp.

PART 3 - EXECUTION

3.1 MANUFACTURED PRODUCTS

A. Materials, fixtures, and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items.

B. Units shall be products of one manufacturer.

C. Manufacturer of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled units.

D. Components of an assembled unit need not be products of same manufacturer.

E. Constituent parts, which are alike, shall be the products of a single manufacturer.

F. Components shall be compatible with each other and with the total assembly for the intended service.

G. Nameplate:

i. Each piece of equipment shall bear a corrosion-resisting steel, or deep-etched anodized aluminum nameplate located in a reasonably accessible position, permanently secured.

ii. Nameplate shall be proportionate to size of equipment and bear the following:

1. Name of manufacturer.
2. Model number.
3. Serial number.
4. Electrical characteristics.

H. Fasteners:

iii. Rivets, bolts, nuts, studs, spacers, and metal used for welding shall be same kind of metal as materials joined.

iv. Where corrosion-resisting metals are joined to each other, or to other metals, rivets, bolts, and materials used for welding shall be corrosion-resisting metal.

I. Welding:

v. Joints in fabricated equipment shall be welded by an accepted method. Carbon arc welding is not acceptable, nor is any process permitting the pick-up of carbon acceptable.

vi. Welds shall be strong and ductile, with exposed surfaces free of imperfections such as pits, runs, spatter, and cracks, and shall have same color as adjoining surfaces.

J. Steel Fabrication:

vii. Steel shall be free from kinks and sharp bends. Shearing and shipping shall be done neatly and accurately. Flame cutting may be employed instead of shearing or sawing. Re-entrant cuts shall be made in the best possible manner. Burned surfaces or flame cut materials shall be ground or machined to remove ash and checks.

viii. All joints, openings, and doors shall be square and neat. The finished equipment shall be free from sharp edges, fins, burrs, and sharp projections.

ix. The surface of parts to be welded shall be free from rust, scale, paint, grease, or other foreign matter. Welds shall be continuous for all major joints and shall have the strength required to satisfy the design, use, and loading conditions. Intermittent welds may be used for attaching reinforcement members provided such welds will satisfy the design. Members to be welded shall be positioned and held by jigs or fixtures when necessary to insure accurate alignment. All outside corners of the containment body shall be of butt joint construction.

x. Castings shall be sound and free from patching, misplaced coring, warping, or other defects, which might render the casting unsound for use. Forging shall be uniform in quality and condition, and shall be free from tears, cracks, seams, laps, internal ruptures, imbedded scale, segregation or other defects, which may detrimentally affect the suitability for the purpose intended.

3.2 EXAMINATION

A. Examine surfaces to receive product before application to ensure that the following conditions are met:

xi. Before shipment from manufacturer's plant and following installation at project site, finished articles shall be thoroughly inspected and tested for compliance with specifications.

xii. Equipment Manufacturer shall inspect the site and conditions for which the equipment is to be installed and advise the Owner and Owner, in writing, of any conditions detrimental to the proper installation and operation of the equipment.

B. Do not start the work of this section until all deficiencies have been corrected. Commencement of work constitutes acceptance of the surfaces.

3.3 PREPARATION

A. Protect equipment against dirt, water, and chemicals during installation. Thoroughly clean equipment at the completion of work.

3.4 INSTALLATION

A. The work under this Section of the Specification shall include all labor, services, materials and equipment and the performance of all work as necessary and required to furnish and install the equipment as indicated on the Drawings and as specified above.

B. Delivery and installation of the equipment shall be so performed as to avoid delay on the work by other contractors. The Owner shall be responsible for receiving, uncrating, setting in place all of the equipment, and providing all the proper utilities, under the supervision of the Equipment Manufacturers.

C. The Equipment Manufacturer shall be responsible for all final connections of their equipment.

D. The equipment locations, as shown on the Drawings shall be checked by the Owner and the Equipment Manufacturers. All exact locations shall be determined by the

dimensions of the equipment approved, and the layout drawing before an apparatus is installed. The Owner shall be solely responsible for the accurate installation and correct any operational aspects and deficiencies of his equipment without any recourse to the Owner.

E. The Owner and the Equipment Manufacturer shall consult the architectural and structural drawings for all dimensions, locations of partitions, locations of pipes and ductwork.

F. The Owner and the Equipment Manufacturer shall have a factory trained, field service technician on the premises to supervise the installation of all equipment. This service shall be at no additional cost to the Owner.

END OF SECTION 118226

SECTION 142100
ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Traction elevators as follows:
   1. Twelve (12) Geared Elevators:
      a. Three (3) Geared Passenger Elevators, Cars 1 - 3.
      b. Three (3) Geared Service Elevators, Cars 4 - 6.
      c. Two (2) Geared Passenger Elevators, Cars 7 - 8
      d. Four (4) Geared Passenger Elevators, Cars 9, 10 - 12.

B. Products Installed but Not Furnished Under This Section:
   1. CCTV camera provisions.
   2. Elevator security devices, control unit, mounting brackets, wiring materials, logic circuits, security system interface terminals, boxes and relays.
   3. Car flooring.
   4. Building Automation System - Monitoring system interface.

1.2 ALLOWANCES

A. Elevator Car Allowances:
   1. Elevator Car Allowances:
      a. Cars 1 - 3, Cars 4 - 6
         Provide finished service/staff elevators (cars 1 thru 6) cars under the elevator car allowance of $20,000 per car for the staff/service elevators
      b. Cars 7 - 8, 9 - 12
         1) Provide finished passenger/public elevator cars under the elevator car allowance of $30,000 per car (Cars 7 thru 12)
   2. Allowance includes furnishing the following:
      a. Car wall finishes material including trim.
      b. Car ceiling finishes including lighting, wiring, and coordination of battery operated emergency lighting
      c. Car light fixtures
      d. Handrails
      e. Cutouts and other provisions for installing elevator signal equipment in cars
      f. Mounting for protective pads Provide finished passenger elevators under the elevator car allowance specified in Division 01 section “Allowances.”

1.3 ALTERNATES:

A. Refer to Division 01 section “Alternates” for requirements and procedures for acceptance.
   1. Not required.

1.4 ACTION SUBMITTALS

A. Product Data:
   1. Include capacities, sizes, performances, operation, control, signal systems operations, safety features, finishes, and similar information.
   2. Include product data for car enclosures and hoistway entrances.

3. Include product data for signal fixtures, lights, graphics, Tactile marking plates, and details of mounting.

B. Shop Drawings:
1. Provide scaled shop drawings and construction drawings of the following:
   a. Plan and section layouts of hoistways, pits, overheads, machinery spaces and openings at each landing, to include the following:
      1) Location of all equipment.
      2) Static and dynamic loads imposed on building structure.
      3) Details of equipment isolation.
      4) Required clearances around equipment.
      5) Machine room heat release.
         a) Provide heat loads based on a non-regenerative emergency power operation.
      6) Power requirements:
         a) motor horsepower, code letter, starting current, full load running current, and demand factor.
      7) Service connections.
      8) Running Clearances.
      9) Location of fixtures.
   b. Elevation section of hoistways:
      1) Overhead, pits (clearance, runby, etc).
      2) Entrance details.
      3) Sill support detail.
   c. Pit Equipment:
      1) Buffers.
      2) Compensation equipment and tie-downs.
      3) Counterweight guards.
      4) Pit reactions.
      5) Service ladder, platform.
         a) Coordinate Car 7 and Car 8 extended buffer access platform.
      6) Stop switches.
   d. Elevator cabs:
      1) Car shell fabrication.
      2) Ventilation.
      3) Ceiling construction detail.
      4) Wall construction detail.
      5) Lighting detail.
      6) Handrail mounting detail.
      7) Transom, front returns.
   e. Fixtures: Individual and Coordinated Lobby Elevation at main floor, upper terminal floor, and lower terminal floor.
      1) Car operating panel.
      2) Hall stations.
      3) Hall Lanterns.
      4) Position indicators.
      5) Access key switch.
      6) Remote panel:
         a) Lobby Desk panel.
         b) Firefighter’s Control Panel.
         c) Emergency Power selector switches.
      7) Two-way conversation device (all master stations).
2. All submittals shall be clearly marked and identified with project title and appropriate device identification.

3. Confirm Elevator Identification prior to initial submittal. Include confirmed University 4-digit number with alpha character prior to submittal review
4. All submittals are subject to approval.
5. Corrections requested shall be incorporated onto the submittals.
6. All submittals shall also be submitted to Elevator Consultant via Portable Document Format (.pdf).

C. Samples for Initial Selection:
1. For finishes involving surface treatment, paint or color selection per Architectural list:
   a. Car 1 – 3 and 4 – 6 hoistway door frames, hoistway door panels, hall fixtures faceplate.
      1) RAL color to be determined by Architect.
   b. Materials included in allowance.

D. Samples for Verification:
1. For exposed car, hoistway door and frame, and signal equipment finishes.
2. Samples of sheet materials: 3" (75 mm) square.
3. Running trim members: 4" (100 mm) lengths.

1.5 CLOSEOUT SUBMITTALS

A. Continuing Maintenance Proposal:
1. If directed by UK Purchasing, submit a continuing maintenance proposal from Installer to Owner with terms, conditions, and obligations as set forth therein, and in same form as, “Owner’s Elevator Maintenance Agreement” at end of this Section, starting on date warranty maintenance service is completed.

B. Record Documents
1. The following record documents shall be furnished upon completion and before final payment:
   a. Shop Drawings:
      1) Complete sets of as installed plan and section layouts of hoistways, pits, overheads and machinery spaces, to include the following:
         a) Static and dynamic loads imposed on building structure.
         b) Details of equipment isolation.
         c) Required clearances around equipment.
         d) Machine room heat release/diversity factor.
         e) Power requirements.
      2) Elevation section of hoistways:
         a) Overhead, pits and entrance details.
      3) Elevator cabs.
      4) Fixtures:
         a) Car fixtures.
         b) Hall fixtures.
         c) Remote fixtures.
      5) Machine room heat release/diversity factor and power requirements.
   b. Wiring Diagrams:
      1) Complete sets of as installed straight-line wiring diagrams, showing the electrical connections of all altered vertical transportation equipment, shall be furnished upon completion.
      2) A legend sheet shall be furnished with each set of drawings containing the following information:
         a) Name and symbol of each relay, switch and other electrical or solid-state apparatus.

b) Location on drawings, drawing sheets, number and area of switches and relays, etc., and location of all contacts.
c) Location of apparatus whether on controller, hoistway or elevator cab.

c. Maintenance and Operating Manuals:
1) Description and sequence of operation of all equipment installed, including operating use for Building Personnel and tenants, as well as system troubleshooting manuals for technicians.
2) Maintenance instructions and procedures of all vertical transportation equipment installed, including parts lists, for each elevator system.
3) Lubrication charts indicating all lubricating points and type of lubricant recommended for all equipment.
4) Complete parts catalogs for all replaceable parts.

d. Elevator Identification
1) Elevators shall be given an individual numbering identity. The number shall be the University 4-digit number followed by an alpha digit assigned to the individual elevator and shown on the record documents.

C. Tools:
1. The following equipment shall be furnished upon completion and before final payment:
a. The Elevator Contractor shall provide all the necessary tools, including laptop, hand-held devices, required software and manuals, required to troubleshoot, adjust, synchronize, calibrate, repair and maintain the vertical transportation systems, as well as perform all necessary procedures to perform all safety tests as required by code and local governing authority.
b. Owner’s equipment and software shall be updated regularly as necessary to properly troubleshoot, adjust, synchronize, calibrate, repair, maintain and test the vertical transportation systems. All equipment and/or software shall be of the same version as issued to technicians maintaining the vertical transportation systems.
c. The Elevator Contractor shall provide a backup copy of any software that resides on the troubleshooting tool.
d. Upon cancellation of service agreement, the Elevator Contractor shall provide all upgrades indicated above.
e. Specialized diagnostic devices used to check the operation of the microprocessor and not permanently attached to the controller, shall be provided as part of the contract and shall become university property.
f. Diagnostic tools or devices requiring “reloading” or “recharging” by the manufacturer shall not be used on a University of Kentucky project.

D. Keys:
1. Four sets of keys to operate all keyed switches and locks shall be furnished upon completion.
2. Keys shall be properly tagged.
3. All keying shall be arranged with the Contractor.
4. Provide one additional set of keys for fire department lock box.

1.6 PERMITS, TESTS AND CERTIFICATES

A. Permits:
1. The Elevator Contractor shall secure the necessary permits required for work to be performed, including work performed by sub-contractors.
2. The Elevator Contractor shall also secure the necessary permits required for the work to be performed to remove any existing devices on the premises.
3. The Elevator Contractor shall obtain and pay for all municipal and state permits necessary for execution of the elevator work, including fees for renewing permits.

4. The Elevator Contractor shall be responsible for posting all permits as required by the AHJ.
5. The Elevator Contractor shall be responsible for obtaining final sign-off for each permit filed by them.

B. Tests and Inspections:
1. The Elevator Contractor shall perform all necessary tests as required by ASME A17.1 and recommended by A17.2.
2. The Elevator Contractor shall be responsible for scheduling the necessary tests as required by the local authorities.
   a. Any fees associated with a missed appointment, expediting of test or overtime test due to delays caused by the Elevator Contractor shall be the responsibility of the Elevator Contractor.
3. When emergency power is provided for the system, the elevators shall be tested under a full load on the generator.
   a. This would include all emergency lighting and other emergency loads connected to the generator.

C. Certificates:
1. Elevator Contractor is responsible for obtaining and providing Contractor with all temporary and final inspection certificates of the proper governing authorities and shall provide the Contractor with such certificates.
2. The Elevator Contractor shall pay for all fees necessary for obtaining temporary and final inspection certificates.

D. Violations:
1. Any violations that exist on devices being removed shall be cleared by the Elevator Contractor prior to final acceptance by the Contractor.

1.7 QUALITY ASSURANCE

A. Compliance with Regulatory Agencies:
1. Comply with most stringent applicable provisions of codes, laws, and/or authorities, including revisions and changes in effect.

B. Inspections:
1. The Contractor is subject to reviews by the Consultant and/or Contractor at any time throughout the project.

1.8 DELIVERY, STORAGE AND HOISTING

A. General:
1. The protection of all equipment and exposed finishes shall be the responsibility of the Elevator Contractor during delivery, handling and installation until completion of project.
2. The Elevator Contractor shall replace damaged materials with new, at no additional cost for material and labor to Contractor.

B. Delivery and Storage:
1. It is expected that manufacturers’ original packing shall adequately protect materials during delivery.
2. Deliver materials to the site ready for use in the accepted manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name and manufacturer's name. Delivered materials shall be identical to accepted samples.

3. Store materials under cover in a dry and clean location, off the ground. Remove delivered materials that are damaged or otherwise not suitable for installation from the job site and replace with acceptable materials.
4. It is the responsibility of the Elevator Contractor to properly store and protect all materials in space provided or designated by the Contractor against damage, stains, scratches, corrosion, weather, construction debris and environmental conditions.

C. Hoisting:
1. All required hoisting and movement of equipment shall be the responsibility of the Elevator Contractor.

1.9 COORDINATION

A. General:
1. Coordinate the following requirements with the other trades.

B. Cast-in-Place Concrete:
1. Elevator Contractor to provide guide rail bracket inserts and the locations for the General Contractor to install.
2. Elevator Contractor to provide templates for machine room slab penetrations.
3. Provide other hoistway and pit requirements, including location of sump pits.

C. Masonry Penetrations:
1. Provide locations in elevator machine room/hoistway walls where conduit, ropes, etc. shall penetrate walls and slabs.
2. Coordinate installation of sleeves, block outs, inserts, and items that are embedded in concrete or masonry for elevator equipment.
3. Furnish inserts, templates and installation instructions and deliver to Project site in time for installation.

D. Structural Steel:
1. Including, but not limited to, elevator machine rooms, hoistways and pits, sill supports, rail supports.

E. Miscellaneous Steel:
1. Pit ladders, working platforms, inspection platforms, guard rails, divider beams.
a. Coordinate requirements for Car 7 and Car 8 extended buffer access platform.

F. Electric:
1. Electrical service, outlets, lights, switches in elevator machine rooms and pits.

G. Sprinklers:
1. Including installation of sprinkler systems in the elevator pits or shaft per NFPA 13.

H. HVAC:
1. Provide necessary information to General Contractor and coordinate installation of equipment for elevator machine rooms.

I. Finishes:
1. Cab interiors, hoistway entrances, fixtures.

J. Elevator Cab Flooring:
1. Material and finish to be specified in other applicable section.

2. Anticipate allow 5 lbs./sf for the 3/8” epoxy terrazzo floor finish. Confirm during submittal process.
3. Flooring installation must be coordinated to ensure car saddle is installed at proper height (even with finished floor).

K. Security Equipment:
1. Coordinate location(s) in elevator machine rooms and cabs where cables, conduit, components, etc. for CCTV and/or secure access interface equipment must be installed.

1.10 WARRANTY

A. Manufacturer’s Warranty:
1. Manufacturer agrees to repair, restore, or replace elevator work that fails in materials or workmanship within specified warranty period.

B. Warranty Period: one (1) year from date of Substantial Completion for the last elevator completed:
1. The Elevator Contractor shall guarantee that the materials and workmanship of the apparatus installed by them and any subcontractor under this contract, shall be first class in every respect and that he will make good on any defects not due to ordinary wear and tear or improper use, which may develop within one year from the date of final acceptance of all equipment.
2. Manufacturer’s warranty to repair or replace defective products or their components in the event of defects within a specified period.
3. Neither the final payment nor any provisions of the contract documents shall relieve the Elevator Contractor of the extent and period provided by law and upon written notice he shall remedy any defects due thereto and pay all expenses for any damage to other work resulting there from.
4. The warranty as outlined above, for all devices, shall start from the date of final acceptance of the final elevator completed, by the Consultant and the Owner, of all work specified and intended under these contract documents.
5. Warranty maintenance services shall be completed as identified in Owner’s Maintenance Scope of Work and herein. Refer to Section 143250.

1.11 MAINTENANCE

A. General:
1. All maintenance shall be performed according to the guidelines stated in manufacturer’s Maintenance and Operations manuals.
2. Maintenance records for each device, including lubrication logs, check charts, shall be provided in each machine room.
3. Specifications for Maintenance Agreement outlined in Owner’s Maintenance Scope of Work and identified herein. Refer to Section 143250.

B. Construction Maintenance:
1. Upon substantial completion of a device, subsequent to receiving sign-off from the governing authorities and acceptance from Consultant and/or Contractor, the device may be accepted for service before completion of the entire project.
2. During the Construction Maintenance period, the necessary preventive maintenance shall be performed on an as required basis, as identified in the Owner’s Maintenance Scope of Work.
3. Provide the necessary protection of the hoistway entrances and sills, hoistway fixtures, cab interiors and fixtures and car door sills.

4. Replacement or repair of the aforementioned components, due to abnormal use by others, shall be the responsibility of the Contractor..
5. Construction Maintenance Period:
    1) Refer to Construction Schedule.
6. Include 24-hour-per-day, 7-day-per-week emergency callback service. Refer to Owner's Maintenance Scope of Work for equipment response times.

C. Warranty Maintenance:
1. Upon final acceptance of each device, after Construction Maintenance period (if applicable), subsequent to receiving acceptance (sign-off) from the governing authorities and final acceptance, each device shall be accepted for full operation.
2. The warranty maintenance period shall begin for each device when all conditions in the above paragraph are met and will continue for the specified period.
    a. Warranty Maintenance Period may begin at different times for each elevator.
3. The warranty maintenance program shall include the following:
    a. Monthly examinations, including adjustments, cleaning and lubrication of equipment.
    b. 24-hour Emergency Call back service shall be provided at no additional cost to Owner.
    c. Replacement of components as required, using only components produced by the original manufacturer.
        1) Each machine room shall be equipped with a lockable storage cabinet to contain the necessary spare parts.
    d. Specifications for Warranty Maintenance outlined in Owner's Maintenance Scope of Work is required. Refer to Section 143250.

D. Maintenance Agreement:
1. Upon completion of the Warranty Maintenance period, the Elevator Contractor will provide the personnel to service the vertical transportation equipment.
    a. Full-Service Maintenance Agreement shall commence upon the completion of the warranty maintenance period for a term of five (5) years:
        1) As directed by UK Purchasing. The Contractor shall provide a proposal for a service agreement as per the specifications provided.

PART 2 - PRODUCTS

2.2 MANUFACTURERS

A. The bidder/company hereby agrees that no proprietary situations will be imposed as to the providing to the University's elevator service providers any maintenance drawings, equipment, part, or control items (including circuit boards, chips, diagnostic tools, etc.), etc. required for the maintenance and upkeep of the elevators provided on this project. Further, the items will be sold to the University's elevator service providers at current wholesale costs and without undue delay.

B. Subject to compliance with requirements, provide products by one of the following:
1. Third Party Controllers:
   a. Elevator Controls Corp.
   b. GAL Galaxy.
   c. Smartrise
   d. Virgina Controls
2. Hoistway Entrance:
   a. KONE Incorporated.
   b. Otis Elevator Company.
   c. Schindler Elevator Corporation.
   d. ThyssenKrupp Elevator.
   e. Wittur.
   f. Columbia.
   g. EDI-ECI.
   h. National Elevator Cab and Doors.
   i. Regency Elevator Cabs.
3. Sill
   a. Stainless Steel as manufactured by Plymouth Engineering Shapes of Hopkinsville, Kentucky www.plymouth.com/ or approved substitute.
4. Passenger Elevator Door Equipment (Operators, Tracks, Hangers, and Closers):
   a. GAL.
5. Elevator Car Enclosures: Refer to Allowances
   a. Canton
   b. Columbia
   c. EDI/ECI.
   d. Elite Cabs.
   e. Globe Architectural & Metal.
   f. Hollister Whitney
   g. National.
   h. Peele
   i. Regency Elevator Cabs.
   j. Manufacturers Standard or Designer Collection.
      1) Refer to Allowances
6. Fixtures vandal resistant:
   a. Innovation.
7. Two-Way Communication Device:
   a. Ramtel model RR833-OEM
8. Hoist Machines:

a. Hollister Whitney.
b. =

9. Rope Brakes:
   a. Hollister Whitney
10. Electronic Car Door Safety Edge
   a. Janus Pana40 Plus 3D.

2.3 PERFORMANCE REQUIREMENTS

A. Car Speed:
1. ± 3% of contract speed under any loading condition.

B. Car Capacity:
1. Safely lower, stop and hold 125% of rated load.

C. Car Stopping Zone:
1. ±1/4" under any loading condition.

D. Door Times:
1. Seconds from start to fully open or fully closed:
   a. Cars 1 - 3: Door open 2.6 seconds, door close 3.7 seconds.
   b. Cars 4 - 6: Door open 2.8 seconds, door close 4.2 seconds.
   c. Cars 8, 9, 10, 12: Door open 1.6 seconds, door close 2.4 seconds.
   d. Cars 7, 11: Door open 1.6 seconds, door close 2.7 seconds.

E. Car Floor-to-Floor Performance Time:
1. Seconds from start of doors closing until doors are 3/4 open (1/2 open for side opening doors) and car level and stopped at next successive floor under any loading condition or travel direction:
   a. Cars 1 - 3: 12.0 seconds, floor height 15’- 4”, between floors 4 and 5
   b. Cars 4 - 6: 13.0 seconds, floor height 15’- 4”, between floors 4 and 5
   c. Cars 8, 9, 10, 12: 11.5 seconds, floor height 15’- 4”, between floors 4 and 5
   d. Cars 7, 11: 12.0 seconds, floor height 15’- 4”, between floors 4 and 5

F. Car Ride Quality:
1. Acceleration and Deceleration:
   a. Smooth, constant, and not less than 3.0 feet/second^2 with an initial ramp between 0.5 and 0.75 second.
2. Sustained Jerk:
   a. Not more than 6 feet/second^3 or twice the rate of acceleration.
3. Horizontal and vertical acceleration within car during all riding and door operating conditions.
   a. Not more than 10 peak to peak (adjacent peaks).
4. Measurement Standards:
   a. Measure and evaluate ride quality consistent with ISO 18738, using low pass cutoff frequency of 10 Hz and A95 peak-to-peak average calculations.

G. Noise and Vibration Control:
1. Airborne Noise:
   a. Measured noise level of elevator equipment and its operation shall not exceed 60 dBA inside car under any condition including door operation and car ventilation exhaust blower on its highest speed.
   b. Limit noise level in the machine room and its operation to no more than 80 dBA.

c. All dBA readings to be taken 3'-0" off the floor and 3'-0" from the equipment using the “A” weighted scale.

2. Vibration Control:
   a. All elevator equipment shall be mechanically isolated from the building structure and other components to minimize the possibility of objectionable noise and vibrations being transmitted to occupied areas of the building.

2.4 ELEVATORS

A. Geared Passenger Elevators Description:
   1. Elevator Identification: Cars 1 - 3.
   2. Capacity:
      a. Cars 1 - 3: 4,000 lbs.
   3. Class of Loading:
      a. Cars 1 - 3: Class A.
   4. Contract Speed: 350 fpm.
   5. Roping: 1:1.
   6. Machine: Geared.
   7. Machine Location: Overhead.
   8. Control System: Collective microprocessor-based: Selective collective
   9. Floors Served: Refer to Architectural Drawings
      a. Cars 1 - 3: Front: 00 - 07, Rear: N/A.
   10. Openings: Refer to Architectural Drawings
      a. Cars 1 - 3: Front: 8, Rear: N/A.
   11. Minimum Clear to underside of canopy: 9’- 0” High.
   12. Entrance Size: Refer to Architectural Drawings
      a. Cars 1 - 3: 48”W x 96”H
   13. Entrance Type:
      a. Cars 1 - 3: Single speed, center opening.

B. Geared Service Elevators Description:
   1. Elevator Identification: Cars 4 - 6.
   2. Capacity:
      a. Cars 4 - 6: 6,500 lbs.
   3. Class of Loading:
      a. Cars 4 - 6: Class C3.
   4. Contract Speed: 350 fpm.
   5. Roping: 1:1.
   6. Machine: Geared.
   7. Machine Location: Overhead.
   8. Control System: Collective microprocessor-based: Selective collective
   9. Floors Served: Refer to Architectural Drawings
      a. Cars 4 - 6: Front: 00 - 07, Rear: 00 - 04, 07 - 08
   10. Openings: Refer to Architectural Drawings
      a. Cars 4 - 6: Front: 8, Rear: 7.
   11. Minimum Clear to underside of canopy: 9’- 0” High.
   12. Entrance Size: Refer to Architectural Drawings
      a. Cars 4 - 6: 60”W x 96”H
   13. Entrance Type:
      a. Cars 4 - 6: Two speed, center opening.

C. Geared Passenger Elevators Description:
   1. Elevator Identification: Cars 7 - 8.
   2. Capacity:
      a. Car 7: 4,000 lbs.

b. Cars 8: 3,500 lbs.
3. Class of Loading: Class A.
4. Contract Speed: 350 fpm.
5. Roping: 1:1.
6. Machine: Geared.
7. Machine Location: Overhead.
8. Control System: Collective microprocessor-based: Selective collective
9. Floors Served: Refer to Architectural Drawings
   a. Front: 01 - 03, future stop at 04
   b. Rear: N/A.
10. Openings: Refer to Architectural Drawings
    a. Front: 3, future opening at 04
    b. Rear: N/A.
11. Minimum Clear to underside of canopy: 8'- 0" High.
12. Entrance Size:
    a. Car 7: 48"W x 84"H
    b. Cars 8: 42"W x 84"H
13. Entrance Type: Single speed, center opening.

D. Cars 9, 10 - 12 Geared Passenger Elevators Description:
1. Elevator Identification: Cars 9 - 12.
2. Capacity:
   a. Cars 9, 10, 12: 3,500 lbs.
   b. Car 11: 4,000 lbs.
3. Class of Loading: Class A.
4. Contract Speed: 350 fpm.
5. Roping: 1:1.
6. Machine: Geared.
7. Machine Location: Overhead.
8. Control System: Collective microprocessor-based: Selective collective
9. Floors Served: Refer to Architectural Drawings
   a. Front: 00 - 07, Rear: N/A.
10. Openings: Refer to Architectural Drawings
    a. Front: 7, Rear: N/A.
11. Minimum Clear to underside of canopy: 8'- 0" High.
12. Entrance Size:
    a. Car 11: 48"W x 84"H
    b. Cars 9, 10, 12: 42"W x 84"H
13. Entrance Type: Single speed, center opening.

2.5 MATERIALS

A. Steel:
1. Sheet Steel (Furniture Steel for Exposed Work): Stretcher-leveled, cold-rolled, commercial quality carbon steel, complying with ASTM A366, matte finish.
2. Sheet Steel (for Unexposed Work): Hot-rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568/A568M-03.
3. Structural Steel Shapes and Plates: ASTM A36.

B. Stainless-steel:
1. Type 302 or 304 series complying with ASTM A240, with standard tempers and hardness required for fabrication, strength, and durability.
2. Apply mechanical finish on fabricated work in the locations shown or specified, Federal Standard and NAAMM nomenclature, with texture and reflectivity required to match Architect's sample. Protect with adhesive paper covering.

a. No. 4 Satin:
   1) Directional polish finish.
   2) Graining directions as shown or, if not shown, in vertical dimension.
b. Textured:
   1) .050 inches mean pattern depth with bright directional polish (No. 4 satin finish).
   2) 5-SM as manufactured by Rimex Metals.

C. Aluminum:
1. Extrusions per ASTM B221; sheet and plate per ASTM B209.
2. Die Cast Aluminum – ASTM B108, Alloy 356.0, T6.
3. Extruded Aluminum – FS QQ-A 200/8, Alloy 6061, T6.

D. Plastic Laminate:
1. ASTM E84 Class A and NEMA LD3.1, Fire-Rated Grade (GP-50), Type 7, 0.050" ±.005" thick.
2. Exposed Surfaces: Color and texture selected by Architect.
3. Concealed Surfaces: Manufacturer's standard color and finish.

E. Fire-Retardant Treated Particle Board Panels:
1. Minimum 3/4" thick backup for natural finished wood and plastic laminate veneered panels, edged and faced as shown, provided with suitable anti-warp backing
2. Meet ASTM E84 Class "I" rating with a flame-spread rating of 25 or less, and smoke development raring of A or less, registered with Local Authorities for elevator finish materials.

F. Paint Finishes:
1. General:
   a. Clean exposed metal parts and assemblies of oil, grease, scale, and other foreign matter and factory paint one shop coat of standard rust-resistant primer.
   b. Galvanized metal need not be painted.
2. Prime Finish:
   a. Apply one coat of rust-resistant primer followed by a filler coat over uneven surfaces.
   b. Sand smooth and apply final coat of primer.
3. All equipment and metal work installed under this contract, which does not have a baked enamel or special architectural finish, and which is exposed in the hoistway, shall be cleaned and painted one field coat of enamel.
4. All machine room equipment shall be painted upon completion of the installation with the manufacturer's standard machinery enamel.
5. Elevator designation (number and/or letter) shall be prominently indicated on all machine room and machinery space equipment, top of car crosshead and pit equipment.

G. Baked Enamel Finish:
1. Prime finish per above.
2. Unless specified "prime finish" only, apply and bake three additional coats of enamel in the selected solid color.
3. Architect to provide RAL color for painted finishes.
   a. Cars 1 – 3 and 4 – 6: Refer to Architectural Drawings for hoistway door frame and car door finish requirements.

H. Terrazzo tile:
1. Refer to Construction Documents.

2.6 OPERATION

A. General:
1. Cars automatically slow down and stop level at floors in response to car and landing calls with stops made in sequence in the established direction of travel, regardless of order in which buttons are pressed.
2. Landing calls canceled when answered.
3. Automatic Dispatch Failure:
   a. Provide auxiliary dispatch system to automatically dispatch elevators in the event of failure of the primary control system.
4. Hall Call Button Failure:
   a. Should failure of hall call button system occur, initiate operation providing predetermined service to all landings; elevators to respond normally from car call buttons.
5. Automatic Leveling:
   a. An automatic two-way leveling device shall be provided, designed to govern the leveling of the car to within 1/8” above or below the landing sill. The leveling operation shall be effective to avoid overtravel, as well as undertravel of the car and maintain the leveling accuracy regardless of the load in the car, direction of travel, rope slippage or stretch.
6. Door Control:
   a. A car without registered car calls arriving at a floor where both up and down hall calls are registered, responds to the call in the direction of car travel. If no car call is registered for further travel in that direction, lantern immediately indicates changed direction without closing and reopening doors.
   b. Direction lantern to remain illuminated until doors are fully closed.
7. Coincident Calls:
   a. The dispatching system shall be designed with a 20 second parameter, whereby an elevator with a car call will receive priority to answer a corresponding corridor call if it can do so within 20 seconds. If that elevator cannot answer the call within the prescribed time, the first available car shall be assigned.
8. Independent Service:
   a. Provide controls for operation of each car from its pushbuttons only.
   b. Close doors by constant pressure on desired destination floor button or door close button.
   c. Open doors automatically upon arrival at selected floor.
9. Load Weighing:
   a. General:
      1) Provide cars with adjustable cable tension monitoring load weighing device.
      2) Devices must be self-calibrating for the time-dependent effects of compression in any resilient materials in the assemblies, transducers, etc.
      3) Control system to provide dispatching at main floor in advance of normal intervals when car fills to capacity.
      4) Provide hall call by-pass when the car is filled to preset percentage of rated capacity and traveling in down direction.
      5) System shall be provided with field adjustable range, 10 to 100%.
      6) Audible and visual overload signaling device inside elevator cab shall be activated upon load weighing device sensing carload has reached or exceeded a pre-determined percentage of capacity.
      7) Elevator shall not be capable of closing doors and running when Overload signaling device is active.

B. Group Operation
1. Groups:
   a. Cars 1-3: Staff

b. Cars 4-6: Service/Patient Transportation
c. Cars 7-8: Public ASC
d. Cars 9-12: Public CTC

2. General:
   a. Arrange for automatic operation through car and landing buttons in conjunction with a microprocessor-based group supervisory system.
   b. A continuous reassessment of all calls shall be made with the processor having the capability of reassessing a minimum of ten (10) times per second.
3. Group Supervisory System - Passenger Elevators:
   a. The supervisory system shall, through a dispatching algorithm, continually measure the number of corridor calls, their duration, their direction, distance, service to previously assigned car and hall calls, car load, door and car motion status, coincidence of car and hall calls, etc., to determine the intensity of traffic and its direction. The supervisory system shall automatically adjust itself to all demands with preference given to the registered calls in the following order:
      1) Main Landing Demands (of any type or duration).
      2) Long wait Down calls.
      3) Long wait Up calls.
      4) Up calls.
   b. Long wait calls shall be considered those that have been registered for over thirty seconds.
   c. Dynamic zoning strategies may be employed consistent with the aforementioned requirements.
4. Hall Call Assignment:
   a. Assign registered hall calls to car that will provide the best response.
   b. Car assignment and response time determined by computing relative factors such as distance, service to previously assigned car and hall calls, carload, direction, door and car motion status, and coincidence of car and hall calls. Continuously compute these factors and assign best car available to answer call.
   c. A car without registered car calls arriving at a floor, where both up and down hall calls are registered, initially responds to the hall call in the direction that car was traveling. If no car call is registered for further travel in that direction, lantern immediately indicates changed direction without closing and reopening doors.
5. Car / Hall Lantern Signals:
   a. The lantern shall generate signal upon each stop, regardless of responding to car or hall call.
   b. An option shall be provided to allow lanterns to be active in response to hall calls only.
   c. Lantern shall be provided with signal from controller compliant with ADA requirements.
6. Delayed Car:
   a. If, for any reason, a car is delayed after it receives a start signal, system transfers the call to another car.
   b. When cause of delay is corrected car automatically returns to normal operation.

C. Car-to-Lobby Feature:
   1. Provide the means in the firefighters' control panel for automatic return to the main floor. Provide means in remote lobby panel or designated key switch near
   2. Return car nonstop after answering pre-registered car calls, and park with doors open for an adjustable time period of 60-90 seconds.
   3. Upon expiration of time period, car shall automatically revert to normal operation and close doors until assigned as next car or until the car is placed on independent service.

D. Firefighters' Service:
   1. Provide equipment and operation in accordance with code requirements.

E. Interface to Building Management Systems:
1. The elevator monitoring system shall be capable of interfacing and exchanging data with a variety of third party building management systems including Tridium.
   a. Refer to appendix at the end of this specification section.
   b. All associated hardware, software, cabling and conduit for a complete connection to the system is to be included as part of the elevator contract.
   c. Connection is to be made via BacNet/IP, BacNet/MSTP or Modbus protocols or other suitable methods as required.

F. Motion Control:
1. Microprocessor-based AC variable-voltage, variable frequency with digitally encoded closed-loop velocity feedback suitable for operation specified and capable of providing smooth, comfortable car acceleration, retardation, and dynamic braking.
2. Limit the difference in car speed between full load and no load to not more than ±3% of the contract speed.

G. Standby Lighting, Communication, and Alarm:
1. Car mounted battery unit with solid-state charger to operate alarm bell, car emergency lighting, and voice communication system.
2. Car lighting and communication shall be provided with a minimum of 4 hours of operation on back-up power during a loss of normal power, and a minimum of 1 hour of operation for car-mounted alarm and any remote alarm mounted at the designated level.
3. Battery to be rechargeable with minimum five-year life expectancy.
4. Provide constant pressure test button in service compartment of car operating panel.
5. Provide lighting integral with portion of normal car lighting system.
   a. Emergency lighting is not to be installed on car operating panel.

H. Door Operation, All Cars:
1. Automatically open doors when car arrives at a floor.
2. At expiration of normal dwell time, close doors.
3. Reopen doors when car is designated for loading.
4. Cars 4-6, provide front or rear selective door operation.

I. Dual-Mode Operation, Cars 4 - 6:
1. Mode I: Normal Mode – Group of three (3) elevators
   a. Operate within group, responding to group supervisory control assignments.
2. Mode II: “Swing Operation” or Construction Use – One (1) group of two (2) elevators and one (1) elevator operating as a single selective collective car
   a. Operate car as a single, selective collective car from a separate riser of hall pushbuttons.
3. Provide means to select operating mode, single car or group automatic positions.
   a. Provide a key switch located on Fire Command Firefighter’s Control Panel or at Main Lobby hall station as directed by Architect. Utilize a Use Yale 7-pin small format removable core.

J. Priority Hospital Emergency:
1. Provide feature as specified for Cars 4 - 6
2. Operation:
   a. Feature shall be activated via two-position on/off keyed switch, mounted in hoistway entrance jamb at all floors, with key removable in the “off” position only.
   b. Feature shall be activated via proximity sensor located within the lobby hall stations.
   c. Activation of device at any floor shall cause a small blue light jewel or larger jewel with engraved target identifying the operation, to illuminate at that floor and all

other floors and firefighter's control panel and group lobby panel, to indicate operation in use.

d. Activation of device shall cause the control system to assign the nearest car with a demand at the desired level:
   1) If the car is traveling to the demand floor, the car shall express to that floor.
   2) If traveling away, the Car shall stop at the next available floor without opening doors, reverse, and express to that floor without stopping at previously assigned floors.
   3) All registered car and hall calls for selected car shall be cancelled.
   4) All registered car and hall calls for selected car shall be cancelled.

e. A blue light with the engraved signage beneath "Please Exit Car" at the top of the car operating panel shall pulsate and audible annunciation verbiage as selected shall sound, indicating to riding passengers the car has been commandeered for the required service.

f. Upon arrival of car at floor of activation, car shall open its doors and "park" for an adjustable time period of 30-90 seconds:
   1) Provide second initiation device adjacent to blue light in car operating panel for attendant operation of car under priority service feature.
   2) Keyed switch shall be two-position, on/off, with key removable in "off" position only.
      a) Coordinate Code Blue requirements with Owner including engraving instructions and use of key switch or card reader.
   3) Upon activation, car "park time" shall be voided and car shall be under control of attendant.
   4) Registration of a destination floor, followed by the activation of the door close button, shall cause express non-stop travel to selected floor.
   5) Upon arrival at selected floor, car shall open its doors and remain at that floor until another floor is selected, or the priority service switch is returned to the "off" position, or the "park" time has completed.
   6) Failure to activate car priority keyswitch in the elevator at the original demand floor within preset time constraints of 30-90 seconds or returning car switch to "off" position, shall cause car to be automatically restored to normal service.

K. Utilize corrosion-resistant finishes for all other elevator components.

L. Standby Power Operation:
1. Upon loss of normal power, adequate standby power will be supplied via building electrical feeders to start and run four (4) elevator simultaneously.
   a. Upon loss of normal power, adequate standby power will be supplied via building electrical feeders to start and run Elevators 4, 5, and 6 simultaneously at contract car speed and capacity.
   b. Upon loss of normal power, adequate standby power will be supplied via building electrical feeders to start and one (1) additional elevator, Elevator 1 - 3, 7 - 8, or 9 – 12, simultaneously with Cars 4, 5, and 6, at contract car speed and capacity.
2. Automatically return cars, nonstop to designated floor, open doors for approximately 3.0 seconds, close doors, and park car.
3. During return operation, car and hall call pushbuttons shall be inoperative.
4. As cars park, system shall immediately select the next car within the sequence until all cars have returned to the designated floor.
5. If a car fails to start or return within 30 seconds, system shall automatically select the next car in the sequence to return.
6. When all operable cars have returned to the designated floor, Cars 4, 5, 6 and one additional car, Car 1 – 3, 7 – 8, or 9 – 12, shall be designated for automatic operation.

When demand exists for 30 seconds and designated car fails to start, next available car shall be automatically selected for operation.

7. Provide separate group selection key switches in firefighters' control panel.
   a. Switches shall be labeled "STANDBY POWER OVERRIDE" with positions marked "AUTO" and appropriate car numbers controlled by each respective switch.
   b. Key shall be keyed the same as differently from the key utilized for firefighters' Phase I and II key switch. Key shall be removable in "AUTO" position only.
   c. Switch shall override automatic return and automatic selection functions and cause the manually selected car to operate.
   d. Manual selection shall cause car to start and proceed to designated floor and open and close its doors before standby power is manually transferred to next selected car.
   e. Engraving shall clearly identify cars included in a group, with group and car identification as approved by Architect.
8. Provide "STANDBY POWER" indicator lights, one per car, in firefighters' and security control panels.
   a. Indicator light illuminates when corresponding car is selected, automatically or manually, to operate on standby power.
9. Provide control logic, conduit, and wiring to provide required sequences, between all cars and groups.
   a. Provide intergroup monitoring required for operation.
10. Successive Starting: When normal power is restored or there has been a power interruption, individual cars in each bank shall restart at five-second intervals.

M. Floor Lockout:
1. Provide means to limit access to building floors for Cars 4-6 as follows
   a. Provide lock-out keyed switch on the Penthouse push button
      1) The push button is to be activated by the keyed switch
      2) Key shall not be removable in the activation position.
         a) Alternate configuration
            (1) For unrestricted elevator service to the penthouse, provide a keyed switch to over-ride the Penthouse mechanical room keyed button lock-out switch;
            (2) Key shall be removable in all positions
            (3) Use Yale 7-pin small format removable core. Place over-ride switch in the top area of the car panel.
   b. Wire controls so as not to interfere with Fire Service operation.
   c. Provide temporary inactivated push buttons for each floor even if a key switch, card reader, and/or other devices are required.
   d. Individual floor lockout means in main car operating panel and security control panel to prevent registration of car calls to any selected secure floor.
   e. Arrange system so that independent service and/or attendant operation overrides security system.
      1) Confirm functionality of override during submittal process
   f. Arrange system so that firefighters' service overrides security system.
   g. Actuate hall lantern each time car arrives at main lobby during secure mode operation.
   h. Provide warning light and/or signal in group control panel to indicate an attempt to register unauthorized destinations or to open car doors when car is moving or parked at a secured floor.
   i. Provide reset switch or button to cancel warning light and signal.

N. Card/Proximity Reader Security System:
1. Provide provisions inside Cars 1 - 3, 4 - 6 for reader unit.

a. Mount reader unit as directed by Architect and make cross connects to card reader terminal interface and relays in machine room.
b. Provide filler plate to match card slot size or proximity reader size and car return panel finish, including direction of graining, where card slot or proximity reader cutout is not initially utilized.

2. Hall Station Access Controls, Cars 4 – 6:
   a. Provide provisions to incorporate card readers at each hall station.
   b. Card readers may be used for access controls or to initiate special operation modes including VIP services (empty car call) or Code Blue amongst other features.
3. Elevator control systems shall provide output signal of selected floor to facilitate system tracking of floor access.

O. AGV Integration:
   1. Not required.

2.7 MACHINE ROOM SPACE EQUIPMENT

A. Arrange equipment in spaces shown on drawings.

B. Geared Traction Hoist Machine and Motor:
   1. Single worm geared or helical geared traction type with AC induction or P.M.S.M. ACV³F motor, brakes, gear, drive shaft, deflector sheave, and gear case mounted in proper alignment on an isolated bedplate.
      a. Incorporate isolation design shown in documents.
   2. Provide bedplate blocking to elevate secondary or deflector sheave above machine room space floor.
   3. Provide hoist machine mounted direct drive, digital, closed-loop velocity encoder.
   4. Provide hoist machine drip pans to collect lubricant seepage.
   5. Provide machine with disc brake and secondary emergency brake:
      a. Provide means to prevent ascending car over speed and unintended car movement.
      b. Mount emergency brake on geared machine frame bed or suitable structural steel supports.
      c. Acceptable emergency brake devices:
         1) Hollister Whitney Rope Gripper.
      d. Provide drawing showing supports stamped by a Professional Engineer verifying the adequacy of the support provided if emergency brake device is not mounted by machine Original Equipment Manufacturer.

C. Solid State Power Conversion and Regulation Unit:
   1. Provide solid-state, alternating current, variable voltage, variable frequency (ACV³F), IGBT converter/inverter regenerative drive.
   2. Design unit to limit current, suppress noise, and prevent transient voltage feedback into building power supply:
      a. Provide internal heat sink cooling fans for the power drive portion of the converter panels.
      b. Conform to IEEE standards 519-2014 for line harmonics and switching noise.
   3. Mechanically isolate unit to minimize noise and vibration transmission.
   4. Provide isolation transformers, filter networks, and choke inductors.
   5. Suppress solid-state converter noises, radio frequency interference, and eliminate regenerative transients induced into the mainline feeders or the building standby power generator.
   6. Supplemental direct-current power for the operation of hoist machine brake, door operator, dispatch processor, signal fixtures, etc., from separate static power supply.

7. ACV³F Drives shall be regenerative and utilize IGBT converter/inverter and dynamic braking during overhauling condition.

D. Resistor Load Bank:
   1. Provide means of diverting regenerated power during emergency power operation and restoring regenerated power delivery back to the electrical distribution system following emergency power operation termination.
   2. Provide resistor load bank to discharge regenerative power during emergency power operation.
   3. Load bank shall be installed on the load side of the mainline disconnect.

E. Encoder:
   1. Direct drive, solid-state, digital type. Update car position at each floor and automatically restore after power loss.

F. Controller:
   1. UL/CSA labeled.
   2. Compartment:
      a. Securely mount all assemblies, power supplies, chassis switches, relays, etc., on a substantial, self-supporting steel frame.
      b. Completely enclose equipment with covers.
      c. Provide means to prevent overheating.
   3. Relay Design:
      a. Magnet operated with contacts of design and material to insure maximum conductivity, long life, and reliable operation without overheating or excessive wear.
      b. Provide wiping action and means to prevent sticking due to fusion.
      c. Contacts carrying high inductive currents shall be provided with arc deflectors or suppressors.
   4. Microprocessor Hardware:
      a. Provide built-in noise suppression devices that provide a high level of noise immunity on all solid-state hardware and devices.
      b. Provide power supplies with noise suppression devices.
      c. Isolate inputs from external devices (such as pushbuttons) with opto-isolation modules.
      d. Design control circuits with one leg of power supply grounded.
      e. Safety circuits shall not be affected by accidental grounding of any part of the system.
      f. System shall automatically restart when power is restored.
      g. System memory shall be retained in the event of power failure or disturbance.
      h. Equipment shall be provided with Electro Magnetic Interference (EMI) shielding within FCC guidelines.
   5. Wiring:
      a. CSA labeled copper for factory wiring.
      b. Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.
      c. Provide labels for all extra or spare wires, neatly organized at base of controller cabinet.
   6. Diagnostics:
      a. Provide an onboard monitor or screen, either inside the controller or in a stand-alone PC station, to display an easily understood format.
      b. Upon command, the current operating parameters, individual car status, floor positions or other selected operational features will be displayed.

c. A display function shall be provided to reference a minimum of twenty (20) previous errors (malfunctions), which will be transmitted to the group dispatcher data log for statistical purposes or selected hard copy printouts.
   1) A color printer shall be provided on site.
d. Diagnostic display shall be programmed for monitoring of elevator motion, velocity, door operation parameters and timing functions.
   1) Provisions shall be made to allow printing of this information at Owner's request.
e. Non-volatile memory shall be used to store group operation data with provisions for data logging and hard copy reporting.
f. A telephone data link provision shall be incorporated in the basic dispatching control system.
   1) At the Owner's request, this provision may be employed for traffic analysis, hard copy computation and/or remote monitoring of status conditions utilizing an isolated PC and compatible printer for reports or graphs.
   2) All reports shall be time and date stamped to confirm reporting period.
g. Monitor shall employ color video displays for the following information:
   1) Display screen (group operations statistics).
   2) Monitoring screen (diagnostics, system status).
   3) Performance screen (traffic analysis).
h. Features required regarding remote and additional location monitoring, as indicated in other applicable sections, apply.

7. Permanently mark components (relays, fuses, PC boards, etc.) with symbols shown on wiring diagrams.
8. Provide control panel compliant with UL 508A SB.SCCR of 5000A required.

G. Electrical Wiring and Wiring Connections:
1. Auxiliary Disconnect:
   a. Provide controller or machine mounted auxiliary, lockable "open" disconnect when machine is not visible from machine. Provide coordinated layout.
2. Conductors and Connections:
   a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
   b. Use no splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes.
3. Conduit:
   a. Use only rigid conduit in the elevator machine room for main power equipment. Minimum conduit size of ¾".
   b. EMT may be used for low-voltage control wiring.
   c. Galvanized steel conduit, EMT, or duct.
   d. Flexible conduit length not to exceed 3'-0".
4. Traveling Cables:
   a. Tag spares in machine room.
   b. Provide cables from controller to car top.
5. Auxiliary Wiring:.
   a. Provide machine room demarcation junction boxes for the fire alarm initiating devices, emergency two-way communication system, firefighters' phone, paging speaker, CCTV, digital video display, security system and card reader interface terminals and relays, intercom, announcement speaker and/or background music.
   b. Provide conduit, wiring and connections for the fire alarm initiating devices, emergency two-way communication system, firefighters' phone, paging speaker, CCTV, digital video display, security system and card reader interface terminals and relays, intercom, announcement speaker and/or background music from machine room junction box to each car controller in machine room

H. Sleeves and Guards:
1. Provide 4" steel angle guards around cable or duct slots through floor slabs or grating.
2. Provide rope and smoke guards for sheaves, cables, and cable slots in machine room.
3. Configure guards to minimize free area around cables.

I. Machine and Equipment Support Beams:
1. Refer to structural drawings.
2. Provide structural steel beams required for direct support of and attachment to building structure of hoist machine, deflector sheaves, overhead sheaves, governor, and hoist rope dead-end hitch assemblies.
3. Provide bearing plates, anchors, shelf angles, blocking, embedment, etc., for support and fastening of machine beams or equipment to the building structure.
4. Isolate machine beams to prevent noise and vibration transmission to building structure.
5. Provide ladders and platforms with handrails and toe boards for machine access within the confines of the machine room.

J. Sheaves:
1. Machined grooves and sealed bearings.
2. Provide mounting to machine beams, machine bedplate, or building structure.

K. Structural Floor:
1. Refer to structural drawings.
2. Provide template for equipment layout.

L. Governor:
1. Centrifugal-type, car machine room mounted with pull-through jaws and bi-directional shutdown switches.
2. Provide required bracketing and supports for attachment to building structure.

2.8 HOISTWAY EQUIPMENT

A. Guide Rails:
1. Planed steel T-sections for car and counterweight of suitable size and weight for the application, including brackets for attachment to building structure.
2. Provide rail backing and intermediate counterweight tie brackets.
3. Provide bracketing, at top and bottom of floor beams.
4. No additional structural points of attachment other than those shown on the Contract Documents will be provided.
   a. Review structural drawings.
   b. Note increased rail weight to achieve bracket spacing.
   c. Hoistway widths are fixed. Include all costs associated with installation in code compliant dimensions shown in Construction Documents.

B. Counterweight:
1. Steel frame with metal filler weights.
2. Provide Type “B” safety device.

C. Counterweight Guide Shoes:
1. Spring dampened roller guide shoes.

D. Counterweight Runway Guard:
1. Where counterweight is located between adjacent elevators, provide counterweight guard along entire runway next to the adjacent elevator.

E. Governor Rope and Encoder Tape Tensioning Sheaves:
1. Mount sheaves and support frame on pit floor or guide rail.
2. Provide frame with guides or pivot point to enable free vertical movement and proper tension of rope and tape.

F. Suspension Means:
1. 8 x 19 or 8 x 25 Seale construction, traction steel type:
a. Fasten with staggered length, adjustable, spring isolated wedge type shackles.

G. Terminal Stopping:
1. Provide normal and final devices.

H. Electrical Wiring and Wiring Connections:
1. Conductors and Connections:
a. Copper throughout with individual wires coded and connections on identified studs or terminal blocks.
b. Use no splices or similar connections in wiring except at terminal blocks, control compartments, or junction boxes.
c. Provide 20% spare conductors for each wire type.
d. Run spare wires from car connection points to individual elevator controllers in the machine room.
2. Conduit:
a. Galvanized steel conduit, EMT, or duct.
b. Flexible conduit between isolated equipment, length not to exceed 3’-0”.
c. Flexible heavy-duty service cord may be used between fixed car wiring and car door switches for door protective devices.
d. Provide conduit from the closest hoistway of each elevator group or single elevator to the firefighters’ control room and group control console.
e. Provide wiring.
3. Traveling Cables:
a. Flame and moisture-resistant outer cover.
b. Prevent traveling cable from rubbing or chafing against hoistway or equipment within hoistway.
c. Provide the following composition at a minimum, which shall not be considered spares:
1) Five pair of shielded 20-guage wire for card reader.
2) Two pair of shielded 18-gauge wire for CCTV, from car controller to car top junction box, plus 3'-0" excess loop at both ends.
3) Two pair of 18-gauge wire for CCTV power.
d. Provide four pair of spare shielded communication wires in addition to those required to connect specified items.
e. Tag spares in machine room. Provide cables from controller to car top.
f. Support traveling cable by suspending from supports by means that automatically tighten around the cable when tension is increased.
4. Auxiliary Wiring:
a. Provide conduit, wiring and connections for systems defined within Section 2.8, H.

I. Entrance Equipment:
1. Two-point hanger roller with non-metallic roller surface and suspension with eccentric upthrust roller adjustment.
2. Bar or formed, cold-drawn removable steel door tracks with smooth roller contact surface.
3. Dust Cover:
a. Provide dust covers at hoist way entrances that conceal the hoist way door tracks and interlocks.

b. Provide covers no less than the width of the door opening plus 12”. Mount covers securely to the header by use of metal screws with keyhole openings.
c. Cover shall be capable of being removed without need of removing screws entirely.

4. Door Interlocks:
   a. Operable door locks without retiring cam.
5. Door Closers:
   a. Spring jamb/strut mounted type.
   b. Design and adjust to ensure a smooth and quiet mechanical close of doors.
6. Future Landing, Cars 7 and 8 Floor 04: see Part 2.9.L

J. Floor Numbers:
1. Stencil paint 4" high floor designations in contrasting color on inside face of hoistway doors and hoistway fascia visible from within car.

2.9 HOISTWAY ENTRANCES

A. Entrance Assemblies:
1. Complete entrances bearing fire labels from a certified testing laboratory approved by authority having jurisdiction.
2. Provide entrance assemblies bearing 1-1/2hr UL label.
3. Paint all exposed metal in hoistway ferrous metal black.

B. Frames:
1. 14-gauge hollow metal at all floors.
2. Bolted and lapped head to jamb assembly at all floors.
3. Cars 1 - 3, 4 - 6: Provide finish material indicated in finish schedule Item 2.5, G., at floors.
4. Provide Arabic floor designation/Tactile marking plates:
   a. Centered at 60" above finished floor.
   b. Located on both side jambs of all entrances.
   c. Minimum 4” in height.
   d. Tactile marking indications shall be below Arabic floor designation.
   e. Permanently fastened.
5. Provide plates at main egress landing with “Star” designation.
   a. For designated emergency cars, Car 4-6, provide “Star of Life” cast designation plates at height of 78"-84" above finished floor on both side jambs at all floors.
6. For designated Fire Service Access Elevators, Cars 4-6, provide fire service access elevator symbol cast designation plates at height of 78"-84" above finished floor on both side jambs at all floors.

C. Transom Panels:
1. Not required.
2. Architectural element above door frame to match door frame, door panel, hall fixtures, and signage as permitted by code.

D. Door Panels:
1. 16-gauge steel, sandwich or pressed with ribbed construction and without binder angles.
2. Provide one leading edge of doors with rubber astragal.
3. Provide a minimum of two gibs per panel, one at leading and one at trailing edge with gibs in the sill groove entire length of door travel.
4. Provide one separate 4” steel reinforcement safety gib mounted between door gibs, where not integrated with door gibs.
5. Cars 1 - 3 and 4 - 6, Architectural finish around leading and trailing edge of panel and return a minimum of 1/2" on rear side of leading edge of panel at all floors.
   a. Refer to 2.5.G. and Architectural Drawings.

E. Sight Guards:
1. 14-gauge, same material, finish, and height as hoistway entrance door panels.
   a. Cars 1 - 3 and 4 - 6: Refer to RAL color provided by architect
   b. Cars 7 - 8, 9 - 12: Brushed stainless steel
2. Construct without sharp edges.

F. Sills:
1. Extruded stainless steel.
2. Refer to approved manufacturers.

G. Sill Supports:
1. Structural or formed steel designed to support door sill based upon car loading classification.
2. Grout sills in place with using a non-shrink, non-metallic grout.
3. Cars 4-6: Provide 5" x 5" x 1/2" structural steel angle, extending full width of hoistway. Fasten to building structure at maximum 18" O.C.

H. Fascia, Toe Guards and Hanger Covers:
1. 14-gauge furniture steel with black enamel Contractor's standard finish.
2. Provide hoistway width fascia, toe guards, and hanger covers for All Cars.
3. Mount covers securely to the header by use of metal screws with keyhole openings.
4. The cover shall be capable of being removed without need of removing screws entirely.
5. Delete fascia for Cars 4-6 and provide car door interlock to prevent opening of car doors outside the unlocking zone.

I. Struts and Headers:
1. Provide all support of entrances and related material to building structure.
2. Provide door open bumpers on entrances equipped with vertical struts.

J. Finish of Frames and Doors:
1. Cars 1 - 3, 4 - 6
   a. Baked enamel.
   b. Provide finish as defined:
      1) Architect to provide RAL color code.
      2) Provide matching fixture faceplates when permitted by code.
2. Cars 7 - 8, 9 - 12
   a. Satin finish stainless-steel.

K. Hoistway Access:
1. Hoistway Door Unlocking Device:
   a. Provide unlocking device with locking escutcheon in door panel at all floors, with finish to match adjacent surface.
2. Hoistway Access Switches:
   a. Mount in entrance frame side jamb at top floor.
      1) Include provisions for Car 7 and Car 8 at upper terminal landing served hoistway door frame (Level 03) and future upper terminal landing hoistway door frame (Level 04).
   b. Provide switch with faceplate, finish to match adjacent surface.

L. Future Landings
   a. Cars 7 - 8, Floor 04: provide hoistway equipment and entrance equipment for future landing. Landing will not be operational and will be sealed from the inside of the hoistway to prevent operation.

1) Include provisions for future installation of hoistway access key switches in door frame.

2.10 PIT EQUIPMENT

A. Buffers:
1. Provide Oil Spring type with blocking and support channels.

B. Pit Access:
1. Hoistway Access Key Switch:
a. Provide key switch at lowest terminal landing.
b. Mount in entrance frame side jamb.
c. Provide switch with faceplate, finish to match adjacent surface.
2. Provide pit stop switches.
3. Pit access, Cars 7 and 8: Provide pit access door switch configured to effectively remove power to elevators in the event of pit access door operation.

C. Float Switches:
1. Float switches shall be provided in each single climb-in elevator pit or lowest point of common climb-in pit.
2. Activation of pit float switch shall cause signal activation to Building Automation System.
3. Flood operation is not required.

D. Equipment Access:
1. Stencil car number on buffer.
2. Provide pit ladder Cars 1 - 3, 4 - 6, 9 - 12: Coordinate code compliant location.
3. Access ladders and platforms, Cars 7 – 8: Provide access ladders and platforms for buffers and undercar.

E. Counterweight Guard:
1. Metal guard in pit in front of counterweight where no compensation is provided or where there is no space greater than 20 inches between the compensation means, suspension means, counterweight rails, or guard(s).

2.11 CAR EQUIPMENT

A. Frame:
1. Welded or bolted or formed steel channel construction to meet load classification specified.

B. Safety Device:
1. Type “B,” flexible guide clamp.

C. Platform:
1. Design and construct to accommodate load classification requirements:
a. Cars 1 - 3, 7 - 12: Provide Class “A” construction for passenger elevators
b. Cars 4 - 6: Provide Class C3 construction for service elevators
c. Provide recess to accommodate a 3/8” epoxy terrazzo floor finish.
d. Provide floor weight allowance as identified in Front End Documents – Allowances.
1) Allow 5 lbs. per square foot for floor weight.
2. The car platform shall consist of a steel frame with necessary steel stringers, all securely welded together.
3. Provide platform with two (2) layers of 3/4" marine grade plywood.
4. Cover the underside of the car platform with sheet steel.

5. Isolate the passenger elevator platform.
   a. The support frame shall carry rubber pads on which the platform shall rest without any connection to the steel frame.
6. Work Light Fixtures and AC Receptacles:
   a. Provide permanent mounted work light fixtures below platform, complete with proper lamp guards.

D. Platform Guard:
1. Minimum 14-gauge steel, reinforced and braced to car platform front and rear with Manufacturer's standard finish.

E. Cartop Guard Rail:
1. Provide a railing system provided on the outside perimeter of the car top on all sides where the horizontal distance between the edges of the car top and the adjacent hoistway enclosure exceeds 12 in..

F. Passenger Guides:
1. Roller type with three or more spring dampened, sound-deadening rollers per shoe. Minimum 6" outside diameter.
2. Maximum roller rotation speed: 350 rpm.

G. Cab Steadying Plates:
1. Provide and install top of car steadying plates.
2. Emphasis shall be placed on proper tension to car styles allowing minimal lateral movement of the cab.
3. Steadying plates shall be isolated using non-metallic guides or rollers.

H. Sills:
1. One-piece extrusion with extension between car entrance columns to face of car front return.
2. Extruded extension to match finish of sill.
3. All Cars: Stainless Steel

I. Door Panels:
1. 16-gauge steel, sandwich or pressed with ribbed construction and without binder angles.
2. Provide one leading edge of doors with rubber astragal.
3. Provide a minimum of two gibs per panel, one at leading and one at trailing edge with gibs in the sill groove entire length of door travel, where not integrated with door gibs.
4. Construct door panels with interlocking, stiffening ribs.

J. Door Hangers:
1. Two-point suspension.
2. Hanger roller with non-metallic surface and eccentric roller adjustment.

K. Door Track:
1. Bar or formed, cold-drawn removable steel track with smooth roller contact surface.

L. Door Header:
1. Construct of minimum 12-gauge steel, shape to provide stiffening flanges.

M. Door Electrical Contact:
1. Prohibit car operation unless car door is closed.

2. Provide car door interlock to prevent opening of car doors outside the unlocking zone, where clearance between the car platform and hoistway enclosure exceeds code maximum on the loading side.

N. Door Clutch:
1. Heavy-duty clutch, linkage arms, vane assembly and pickup rollers or cams to provide positive, smooth, quiet door operation.

O. Restricted Opening Device:
1. Provide mechanical car-door restrictor to prevent opening of doors when outside unlocking zone.

P. Door Operator:
1. High speed, heavy-duty door operator capable of opening doors at no less than 2.5 f.p.s.
2. Accomplish reversal with less than 2½" of door movement.
3. Provide solid-state door control with closed loop circuitry to constantly monitor and automatically adjust door operation based upon velocity, position, and motor current.
4. Provide a minimum of four controller-based motion profiles, per floor, per door, to maintain consistent, smooth, and quiet door operation at all floors, regardless of door weight or varying air pressure.

Q. Door Reversing Device:
1. Infrared Reopening Device:
   a. Black fully enclosed device with full screen infrared matrix or multiple beams extending vertically along leading edge of each door panel to minimum height of 7'-0" above finished floor.
      1) Provide extension of housing and lens additional beams full height of door panels for door heights greater than 7’ – 0” tall.
   b. Device shall prevent doors from closing and reverse doors at normal opening speed if beams are obstructed while doors are closing, except during nudging operation.
   c. In event of device failure, provide for automatic shutdown of car at floor level with doors open.
2. Nudging Operation:
   a. After beams of door control device are obstructed for a predetermined time interval (minimum 20.0-25.0 seconds), warning signal shall sound, and doors shall attempt to close with a maximum of 2.5 foot-pounds kinetic energy.
   b. Activation of the door open button shall override nudging operation and reopen doors.
3. Interrupted Beam Time:
   a. When beams are interrupted during initial door opening, hold door open a minimum of 3.0 seconds.
   b. When beams are interrupted after the initial 3.0 second hold open time, reduce time doors remain open to an adjustable time of approximately 1.0-1.5 seconds after beams are reestablished.
4. Differential Door Time:
   a. Provide separately adjustable timers to vary time that doors remain open after stopping in response to calls.
   b. Car Call:
      1) Hold open time adjustable between 3.0 and 5.0 seconds.
   c. Hall Call:
      1) Hold open time adjustable between 5.0 and 8.0 seconds.
      2) Use hall call time when car responds to coincidental calls.

R. Car Operating Panel:

1. All Cars:
   a. Two (2) car operating panels with faceplates:
      1) Consisting of a metal box containing the vandal resistant operating fixtures, mounted behind the car stationary front and rear return panels.
   b. Suitably identify floor buttons, alarm button, door open button, door close button and emergency push-to-call button with cast tactile symbols recessed rear mounted.
      1) Push button designation shall match the architectural floor designation.
   c. Provide “door open” button to stop and reopen doors or hold doors in open position.
   d. Provide “door close” button to activate door close cycle.
      1) Cycle shall not begin until normal door dwell time for a car or hall call has expired, except firefighters’ operation.
   e. Pushbuttons:
      1) Provide vandal resistant with minimum 3/4" diameter raised floor pushbuttons which illuminate to indicate call registration.
      2) Provide brushed stainless buttons with illuminated LED halo.
      3) Provide temporary inactivated push buttons for each floor even if a key switch, card reader, and/or other devices are required.
         a) Provide space for push buttons for future landings not currently served.
      4) Service Elevators:
         a) For restricted access to a Penthouse mechanical room, provide lock-out momentary keyed switch on the Penthouse push button. The push button is to be activated by the keyed switch. Key shall not be removable in the activation position.
            (1) 7-pin Yale with removable core for MPPD.
         b) For unrestricted elevator service to the penthouse, provide a keyed switch to over-ride the Penthouse mechanical room keyed button lock-out switch; key shall be removable in all positions. Use 7-pin small format removable core. Place this over-ride switch in the top area of the car panel..
            (1) Confirm YALE or BEST with Owner.
      5) Future Travel, Cars 7 – 8: Include space in car operating panel to accommodate additional landing served if future travel is added. Provide blanks to allow for installation without drilling car operating panel.
   f. Locate operating controls no higher than 48" above the car floor; no lower than 35" for emergency push-to-call button and alarm button.
   g. Locked Firefighters Operation Panel:
      1) For fire officer use and use of car on independent service only.
      2) Openable by the same key which operates the Fire Operation switch.
      3) Including the following features:
         a) Phase II fire access switch.
         b) Firefighters’ visual indication.
         c) Call cancel button.
         d) Stop switch, manually operated.
            (1) Key should be removable in all positions; use 7-pin Yale with removable core for MPPD
            (2) Position the cylinder near the bottom of the pushbuttons with the key removable in either position and with one set of normally closed contacts.
            (3) Mark the switch with etched, engraved, or embossed “ON” and “OFF.”
         e) Door open button.
         f) Door close button.

4) Arrange manually operated stop switch to sound group control panel distress signal when actuated.

2. Service Compartment (all cars):
   a. Provide lockable service compartment with recessed flush door.
      1) Key should be removable in all positions; use Best Cylinder with removable core 7-pin Yale with removable core for MPPD and include slam door lockset.
   b. Door material and finish shall match car return panel or car operating panel faceplate.
   c. Include the following controls in lockable service cabinet with function and operating positions identified by permanent signage or engraved legend:
      1) Access switch.
      2) Light switch.
      3) Two speed fan, 3-position two-speed Exhaust blower switch
         a) Key should be removable in all positions; use Best Cylinder with removable core 7-pin Yale with removable core for MPPD.
      4) Independent service switch.
      5) Constant pressure test button for battery pack emergency lighting.
      6) 120-volt, AC, GFCI protected electrical convenience duplex outlet.
      7) Card reader override switch.
      8) Switch to select either floor voice annunciation, floor passing tone, or chime.
3. All Cars: Provide black paint filled (except as noted), engraved, or approved etched signage as follows with approved size and font:
   a. Phase II firefighters' operating instructions on inside face of firefighters' compartment door.
   b. Engrave filled red firefighters' operation on outside face of compartment door.
   c. Building identification car number on main and auxiliary car operating panel.
   d. Car capacity in pounds on main car operating panel service compartment door.
   e. Cars 4-6: Loading classification and description on car operating panel service compartment door.
   f. Provide special language engraved pertaining to the posting of the Elevator Permit.
4. All Cars: Load weighing:
   a. Audible and visual overload signaling device inside elevator cab shall be activated upon load weighing device sensing carload has reached or exceeded a pre-determined percentage of capacity.
   b. Include engraving to identify visual overload signaling device.
5. Priority Hospital Emergency, Cars 4 – 6:
   a. Refer to 2.6.I. Incorporate Priority Hospital Emergency visual indicator, instructions, and means to activate feature in Car Operating Panel.

S. Car Top Control Station:
   1. Mount to provide safe access and utilization while standing on car top.
   2. Operating device shall contain Up and Down direction buttons, a Run button, an Inspection/Automatic switch and Emergency Stop switch.
   3. Operating device shall contain an audible and visible indicator that fire recall has been initiated.
   4. This station shall be fixed to the car crosshead or may be portable provided the extension cord and housing is permanently attached to the car crosshead.
   5. The car will be operated by constant pressure on the appropriate directional button and the Run button simultaneously.
   6. Normal operating devices will be inoperative while this device is in use.

T. Emergency Audible Signal:
   1. Provide on top of each elevator.

2. Activation of Alarm Button or Emergency Stop switch will cause Emergency Audible Signal.
3. Provide battery back-up system to provide 1hr power in the event of loss of normal power.
4. Provide second alarm to be provided at pit level.

U. Work Light and Duplex Plug Receptacle:
1. GFCI protected outlet at top and bottom of car.
2. Include on/off switch and lamp guard.
3. Provide additional GFCI protected outlet on car top for installation of car CCTV.

2.12 CAR ENCLOSURE

A. Passenger Elevators, Cars 1 – 3, 7 - 8, 9 - 12: Provide complete as specified herein and detailed on architectural drawings:
1. Refer to Allowances
2. Shell:
   a. Reinforced 14-gauge furniture steel formed panels with baked enamel interior finish as selected.
   b. Apply sound-deadening mastic to exterior.
   c. Provide concealed ventilation cutouts.
3. Canopy:
   a. Reinforced 12-gauge furniture steel formed panels with lockable, contacted, hinged emergency exit.
   b. Interior finish white color reflective baked enamel.
4. Front Stationary Return Panels:
   a. Reinforced 14-gauge furniture satin stainless-steel with minimum 16-gauge with cutouts for applied car operating panels and other equipment.
5. Transom:
   a. Reinforced 14-gauge furniture steel clad with minimum 16-gauge satin stainless-steel full width of enclosure.
6. Base:
   a. Stainless-steel with concealed ventilation cutouts.
7. Finish Floor Covering:
   a. Furnished under other sections.
   b. Accommodate a minimum 3/8" floor thickness.
   c. Allow 5lbs./ft^2 for floor weight.
8. Interior Wall Finish:
   a. Include allowance for interior car finishes.
9. Ventilation:
   a. Morrison Products, Inc. two-speed model exhaust blower mounted to car canopy on isolated rubber grommets.
   b. Exhaust blower shall meet noise and vibration criteria.
10. Lighting:
   a. Include allowance for lighting.
   b. Coordinate with emergency lighting requirements.
11. Suspended Ceiling:
   a. Special design included in allowance in Item 8 above.
12. Handrails:
   a. Special design included in allowance in Item 8 above.
13. Pads and Buttons, All Cars:
   a. Three-piece removable pads.
   b. Two pads covering side walls and adjacent front returns and one covering rear wall.
   c. Provide cutouts to access main car operating panel.

B. Firefighter's Elevator, Service Elevators, Cars 4 - 6: Provide complete as specified herein:
   1. Provide watertight components.
   2. Shell:
      a. Reinforced 14-gauge satin finish stainless-steel formed panels no more than 18" wide with light-proof joints.
      b. Apply sound deadening mastic to exterior.
   3. Canopy:
      a. Reinforced 12-gauge furniture steel formed panels with lockable, contacted, hinged emergency exit.
      b. Interior finish white reflective baked enamel.
   4. Front and Rear Stationary Return Panels:
      a. Reinforced 14-gauge furniture steel clad with minimum 16-gauge textured finish stainless-steel as specified in Item 2.3.
   5. Entrance Columns and Transom:
      a. Reinforced 14-gauge furniture steel clad with minimum 16-gauge textured finish stainless-steel.
   6. Base:
      a. Stainless-steel with concealed ventilation cutouts.
   7. Finish Floor Covering:
      a. Furnished under other sections.
      b. Allow 5 lbs./ft^2 for floor weight.
      c. Service Cars 3/8" thick 3/8" epoxy terrazzo floor finish.
      d. Design for ease of replacement from within cab.
   8. Interior Wall Finish:
      a. Include allowance for interior car finishes.
   9. Ventilation:
      a. Morrison Products, Inc. two-speed model AA No. 06-01048 exhaust blower mounted to car canopy on isolated rubber grommets.
      b. Exhaust blower shall meet noise and vibration criteria.
   10. Lighting:
      a. Include allowance for lighting.
      b. Coordinate with emergency lighting requirements.
   11. Handrails/Guardrails:
      a. Include allowance for handrails and guard rails
   12. Pads and Buttons Permanently Mounted:
      a. Removable pads.
      b. Two pads covering side walls and adjacent front and rear returns.
      c. Provide cutouts to access main and auxiliary car operating panel and fire service panel.

2.13 HALL CONTROL STATIONS

A. Pushbuttons:
   1. Risers per groups:
      a. Cars 1 - 3: Provide two (2) hall control stations at each landing
      b. Cars 4 - 6: Provide two (2) hall control stations at each lobby.
         1) Front openings: Provide two (2) hall control stations at each landing
         2) Rear openings: Provide two (2) hall control stations at each landing
      c. Cars 7 - 8: Provide one (1) hall control station at each landing
         1) Provide two (2) additional hall stations to accommodate future travel
            a) Floor 03 – new intermediate hall control station
            b) Floor 04 – new upper terminal hall control station
      d. Cars 9 - 12: Provide two (2) hall control stations at each landing
   2. Provide flush mounted faceplates

a. Car 1 - 3 and Car 4-6 faceplates per architectural drawings, match elevator hoistway door frames and hoistway door finish. Architect to provide RAL color.
1) Refer to 2.5.G.

3. Include pushbuttons for each direction of travel that illuminate to indicate call registration.
a. Provide braille tags identified as “UP” and “DOWN” in each hall station.
4. Include approved engraved message and pictorial representation prohibiting use of elevator during fire or other emergency as part of faceplate.
5. Pushbutton design shall match car operating panel pushbuttons.
6. Provide vandal resistant pushbutton and light assemblies.
7. Provide LED illumination.
8. Provide Phase I Fire Service key switch, engraved operating instructions and illuminating jewel.
9. Provide communication check failure indication and silence key switch.
10. Provide illuminating jewels indicating standby power status.
11. Incorporate all items required by Code at the primary egress level into a single hall fixture.
12. Priority Service, Cars 4 – 6:
a. Hospital Emergency: Provide a means to activate hospital emergency service at each landing including rear openings where installed..
1) Coordinate activation means either key switch using Use 7-pin small format removable core or card reader.
2) Include engraving to identify feature.
13. Dual-Mode Operation, Cars 4 – 6
a. Incorporate Dual-Mode Operation. Refer to 2.6.I.
b. One (1) hall station at each landing to operate single car when Dual-Mode Operation II is selected by key switch.
c. One (1) hall station at each landing to operate remaining two (2) elevators as a group.
d. Incorporate key switch at main landing. Utilize a Use Yale 7-pin small format removable core. Engrave “Split Bank” with “on” and “off” labeled key positions.

B. Phase I Fire Service fixture:
1. Provide separate fixture including key switch, engraved operating instructions, and illuminating jewel.
2. Provide illuminating jewels indicating standby power status.
3. Include Car to Lobby Key Switches.

2.14 SIGNALS

A. Hall Direction Lantern, All Cars:
1. Provide at each entrance to indicate travel direction of arriving car.
2. Illuminate up or down LED lights and sound tone once for up and twice for down direction prior to car arrival at floor.
3. Illuminate light until the car doors start to close.
4. Sound level shall be adjustable from 20-80 dBA measured at 5'-0" in front of hall control station and 3'-0" off floor.
5. Provide advanced hall lantern notification to comply with ADA hall call notification time.
6. Provide adjustable car door dwell time to comply with ADA requirements relative to hall call notification time.
7. Hall direction lenses shall be arrow shaped with faceplates.
8. Lenses shall be minimum 2½" in their smallest dimension.
9. Locate as detailed on architectural drawings.
a. Cars 1 - 3: Provider vertical orientation located adjacent to hoistway door frame
b. Cars 4 - 6 Provider vertical orientation located adjacent to hoistway door frame

c. Cars 7 - 8: Provide horizontally orientated fixture located above hoistway door frame
d. Cars 9 - 12: Provide horizontally orientated fixture located above hoistway door frame.

B. Hall Position Indicator, All Cars:
1. Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 2½" high to indicate floor served and direction of car travel.
2. Mount integral with hall lanterns at all floors.
3. Provide vandal resistant indicator and light assemblies.

C. Car Position Indicator:
1. Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 2" high to indicate floor served and direction of car travel.
2. Locate fixture in car return panel above each car operating panel.
3. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway.
4. Illuminate proper direction arrow to indicate direction of travel.

D. Fixture Faceplate Material and Finish:
1. Hall Lantern:
a. Cars 1 - 3, 4 - 6: Painted, RAL color provided by Architect
b. Cars 7 - 8, 9 - 10: Satin stainless-steel
2. Car Position Indicator: Satin stainless-steel
3. Hall Position Indicator:
a. Cars 1 - 3, 4 - 6: Painted, RAL color provided by Architect
b. Cars 7 - 8, 9 - 10: Satin stainless-steel
4. Hoistway Access Switch.
a. Cars 1 - 3, 4 - 6: Painted, RAL color provided by Architect
b. Cars 7 - 8, 9 - 10: Satin stainless-steel
5. Phase I Key Switch Faceplate.
a. Cars 1 - 3, 4 - 6: Painted, RAL color provided by Architect
b. Cars 7 - 8, 9 - 10: Satin stainless-steel
6. Custom Design: See architectural details.
7. Tamper resistant fasteners for all fastenings exposed to the public.

E. Voice Synthesizer:
1. Provide electronic device with easily reprogrammable message and female voice to announce car direction, floor, emergency exiting instructions, etc.

2.15 COMMUNICATION

A. Car Communication System:
1. Hands-Free Phone System:
a. Two-way communication instrument in car with automatic dialing, tracking, and recall features, with shielded wiring to car controller in machine room.
b. Provide dialer with automatic rollover capability with minimum two numbers:
1) Actuate two-way communication via “Help” button.
2) Adjacent light jewel shall illuminate and flash when call is acknowledged.
3) Button shall match car operating panel pushbutton design.
4) Provide “Help” button tactile symbol, engraved signage, and Tactile marking adjacent to button mounted integral with car front return panel.
c. The device shall consist of a single pushbutton, automatic dialer with appropriate indicator lights, and all other essential features necessary to comply with ADA.

d. The emergency phone shall be Ramtel model RR833-OEM and be mounted flush on the back of a hinged door at the bottom portion of the in-car control panel and locked with a barrel key #EX513.

e. The communication device shall be as manufactured by Ramtel model RR833-OEM to match the existing elevator emergency communication system including remote location indicator and other existing features now in use.

f. A stand-alone flush box-type device is not to be used without approval of the Owner.

g. The face plate shall have, including but not necessarily limited to:

EMERGENCY PHONE
UNIVERSITY OF KENTUCKY

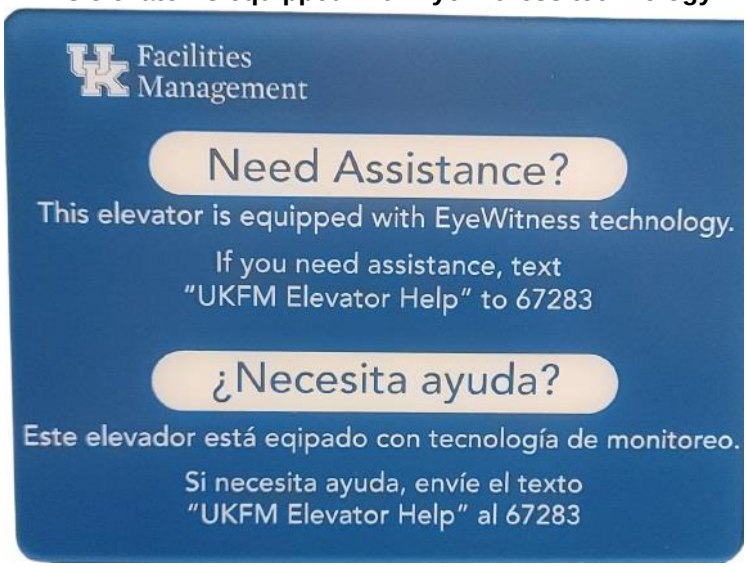
(include **UK** logo - Contact UK Public Relations for most recent logo updates)

Other information and instructions on the faceplate are as provided by the Ramtel communication device.

h. **RAVE Eyewitness Signage** should be included in every University of Kentucky owned elevator. The signs are 7.5 inches wide and 5.5 inches tall and should be installed at eye level as close to the emergency elevator call box as possible inside the elevator car. The signs are constructed from a hard plastic with quality 3M 467MP 200MP adhesive on the back. They should be UK Blue with white wording. The University Sign Shop has this on file and sample pictured below.

a. Wording should be as follows in both English and Spanish:

Need Assistance?
This elevator is equipped with EyeWitness technology.



If you need assistance, text
"UKFM Elevator Help" to 67283

Figure 1

2.

2. Emergency Personnel Communication:
   a. Communication system shall be provided allowing emergency personnel to establish communications with each elevator individually.

b. Emergency Personnel Communication shall override any existing connection outside of building.
c. Adjacent light jewel shall illuminate and flash when call is acknowledged.
d. Provide operating instructions.
e. On the same car operating panel as the phone push button, provide capability to communicate with and obtain responses from passengers.

3. Intercom System:
   a. General:
      1) Provide intercommunication system complete with talkback speaker, required auxiliary equipment and wiring.
      2) Include a preamplifier and associated equipment required to receive input from building.
      3) A battery backup system shall be provided for the two-way conversation system.
         a) The battery backup system shall be capable of providing power for a minimum of four (4) hours.
      4) If it is determined that there will not be a 24-hour manned station on the premises, then the system provided shall be capable of dialing out of the facility to a 24-hour manned answering service, or must be of the automatic dialing system and not an intercommunication system.
         a) In locations that call for Master Stations, a phone with a dedicated line shall be provided (by others).
   b. Master Stations:
      1) Fire Control Station
         a) Arrange to communicate with any other station, any group of stations or all stations simultaneously; include following devices:
            (1) Combination speaker-microphone.
            (2) Selector buttons for each station in system.
            (3) A button for simultaneous conversation with all stations in system.
            (4) Talk-listen button; press to talk, release to listen.
            (5) IN USE light to indicate when any master station is in use.
            (6) Reset Button; to disconnect call, extinguish in use light, and reset selection buttons to free system for next call.
            (7) Volume control.
      2) Machine Rooms:
         a) Arrange to communicate with other master stations and all elevator cars.
         b) In addition to devices specified for Fire Control Station, provide a loud audible signal to announce calls to this unit.
   c. Remote Stations:
      1) Provide combination speaker microphone in each elevator car as specified:
         a) Arrange to communicate with all master stations.

B. Elevator Management System and Information:
   1. General:
      a. Each controller shall provide an extensive list of output information, including data logging, fault logs operational events, performance information including car speed, floor to floor times, and door times.
      b. The system shall be real time, capable of driving remote monitors or computer terminal systems connected via Intranet system, that continually display the status of each car and call.
      c. Provide each group with a complete, interactive elevator monitoring system.
   2. The system shall concurrently display all units in a group and separate units on one screen in a graphical format and record the following information for each monitored unit:

a. Group status.
b. Individual car status with expandable menus.
c. Service Driven Outages.
d. Maintenance Activity Indicators.

3. Faults monitored with visual and audible alarm, triggered by combinations of any of the above status points. Transmit email when any monitored faults occur.
4. If out of service 15 minutes, initiate email to designated address. If fault continues more than eight hours, send email hourly until car returned to service.
5. Reporting Requirements:
   a. System shall provide reports in both tabular and graphical format, both on-screen and in printed form capability.
   b. Data for all reports shall be continuously recorded and stored.
   c. Reports shall be displayed by simply selecting a date and time range, bank of equipment, and report type.
   d. Date and time range selections shall carry forward from one report selection to the next.
   e. Reporting functions shall be sub-divided into the following categories:
      1) Traffic Reports.
      2) Fault Reports.
      3) Car Use Statistics.
      4) Group Service Log.
      5) Playback capability.

C. Service Account Interface Reporting:
1. Provide access to real-time data for elevators, including the following:
   a. Complete service history for all vertical transformation.
   b. Key performance indicators.
   c. Access to service request logs, disposition, and total downtime.
   d. Create service requests.
   e. View customer contracts.
   f. View and or accept Work Orders.
   g. Provide document repository.
2. Data shall be accessible from any device, including mobile.
3. Proper safeguards shall be confirmed, protecting clients from malware and virus receipt.

2.16 GROUP CONTROL AND FIREFIGHTERS' CONTROL PANEL

A. Elevator Control System, Cars 1 - 3, 4 - 6, 7 - 8, 9 - 12:
1. Provide a CPU and minimum 17" diagonal flat screen color monitor with the capability to activate, display, monitor, or control the following functions:
   a. On/off means to place car in or out of service.
      1) When placed in "off" position, return cars nonstop to designated floor and park with doors open for adjustable period of 1 to 3 minutes.
      2) At expiration of time, restore car to service.
   b. Car operating on normal/standby power.
   c. Car position and direction of travel.
   d. Car calls.
   e. Hall calls.
   f. Operating mode.
   g. Door status.
   h. Delayed car.
   i. Load weighing and by-pass.
   j. Car to lobby feature.
   k. Car in/out of service.
   l. Emergency power.

m. Firefighters' operation.
n. Alarm distress signal.
o. Card reader override.
p. Individual car on/off provisions.

2. Fixtures and monitor shall be located as directed by Contractor.
3. Where applicable, identify all indicators and manual switches with appropriate engraving.
4. Provide wiring and conduit to control panel.
   a. Coordinate size and location with Architect.

B. Firefighters' Control Panel:
1. Locate in building fire control room or as directed by Contractor.
2. Fixture faceplate, stainless-steel, satin finish, including the following features:
   a. Car position and direction indicator, digital-readout or LCD flat screen color monitor.
      1) Identify each position indicator with car number and group identification.
   b. Indicator showing operating status of car.
   c. Manual car standby power selection switches and power status indicators.
   d. Two-position firefighters' emergency return switches and indicators with engraved instructions filled red.
   e. Car to lobby key switches.
   f. Designate FSAE elevators.
   g. Dual mod Operation Key Switch, Cars 4 – 6.
   h. Master Station: Two-way communication inside service cabinet integral to control panel.
3. Where applicable, identify all indicators and manual switches with appropriate engraving.
4. Provide wiring and conduit to control panel.
   a. Coordinate size and location of conduit with Contractor.

C. Security Lobby Panel:
1. Locate in greater desk, as directed by Architect, refer to A201.A.
2. Fixture faceplate, stainless-steel, satin finish, including the following features:
   a. Car position and direction indicator, digital-readout or LCD flat screen color monitor.
      1) Identify each position indicator with car number and group identification.
   b. Indicator showing operating status of car.
   c. Car standby power status indicators.
   d. Two-position firefighters' emergency return switches and indicators with engraved instructions filled red.
   e. Designate FSAE elevators.
3. Where applicable, identify all indicators and manual switches with appropriate engraving.
4. Provide wiring and conduit to control panel.
   a. Coordinate size and location of conduit with Contractor.
5. Provide Car to Lobby key switches.
6. Provide the means in the Security Lobby Panel for automatic return to the primary landing.

D. Firefighters' Key Box: provide one (1) per group.
1. Flush-mounted box with lockable hinged cover.
2. Engrave instructions for use on cover per Local Fire Authority requirements.
3. Locate as directed by Architect at primary recall floor.

E. Machine Room Monitoring and Display System with Battery Backup:
1. Provide groups of elevators with a monitoring system in the Chief Engineer's office, or as directed by Architect, with color monitor.

2. System shall be a Windows based operating system capable of outputting to external media. As a minimum, system shall display the following functions:
   a. Car operating in normal/standby power.
   b. Car position and direction of travel.
   c. Car and hall calls.
   d. Operating mode.
   e. Door status.
   f. Delayed car.
   g. Load weighing and by-pass.
   h. Car to lobby feature.
   i. Car in/out of service.
   j. Emergency power.
   k. Firefighters' operation.
   l. Alarm distress signal.
   m. Card reader override.
      1) Individual car on/off provisions.
3. System Performance Monitoring:
   a. Hall call registration information:
      1) Provide memory capacity for at least the preceding five, 24-hour periods, in blocks of 5- or 15-minute segments, running hour to hour (i.e., 2:00 p.m. to 3:00 p.m.).
      2) Visual and printed summary of hall call registration events by floor, direction, and duration, totaled in 5- or 15-minute segments during any 60-minute block using an internal clock.
      3) Visual and printed summary of hall call registration duration averaged for 5- or 15-minute and hourly periods.
      4) Visual and printed summary of percentage of hall calls answered within 30 and 60 seconds in each 5- or 15-minute and hourly periods.
      5) Visual and printed summary of time periods during which individual cars are not in group operation (operating separately or out of service).
   b. Accumulate system fault data including nature of fault, time, and day.
   c. Store and retrieval capabilities for minimum 30-day period.
4. Provide printer to produce a hard copy of stored data.
5. Provide directions and software to accomplish information retrieval.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to beginning installation of equipment examine hoistway and machine room space areas.

B. Verify no irregularities exist that affect execution of work specified.

C. Verify electrical power location and characteristics in coordination with equipment requirements.

D. Do not proceed with installation until work in place conforms to project requirements.

3.2 INSTALLATION

A. Install all equipment in accordance with Contractor’s instructions, referenced codes, specification, and approved submittals.

B. Install machine room equipment with clearances in accordance with referenced codes and specification.

C. Install all equipment so it may be easily removed for maintenance and repair.

D. Provide any required hoisting/safety beams.

E. Install all equipment to afford maximum accessibility, safety, and continuity of operation.

F. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel.
   1. All exposed equipment and metal work installed as part of this work which does not have architectural finish.
   2. Machine room equipment, hoistway equipment including guide rails, guide rail brackets, and pit equipment.
   3. Neatly touch up damaged factory-painted surfaces with original paint color. Protect machine-finish surfaces against corrosion.

G. Fill hoistway door frames, back boxes for hallway stations and signal devices, and sills.

H. Clean all architectural finishes and replace or restore any surfaces damaged during construction to like new condition.

3.3 FIELD QUALITY CONTROL

A. Acceptance Testing:
   1. On completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by governing regulations and agencies.

B. Operating Test:
   1. When emergency power is provided for the new elevator system, the elevators shall be tested under a full load on the generator. Include all emergency lighting and other emergency loads connected to the generator.
   2. Fireman’s Service shall be tested under emergency power conditions.
   3. Operate continuously for 30 minutes over full travel distance, stopping at each level and proceeding immediately to the next.
   4. Record temperature rise of elevator machine during 30-minute test period.
   5. Record failure to perform as required.

C. Advise Contractor, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on elevators.

D. Independent final installation review for conformance to construction documents by Owner’s Consultant.

3.4 CONSTRUCTION TOLERANCES

A. Install rails plumb and align vertically with tolerance of 1/16" in 100'-0".
   1. Secure joints without gaps and file any irregularities to a smooth surface.

3.5 ADJUSTING

A. Static balance car to equalize pressure of guide shoes on guide rails.
   1. Dynamically balance car and counterweight.

B. Lubricate all equipment in accordance with Contractor’s instructions.

C. Adjust motors, power conversion units, brakes, controllers, leveling switches, limit switches, stopping switches, door operators, interlocks, and safety devices to achieve specified performance levels.

3.6 CLEANING

A. Keep work areas orderly and free from debris during progress of project.

B. Remove packaging materials on a daily basis.

C. Remove all loose materials and filings resulting from work.

D. Clean machine room equipment and floor.

E. Clean hoistways, car, car enclosure, entrances, operating and signal fixtures.

F. Clean pit equipment and floor.

3.7 DEMONSTRATION:

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to operate all aspects of elevators while in normal operation.

B. All non-propriety controls, tools, passwords, equipment, parts, and training necessary to service the elevator be provided to the University of Kentucky by the manufacturer and/or the Contractor.

C. Check operation of each elevator with Owner's personnel present before date of Substantial Completion and again not more than one month before end of warranty period.
   1. Determine that operation systems and devices are functioning properly.

3.8 PROTECTION

A. Temporary Use: Comply with the following requirements for each elevator used for construction purposes:
   1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
   2. Provide strippable protective film on entrance and car doors and frames.
   3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
   4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
   5. Do not load elevators beyond their rated weight capacity.
   6. Engage elevator Installer to provide full maintenance service.
      a. Include preventive maintenance, repair, or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity.
      b. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
   7. Engage Elevator Installer to restore damaged work, if any, so no evidence remains of correction.
      a. Return items which cannot be refinished in the field to the shop, make required repairs, and refinish entire unit, or provide new units as required.

PART 4 - APPENDIX – TRIDIUM BUILDING AUTOMATION SYSTEM MONITORING POINTS

142000S02 ELEVATORS Appendix 1

APPENDIX 1			
Elevator Monitoring Tridium Minimum Points List – UK MCPPD			
Point List	**Point Type**	**Alarmable**	**Description**
Floor	ANALOG INPUT	NO	Current Floor Card is on or floor being called to
Controller Power	BINARY INPUT	YES	Power condition of controller
Controller Communications	BINARY INPUT	YES	Communication condition of controller
Up Direction	BINARY INPUT	NO	Travel Direction
Down Direction	BINARY INPUT	NO	Travel Direction
Door Open	BINARY INPUT	NO	Door Open Limit
Door Closed	BINARY INPUT	NO	Door Close Limit
In Normal Service	BINARY INPUT	NO	Service Condition
Inspection Service	BINARY INPUT	NO	Service Condition
Independent Service	BINARY INPUT	NO	Service Condition
Fire Service	BINARY INPUT	NO	Service Condition
Door Disabled	BINARY INPUT	YES	The doors appear to be disabled for use.
Emergency Power	BINARY INPUT	YES	Power condition of controller
Safety Circuit	BINARY INPUT	YES	An electrical contact wired in the main safety circuit is open. Car will not run. May be a temporary condition.
Door Fully Open and Locked at the Same Time	BINARY INPUT	YES	The doors appear to be locked and fully open simultaneously.
Bypass System Fault	BINARY INPUT	YES	Either the car door or hall door bypass switch (or circuit) has failed.
Door Lock Relay Fault	BINARY INPUT	YES	Either the car gate or the hall door relay (or input) has failed.
Door Zone Relay Fault	BINARY INPUT	YES	The door zone relay (or input) has failed)
Emergency Stop Relay Fault	BINARY INPUT	YES	Either the GTS or GTSX relay has failed.
Inspection Switch Fault	BINARY INPUT	YES	An Inspection switch or input has failed.
Level Relay Fault	BINARY INPUT	YES	The LVL relay has failed.
Stop Relay Fault	BINARY INPUT	YES	The STOP relay has failed.
Door Lock System Fault	BINARY INPUT	YES	Either the car gate or a hall door lock has been shunted.
Governor Contact System Fault	BINARY INPUT	YES	The overspeed governor has activated.
Front Door Limit System Fault	BINARY INPUT	YES	One of the two front door limit switches has failed in the open state.
Rear Door Limit System Fault	BINARY INPUT	YES	One of the two rear door limit switches has failed in the open state.
Contactor Drop System Fault	BINARY INPUT	YES	Contactor proofing fault (a monitored contactor did not drop as expected).
Unintended Movement System Fault	BINARY INPUT	YES	The car has left the floor with doors open.
Car Stop Bypass Relay Fault	BINARY INPUT	YES	The CSB relay has failed.
Drive Fault	BINARY INPUT	YES	The drive has declared a fault (or the DDRV relay has failed).
Down Relay Fault	BINARY INPUT	YES	The D relay has failed.
Up Relay Fault	BINARY INPUT	YES	The U relay has failed.

142000S02 ELEVATORS Appendix 1 **Page 1 0f 1**
Date: 3/2023
Applies to: All Projects
University of Kentucky

END OF SECTION

SECTION 200100 - GENERAL PROVISIONS - MECHANICAL

1. GENERAL

A. The Advertisement for Bids, Instructions to Bidders, Bidding Requirements, General, Special and Supplementary Conditions, and all other contract documents shall apply to the Contractor's work as well as to each of his Sub-Contractor's work. All manufacturers, suppliers, fabricators, contractors, etc. submitting proposals to any part if for work, services, materials or equipment to be used on or applied to this project are hereby directed to familiarize themselves with all documents pertinent to this Contract. In case of conflict between these General Provisions and the General and/or Special Conditions, the affected Contractor shall contact the Engineer for clarification and final determination.

B. Each Proposer shall also be governed by any unit prices and Addenda insofar as they may affect his part of the work or services.

C. The work included in this division consists of the furnishing of all labor, equipment, transportation, excavation, backfill, supplies, material, appurtenances and services necessary for the satisfactory installation of the complete and operating Mechanical System(s) indicated or specified in the Contract Documents.

D. Any materials, labor, equipment or services not mentioned specifically herein which may be necessary to complete or perfect any part of the Mechanical Systems in a substantial manner, in compliance with the requirements stated, implied or intended in the drawings and/or specifications, shall be included as part of this Contract.

E. It is not the intent of this section of the specifications to make any Contractor, other than the General Contractor (or Construction Manager, if applicable), responsible to the Owner, Architect and Engineer. All transactions such as submittal of shop drawings, claims for extra costs, requests for equipment or materials substitution, shall be routed through the General Contractor to the Architect (if applicable), then to the Engineer. Also, this section of the specifications shall not be construed as an attempt to arbitrarily assign responsibility of work, material, equipment or services to a particular trade or Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be optional.

F. It is the intent of this Contract to deliver to the Owners a "like new" project once work is complete. Although plans and specifications are complete to the extent possible, it shall be the responsibility of the Contractors involved to remove and/or relocate or re-attach any existing or new systems which interfere with new equipment or materials required for the complete installation without additional cost to the Owner.

G. In general, and to the extent possible, all work shall be accomplished without interruption of existing facilities operations. The Contractor shall advise the Owners at least two weeks prior to the interruption of any services or utilities. The Owners shall be advised of the exact time that interruption will occur and the length of time the interruption will last. Failure to comply with this requirement may result in complete work stoppage by the Contractors involved until a complete schedule of interruptions can be developed.

H. Definitions and Abbreviations

(1) Contractor - Any Contractor whether proposing or working independently or under the supervision of a General Contractor and/or Construction Manager and who installs any type of

mechanical work (Controls, Plumbing, HVAC, Sprinkler, Gas Systems, etc.) or, the General Contractor.

(2) Engineer - The Consulting Mechanical-Electrical Engineers either consulting to the Owners, Architect, other Engineers, etc. In this case: CMTA, Inc., Consulting Engineers.

(3) Architect - The Architect of Record for the project.

(4) Furnish - Deliver to the site in good condition and turn over to the Contractor who is to install.

(5) Provide - Furnish and install complete, tested and ready for operation.

(6) Install - Receive and place in satisfactory operation.

(7) Indicated - Listed in the Specifications, shown on the Drawings or Addenda thereto.

(8) Typical - Where indicated repeat this work, method or means each time the same or similar condition occurs whether indicated or not.

(9) Contract Documents - All documents pertinent to the quality and quantity of work to be performed on this project. Includes, but not limited to: Plans, Specifications, Instructions to Bidders, General and Special Conditions, Addenda, Alternates, Lists of Materials, Lists of Sub-Contractors, Unit Prices, Shop Drawings, Field Orders, Change Orders, Cost Breakdowns, Schedules of Value, Periodical Payment Requests, Construction Contract with Owners, etc.

(10) Proposer - Any person, agency or entity submitting a proposal to any person, agency or entity for any part of the work required under this contract.

(11) OSHA - Office of Safety and Health Administration.

(12) SBC - State Building Code.

(13) The Project - All of the work required under this Contract.

(14) NEC - National Electrical Code.

(15) NFPA - National Fire Protection Association.

(16) ASME - American Society of Mechanical Engineers.

(17) AGA - American Gas Association.

(18) SMACNA - Sheet Metal and Air Conditioning Contractors National Association.

(19) ANSI - American National Standards Institute.

(20) ASHRAE - American Society of Heating, Refrigeration and Air Conditioning Engineers.

(21) NEMA - National Electrical Manufacturers Association.

(22) UL - Underwriters Laboratories.

(23) ADA - Americans with Disabilities Act.

(24) IMC - International Mechanical Code.

(25) IECC - International Energy Conservation Code.

(26) IFGC - International Fuel Gas Code.

I. Required Notices:

(1) Ten days prior to the submission of a proposal, each proposer shall give written notice to the Engineer of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted. In the absence of such written notice, Proposers signify that they have included the cost of all required items in the proposal and that the Proposer will be responsible for the safe and satisfactory operation of the entire system.

2. INTENT

A. It is the intention of the Contract Documents to call for finished work, tested and ready for operation.

B. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

3. DRAWINGS AND SPECIFICATIONS

A. The drawings are diagrammatic only and indicate the general arrangement of the systems and are to be followed. If deviations from the layouts are necessitated by field conditions, detailed layouts of the proposed departures shall be submitted to the Engineer for approval before proceeding with the work. The drawings are not intended to show every item which may be necessary to complete the systems. All proposers shall anticipate that additional items may be required and submit their bid accordingly.

B. The drawings and specifications are intended to supplement each other. No Proposer shall take advantage of conflict between them, or between parts of either. Should this condition exist, the Proposer shall request a clarification not less than twelve days prior to the submission of the proposal so that the condition may be clarified by Addendum. In the event that such a condition arises after work is started, the interpretation of the Engineer shall be final.

C. The drawings and specifications shall be considered to be cooperative and anything appearing in the specifications which may not be indicated on the drawings or conversely, shall be considered as part of the Contract and must be executed the same as though indicated by both.

D. Contractor shall make all his own measurements in the field and shall be responsible for correct fitting. He shall coordinate this work with all other branches of work in such a manner as to cause a minimum of conflict or delay.

E. The Engineer shall reserve the right to make adjustments in location of piping, ductwork, equipment, etc. where such adjustments are in the interest of improving the project.

F. Should conflict or overlap (duplication) of work between the various trades become evident, this shall be called to the attention of the Engineer. In such event neither trade shall assume that he is to be relieved of the work which is specified under his branch until instructions in writing are received from the Engineer.

G. Unless dimensioned, the mechanical drawings only indicate approximate locations of equipment, piping, ductwork, etc. Dimensions given in figures on the drawings shall take precedence over scaled dimensions and all dimensions, whether given in figures or scaled, shall be verified in the field to ensure no conflict with other work.

H. Each Proposer shall review all drawings including Architectural, Mechanical, Electrical, Fire Protection, Landscaping, Structural, Surveys, etc., to ensure that the work he intends to provide does not encroach a conflict with or affect the work of others in any way. Where such effect does occur, it shall be the Proposer's responsibility to satisfactorily eliminate any such encroachment conflict or effect prior to the submission of his proposal. Each Proposer shall in particular ensure that there is adequate space to install his equipment and materials. Failure to do so shall result in the correction of such encroachment conflict or effect of any work awarded the proposer and shall be accomplished fully without expense to others and that they are reasonably accessible for maintenance. Check closely all mechanical and electrical closets, chases, ceiling voids, wall voids, crawl spaces, etc., to ensure adequate spaces.

I. Where on the drawings a portion of the work is drawn out and the remainder is indicated in outline, or not indicated at all, the parts drawn out shall apply to all other like portions of the work. Where ornamentation or other detail is indicated by starting only, such detail shall be continued throughout the courses or parts in which it occurs and shall also apply to all other similar parts of the work, unless otherwise indicated.

J. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

K. Where on the Drawings or Addenda the word typical is used, it shall mean that the work method or means indicated as typical shall be repeated in and each time it occurs whether indicated or not.

L. Special Note: Always check ceiling heights indicated on Architectural Drawings and Schedules and ensure that they may be maintained after all mechanical and electrical equipment is installed. Do not install equipment in the affected area until the conflict is resolved.

4. EXAMINATION OF SITE AND CONDITIONS

A. Each Proposer shall inform himself of all of the conditions under which the work is to be performed, the site of the work, the structure of the ground, above and below grade, the obstacles that may be encountered, the availability and location of necessary facilities and all relevant matters concerning the work. Each Proposer shall also fully acquaint himself with all existing conditions as to ingress and egress, distance of haul from supply points, routes for transportation of materials, facilities and services, availability of utilities, etc. His proposal shall cover all expenses or disbursements in connection with such matters and conditions. No allowance will be made for lack of knowledge concerning such conditions after bids are accepted.

5. EQUIPMENT AND MATERIALS SUBSTITUTIONS OR DEVIATIONS

A. When any Contractor requests approval of materials and/or equipment of different physical size, capacity, function, color, access, it shall be understood that such substitution, if approved, will be made without additional cost to anyone other than the Contractor requesting the change regardless of changes in connections, space requirements, electrical characteristics, electrical services, etc., from that indicated. In all cases where substitutions affect other trades, the Contractor requesting such substitutions shall advise all such Contractors of the change and shall remunerate them for all necessary changes in their work. Any drawings, Specifications, Diagrams, etc., required to describe and coordinate such substitutions or deviations shall be professionally prepared at the responsible Contractor's expense. Review of Shop Drawings by the Engineers does not in any way absolve the Contractor of this responsibility.

B. Notwithstanding any reference in the specifications to any article, device, product, material, fixture, form, or type of construction by name, make or catalog number, such reference shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition; any devices, products, materials, fixtures, forms, or types of construction which, in the judgment of the Engineer, are equivalent to those specified are acceptable, provided the provisions of Paragraph (A) immediately preceding are met. Requested substitutions shall be submitted to the Engineer a minimum of twelve days prior to bids.

C. Wherever any equipment and material is specified exclusively only such items shall be used unless substitution is accepted in writing by the Engineers.

D. Each Proposer shall furnish along with his proposal a list of specified equipment and materials which he is to provide. Where several makes are mentioned in the specifications and the Contractor fails to state which he proposes to furnish, the Engineer shall choose any of the makes mentioned without change in price. Inclusion in this list shall not ensure that the Engineers will approve shop drawings unless the equipment, materials, etc., submitted in shop drawings is satisfactorily comparable to the items specified and/or indicated.

6. SUPERVISION OF WORK

A. The Contractor shall personally supervise the work for which he is responsible or have a competent superintendent, approved by the Engineers, on the work at all times during progress with full authority to act for him.

7. CODES, RULES, PERMITS, FEES, INSPECTIONS, REGULATIONS, ETC.

A. The Contractor shall give all necessary notices, obtain and pay for all permits, government sales taxes, fees, inspections and other costs, including all utility connections, meters, meter settings, taps, tap fees, extensions, water and/or sewer system development charge, etc. in connection with his work. He shall also file all necessary plans, prepare all documents and obtain all necessary approvals of all governmental departments and/or the appropriate municipality or utility company having jurisdiction, whether indicated or specified or not. He shall hire an independent Registered Engineer to witness installations and provide necessary certifications where required by utility companies, municipal agencies or others that have review authority. He shall also obtain all required certificates of inspection for his work and deliver same to the Engineers before request for acceptance and final payment for the work. Ignorance of Codes, Rules, Regulations, Laws, etc. shall not render the Contractor irresponsible for compliance. The Contractor shall also be versed in all Codes, Rules and Regulations pertinent to his part of the work prior to submission of a proposal.

B. The Contractor shall include in his work, without extra cost, any labor, materials, services, apparatus and drawings in order to comply with all applicable laws, ordinances, rules and regulations, whether or not indicated or specified.

C. All materials furnished and all work installed shall comply with the National Fire Codes of the National Fire Protection Association, with the requirements of local utility companies, or municipalities and with the requirements of all governmental agencies having jurisdiction.

D. All materials and equipment so indicated and all equipment and materials for the electrical portion of the mechanical systems shall bear the approval label of, or shall be listed by the Underwriters' Laboratories (UL), Incorporated. Each packaged assembly shall be approved as a package. Approval of components of a package shall not be acceptable. Where required by the Code and/or the Authority Having Jurisdiction, provide the services of a field labeling agency to provide a UL label for the entire system in the field under evaluation.

E. All plumbing work is to be constructed and installed in accordance with plans and specifications which have been approved in their entirety and/or reflect any changes requested by the State Department of Health. Plumbing work shall not commence until such plans are in the hands of the Contractor.

F. All Heating, Ventilation and Air Conditioning work shall be accomplished in accordance with the local Building Code and amendments thereto, the latest standards recognized by the American Society of Heating, Refrigerating and Air Conditioning and the National Fire Protection Association. Contractor shall secure a permit from the Division of HVAC. Final inspection certificate shall be provided by Contractor and a copy included in Operation and Maintenance Manuals.

G. All pressure vessel installations shall comply with the State, and/or Federal Code applicable. A Certificate of Final Boiler Inspection shall be required.

H. The Contractor shall furnish three (3) copies of all Final Inspection Certificates obtained to the Engineer when work is complete. Final payment for work will be contingent upon compliance with this requirement.

I. Where minimum code requirements are exceeded in the Design, the Design shall govern.

J. The Contractor shall ensure that his work is accomplished in accord with the OSHA Standards and that he conducts his work and the work of his personnel in accord with same.

K. The installation of all fuel storage tanks and associated piping, whether interior or exterior, shall be inspected by the State Fire Marshal, Hazardous Materials Section, before backfill. Submit certificate of this inspection to the Engineers.

L. Work in elevators, elevator shafts and elevator equipment rooms shall comply with the Elevator Code enforced by the local Building Code

M. All work relating to the handicapped shall be in accord with regulations currently enforced by the local Building Code and the American Disabilities Act.

N. All work in conjunction with a natural gas installation shall, in addition to all other Codes, Rules, Regulations, Standards, etc., comply with the requirements of the local gas supplier and/or standards and recommendations of the American Gas Association.

O. All work in relation to domestic water systems shall, in addition to all other Codes, Rules, Regulations and Standards, be in compliance with the requirements of the local water utility company and the adopted edition of the 10 States Standards.

P. All work in relation to the installation of sanitary or storm sewers shall, in addition to all other Codes, Rules, Regulations and Standards, be in compliance with the local agency governing such installations and the adopted edition of the 10 States Standards.

Q. All work relating to the handicapped shall be in accord with regulations currently enforced by the local Building Code and the American Disabilities Act.

R. The Contractor shall provide the services of a qualified third party independent inspector to perform all required special inspections required by local Building Code, as follows:

(1) Mechanical and Electrical Component Seismic Bracing per IBC 1705.

8. EQUIPMENT AND PIPING SUPPORT

A. Each piece of equipment, apparatus, piping, or conduit suspended from the structure or mounted above the floor level shall be provided with suitable structural support, pipe stand, platform or carrier in accordance with the best recognized practice. Such supporting or mounting means shall be provided by the Contractor for all equipment and piping. Exercise extreme care that structural members of building are not overloaded by such equipment. Provide any required additional bracing, cross members, angles, support, etc., as indicated or required by the Structural Engineer. This, in some instances, will require the Contractor to add an angle to a joist to transfer the load to a panel point. If in doubt, contact the Structural Engineer.

9. DUCT AND PIPE MOUNTING HEIGHTS

A. All exposed or concealed ductwork, piping, etc., shall be held as high as possible unless otherwise noted and coordinated with all other trades. Exposed piping and ductwork shall, insofar as possible, run perpendicular or parallel to the building structure.

10. COST BREAKDOWNS (SCHEDULE OF VALUES)

A. Within thirty days after acceptance of the Contract, the Contractor shall furnish to the Engineer, one copy of a detailed cost breakdown on each respective area of work. These cost breakdowns shall be made in a format approved by the Engineer. Payments will not be made until satisfactory cost breakdowns are submitted.

11. CORRECTION PERIOD

A. All equipment, apparatus, materials, and workmanship shall be the best of its respective kind. The Contractor shall replace all parts at his own expense, which are proven defective as described in the General Conditions. The effective date of completion of the work shall be the date of the Architect's or Engineer's Statement of Substantial Completion. Items of equipment which have longer guarantees, as called for in these specifications, shall have warranties and guarantees completed in order, and shall be in effect at the time of final acceptance of the work by the Engineer. The Contractor shall present the Engineer with such warranties and guarantees at the time of final

acceptance of the work. The Owner reserves the right to use equipment installed by the Contractor prior to date of final acceptance. Such use of equipment shall not invalidate the guarantee except that the Owner shall be liable for any damage to equipment during this period, due to negligence of his operator or other employees. Refer to other sections for any special or extra warranty requirements.

B. It is further clarified that all required and specified warranties shall begin on the date of Substantial Completion, not at the time of equipment start-up.

C. All gas fired heat exchangers shall have 20-year warranty.

D. All compressors shall have five-year warranty.

12. COMPUTER-BASED SYSTEM SOFTWARE

A. For all equipment, controls, hardware, computer-based systems, programmable logic controllers, and other materials provided as a part of the work, software that is installed shall be certified in writing to the Engineer and Owner by the manufacturer and/or writer to be free of programming errors that might affect the functionality of the intended use.

13. CHANGES IN MECHANICAL WORK

REFER TO GENERAL AND SPECIAL CONDITIONS.

14. CLAIMS FOR EXTRA COST

REFER TO GENERAL AND SPECIAL CONDITIONS.

15. SURVEY, MEASUREMENTS AND GRADE

A. The Contractor shall lay out his work and be responsible for all necessary lines, levels, elevations and measurements. He must verify the figures shown on the drawings before laying out the work and will be held responsible for any error resulting from his failure to do so.

B. The Contractor shall base all measurements, both horizontal and vertical from established bench marks. All work shall agree with these established lines and levels. Verify all measurements at the site and check the correctness of same as related to the work.

C. Should the Contractor discover any discrepancy between actual measurements and those indicated, which prevents following good practice or the intent of the contract documents, he shall promptly notify the Engineer and shall not proceed with this work until he has received instructions from the Engineer on the disposition of the work.

16. TEMPORARY USE OF EQUIPMENT

A. The permanent heating and plumbing equipment, when installed, may be used for temporary services, with the consent of the Engineers. Should the permanent systems be used for this purpose the Contractors shall make all temporary connections required at their expense. They shall also make any replacement required due to damage wear and tear, etc., leaving the same in "as new" condition.

B. Permission to use the permanent equipment does not relieve the Contractors from the responsibility for any damages to the building construction and/or equipment which might result because of its use.

C. A pre-start-up conference shall be held with the Architect, Owner, General Contractor and the Mechanical Contractor. Equipment shall not be started until after this meeting.

D. During all phases of construction:

(1) Air Handling Units:

a. At a minimum, four complete sets of filter media are required for each unit. In each unit, install two sets of filter media during construction (more shall be required if construction activities dictate more frequent changes). In each unit, install one set of filter media at substantial completion. Leave one set of filter media in boxes in appropriate mechanical room as a spare set for the Owner. All other filters shall be used by the Contractor during construction. Dispose of all construction filter media.

b. On the outside of all return air openings install a minimum of two sets of fiberglass filter media, such as cheesecloth, to be utilized as pre-filters for the “construction” filters. Install first set upon start-up and then install second set when first set is dirty. Dispose of all dirty construction filters. Change filters as often as necessary to keep units from becoming dirty at no additional cost.

c. At substantial completion of the project the entire unit shall be cleaned to present a like “new” unit for the Owner and all filters shall be replaced with new.

E. The contractor shall be allowed to use the above-mentioned units and its associated ductwork provided the following conditions are met:

(1) The return air ductwork main shall be disconnected above the ceiling to utilize the space above the ceiling as a plenum. This shall prevent the return air ductwork from being used.

(2) Four sets of fiberglass filter media shall be installed at all of the inlets of each air handling unit. A differential pressure gauge shall be installed and the filter media shall be changed whenever a 1.0” wg pressure differential is present across the filter media. This shall be reviewed and recorded weekly by the contractor. The contractor is responsible for any temporary duct modifications as required to install the filter media.

(3) The MERV 14 final filters shall be installed prior to the start-up of the air handling units. These shall be replaced whenever a 1.5” wg pressure differential is present. This shall be reviewed and recorded weekly.

(4) The contractor shall replace all filter media with new and connect all ductwork to the units prior to the start of balancing any duct systems.

(5) Upon completion of the project the entire unit shall be cleaned to present a like “new” unit for the owner and all filters shall be replaced with new.

17. TEMPORARY SERVICES

A. The Contractor shall arrange any temporary water, electrical and other services which he may require to accomplish his work. Refer also to General and Special Conditions.

18. RECORD DRAWINGS

A. The Contractor shall ensure that any deviations from the Design are as they occur recorded in red, erasable pencil on record drawings kept at the jobsite. The Engineer shall review the record documents from time to time to ensure compliance with this specification. Compliance shall be a contingency of final payment. Pay particular attention to the location of under floor sanitary and water lines, shut-off valves, cleanouts and other appurtenances important to the maintenance and operation of Mechanical Systems. Also, pay particular attention to Deviations in the Control Systems and all exterior utilities. Keep information in a set of drawings, either hard copy of electronic pdf set aside at the job site especially for this purpose.

19. MATERIALS AND WORKMANSHIP

A. All equipment, materials and articles incorporated in the work shall be new and of comparable quality to that specified. Each Proposer shall determine that the materials and/or equipment he proposes to furnish can be brought into the building(s) and installed within the space available. In certain cases, it may be necessary to remove and replace walls, floors and/or ceilings and this work shall be the responsibility of the Contractor. All equipment shall be installed so that all parts are readily accessible for inspection, maintenance, replacement of filters, etc. Extra compensation will not be allowed for relocation of equipment for accessibility or for dismantling equipment to obtain entrance into the building(s). Ensure, through coordination, that no other Contractor seals off access to space required for equipment, materials, etc.

B. Materials and equipment, where applicable, shall bear Underwriters' Laboratories label where such a standard has been established.

C. Use extreme care in the selection of equipment and its installation to ensure that noise and vibration are kept at a minimum. The Engineer's determination shall be final and corrections to such discrepancies shall be made at the cost of the Contractor.

D. Each length of pipe, fitting, trap, fixture and device used in the plumbing or drainage systems shall be stamped or indelibly marked with the weight or quality thereof and with the manufacturer's mark or name.

E. All equipment shall bear the manufacturer's name and address. All electrically operated equipment shall bear a data plate indicating required horsepower, voltage, phase and ampacity.

20. COOPERATION AND COORDINATION WITH OTHER TRADES

A. The Contractor shall give full cooperation to all other trades and shall furnish in writing with copies to the Engineer, any information necessary to permit the work of other trades to be installed satisfactorily and with the least possible interference or delay.

B. Where any work is to be installed in close proximity to, or will interfere with work of other trades, each shall cooperate in working out space conditions to make a satisfactory adjustment. If so directed by the Engineer, the Contractor shall prepare composite working drawings and sections at a suitable scale not less than 1/4” = 1'-0”, clearly indicating how his work is to be installed in relation to the work

of other trades, or so as not to cause any interference with work of other trades. He shall make the necessary changes in his work to correct the condition without extra charge.

C. The Contractor shall furnish to other trades, as required, all necessary templates, patterns, setting plans, and shop details for the proper installation of work and for the purpose of coordinating adjacent work.

21. QUALIFICATIONS OF WORKMEN

A. All mechanical work shall be accomplished by qualified workmen competent in the area of work for which they are responsible. Untrained and incompetent workmen, as evidenced by their workmanship, shall be summarily relieved of their responsibilities in areas of incompetency. The Engineer shall reserve the right to determine the quality of workmanship of any workman and unqualified or incompetent workman shall refrain from work in areas not satisfactory to him. Requests for relief of a workman shall be made through the normal channels of Architect, Contractor, etc.

B. All plumbing work shall be accomplished by Journeymen Plumbers under the direct supervision of a Master Plumber as defined and clarified under State Plumbing Law Regulations and Code. Proof and Certification may be requested by the Engineer.

C. All sheet metal, insulation and pipe fitting work shall be installed by workmen normally engaged or employed in these respective trades, except where only small amounts of such work are required and are within the competency of workmen directly employed by the Contractor involved.

D. All automatic control systems shall be installed by workmen normally engaged or employed in this type work, except in the case of minor control requirements (residential type furnaces, packaged HVAC equipment with integral controls, etc.) in which case, if a competent workman is the employee of this Contractor, he may be utilized subject to review of his qualifications by the Engineer and after written approval from same.

E. All special systems (Pneumatic Tube, Oxygen, Vacuum, Medical Air, Automatic Sprinkler Equipment, etc.) shall be installed only by workmen normally engaged in such services. Exception to this specification may only be made in writing by the Engineer.

F. All electrical work shall be installed only by competent workmen under direct supervision of a fully qualified Electrician.

22. CONDUCT OF WORKMEN

A. The Contractor shall be responsible for the conduct of all workmen under his supervision. Misconduct on the part of any workman to the extent of creating a safety hazard, or endangering the lives and property of others, shall result in the prompt relief of that workman. The consumption of alcoholic beverages or other intoxicants, narcotics, barbiturates, hallucinogens or debilitating drugs on the job site is strictly forbidden.

23. PROTECTION OF MATERIALS AND EQUIPMENT

A. The Contractor shall be entirely responsible for all material and equipment furnished by him in connection with his work and special care shall be taken to properly protect all parts thereof from physical, sun, and weather damage during the construction period. Such protection shall be by a

means acceptable to the manufacturer and Engineer. All rough-in soil, waste, vent and storm piping, ductwork, etc., shall be properly plugged or capped during construction in a manner approved by the Engineer. Equipment damaged, stolen or vandalized while stored on site, either before or after installation, shall be repaired or replaced by the Contractor at his own expense.

24. SCAFFOLDING, RIGGING AND HOISTING

A. The Contractor shall furnish all scaffolding, rigging, hoisting and services necessary for erection and delivery onto the premises of any equipment and apparatus furnished. All such temporary appurtenances shall be set up in strict accord with OSHA Standards and Requirements. Remove same from premises when no longer required.

25. BROKEN LINES AND PROTECTION AGAINST FREEZING

A. No conduits, piping, troughs, etc. carrying water or any other fluid subject to freezing shall be installed in any part of the building where danger of freezing may exist without adequate protection being given by the Contractor whether or not insulation is specified or indicated on the particular piping. All damages resulting from broken and/or leaking lines shall be replaced or repaired at the Contractor's own expense. If in doubt, contact the Engineer. Do not install piping across or near openings to the outside whether they are carrying static or moving fluids or not. Special Note: Insulation on piping does not necessarily ensure that freezing will not occur.

26. CLEANING

A. The Contractor shall, at all times, keep the area of his work presentable to the public and clean of rubbish and debris caused by his operations; and at the completion of the work, shall remove all rubbish, debris, all of his tools, equipment, temporary work and surplus materials from and about the premises, and shall leave the area clean and ready for use. If the Contractor does not attend to such cleaning upon request, the Engineer may cause cleaning to be done by others and charge the cost of same to the Contractor. The Contractor shall be responsible for all damage from fire which originates in, or is propagated by, accumulations of his rubbish or debris.

B. After completion of all work and before final acceptance of the work, the Contractor shall thoroughly clean all equipment and materials and shall remove all foreign matter such as grease, dirt, plaster, labels, stickers, etc., from the exterior of piping, equipment, fixtures and all other associated or adjacent fabrication.

27. CONCRETE WORK

A. The Contractor shall be finally responsible for the provisions of all concrete work required for the installation of any of his systems or equipment. He may, at his option, arrange with the others to provide the work. This option, however, will not relieve the Contractor of his responsibilities relative to dimensions, quality of workmanship, locations, etc. In the absence of other concrete specifications, all concrete related to Mechanical work shall be 3000 psi minimum compression strength at 28 days curing and shall conform to the standards of the American Concrete Institute Publication AC1-318. Heavy equipment shall not be set on pads for at least seven (7) days after pour. Insert 6-inch steel dowel rods into floors to anchor pads.

B. All mechanical equipment (tanks, heaters, chillers, boilers, pumps, air handling units, etc.) shall be set on a minimum of 4” tall concrete pads. Pads shall be taller where required for condensate traps; confirm with cooling equipment submittal requirements. All concrete pads shall be complete with all

pipe sleeves, anchor bolts, reinforcing steel, concrete, etc. as required. Pads larger than 18" in width shall be reinforced with ½" round bars on 6" centers both ways. Bars shall be approximately 3" above the bottom of the pad. All parts of pads and foundations shall be properly rodded or vibrated. If exposed parts of the pads and foundations are rough or show honeycomb after removing forms, all surfaces shall be rubbed to a smooth surface. Chamfer all square edges one-half inch.

C. In general, concrete pads for equipment shall extend six (6) inches beyond the equipment's base dimensions. Where necessary, extend pads 30 inches beyond base or overall dimensions to allow walking and servicing space.

D. Exterior concrete pads shall be four (4) inches minimum above grade and four (4) inches below grade on a tamped four (4) inch dense grade rock base unless otherwise indicated or specified. Surfaces of all foundations and bases shall have a smooth finish with one-half (1/2) inch chamfer on exposed edges.

E. All exterior below grade concrete structures (utility vaults, grease traps, manholes, etc.) shall be provided with exterior waterproofing. Waterproofing shall be hot-fluid applied rubberized-asphalt waterproofing membrane with elastomeric sheets at edges, corners, and terminations of membrane for continuous watertight construction. Apply in layers and reinforce as required to provide uniform seamless membrane minimum 4mm thickness. Also, seal penetrations into and out of the structure watertight. Provide Link-Seal modular seal or equal.

28. NOISE, VIBRATION OR OSCILLATION

A. All work shall operate under all conditions of load without any sound or vibration which is objectionable in the opinion of the Engineer. In case of moving machinery, sound or vibration noticeable outside of room in which it is installed, or annoyingly noticeable inside its own room, will be considered objectionable. Sound or vibration conditions considered objectionable by the Engineer shall be corrected in an approved manner by the Contractor at his expense.

B. All equipment subject to vibration and/or oscillation shall be mounted on vibration supports whether indicated or not suitable for the purpose of minimizing noise and vibration transmission, and shall be isolated from external connections such as piping, ducts, etc. by means of flexible connectors, vibration absorbers, or other approved means. Unitary equipment, such as small room heating units, small exhaust fans, etc., shall be rigidly braced and mounted to wall, floor or ceiling as required and tightly gasketed and sealed to mounting surface to prevent air leakage and to obtain quiet operation. Flush and surface mounted equipment such as diffusers, grilles, etc., shall be gasketed and affixed tightly to their mounting surface.

C. The Contractor shall provide supports for all equipment furnished by him. Supports shall be liberally sized and adequate to carry the load of the equipment and the loads of attached equipment, piping, etc. All equipment shall be securely fastened to the structure either directly or indirectly through supporting members by means of bolts or equally effective means. If strength of supporting structural members is questionable, contact Engineers.

29. ACCESSIBILITY

A. The Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate clearance in double partitions and hung ceilings for the proper installation of his work. He shall cooperate with all others whose work is in the same space. Such spaces and clearances shall, however, be kept to the minimum size required.

B. The Contractor shall locate and install all equipment so that it may be serviced, and maintained as recommended by the manufacturer. Allow ready access and removal of the entire unit and/or parts such as valves, filters, fan belts, motors, prime shafts, etc.

C. The Contractor shall provide access panels for each concealed valve, control damper or other device requiring service as shown on engineer's plans or as required. Locations of these panels shall be identified in sufficient time to be installed in the normal course of work.

30. RESTORATION OF NEW OR EXISTING SHRUBS, PAVING, SURFACES, ETC.

A. The Contractor shall at his expense restore to their original conditions all paving, curbing, surfaces, drainage ditches, structures, fences, shrubs, existing or new building surfaces and appurtenances, and any other items damaged or removed by his operations. Replacement and repairs shall be in accordance with good construction practice and shall match materials employed in the original construction of the item and shall be to the satisfaction of the Architect and/or Engineer.

31. MAINTENANCE OF EXISTING UTILITIES AND LINES

A. The locations of all piping, conduits, cables, utilities and manholes existing, or otherwise, that comes within the contract construction site, shall be subject to continuous uninterrupted service with no other exception than the Owner of the utilities permission to interrupt same temporarily.

B. Utilities and lines, where known, are indicated on the drawings. Locations and sizes are approximate. Prior to any excavation being performed, the Contractor shall ascertain that no utilities or lines are endangered by new excavation. Exercise extreme caution in all excavation work.

C. If utilities or lines occur in the earth within the construction site, the Contractor shall probe and locate the lines prior to machine excavation or blasting in the respective area. Electromagnetic utility locators and acoustic pipe locators shall be utilized to determine where metallic and non-metallic piping is buried prior to any excavation.

D. Cutting into existing utilities and services where required shall be done in coordination with and only at times designated by the Owner of the utility.

E. The Contractor shall repair to the satisfaction of the Engineer, any surfaces or subsurface improvements damaged during the course of the work, unless such improvement is shown to be abandoned or removed.

F. Machine excavation shall not be permitted with ten feet of electrical lines or lines carrying combustible and/or explosive materials. Hand excavate only.

G. Protect all new or existing lines from damage by traffic, etc. during construction. Repairs or replacement of such damage shall be at the sole expense of the party responsible.

32. SMOKE AND FIRE PROOFING

A. The Contractor shall fire and smoke stop all openings made in fire or smoke rated walls, chases, ceilings and floors in accord with the Building Code. Patch all openings around ductwork and piping with appropriate type material to stop smoke at smoke walls and provide commensurate fire rating at

fire walls, floors, ceilings, roofs, etc. Back boxes in rated walls shall be a minimum distance apart as allowed by code to maintain the rating. If closer provide rated box or fireproofing in code approved manner.

33. MOTORS

A. Motors shall be built in accordance with the latest standards of NEMA and as specified. Motors shall be tested in accordance with standards of A.S.A. C50, conforming to this and all applicable standards for insulation resistance and dielectric strength.

B. Each motor shall be provided by the equipment supplier, installer or manufacturer with conduit terminal box, and N.E.C. required disconnecting means as specified or required. Three-phase motors shall be provided with external thermal overload protection in their starter units. Single-phase motors shall be provided with thermal overload protection, integral to their windings or external, in control unit. All motors shall be installed with NEMA-rated starters as specified and shall be connected per the National Electrical Code.

C. The capacity of each motor shall be sufficient to operate associated driven devices under all conditions of operation and load and without overload, and at least of the horsepower indicated or specified. Each motor shall be selected for quiet operation, maximum efficiency and lowest starting KVA per horsepower. Motors producing excessive noise or vibration shall be replaced by the responsible contractor. See Division 26 of Specifications for further requirements related to installation of motors.

34. CUTTING AND PATCHING

A. The Contractor shall provide his own cutting and patching necessary to install his work. Patching shall match adjacent surfaces and shall be to the satisfaction of the Architect and Engineer.

B. No structural members shall be cut without the approval of the Engineer and all such cutting shall be done in a manner directed by him.

C. When installing conduit, pipe, or any other work in insulated concrete form (ICF) walls, the responsible subcontractor for the work shall provide spray foam insulation to patch the rigid insulation to maintain full integrity of the insulating value of the wall after the mechanical and electrical work is complete. Furthermore, all new work shall NOT be installed in concrete center of wall. All mechanical and electrical installations shall be on the interior side of the concrete.

35. CURBS, PLATES, ESCUTCHEONS & AIR TIGHT PENETRATIONS

A. In all areas where ducts are exposed and ducts pass thru floors, the opening shall be surrounded by a 4-inch-high by 3-inch-wide concrete curb.

B. Escutcheon plates shall be provided for all pipes and conduit passing thru walls, floors and ceilings. Plates shall be nickel plated, of the split ring type, of size to match the pipe or conduit. Where plates are provided for pipes passing thru sleeves which extend above the floor surface, provide deep recessed plates to conceal the pipe sleeves.

C. Seal all duct, pipe, conduit, etc., penetrations through walls and floors air tight. If wall or floor assembly is fire or smoke rated then the proper firestopping material and method shall be used to maintain the associated rating. Do not use firestopping for penetrations of non-rated assemblies.

36. WEATHERPROOFING

A. Where any work pierces waterproofing including waterproof concrete, the method of installation shall be as approved by the Engineer before work is done. The Contractor shall furnish all necessary sleeves, caulking and flashing required to make openings permanently watertight.

37. OPERATING INSTRUCTIONS, MAINTENANCE MANUALS AND PARTS LISTS

A. Upon completion of all work tests, the Contractor shall instruct the Owner or his representative(s) fully in the operations, adjustment and maintenance of all equipment furnished. The time and a list of representatives required to be present will be as directed by the Engineer. Turn over all special wrenches, keys, etc., to the owner at this time.

B. The Contractor shall furnish three (3) complete bound sets for delivery to the Engineer of typewritten and/or blueprinted instructions for operating and maintaining all systems and equipment included in this contract prior to substantial completion. All instructions shall be submitted in draft, for approval, prior to final issue. Manufacturer's advertising literature or catalogs alone will not be acceptable for operating and maintenance instructions.

C. The Contractor, in the instructions, shall include a preventive maintenance schedule for the principal items of equipment furnished under this contract and a detailed, parts list and the name and address of the nearest source of supply.

D. The Contractor shall frame under Lexan in the main mechanical room all temperature control diagrams and all piping diagrams.

38. PAINTING

A. In general, all finish painting shall be accomplished under the Painting Section of the specifications by the Contractor; however, unless otherwise specified under other sections of these specifications, the following items shall be painted:

(1) All exposed piping, valve bodies and fittings (bare and insulated), including hangers, platforms, etc.

(2) All mechanical equipment not factory finished. Aluminum and stainless-steel equipment, motors, identification plates, tags, etc. shall not be painted. All rust and foreign matter shall be thoroughly removed from surfaces prior to painting. All baked enamel factory finish of equipment which may have been scratched or chipped shall be touched up with the proper paint as recommended and supplied by the manufacturer.

(3) All ductwork exposed in finished areas (bare and insulated), all grilles, diffusers, etc. not factory finished. Paint the inside surfaces of all interior duct surfaces visible from any register, grille or diffuser opening on all jobs; surfaces shall receive one (1) prime coat of Rustoleum 1225 red "galvinoleum" or other approved equivalent primer and rust inhibitor and one (1) coat of Rustoleum 1579 jet black "Speedy Dry" enamel or approved equivalent applied in accordance with the manufacturer's recommendations.

(4) All insulated piping, ductwork and equipment shall be properly prepared for painting by the Contractor where mechanical items are to be painted. In the case of externally insulated duct

and pipe, the Contractor shall provide 6 oz. canvas jacket with fire retardant lagging. The jacket shall be allowed to dry properly before applying paint to avoid shrinking after painting and exposing unpainted surfaces. The Contractor, at his option, may provide double wall ductwork in lieu of externally insulated ductwork with canvas jacket and lagging.

39. ELECTRICAL CONNECTIONS

A. The Contractor shall furnish and install all (1) temperature control wiring; (2) equipment control wiring and (3) interlock wiring. The Contractor shall furnish and install all power wiring complete from power source to motor or equipment junction box, including power wiring thru starters, and shall furnish and install all required starters not factory mounted on equipment.

B. The Contractor shall, regardless of voltage, furnish and install all temperature control wiring and all associated interlock wiring, all equipment control wiring and conduit for the equipment that the Contractor furnishes. He may, at his option, employ at his own expense, the Electrical Contractor to accomplish this work.

C. After all circuits are energized and completed, the Contractor shall be responsible for all power wiring, and all control wiring shall be the responsibility of the Contractor. Motors and equipment shall be provided for current characteristics as shown on the drawings.

D. The Contractor shall furnish motor starters of the type and size required by the manufacturer for all equipment provided by him, where such starters are necessary. Starters shall have overloads for each phase.

40. FINAL CONNECTIONS TO EQUIPMENT

A. The Contractor shall finally connect to mechanical services, any terminal equipment, appliances, etc., provided under this and other divisions of the work. Such connections shall be made in strict accord with current codes, safety regulations and the equipment manufacturer’s recommendations. If in doubt, contact the Engineers prior to installation.

41. REQUIRED CLEARANCE FOR ELECTRICAL EQUIPMENT

A. The NEC has specific required clearances above, in front, and around electrical gear, panels etc. The Contractor shall not install any piping, ductwork, etc., in the required clearance. If any appurtenance is located in the NEC required clearance, it shall be relocated at no additional cost.

42. INDEMNIFICATION

A. The Contractor shall hold harmless and indemnify the Engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for, or on account of any personal injury or property damage received or sustained by any person, persons, (including third parties), or any property growing out of, occurring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the Contractor, any subcontractor, any employee, agent or representative.

43. HAZARDOUS MATERIALS

A. The Contractor is hereby advised that it is possible that asbestos and/or other hazardous materials are or were present in this building(s). Any worker, occupant, visitor, inspector, etc., who encounters

any material of whose content they are not certain shall promptly report the existence and location of that material to the Contractor and/or Owner. The Contractor shall, as a part of his work, ensure that his workers are aware of this potential and what they are to do in the event of suspicion. He shall also keep uninformed persons from the premises during construction. Furthermore, the Contractor shall ensure that no one comes near to or in contact with any such material or fumes therefrom until its content can be ascertained to be non-hazardous.

B. CMTA, Inc., Consulting Engineers, have no expertise in the determination of the presence of hazardous materials. Therefore, no attempt has been made by them to identify the existence or location of any such material. Furthermore, CMTA nor any affiliate thereof will neither offer nor make any recommendations relative to the removal, handling or disposal of such material.

C. If the work interfaces, connects or relates in any way with or to existing components which contain or bear any hazardous material, asbestos being one, then, it shall be the Contractor's sole responsibility to contact the Owner and so advise him immediately.

D. The Contractor by execution of the contract for any work and/or by the accomplishment of any work thereby agrees to bring no claim relative to hazardous materials for negligence, breach of contract, indemnity, or any other such item against CMTA, its principals, employees, agents or consultants. Also, the Contractor further agrees to defend, indemnify and hold CMTA, its principals, employees, agents and consultants, harmless from any such related claims which may be brought by any subcontractors, suppliers or any other third parties.

44. ABOVE-CEILING AND FINAL PUNCH LISTS

A. The Contractor shall review each area and prepare a punch list for each of the subcontractors, as applicable, for at least two stages of the project:

(1) For review of above-ceiling work that will be concealed by tile or other materials well before substantial completion.
(2) For review of all other work as the project nears substantial completion.

B. When all work from the Contractor's punch list is complete at each of these stages and prior to completing ceiling installations (or at the final punch list stage), the Contractor shall request that the Engineer develop a punch list. This request is to be made in writing seven days prior to the proposed date. After all corrections have been made from the Engineer's punch list, the Contractor shall review and initial off on each item. This signed-off punch list shall be submitted to the Engineer. The Engineer shall return to the site once to review each punch list and all work prior to the ceilings being installed and at the final punch list review.

C. If additional visits are required by the Engineer to review work not completed by this review, the Engineer shall be reimbursed directly by the Contractor at a rate of $140.00 per hour for extra trips required to complete either of the above-ceiling or final punch lists.

Phone: 859 253-0892 Fax: 859 231-8357

The following is CMTA's guide for Division 20-25 required information relative to the Schedule of Values. Please utilize all items that pertain to this project and add any specialized system as required. A thorough and detailed schedule of values will allow for fair and equitable Pay Application approval and minimize any discrepancies as to the status of the job. For projects with multiple areas, provide a unique schedule of values for each independent area.

END OF SECTION 200100

SECTION 200200 - SCOPE OF THE MECHANICAL WORK

1. GENERAL

A. The Mechanical work for this Contract shall include all labor, materials, equipment, fixtures, excavation, backfill and related items required to completely install, test, place in service and deliver to the Owner the complete mechanical systems in accordance with the accompanying plans and all provisions of these specifications. This work shall primarily include, but is not necessarily limited to the following:

(1) Complete exterior domestic water service finally connected to the local domestic water system.

(2) Complete exterior sanitary sewer system connected to the local system.

(3) Complete exterior storm drainage system.

(4) Complete exterior fire protection system.

(5) Interior domestic hot, cold and recirculating hot water system.

(6) Interior soil, waste and vent systems.

(7) Roof drainage system.

(8) All plumbing equipment, fixtures and fittings.

(9) 100% automatic sprinkler system.

(10) All mechanical exhaust systems.

(11) All insulation associated with mechanical systems.

(12) Condensate drainage systems.

(13) Complete heating, ventilation and air conditioning systems.

(14) Final connection of all mechanical equipment furnished by others (e.g., kitchen equipment).

(15) Complete balancing of air and water systems.

(16) Complete natural gas piping systems.

(17) All applicable services and work specified in Section 200100; General Provisions - Mechanical.

(18) All specified or required control work.

(19) Provide all required motor starters, etc. not provided under the electrical sections.

(20) One year guarantee of all mechanical equipment, materials and workmanship.

(21) Thorough instruction of the owner’s maintenance personnel in the operation and maintenance of all mechanical equipment.

(22) Thorough coordination of the installation of all piping, equipment and any other material with other trades to ensure that no conflict in installation.

(23) Approved supervision of the mechanical work.

(24) Excavation, backfilling, cutting, patching, sleeving, concrete work, etc., required to construct the mechanical systems.

(25) Prior to submitting a bid, the Contractor shall contact all serving utility companies to determine exactly what each utility company will provide and exactly what is required of the Contractor and shall include such requirements in his base bid.

(26) Procurement of all required permits and inspections, including fees for all permits and inspection services and submission of final certificates of inspection to the Engineers (Plumbing, Boiler, HVAC, etc.).

(27) All necessary coordination with gas, water, and sewer utility companies, etc., to ensure that work, connections, etc., that they are to provide is accomplished.

(28) Factory start-up of all major equipment (including terminal HVAC equipment) and submission of associated factory start-up reports to the Engineer.

END OF SECTION 200200

SECTION 200300 - SHOP DRAWINGS, DESCRIPTIVE LITERATURE, MAINTENANCE MANUALS, PARTS LISTS, SPECIAL KEYS AND TOOLS

1. GENERAL

A. The Contractor's attention is directed also to the General and Special Conditions and Section 200100 - General Provisions - Mechanical as well as to all other Contract Documents as they may apply to his work.

B. The Contractor shall prepare and submit to the Engineer, through the General Contractor and the Architect (where applicable) within thirty (30) days after the date of the Contract, all shop drawings, certified equipment drawings, installation, operating and maintenance instructions, samples, wiring diagrams, etc. on all items of equipment specified hereinafter through **EComm.**

C. Submittal data shall include specification data including metal gauges, finishes, accessories, etc. Also, the submittal data shall include certified performance data, wiring diagrams, dimensional data, and a spare parts list. Submittal data shall be reviewed by the Engineer before any equipment or materials is ordered or any work is begun in the area requiring the equipment.

D. All submittal data shall have the stamp of approval of the Contractor submitting the data as well as the General Contractor and the Architect (if applicable) to show that the drawings have been reviewed by the Contractor. Any drawings submitted without these stamps of approval may not be considered and will be returned for proper resubmission.

E. It shall be noted that review of shop drawings by the Engineer applies only to conformance with the design concept of the project and general compliance with the information given in the contract documents. In all cases, the Contractor alone shall be responsible for furnishing the proper quantity of equipment and/or materials required, for seeing that all equipment fits the available space in a satisfactory manner and that piping, electrical and all other connections are suitably located.

F. The Engineers review of shop drawings, schedules or other required submittal data shall not relieve the Contractor from responsibility for: adaptability of the item to the project; compliance with applicable codes, rules, regulations and information that pertains to fabrication and installation; dimensions and quantities; electrical characteristics; and coordination of the work with all other trades involved in this project. Any items that differ from the Drawings or Specifications shall be flagged by the Contractor so the Engineer will be sure to see the item. Do not rely on the Engineer to “catch” items that do not comply with the Drawings or Specifications. The Contractor is responsible for meeting the Drawings and Specification requirements, regardless of whether or not something does not get caught by the Contractor or Engineer during shop drawing reviews.

G. Equipment shall not be ordered and no final rough-in connections, etc., shall be accomplished until reviewed equipment shop drawings are in the hands of the Contractor. It shall be the Contractor's responsibility to obtain reviewed shop drawings and to make all connections, etc. in the neatest and most workmanlike manner possible. The Contractor shall coordinate with all the other trades having any connections, roughing-in, etc. to the equipment.

H. If the Contractor fails to comply with the requirements set forth above, the Engineer shall have the option of selecting any or all items listed in the Specifications or on the drawings; and the Contractor shall be required to furnish all materials in accordance with this list.

I. Colors for equipment in other than mechanical spaces shall be selected from the Manufacturer's standard and factory optional colors. Color samples shall be furnished with the shop drawing submission for such equipment.

J. Shop Drawing Submittals

(1) All submittals for HVAC equipment shall include all information specified. This shall include air and water pressure drops, RPM, noise data, face velocities, horsepower, voltage motor type, steel or aluminum construction, and all accessories clearly marked.

(2) All items listed in the schedules shall be submitted for review in a tabular form similar to the equipment schedule.

(3) All items submitted shall be designated with the same identifying tag as specified on each sheet.

(4) Any submittals received in an unorganized manner without options listed and with incomplete data will be returned for resubmittal.

2. SHOP DRAWINGS

Shop Drawings, descriptive literature, technical data and required schedules shall be submitted on the following:

Air Handling Units
Chillers
Boilers
Fans
Steam Heat Exchangers
Steam Condensate Pumps
Fan Coil Units
Blower Coil Units
Hydronic Pumps
Fire Pump
Domestic Water Booster Pump
Fire Protection System
Duct Insulation
Pipe Insulation
Duct Materials
Piping Materials
Hydronic Specialties
Hydronic Chemical Treatment

SPECIAL NOTES:

1) Upon substantial completion of the project, the Contractor shall deliver to the Engineers (in addition to the required Shop Drawings) an electronic copy of operation and maintenance instructions and parts lists for each item marked (1) above. These documents shall include at least:

a. Detailed operating instructions
b. Detailed maintenance instructions including preventive maintenance schedules.

c. Addresses and phone numbers indicating where parts may be purchased.

2) Shop drawings for the Control Systems shall include detailed, scaled plans and schematic diagrams indicating the function and operation of the system.

3) Shop drawings for the Building Fire Protection System shall be prepared and stamped by a Certified Contractor and shall meet the criteria of the Department of Housing, Buildings and Construction and submitted to the Engineer. After the Engineer's review, they shall be submitted by the Contractor to the proper state authorities along with the required State review fee.

4) The Contractor shall submit to the Boiler Inspector's Office the required documentation and review fees for a boiler permit. The boiler permit shall be submitted to the Engineer along with the Boiler Shop Drawings.

5) The Contractor shall submit shop drawings for the kitchen hood system(s) along with all required supporting documentation and review fees to the Department of Housing, Buildings and Construction and receive approval prior to submittal to the Engineers.

6) The Contractor shall submit Material Safety Data sheets for all chemical treatment and anti-freeze solutions.

3. SPECIAL WRENCHES, TOOLS, ETC.

(1) The Contractor shall furnish, along with equipment provided, any special wrenches or tools necessary to dismantle or service equipment or appliances installed under the Contract. Wrenches shall include necessary keys, handles and operators for valves, cocks, hydrants, etc. A reasonable number of each shall be furnished.

4. BALANCE REPORTS

A. Upon substantial completion of the project, the Contractor shall submit to the Engineers an electronic copy of the Certified Air and Hydronic Balance Report.

END OF SECTION 200300

SECTION 200500 - COORDINATION AMONG TRADES, SYSTEMS INTERFACING AND CONNECTION OF EQUIPMENT FURNISHED BY OTHERS

1. COORDINATION

   A. The Contractor is expressly directed to read the General Conditions and all detailed sections of these specifications for all other trades and to study all drawings applicable to his work, including Architectural and Structural drawings, to the end that complete coordination between trades will be affected. Special attention shall be given to the points where ducts or piping must cross other ducts or piping, where lighting fixtures must be recessed in ceilings, and where ducts, piping and conduit must fur into walls, soffits, columns, etc. It shall be the responsibility of the Contractor to leave the necessary room for other trades. No extra compensation will be allowed to cover the cost of removing piping, conduit, ducts, etc., or equipment found encroaching on space required by others.

   B. The Contractor shall be responsible for coordination with the Electrical trade to ensure that he has made provision for connections, operational switches, disconnect switches, fused disconnects, etc. for electrically operated equipment provided under this division of the specifications, or called for on the plans.

   C. If any discrepancies occur between accompanying drawings and these specifications and drawings and specifications covering other Contracts, each trade shall report such discrepancies to the Architect far enough in advance so that a workable solution can be presented. No extra payment will be allowed for relocation of piping, ductwork, conduit, and equipment not installed in accordance with the above instructions, and which interfered with work and equipment of other trades.

   D. In all areas where air diffusers and lighting fixtures are to be installed, the Contractor shall coordinate their respective construction and installations so as to provide combined symmetrical arrangements.

2. INTERFACING

   The Contractor shall ensure that coordination is affected relative to interfacing of systems. Some interface points are (but not necessarily all):

   A. Connection of Domestic Water System to water service mains.

   B. Connection of Natural Gas System to natural gas service.

   C. Connection of Fire Protection System to domestic water service.

   D. Connection of Sanitary sewer house line to municipal service.

   E. Connection of Storm Drainage System to municipal system.

   F. Connection of fuel oil piping to emergency generator.

   G. Connection of Domestic Water System to Hydronic System.

   H. Connection of all controls to equipment.

   I. Electrical power connections to electrically operated (or controlled) equipment.

   J. Connection of Emergency Engine Exhaust System.

3. CONNECTION OF EQUIPMENT FURNISHED BY OTHERS

A. The Contractor shall make all connections to equipment furnished by others, or relocated from the existing structure, whenever such equipment is shown on any part of the drawings or mentioned in any part of the Specifications, unless otherwise specifically specified hereinafter.

B. Supervision to assure proper functioning and operation shall be provided by the Contractor.

C. Items indicated on the drawings as rough-in only (RIO) will be connected by others. The Contractor shall be responsible for rough-in provisions only.

D. For items furnished by others, relocated, or RIO, the Contractor shall obtain from the supplier or shall field determine as appropriate, the exact rough-in locations and connection sizes for the referenced equipment.

E. The Contractor shall be responsible for coordinating to determine any and all final connections that he is to make to equipment furnished by others.

4. COORDINATION DRAWINGS AND RECORD DRAWINGS

A. COORDINATION as follows:

(1) Detailed electronic coordination drawings shall be required for this project and shall be led by the Mechanical Contractor. A specific line-item shall be included on the schedule of values by each Trade for “preparation of coordination drawings”. The Engineer and the Engineer’s Field Inspector shall closely monitor progress and quality of the preparation of the electronic coordination drawings and may withhold pay requests as deemed appropriate.

(2) Coordination Drawings shall be provided on this project by each Trade (Mechanical, Fire Protection, Electrical). Drawings shall be 30 x 42 sheet size and shall be at ¼” scale and shall match the drawing setup as included in the Architectural Drawings. The Architect and Engineer will supply electronic drawings files of the Contract Documents upon the Contractor’s request and release.

(3) The basis for the Coordination Drawings shall be the sheet metal ductwork fabrication shop drawings and shall be prepared by the Mechanical Contractor. The Coordination Drawings shall indicate (1) systems above ceilings in finished areas, (2) systems supported from the structure in finished areas without ceilings, (3) systems in the mechanical rooms, and (4) all wall, roof, floor penetrations. **These drawings shall be 3-D drawings and shall be able to be reviewed with a 3-D software system such as Revit or Navisworks.**

(4) The sheet metal fabrication shop drawings shall be completed in a timely manner so as not to conflict with construction schedule and phasing plan. At the General Contractor’s discretion, these drawings shall be completed in phases to correspond with the project construction work sequencing. The Mechanical Contractor shall furnish an electronic copy of these ductwork shop drawings to all other Trades, specifically the Fire Protection and Electrical and other Contractors as requested by the General Contractor for the purpose of including other trades work on the Coordination Drawings.

(5) Pre-Coordination Meetings with all necessary trades shall occur. During these meetings, the Contractors shall discuss locations/elevations where piping, conduits, cable trays, etc.

will be installed with respect to the sheet metal fabrication drawings and other trades. The sheet metal ductwork and gravity piping systems shall be given the first priority. Within 30 days of the meeting, each Trade shall provide the Mechanical Contractor electronic drawings of all of their systems (with elevation noted), coordinated with the ductwork and other trades for them to incorporate into the Coordination Drawings. Coordination Meetings shall then occur so that all conflicts can be resolved between Trades. All conflicts shall be resolved between all Trades at these Coordination Meetings and the Mechanical Contractor shall then amend the Drawings to include the Final Coordinated Work.

(6) It is realized that not all systems can be completely detailed. The coordination drawings shall include the following at a minimum:

a. All ductwork including and all above ceiling equipment i.e. VAV boxes indicating appropriate maintenance access routed as indicated on the drawings. The drawings shall indicate a 3 ft. clearance zone that is unobstructed and allows access from a 2x2 ceiling tile.
b. All hydronic, plumbing, and sprinkler piping. Indicate all valves and ensure that appropriate access is provided for all valves.
c. Provide all conduits (existing or new) 2" and above. Multiple smaller conduits hung on a common trapeze hanger that is larger than 6" wide
d. All cable tray and enclosed wireway shall be indicated and shall indicate all required access.
e. All wall, roof, floor penetrations.

(7) After completion of the Final Coordination Drawings, a Final Review with the all Trades shall occur to provide any final comments and approval by all Trades. Other interim coordination meeting will be required to ensure successful coordination drawings. Any additional coordination items will be updated by the Mechanical Contractor. The Final Approved Coordination Drawings shall distributed electronically (on CD) to each Trade by the Mechanical Contractor. The Mechanical Contractor shall also furnish a complete 30x42 paper set of drawings to the jobsite main office and shall utilize them for updates of field conditions/deviations that occur during construction. Final Approved Coordination Drawings shall also be distributed to the General Contractor, Owner, Architect and Engineer for their Records. This process shall be completed prior to starting any work.

(8) RECORD DRAWINGS - Each Contractor shall ensure that any deviations from the Coordination Drawings are recorded as they occur, in red erasable pencil on Coordination Drawings kept at the jobsite. Upon completion of a particular phase, the Mechanical Contractor shall incorporate all field deviations into the Coordination Drawings to be utilized as Record Drawings. The Engineer shall review the Record Documents from time to time to ensure compliance with this specification. Compliance shall be a contingency of final payment. Pay particular attention to the location of under floor sanitary and water lines, shut-off valves, cleanouts and other appurtenances important to the maintenance and operation of Mechanical Systems. Also, pay particular attention to Deviations in the Control Systems and all exterior utilities. Keep information in a set of drawings set aside at the job site especially for this purpose. The Record Drawings shall be distributed electronically (on CD) to the Construction Manager, Owner, Architect and Engineer for their Records.

END OF SECTION 200500

SECTION 201100 - SLEEVING, CUTTING, PATCHING AND REPAIRING

1. GENERAL

   A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

   B. The Contractor shall be responsible for all openings, sleeves, trenches, etc., that he may require in floors, roofs, ceilings, walls, etc., and shall coordinate all such work with the General Contractor and all other trades. Coordinate with the General Contractor, any openings which he is to provide before submitting a bid proposal in order to avoid conflict and disagreement during construction. Improperly located openings shall be reworked at the expense of the Contractor.

   C. The Contractor shall plan his work ahead and shall place sleeves, frames or forms through all walls, floors and ceilings during the initial construction, where it is necessary for piping, ductwork, conduit, etc., to go through; however, when this is not done, the Contractor shall do all cutting and patching required for the installation of his work, or he shall pay other trades for doing this work when so directed by the Engineer. Any damage caused to the buildings by the workmen of the responsible Contractor must be corrected or rectified by him at is own expense.

   D. The Contractor shall notify other trades in due time where he will require openings or chases in new concrete or masonry. He shall set all concrete inserts and sleeves for his work. Failing to do this, he shall cut openings for his work and patch same as required at his own expense.

   E. The Contractor shall be responsible for properly shoring, bracing, supporting, etc., any existing and/or new construction to guard against cracking, settling, collapsing, displacing or weakening while openings are being made. Any damage occurring to the existing and/or new structures, due to failure to exercise proper precautions or due to action of the elements shall be promptly and properly made good to the satisfaction of the Engineer.

   F. All work improperly done or not done at all as required by the Mechanical Trades in this section, will be performed by the Contractor at the direction of the trade whose work is affected.

2. SLEEVES, PLATES AND ESCUTCHEONS

   A. The Contractor shall provide and locate all sleeves and inserts required for his work before the floors and surface being penetrated are built, otherwise the Contractor shall core drill for pipes where sleeves and inserts were not installed, or where incorrectly located. Core drilling is the only acceptable alternative to sleeves. Do not chisel openings. Where sleeves are placed in exterior walls or in slabs on grade, the space between the pipe or conduit and the sleeves shall be made completely and permanently water tight.

   B. Pipe that penetrates fire and/or smoke rated assemblies shall have sleeves installed as required by the manufacturer of the rating seal used.

   C. At all other locations either pipe sleeves or core drilled openings are acceptable.

   D. Where thermal expansion does not occur, the wall may be sealed tight to the pipe or insulation.

E. Insulation, that requires a vapor barrier (i.e., cold water or refrigerant piping, etc.), must be continuous through the sleeve/cored hole. For other piping, insulation may stop on either side of the sleeve.

F. Sleeves shall be constructed of 24-gauge galvanized sheet steel with lock seam joints or Schedule 40 pipe. Sleeves in floors shall extend 1" above finished floor level.

G. Fasten sleeves securely in floors, walls, so that they will not become displaced when concrete is poured or when other construction is built around them. Take precautions to prevent concrete, plaster or other materials being forced into the space between pipe and sleeve during construction.

H. In all areas where ducts are exposed and ducts pass thru floors, the opening shall be surrounded by a 4-inch-high by 3-inch-wide concrete curb.

I. Escutcheon plates shall be provided for all pipes and conduit passing thru walls, floors and ceilings. Plates shall be nickel plated, of the split ring type, of size to match the pipe or conduit. Where plates are provided for pipes passing thru sleeves which extend above the floor surface, provide deep recessed plates to conceal the pipe sleeves.

3. CUTTING

A. All rectangular or special shaped openings in plaster, stucco or similar materials, including gypsum board, shall be framed by means of plaster frames, casing beads, wood or metal angle members as required. The intent of this requirement is to provide smooth even termination of wall, floor and ceiling finishes as well as to provide a fastening means for grilles, diffusers, lighting fixtures, etc.

B. Mechanical, plumbing, and fire protection contractors shall coordinate all openings in new and existing masonry walls with the General Contractor; and, unless otherwise indicated on the Architectural or Structural drawings, provide lintels for all openings required for the work (Louvers, wall boxes, exhaust fans, etc.). Lintels shall be sized as follows:

(1) New Openings under 48" in width: Provide one 3-1/2"x3-1/2"x3/8" steel angle for each 4" of masonry width. Lintel shall have 8" bearing on either side.

(2) New Openings 48" to 96" in width: Provide one 3-1/2"x6"x3/8" steel angle for each 4" of masonry width. Lintel shall have 8" bearing on either side.

(3) New Openings over 96" in width: Consult the Project Structural Engineer.

C. No cutting is to be done at points or in a manner that will weaken the structure and unnecessary cutting must be avoided. If in doubt, contact the Engineer.

D. Pipe openings in slabs and walls shall be cut with core drill. Hammer devices will not be permitted. Edges of trenches and large openings shall be scribe cut with a masonry saw.

E. Openings in metal building walls shall be made in strict accord with building suppliers recommendations.

4. PATCHING AND REPAIRING

A. Patching and repairing made necessary by work performed under this division shall be included as a part of the work and shall be done by skilled mechanics of the trade or trades for work cut or

damaged, in strict accordance with the provisions herein before specified for work of like type to match adjacent surfaces and in a manner acceptable to the Engineer.
